Barclay de Tolly, Michael, Prince, distinguished Russian general: b. Livonia, 1761; d. Insterburg, 14 May 1818. He entered the army at an early age, and his long service as a subordinate in campaigns against the Turks, Swedes, and Poles, laid the basis of a valuable experience, and served to develop his great natural capacity for command. In 1810 he was named minister of war. He occupied this position in 1812, when Napoleon invaded Russia, but was soon appointed to the chief command of the army. He adopted a plan of retreat, which was soon seen to be a strict necessity, as the Russian army, officially estimated at more than 500,000, did not greatly exceed 100,000 men. In this difficult campaign Barclay proved no unworthy opponent of Napoleon himself. Notwithstanding, the Russians became impatient of a policy which seemed to show no active results, while jealousy of the Scottish extraction of Barclay and other causes completed his overthrow, and after the capture of Smolensk by the French he was superseded by Kutusoff. Serving under his successor, he commanded the right wing of the Russian army at the battle of Moscow, maintained his position, and covered the retreat of the rest of the army. After the battle of Bautzen, in 1813, at which he again distinguished himself, he was reappointed to the chief command, which he had soon after to resign to Prince Schwarzenberg. He forced the surrender of Gen. Vandamme, who had been detached by Napoleon for some special operations, after the battle of Dresden, and took part in the decisive battle of Leipsic. On crossing the Rhine at the head of the Prussian troops he issued a strict proclamation, forbidding all license on the part of his soldiers, and by the maintenance of an exact discipline he conciliated the French as much as possible to the invaders. He was made a field-marshal in Paris. In 1815 he commanded a mixed corps of continental troops. In this year he received from the emperor the title of prince, and from Louis XVIII. the badge of the order of Military Merit. The Emperor Alexander caused a statue to be erected to him in one of the principal places of St. Petersburg.

Barclay Sound, an inlet on the west coast of Vancouver Island. It is some 35 miles in extent and the Alberni Canal continues it yet farther inland. It contains several islands and iron ore is found along its shores.

Bard, John, American physician: b. near Philadelphia, February 1716; d. 30 March 1799. He was of a family which had fled from France upon the revocation of the edict of Nantes. He practised his profession a few years in Philadelphia, but removed to New York in 1746, where he rose to the first rank among physicians. In 1759, the citizens of New York were alarmed by the arrival of a ship, on board which a malignant fever was raging, and Dr. Bard was appointed to take measures to prevent the disease from spreading. He succeeded in keeping the pestilence within the limits of a temporary hospital, but to guard against similar dangers in future, at his suggestion, Bedloe's Island was purchased, and hospital buildings erected thereon, which were placed under his charge. He continued the practice of his profession to an advanced age, and upon the establishment of the New York Medical Society in 1788, was elected its first president.

Bard, Samuel, American physician: b. Philadelphia, 1 April 1742; d. 24 May 1821. He practised in Philadelphia and New York; organized the medical school of Kings (Columbia) College, and was dean of the faculty; also was president of the New York College of Physicians and Surgeons that succeeded the medical school. He published several works, including 'The Shepherd's Guide' (1807); and a 'Manual of Midwifery' (1807).

Bard, Thomas Robert, American politician: b. Chambersburg, Pa., 8 Dec. 1841. He engaged in railroading in Maryland 1858–64, when he went to California to look after the interests of Col. Thomas A. Scott. Since then he has resided in Ventura County, engaging in wharving and warehousing, banking, sheep grazing, real estate, and petroleum mining. In 1892 he was the only Republican elector for California. He was elected to the United States Senate 7 Feb. 1900 by the unanimous vote of the Republican majority in the legislature.

Bard, a fortress and village in Italy, about 23 miles southeast of Aosta. When the French crossed the St. Bernard, in 1800, the fortress of Bard, manned by 400 Austrians, maintained for 10 days a resistance to their further advance into Italy. Ultimately Napoleon contrived to elude the vigilance of the garrison, and passed by a mountain-track during the night.

Bard, a designation applied to the ancient poets of the Celtic tribes, who, in battle, raised the war-cry, and in peace sang the exploits of their heroes, celebrated the attributes of their gods, and chronicled the history of their nation. Their early history is uncertain. Diodorus tells us that the Celts had bards, who sang to musical instruments; and Strabo testifies that they were treated with respect approaching to veneration. There is a passage in the 'Germania' of Tacitus in which a word occurs that some have read as *barditus,* and translated BARD'S SONG; but *baritus* appears to be the true reading, and the true signification merely WAR-CRY. The first Welsh bards of whom anything is extant are Taliesin, Aneurin, and Llywarch Hen, of the 6th century; but their language is imperfectly understood. From the days of these early representatives of the bards we have nothing further till the middle of the 10th century, when the reputation of the order was increased under the auspices of Howel Dha. A code of laws was framed by that prince, to regulate their duties and fix their privileges. They were distributed into three classes, with a fixed allowance; degrees of rank were established, and regular prize contests, known as *eisteddfods,* were instituted. Their order was frequently honored by the admission of princes, among whom was Llewellyn, last king of Wales. The Britons, kept in awe as they were by the Romans, subsequently harassed by the English, and eternally jealous of the attacks, the encroachment, and the neighborhood of aliens, were, on this account, attached to their Celtic manners. This situation and these circumstances inspired them with a proud and obstinate determination to maintain a national distinction, and preserve their ancient usages, among which the bardic profession is so eminent. Sensible of the influence of their traditional poetry in keeping alive the ideas of military valor and of ancient glory among the people, Edward I. is said to have collected all the Welsh bards, and caused them to be hanged by martial law as stirrers up of sedition. On this incident is founded Gray's well-known ode 'The Bard.' We, however, find them existing at a much later period, but confining themselves to the humble task of compiling private genealogies. But little is known of the music and measures of the bards; their prosody depended much on alliteration; their instruments were the harp, the pipe, and the crwth. Attempts have been made in Wales for the revival of bardism, and the Cambrian Society was formed in 1818, for the preservation of the remains of this ancient literature, and for the encouragement of the national muse. The bardic institution of the Irish bears a strong affinity to that of the Welsh. The genealogical sonnets of the Irish bards are still the chief foundations of the ancient history of Ireland. Their songs are strongly marked with the traces of Skaldic imagination, which still appears among the «tale-tellers,» a sort of poetical historians, supposed to be the descendants of the bards. There was, also, evidently a connection of the Welsh with Armorica. Hence, in the early French romances, we often find the scene laid in Wales; and, on the other hand, many fictions have passed from the Troubadours into the tales of the Welsh. In the Highlands of Scotland there are considerable remains of compositions supposed to be those of their old bards still preserved. Of these, the poems of Ossian, said to be collected and translated by MacPherson, were the most celebrated, but the best authorities have decided that they are spurious.

Bardell', Mrs., the obliging landlady of Mr. Pickwick in Dickens' 'Pickwick Papers,' and the heroine of the famous 'Bardell vs. Pickwick' case.

Bardesanes, bär-dē-sā'nēz, Syrian poet and theologian, who lived in the latter half of the 2d century, in Edessa, and is memorable for the peculiarity of his doctrines. He considered the evil in the world only an accidental reaction of matter, and all life as the offspring of male and female Æons. From God, the inscrutable Principle of all substances, and from the consort of this first Principle, proceeded Christ, the Son of the Living, and a female Holy Ghost; from these, the spirits or created powers of the four elements; thus forming the holy eight, or the godlike fulness, whose visible copies he found in the sun, moon, and stars, and therefore attributed to these all the changes of nature and of human destiny. The female Holy Ghost, impregnated by the Son of the Living, was, according to him, the Creator of the world. The human soul, originally of the nature of the Æons, was confined in the material body only as a punishment to its fall, but not subjected to the dominion of the stars. He considered Jesus, the Æon destined for the salvation of souls, only a feigned man, and his death only a feigned death, but his doctrine the sure means to fill the souls of men with ardent desires for their celestial home, and to lead them back to God, to whom they go immediately after death, and without a resurrection of the earthly body. Bardesanes propagated this doctrine in Syrian hymns, and is the first writer of hymns in this language. The Bardesanists did not formally separate themselves from the orthodox Christian Church, and they maintained themselves until the 5th century. A fragment of the work of Bardesanes upon destiny is preserved in the Greek language, by Eusebius, 'Præpar. Evangel. lib. vi. cap. 10.' He led an irreproachable life.

Bardili, Christoph Gottfried, German metaphysician: b. Blaubeuren, Würtemberg, 28 May 1761; d. Stuttgart, 5 June 1808. He was distinguished as a critic and opponent of Kant, and philosophically a forerunner of Schelling and Hegel through his exposition and defense of the reality of pure abstract thought as a ground of concrete thinking and being.

Bar'dolph, Shakespearean character. He is one of the dissolute comrades of Falstaff and appears in the plays 'Henry IV.' parts I. and II; 'Henry V.'; and 'Merry Wives of Windsor.'

Bardowick, bär'dō-vēk, a town in Hanover, once the commercial centre of northern Germany, but now an insignificant village, famous for the ruins of a one time magnificent cathedral, dating from before the destruction of the town in 1189. Pop. (1900) 2,002.

Bardsley, Charles Wareing, English clergyman and author: b. Keighley, Yorkshire, 1834. He was graduated at Oxford in 1868, and ordained deacon in 1870. His publications include 'English Surnames, their Sources and Significations' (1875); 'John Leeley's Troubles' (1876); 'Memorials of St. Anne's, Manchester' (1876); 'Curiosities of Puritan Nomenclature' (1880); 'Her Grandfather's Bible, a Tale of Furner's Fells' (1886), etc.

Bardwan, bŭrd-wän', a division of Bengal, upon the Hugli. Area, 13,850 square miles; pop. (1901) 2,245,000. Apart from its products, rice, grain, hemp, cotton, indigo, etc., it has a noted coal field of about 500 square miles in area, with an annual output of about 500,000 tons. The capital of the same name has a population of 34,080.

Bare'bone, or **Barbon, Praise-God,** the name of a leather seller in Fleet Street in London, well known in his day as a prominent preacher among the Baptists: b. about 1596; d. 1679. He made himself notorious as an enemy of the monarchy, and in 1660, on Monk's arrival in London, Barebone, at the head of a numerous mob, presented a petition to Parliament against the restoration of the Stuarts. In 1661 he was committed to the Tower, and remained for some time in confinement.

Barebones Parliament, a derisive term applied to the "Little Parliament" summoned by Oliver Cromwell, 4 July 1653. It consisted of 140 persons, "faithful, fearing God, and hating covetousness," but mostly of very destructive social principles. These began by abolishing the court of chancery, and were proceeding to abolish tithes, to the alarm of the more moderate members, and of Cromwell himself, who dissolved the Parliament on 12 December of the same year. See Gardiner, 'History of the Commonwealth and Protectorate' Vol. II. (1897).

Barefooted Friars. See FRIARS.

Barége bä-rāzh, a light, open tissue of silk and worsted or cotton and worsted for women's dresses, originally manufactured near Baréges, France, and in that country known as crêpe de barège. The fabric is now chiefly manufactured at Bagnères de Bigorre.

Baréges (ancient VALLETRIA), a watering place in the south of France, department of the Hautes-Pyrénées, 22 miles south from Tarbes, and celebrated for its thermal springs. It is situated in a valley between two perpendicular chains of mountains, along with numerous other villages. From June to September it is crowded with patients, and the bath establishment is a spacious marble building. A military hospital and an ecclesiastical charity hospital are also prominent local institutions.

Bareilly, bä-rā'le, a town of Hindustan in the northwest provinces, capital of a district of the same name, 131 miles east-southeast from Delhi. It has a pleasant and elevated site, and contains one well-built street, an old and a new fort, and cantonments in the environs. The principal manufactures are ornamental furniture, sword-cutlery, gold and silver lace, and perfumery. On the outbreak of the Indian mutiny the native garrison mutinied and took possession of the place. It was retaken by Lord Clyde in May, 1858. Pop. (1901) 117,400.

Barentz, William, Dutch navigator: b. about 1560, who discovered Nova Zembla in 1594. While on a third expedition to the same region, in 1596, he discovered Spitzbergen, but had to spend the winter of 1596–7 in Nova Zembla. He and his companions suffered great hardships which led to his death on the homeward journey. Relics of his expedition were discovered undisturbed in 1871.

Barère de Vieuzac, bä-rār-dĕ-vyē-zak, **Bertrand,** French revolutionist and agitator: b. Tarbes, 10 Sept. 1755; d. 14 Jan. 1841. An advocate of Toulouse, he acted as a deputy in the National Assembly, and was sent by the department of the Hautes-Pyrénées to the National Convention in 1792. He soon became active as a journalist, and attached himself to the *Mountain,* supporting it with eloquence of such a flowery and poetical style as afterward earned him the name of the "Anacreon of the guillotine." He was president of the convention when the sentence was passed upon Louis XVI. He rejected the appeal to the people, and gave his vote with these words: "The law is for death, and I am here only as the organ of the law." Though a supporter of Robespierre, he concurred in his downfall, yet this did not save him from being impeached and sentenced to transportation. His sentence was not carried into effect, and he shared in the general amnesty of the 18th Brumaire. Elected a deputy during the Hundred Days, he was banished after the second restoration. He went to Brussels, where he devoted himself to literary work till the revolution of July permitted his return.

Baretti, bä-rĕt'te, **Giuseppe Marc' Antonio,** Italian writer: b. Turin 25 April 1716; d. 5 May 1789. In 1753 he published a 'Defence of the Poetry of Italy against the Censures of M. Voltaire.' About this time he was introduced to Johnson, then engaged in the compilation of his 'Dictionary,' of which Baretti availed himself to compile an Italian and English dictionary in 1760, much more complete than any which had hitherto appeared. In this year he revisited his native country, and published at Venice a critical journal, the 'Frusta Literaria,' which was soon suppressed. He therefore returned to England, and in 1768 published an 'Account of the Manners and Customs of Italy.' While defending himself in a street brawl he mortally wounded one of his assailants, and was tried for murder at the Old Bailey, but acquitted. On this occasion Johnson, Burke, Goldsmith, Garrick, Reynolds, and Beauclerk gave testimony to his good character. In 1770 he published his 'Journey from London to Genoa through England, Portugal, Spain, and France,' and continued to publish introductory works for students in the Italian and other modern languages, and superintended an edition of Machiavelli's works. His 'Opere Scritte in Lingua Italiana' appeared at Milan in 6 volumes in 1813–18. Baron Pietri Custodi published his 'Scritti Scelti, Inediti, o Rari' (1822).

Barfleur, bär-flĕr, a seaport of France, in the department of La Manche, about 15 miles east of Cherbourg. It was at one time the best port on the coast of Normandy, but in the year 1346 was taken and pillaged by Edward III., king of England, and the harbor destroyed.

William the Conqueror fitted out at Barfleur the expedition which effected the conquest of England. Pop. (1897) 1,189.

Barge, a term commonly applied to flat-bottomed boats such as are used on rivers and canals, the name including various craft, many of them carrying sails and being rigged in several ways. Formerly the name was given to a boat of state or pleasure used chiefly for ornamental purposes, and to the boat of the commanding officer of a ship of war. In eastern New England the name is also given to a kind of open omnibus much used at railway stations and seaside resorts.

Bar'ham, Richard Harris, English humorous writer: b. Canterbury, 6 Dec. 1788; d. 17 June 1845. Having been ordained a clergyman, he became in 1821 one of the minor canons of St. Paul's Cathedral. In 1824 he was appointed a priest in ordinary of the chapel-royal, and was shortly afterward presented to the rectory of the united parishes of St. Mary Magdalene and St.-Gregory-by-St. Paul, London. In 1837, on the starting of Bentley's 'Miscellany,' under the editorship of Charles Dickens, he laid the foundation of his literary fame by the publication in that periodical of the 'Ingoldsby Legends'—a series of humorous tales in verse which achieved an immense success, having in a collective form, from 1840 onward, been published over and over again in various editions, with many "legends" added to the original number. Though a brilliant member of society, and ranking with the most distinguished wits of the day, including his intimate friends, Sydney Smith and Theodore Hook, Mr. Barham never neglected his more serious duties as a clergyman. His life has been written by his son.

Bari, a negro people of Africa, dwelling on both sides of the White Nile. Gondokoro is their chief town. They practise agriculture and cattle-raising. Their country was conquered by Baker Pasha in 1871 for Egypt.

Bari, bä're (ancient BARIUM), an important seaport of southern Italy, in Apulia, capital of the province Terra di Bari, and situated on a promontory of the Adriatic, 69 miles northwest of Brindisi. It was a place of some importance under the Romans, passed from them to the Saracens, and was afterward selected as the seat of government by the Northmen who conquered Apulia. It has been thrice destroyed and rebuilt on the same site. The present town, surrounded by walls, and defended by a castle, consists of a poorly-built old town with a better part of more recent date. It is the see of an archbishop, and possesses a cathedral with a tower 260 feet high, dating from the early half of the 11th century, but largely spoiled by recent alterations. The church of San Nicola dates from 1087; and there is also a royal lyceum. Bari manufactures cotton and linen goods, organs, pianos, hats, soap, glass, and liquors, and has a trade in wine, grain, almonds, oil, etc. It has regular steamboat communication with Venice, Ancona, Trieste, Brindisi, Genoa, and Marseilles. A United States consul is stationed here. Pop. (1901) 77,478.

Bariatinski, Alexander Ivanovich, Prince, bär-yä-tēn'skē, Russian field-marshal: b. 1814; d. Geneva, 9 March 1879. He was educated with the future czar, Alexander II., and while a young officer in the hussars was transferred to the Caucasus, where his successes against the famous Shamyl secured him, in 1852, the rank of lieutenant-general. On the accession of Alexander II. he returned to St. Petersburg, and in 1856 was appointed to the command of the army of the Caucasus. Three successful campaigns were closed by the storming of Ghunib, and the capture of Shamyl. For these services he was made a field-marshal. His health, however, had broken down, and the remainder of his life was passed chiefly abroad.

Barili, bä-rē'lę, Philippines, a town in the province of Cebu, 52 miles from Cebu, its capital. Pop. (1898) 20,914.

Barilla (Spanish, "impure soda"), the commercial name of a crude variety of soda obtained by burning certain fleshy plants that grow near the ocean and in other salty places. The *Salsola soda* was largely used for this purpose, and was cultivated in Spain, Sicily, Sardinia, and other places on account of the considerable yield of barilla that it furnished. The plants were cut in September, dried for about a month, and then burned on an iron grating, beneath which was a pit into which the fused ashes fell. The burning was continued until a ton or two of the ash had accumulated in the pit, after which the product was allowed to cool, and was then broken up and shipped to market. Barilla contains about 20 per cent of soda, the remainder consisting chiefly of chlorides and sulphates of sodium, calcium, and aluminum. It was formerly much used in the manufacture of soap, but has now been almost entirely replaced by purer grades of soda, obtained by chemical means from common salt. See KELP.

Bar'ing, the family name of one of the most influential financial establishments in the world, the well-known house of Baring Brothers & Company. John Baring, the father of the founders, was a German cloth maker who engaged in business in a small way at Larkbear, Devonshire, England, in the earlier half of the 18th century. His sons, Francis and John, established the firm of Baring Brothers in London, in 1770. Since 1890 the house has been reorganized as a limited banking company.

Baring, Alexander. See ASHBURTON, ALEXANDER BARING, LORD.

Baring, **Sir Evelyn** (VISCOUNT CROMER), an English colonial civil servant: b. Norfolk, Eng., 26 Feb. 1841. He served in the Royal Artillery, became secretary to his cousin, the Earl of Northbrook, one of the controllers-general of Egyptian finance (1879), finance minister of India (1880), and agent and consul-general in Egypt from 1883 till April 1907. He was created a peer in 1892, viscount in 1899, and is author of 'Staff College Essays'; 'The War Game.'

Baring, Sir Francis, English banker: b. Larkbear, England, 1740; d. 1810. He obtained a commercial training, founded a large and successful business, became a director of the East India Company, and was created a baronet in 1793. He took an active part in the discussions relative to the bank restriction act of 1797, and at the time of his death was reckoned the first merchant in Europe.

Baring, Sir Francis Thornhill, English banker, son of Sir Thomas: b. 1796; d. 1866. Under successive Whig governments, he was a

lord of the treasury, secretary to the treasury, chancellor of the exchequer, and first lord of the admiralty. He was created Baron Northbrook in 1866.

Baring, Sir Thomas, English banker: b. 1772; d. April 1848. He was the eldest son of Sir Francis, whom he succeeded in the baronetcy. He was chiefly remarkable as an admirer and encourager of art. His magnificent collection of paintings was dispersed by public sale after his death. His fourth son, Charles Thomas (1807–79), was bishop of Durham.

Baring, Thomas, English banker and politician, brother of the first Lord Northbrook: b. 1799; d. 1873. He devoted himself early to commercial pursuits, and also to politics, in which he was a Conservative, thus taking the opposite side to his brother. He entered Parliament in 1835, representing the borough of Huntingdon from 1844 till his death.

Baring, Thomas George, second Earl of Northbrook: b. 1826; d. London, Eng., 15 Nov. 1904. He was successively a lord of the admiralty, under secretary of state for India, under secretary of war, governor-general of India (1872–6), and first lord of the admiralty (1880–5), and was created an earl in 1876. He has published 'The Teachings of Christ in His Own Words.'

Baring-Gould, Sabine, English clergyman and novelist: b. Exeter, 28 Jan. 1834; d. Port Elizabeth, South Africa, 4 June 1906. He graduated from Cambridge in 1856, and since 1881 has been rector of Lew-Trenchard in Devon. Among his numerous works are: 'Iceland: Its Scenes and Sagas' (1864); 'The Book of Werewolves' (1865); 'Curious Myths of the Middle Ages' (1866–7); 'Lives of the Saints' (1872–9); 'Yorkshire Oddities' (1874); 'Germany, Past and Present' (1879). Prominent among his novels and other later books are: 'Mehalah: a Story of the Salt Marshes' (1880); 'John Herring' (1883); 'Red Spider' (1887); 'Grettis the Outlaw' (1890); 'The Broom Squire' (1896); 'Guavas the Tinner' (1897); 'Bladys (1897); 'Domitia' (1898); 'Pabo the Priest' (1899); 'A Book of the West' (1899); 'Furze-Bloom' (1899); 'The Crock of Gold' (1899); 'Winefred' (1900); 'A Book of Dartmoor' (1900); 'In a Quiet Village' (1900); 'Virgin Saints and Martyrs' (1900); 'The Frobishers'; 'A Book of Brittany' (1901); 'Royal Georgie' (1901); 'Miss Quillet'; 'Nebo the Nailer' (1902).

Baring Island, an island in the Arctic Archipelago. The name is also given to a bay and strait. They were named for Sir Francis Baring, who was first lord of the admiralty at the time of their discovery.

Baringo, a lake in East Africa, northeast of the Victoria Nyanza, about 20 miles long, 200 square miles in area, and between 3,000 and 4,000 feet above sea-level. Though fed by many streams, it has no visible outlet. It contains several small islands and was discovered by Thomson in 1883.

Barite, ba'rīt (Greek, "heavy," in allusion to its high specific gravity), a mineral having the formula $BaSO_4$, and crystallizing in the orthorhombic system, but also occurring massive, and in granular, earthy, and stalactitic forms. It is usually white or nearly so, and has a hardness of from 2.5 to 3.5. Its specific gravity ranges from 4.3 to 4.6, and from this circumstance the mineral is often called "heavy-spar." Barite was first examined (in 1602) by Casciorolus, a shoemaker of Bologna, who discovered that it becomes phosphorescent when heated with combustible matter, and gave it the name *lapis solis,* or "sun stone." Barite occurs in many parts of the world, and in large quantities. In the United States it is found abundantly in many States, notably in Virginia, North Carolina, and Missouri, and in the Lake Superior region. It constitutes an important source of barium compounds, and was mined in the United States to the extent of about 61,000 tons in 1902. See also BARIUM.

Baritone, or **Barytone,** a male voice, whose compass partakes of those of the common bass and the tenor, but does not extend so far downward as the one nor to an equal height with the other. Its best tones are from the lower A of the bass clef to the lower E or F in the treble; yet we find Verdi and Meyerbeer exacting G and even A flat from it. This name is also given to the smaller bass saxhorn in B flat or C, used in reed and brass bands.

Ba'rium, a metallic element, strongly resembling calcium in its chemical properties. The mineral barite (q.v.) was the first compound of barium to be examined. In 1750 Marggraf showed that barite contains sulphuric acid, and the subsequent labors of Scheele and Gahn proved that it also contains a previously unrecognized earth, which Bergmann called *terra ponderosum,* or "heavy earth." In 1779 Guyton de Morveau proposed the name "barote" (Greek, "heavy") for this earth, and Lavoisier modified the word to "baryta," in which form it still survives. Subsequently baryta was found to be the oxid of a new metal, which was isolated by electrolysis in 1808 by Berzelius and Pontin, and afterward by Davy, and named "barium." The properties of metallic barium are not yet satisfactorily ascertained, for it is probable that the metal has never been obtained in a state of even approximate purity. Thus, Davy says it is a silver white metal; Clarke ascribes to it the color and lustre of iron; Bunsen and Matthiessen describe it as golden yellow; and Donath states that its true color is that of bronze. It oxidizes rapidly in the air, and decomposes water readily. It is ductile and somewhat malleable. Its atomic weight is 137.4 (O = 16), and its chemical symbol is Ba. It melts at about the same temperature as cast iron, and its specific gravity appears to be between 3.75 and 4.00. The most common sources of barium compounds are the carbonate and sulphate, which occur native as Witherite and Barite (qq.v.), respectively. The nitrate is prepared by acting upon the native carbonate with nitric acid. It is a soluble salt, with the formula $Ba(NO_3)_2$. The nitrate decomposes upon being strongly heated, the nitric acid being expelled, while barium monoxid (or baryta), BaO, is left behind as a gray, porous mass, strongly caustic and alkaline. When gently heated in air, barium monoxid takes up another molecule of oxygen and forms the dioxid, BaO_2; and on being more strongly heated, the dioxid gives up the extra atom of oxygen again, and returns to the monoxid. It was long ago proposed to make use of

this curious property for isolating pure oxygen from the air, by alternately heating the dioxid at a high temperature, and collecting the oxygen given off as it returns to the monoxid, and then submitting it, at a lower temperature, to the action of a current of air until it has again passed into the state of dioxid. It was found, however, that the process would work only for a short time, after which a fresh supply of baryta was required. Recent investigations have gone far toward discovering the cause of this loss of activity, and it is now likely that oxygen will soon be made on a commercial scale by this most ingenious process. Baryta absorbs water with considerable evolution of heat and the formation of a hydrate, $Ba(OH)_2$, which crystallizes with eight molecules of water. Barium hydrate is also made, in large quantities and at a low price, at Niagara Falls, by the electrolysis of soluble salts of barium. The hydrate is used in refining sugar, being much superior to lime for this purpose. With cane sugar it forms an insoluble compound from which the sugar may afterward be set free by a current of carbon dioxid gas. The hydrate is also likely to be of great use, in the near future, for preventing the formation of boiler scale, by precipitating the carbonates and sulphates in the feed water, in the form of insoluble barium compounds. The value of barium hydrate for this purpose has long been known, but until the development of the electrolytic method of manufacturing it, the expense involved was prohibitive. Barium sulphate (barite) is thrown down as a precipitate whenever a soluble barium compound is added to a solution of any sulphate; and for this reason soluble barium salts are much used by the chemist in testing for sulphuric acid and sulphates. The chloride ($BaCl_2$) is the salt most commonly employed as a reagent for this purpose. Barium sulphate is one of the most insoluble salts known. The native sulphate, when ground up, is used to adulterate white lead. The artificial sulphate is also used for this purpose, and is itself used as a paint, under the name of «permanent white,» or *blanc fixe*. The artificial sulphate is said to be superior to the natural mineral for use as a paint, as it has more «body.» When barium sulphate is heated with coal it loses its oxygen, and becomes reduced to the sulphid, BaS, a salt which is highly phosphorescent, and is known as Bologna phosphorus. After exposure to sunlight or to a strong artificial light, barium sulphid shines for hours with a bright, orange color. Barium is readily recognized by the spectroscope, by a number of characteristic green lines. Its volatile salts communicate a green color to non-luminous flames, and are used (especially the nitrate) in pyrotechny.

In poisoning by the barium salts the symptoms resemble those seen in poisoning by other metals. In the acute forms there is pain and burning in the mouth and stomach, nausea, vomiting, and chills. These are followed by diarrhœa, dizziness, and chilly feelings. The pulse is slowed, at first large and full, later small and scarcely recognizable. Muscle paralysis supervenes with dyspnœa, loss of consciousness, convulsions, and death. In the treatment prompt washing of the stomach with a solution of Glauber's salts is advisable. This forms an insoluble barium sulphate.

Bark, the more or less easily separable layers of tissue surrounding the woody cylinder of trees and shrubs, also, by extension, the analogous part (cortex) of textile plants such as hemp, jute, ramie, flax, etc., and other annual stems. The layers are divided into three groups which may be readily seen in a yearling stem: (1) The phloëm, bast, the inner food-conducting tissue annually thickened from the cambium (q.v.) layer which separates it from the wood; (2) the green zone which generally does not increase in thickness but which in young twigs assists in food elaboration (see PHOTOSYNTHESIS); (3) the epidermis or external layer with contiguous cork cells which increase from the phellogen, or cork cambium, a layer of epidermal or cortical cells. These cork cells which develop mainly at right angles to the direction of the stem, die and become more or less weather-beaten and seamed from cracking and give the characteristic appearance to tree trunks. Many trees can be identified by their bark alone.

The bark of many trees and shrubs is of economic use mainly in tanning, dyeing, medicine, and cookery. In tanning (q.v.) such barks as are rich in tannic acid are most in demand; oak, hemlock, and chestnut (qq.v.) are general favorites in America and Europe; eucalyptus and acacia in Australia. Larch and willow bark are used for special work. To obtain these barks the trees are felled after the sap has started to flow in the spring, the rough exterior layers removed, the bark of the trunk and main limbs peeled off in lengths of about two feet with specially made tools; the bark of the smaller branches, in equal lengths, is loosened with mallets and slipped off. After removal the bark is loosely piled in open sheds to dry or stacked on end in the open air, the larger pieces being placed on the outside to protect the smaller inner ones from rain and sun, which together with mildew are the important agencies that may injure the quality of the product. The barks used in medicine, cookery, etc., are treated under individual titles. See CASCARILLA, CINCHONA, and CINNAMON; also CORK.

Bark, or **Barque,** a three-masted vessel whose foremast and mainmast are square-rigged, but whose mizzenmast has fore-and-aft sails only. The distinction between a bark and a barkentine is that the latter has but one mast square-rigged, the main and mizzen being both rigged fore-and-aft.

Bark-beetles, members of the family *Scolytidæ,* and allied to the weevils. They are of an elongate cylindrical form, truncated before and behind. They mine under the bark of trees, running their winding galleries in every direction, but rarely attack living healthy trees. They are usually brown or black in color. The rounded head does not end in a snout and is deeply sunken in the thorax; the clavate antennæ are somewhat elbowed, while the palpi are very short; the elytra are often hollowed at the end, and the short stout legs are toothed on the under side of the femora, and the tarsi are slender and narrow. The eggs are laid in the bark, whence the larvæ on being hatched bore straight into the sap wood, or mine between the bark and the sap wood. They are fleshy, cylindrical, footless larvæ, wrinkled on the back.

When fully grown in the autumn they gnaw an exit for the beetle, taking care to leave a little space closed in front of their burrow to conceal the pupa. The various species of Scolytus, Tomicus, and Xyloterus give rise to a disease similar to fireblight, by their ravages beneath the twigs of fruit trees, causing the bark to shrivel and peal off as if a fire had run through the orchard. *Xyloterus fuscatus* has been found to bore into empty wine casks and spoil them for use. The spruce forests of Maine and other parts of northern New England have, since 1818, been devastated by *Dendrocotonus piceaperda* of Hopkins. It attacks and kills vigorous trees in perfect health, the largest and best stands of timber suffering most from its ravages. The estimated number of adults which under favorable conditions may emerge from an average-sized tree is from 5,000 to 7,000. Hopkins estimates that an average of three pairs of beetles to the square foot of bark on 10 to 15 feet of the trunk of an average-sized tree are sufficient to kill it, and that 6,000 beetles breeding in one tree may be sufficient to kill from 20 to 25 more trees. Two other beetles (*Polygraphus sufipennis* and *Tetropium cinnamopterum*) also aid the Deudrocotonus in killing the spruce. Consult: Packard, 'Report on the Insects Injurious to Forest and Shade Trees' (1890); Hopkins, 'Insect Enemies of the Spruce in the Northeast' (Bull. No. 28, Division of Entomology, U. S. Dept. Agriculture, 1891).

Bark-louse, a hemipterous insect of the scale family (*Coccidæ*). The bark-lice are very small insects, whose females are wingless, their bodies resembling scales. The females sting the bark of trees with a long slender beak, sucking in the sap, and, when very numerous, injure or kill the tree. The males have two wings but no beak, and take no food. The apple bark-louse (*Mytilaspis pomorum*) is destructive to young apple-trees, while in Florida *M. gloveri* is a pest of the orange, as is also the San José scale-insect (q.v.). The cochineal, the mealy-bug of hot-houses, and various other coccid insects, belong to this group. See SCALE-INSECTS, and the names of various species.

Bark, Peruvian. A bark obtained from several trees belonging to the genus *Cinchona,* which grow spontaneously in many parts of South America, but more particularly of Peru. The trees somewhat resemble a cherry-tree in appearance, and have white or pink flowers. This valuable medicine was formerly called Jesuit's Bark, from having been introduced into Europe by the members of that Order settled in South America. They were instructed in its use by the natives of Peru, and it continued for many years a source of profit to the Order. Its bontanical name was derived from that of the Countess del Chinchon, the lady of a Spanish viceroy, who had been cured by it. The tree from which it is obtained grows abundantly in the forests of Quito and Peru, and the bark is cut by the natives in the months of September, October, and November, during which alone the weather is free from rain. The bark is of three kinds — red, yellow, and pale, of which the yellow and pale barks are the stronger in their febrifuge properties. The crown-bark, as the highest-priced is termed, is of a pale yellowish-red. The pale is the original Peruvian cinchona, and is produced by several varieties of the *Cinchona officinalis.* The red is obtained from the *C. succirubra,* which grows chiefly in the forests of Ecuador around Chimborazo. The yellow sort is produced by the *C. calisaya,* and grows in Bolivia and Peru.

The uses of the bark in medicine are too well known to need description; but the chemical discoveries in relation to it are deserving of more particular mention. Its medicinal properties were found to depend upon the presence of a substance called quinine. This exists, more or less, in all kinds of Peruvian bark, but in quantities very unequal in the various kinds. See QUININE.

Barkal, or **Jebel Barkal,** an isolated sandstone rock, 400 feet high, in Nubia, near the Fourth Cataract of the Nile. It is nearly perpendicular on all sides, but fully so on the side nearest the Nile. There are some remarkable ruins in the vicinity. Excavations here have revealed inscriptions and archæological remains of great interest and value, an account of which may be found in Lepsius's 'Denkmäler,' Vol. V.

Bark'entine. See BARK or BARQUE.

Barker, Albert Smith, American naval officer: b. Massachusetts, March 1843. He was graduated at the United States Naval Academy in 1859; served on the frigate Mississippi in the operations to open the Mississippi River in 1861–3, taking part in the bombardment and passage of forts Jackson and St. Philip and the Chalmette batteries, the capture of New Orleans, and the attempted passage of Port Hudson, where his vessel was destroyed. He became captain 5 May 1892; commanded the cruiser Newark during the war with Spain; subsequently succeeded to the command of the battleship Oregon, which he took to Manila; became a rear-admiral, and was placed in command of the Norfolk Navy Yard in 1899; and in July 1900 succeeded the late Rear-Admiral Philip as commandant of the Brooklyn Navy Yard.

Barker, Edmund Henry, English philologist: b. Hollym, Yorkshire, December 1788; d. London, 21 March 1839. He undertook the labor of reprinting the 'Thesaurus Græcus' of H. Stephens, upon which was expended an immense amount of time and money, but owing to severe adverse criticisms, the work did not appear in the form which was originally intended, or under his name. His first work, 'Classical Recreations,' appeared in London, 1812; one volume only was published. He also wrote several dissertations, essays, etc., for reviews; a work upon the claims of Sir Philip Francis to the authorship of the Junius letters; a Greek and English dictionary, etc. In the latter part of his life he became so reduced that he was at one time confined in a debtors' prison, and finally died in an obscure lodging-house in extreme want.

Barker, Fordyce, American physician: b. Wilton, Franklin County, Me., 2 May 1819; d. 30 May 1891. He entered upon the practice of his profession in Norwich, Conn., in 1845, and made a specialty of obstetrics and diseases of women. After serving as professor of midwifery at Bowdoin, he removed to New York in 1850. He was an incorporator of the New York Medical College and obstetrical

surgeon to Bellevue Hospital, besides acting as consulting physician in leading hospitals. He wrote 'Puerperal Diseases' (1872); and 'On Seasickness.'

Barker, George Frederick, American physicist: b. Charlestown, Mass., 14 July 1835. He was graduated from Sheffield Scientific School, 1858, and Albany Medical College, 1863, and from 1859 to 1872 taught at Harvard, Yale, Wheaton College (Ill.), and Western University of Pennsylvania. Since 1873 he has been professor of physics in the University of Pennsylvania. He was a United States commissioner at the International Electrical Exhibition at Paris, 1881, where he received the Legion of Honor decoration, with rank of commander. He has frequently served as an expert in patent and other cases, notably as a government expert in the suit against the American Bell Telephone Company, and in the Lydia Sherman poisoning case in 1872. His publications have chiefly appeared in the 'American Journal of Science,' 'American Chemist,' and 'Proceedings of the American Philosophical Society.' Others are, besides text-books on chemistry: 'Nitrous-Oxide' (1866); 'Correlation of Vital and Physical Forces' (1871); 'Progress in Physics.' For several years he contributed to the Smithsonian reports.

Barker, Jacob, American financier: b. Swan Island, Me., 7 Dec. 1779; d. Philadelphia, 26 Dec. 1871. He early developed remarkable business ability, settled in New York, and before he was 21 owned five trading vessels and controlled a large credit. In 1801 he met with heavy reverses, but obtaining a government contract for supplying oil, made up his losses, and at the outbreak of the War of 1812, undertook the raising of a loan of $5,000,000 for the government. He was a founder of Tammany Hall, and a State senator, and established a bank in Wall Street in 1815 which failed in 1819. His financial methods aroused intense opposition and he was once indicted for fraud and convicted, but a new trial quashed the indictment. Removing to New Orleans in 1834, he was admitted to the bar and accumulated a large fortune that was mostly lost during the Civil War. During the latter part of his life he lived in Philadelphia with his son, Wharton Barker. See 'Incidents in the Life of Jacob Barker, 1800-1855' (1855).

Barker, James Nelson, American author: b. Philadelphia, 17 June 1784; d. Washington, March 1858. He served with distinction in the War of 1812, but subsequently entered civil life, becoming mayor of his native city in 1820. He was collector of customs at Philadelphia 1829–38 and during the ensuing 20 years was comptroller of the United States Treasury. His dramatic works, especially 'Marmion,' 'The Indian Princess,' and 'Smiles and Tears,' were popular.

Barker, Lewellys Franklin, Canadian-American anatomist: b. Norwich, Ont., 1867. He was a professor of anatomy at Johns Hopkins University 1894–1900, and from 1900 has been at the head of the department of anatomy in the Rush Medical College of University of Chicago. He is author of 'The Nervous System and Its Constituent Neurones' (1899).

Barker, Matthew Henry, English novelist: b. Deptford, 1790; d. London, 29 June 1846. He followed the sea, and under the name of «The Old Sailor,» wrote spirited sea tales, very popular in their day. They include 'Land and Sea Tales' (1836); 'Life of Nelson' (1836); 'Topsailsheet Blocks' (1838; new ed. 1881); and 'The Victory, or the Wardroom Mess' (1844).

Barker's Mill, a form of waterwheel devised by Dr. Barker, some 300 years ago. It turns about a vertical axis, down which the water that is to operate it flows. At the lower extremity of the vertical axis two or more hollow arms project horizontally, like the spokes of a wheel. Water is discharged tangentially from the ends of these hollow arms, and by its reaction causes the wheel to rotate. Barker's mill is now used only as a toy, although a modification of it, invented by Whitelaw, is still used, to some extent, as a source of power in Great Britain, where it is known as the Scotch turbine. See TURBINE.

Barking, England, a town in Essex, on the left bank of the Roding, about two miles above its junction with the Thames, and seven miles northeast from London. The houses are mostly of brick and generally well built. It has a parish church, a handsome structure, with a lofty tower, and some fine public buildings. There are also the ruins of Barking Abbey, at one time among the wealthiest nunneries of England. There are several important industrial works, the largest being a gas works employing many hands. Pop. (1901) 21,500. Consult 'Barking Town' (1897).

Barking Wolf, a name in early American books for the prairie wolf or coyote, on account of the greater resemblance in its voice to the barking of a dog than to the howl of the wolf. See COYOTE.

Bar'kis, a rustic figure in Dickens' 'David Copperfield.' He proposes to David's nurse, Peggotty, in the since famous phrase «Barkis is willin'.»

Barks'dale, William, American statesman and military officer: b. Rutherford County, Tenn., 21 Aug. 1821; d. 2 July 1863. He was admitted to the bar when under 21, and rapidly achieved eminence in law and politics, editing the Columbus *Democrat,* and serving in the Mexican war. He entered Congress in 1853, but resigned his seat when his State seceded, and took command of a regiment of Mississippi volunteers. He was made a Confederate brigadier-general after a campaign in Virginia, and was killed at Gettysburg.

Barlaam, bär'la-äm, Italian theologian: b. Seminaria, Calabria; d. about 1348. He was a monk of St. Basil, noted for his learning, and particularly for his thorough knowledge of the Greek language. In 1327 he visited Constantinople, and in 1331 he was appointed abbot of the convent of St. Salvator. In 1339 the kings of France and Sicily sent Barlaam in vain to Pope Benedict XII. at Avignon, for the purpose of obtaining assistance against the Mohammedans, and of arranging a union between the Greek and Latin Churches. Henceforth he was engaged in various religious controversies, and was defeated in them all. He finally en-

tered the Roman Catholic Church, and through the influence of his friend, Petrarch, received from Pope Clement VI. the bishopric of Geraci.

Barlaam and Josaphat, one of the most popular of early mediæval romances, supposed to have been written by St. John of Damascus, — or Damascenus, as he is sometimes called,— a Syrian monk born about the end of the 7th century. The name of Barlaam and Josaphat appear in both the Greek and Roman lists of saints. According to the narrative of Damascenus, Josaphat was the son of a king of India brought up in magnificent seclusion, to the end that he might know nothing of human misery. Despite his father's care, the knowledge of sickness, poverty, and death cannot be hidden from him: he is oppressed by the mystery of existence. A Christian hermit, Barlaam, finds his way to him at the risk of life, and succeeds in converting him to Christianity. The prince uses his influence to promote the new faith among his people. When he has raised his kingdom to high prosperity, he leaves it to spend the remainder of his days as a holy hermit. Professor Max Müller traces a very close connection between the legend of Barlaam and Josaphat, and the Indian legends of the Buddha as related in the Sanskrit of the Lalita Vistara. This connection was first noticed, according to Prof. Müller, by M. Laboulaye in the 'Journal des Débats' (July 1859). A year later, Dr. Felix Liebrecht made an elaborate treatment of the subject. The compilers of the 'Gesta Romanorum,' Boccaccio, Gower, and Shakespeare have all drawn materials from this romance.

Barlæus, bär-lē'ŭs, or **Bærle, Kaspar van,** Dutch historian and learned writer: b. Antwerp, 12 Feb. 1584; d. Amsterdam, 14 Jan. 1648. His 'Poems,' mostly Latin, are not forcible, but his 'History of Brazil under Maurice of Nassau' is decidedly so; and he composed also numerous fine orations, the influence he exercised upon contemporary thought being very considerable.

Barletta, bär-lĕt'ta, **Gabriello,** Italian monk: b. perhaps at Barletta, in the kingdom of Naples, in the 15th century. He became celebrated at Naples on account of his sermons, in which he mixed sarcasm and the ludicrous with the sacred; quoting, now Virgil, now Moses; placing David at the side of Hercules; and commencing a sentence in Italian to continue it in Latin, and end it in Greek. Sometimes he forgot himself so far as to use expressions of which he had not considered the signification, as when he asked by what signs the Samaritan knew Jesus was a Jew. Very serious authors, Niceron and others, have given the response of the preacher; but it cannot be reproduced here. There is under his name a collection of Latin sermons, which have gone through more than 20 editions.

Barletta, Italy, a seaport town on the west shore of the Adriatic, 33 miles northwest of Bari. In the market-place is a colossal bronze statue, about 18 feet high, supposed to represent the Emperor Heraclius. A statue of the statesman Massimo d' Azeglio, who died in 1866, adorns another square. The cathedral is a fine Byzantine edifice, the nave of which is supported by antique granite columns. There are several other churches, convents for both sexes, an orphan institution, a college founded by Ferdinand IV., and a theatre. The harbor is formed by a mole running out from the shore. It admits of small vessels only, but good anchorage-ground is found in the roadstead. Barletta has a considerable trade in grain, wine, almonds, and the other productions of the country, which are exported to the different ports of the Adriatic. Pop. (1901) 42,022.

Barley (*A. S. bærlic,* from *bere,* barley + *leac,* a leek, plant); genus *Hordeum;* our fourth most important cereal. It belongs to the natural order *Gramineæ* or grass family, and is one of the oldest of the cultivated members of this family. It was cultivated in ancient Egypt (Exod. ix. 31), by the Greeks and Romans. Pliny regarded it as the most ancient food of mankind. It has been found in the lake dwellings of Switzerland in deposits belonging to the Stone Age. Ears of barley are represented plaited in the hair of the goddess Ceres, and are also shown on ancient coins. One of the sacred books of the Chinese claims that it was grown in China 2000 B.C. It grows wild in western Asia, and some authorities regard this as its original home. It is adapted to both warm and cold climates, has a wider range of distribution than any other cereal, being grown all over the region embraced in the temperate zones, from Alaska, Iceland, and Norway in the north to Algeria, Egypt, India, and other sub-tropical countries. The Nepaul or Himalaya barley is very hardy, producing good crops at an elevation of 14,000 feet above the sea. In Chile and Switzerland it thrives at 5,000 feet, but on the plateaus of Peru it rarely ripens.

This species is divided into several types, of which the following are recognized: Two-rowed barley, *Hordeum distichon;* four-rowed barley, *H. vulgare,* the common barley, bere or bigg; six-rowed barley, *H. hexastichon;* naked barley, *H. distichon nudum,* the flowering glume and pale not adhering to the grain as in other types; fan, spratt, or Battledore barley, *H. zeocriton,* two-rowed with wide-spreading awns; this is valued in Germany and is sometimes called German rice. These types are further subdivided into varieties, the most popular for malting belonging to the two-rowed type. The best known is the Chevalier, which originated in Suffolk, England, in 1819. This variety and selections from it constitute the high-priced barley of California. In Europe the two-rowed type predominates. In this country the six-rowed is more common. The four-rowed varieties were formerly used for malting; they are hardy and productive but coarse, and are being replaced by the two-rowed. In northern latitudes well-drained and fertile medium or rather light soils, particularly those of a calcareous nature are best. Strong loams, heavy clays, and soils rich in humus, produce heavy crops, but of inferior quality. In southern latitudes medium to heavy loams are best. Climate and season are of more importance than soil in determining whether the barley will be a good malting variety or not. A rather dry climate suits well. The climate of eastern and southeastern England produces the best malting barley. It may be sown broadcast or drilled, but the latter method is more satisfactory. Fall-sown varieties are handled like fall-sown wheat, but it is generally sown in the spring after

spring-wheat sowing is over. The amount sown varies from two to three bushels per acre. It germinates quickly, and late spring frosts may injure it. Fertilizers when applied must be evenly distributed or an uneven growth will result. It ripens before spring wheat, and should be fully ripe before it is cut. The color and value of the grain is easily injured by damp weather. From 30 to 40 bushels of grain and 1,500 to 2,200 pounds of straw is a good yield. Sometimes this yield of grain is doubled. A good malting variety must have quick, high, and even germinating power; the grains must be plump, heavy, thin-husked, and uniform in size; of good bright color, not "steely" or bleached, indicating immaturity when cut, nor musty; must contain a high percentage of starch, mealy not flinty, showing that the starch can be readily transformed during malting. Barley is sometimes attacked by rust and smut, but less so than wheat. (See RUSTS; WHEAT.) Wireworms are sometimes troublesome. The production of barley in the United States is increasing. In 1866, 7,916,342 bushels were grown on 492,532 acres. In 1905, 136,651,020 bushels on 5,095,528 acres. The four leading States in 1904 were Minnesota, 32,123,041 bushels; California, 28,091,999 bushels; North Dakota, 17,518,074; Wisconsin, 14,941,290 bushels. The average yield for the 10 years 1895–1904 was 25.02 bushels per acre. The average farm value 40.48c per bushel. In 1904 only Russia grew more barley than the United States.

Feeding Value and Uses.—The average percentage composition of barley is, water, 10.9; proteids, 12.4; nitrogen-free extract, chiefly starch, 69.8; ether extract, 1.8; crude fibre, 2.7; ash, 2.4. Digestion experiments with pigs showed that 80 per cent of the dry matter, 81 per cent of the protein, 87 per cent of the nitrogen-free extract, and 57 per cent of the ether extract were digestible. Barley is chiefly used for malting, for the preparation of spirits, beer, and malted foods. It is also employed in domestic cookery as "pot or hulled barley" in which only the husks are removed; "pearl barley" is the grain deprived of husk and pellicle, then ground to a round form and polished; "patent barley" is flour obtained by grinding pearl barley. It is used in soups, for making demulcent and emollient drinks for invalids and other purposes. Barley bread is darker in color and less nutritious than that from wheat flour; it does not contain gluten, but is fairly rich in other proteids.

Barley, or decoctions of it, are used to modify cows' milk for feeding to infants. Barley meal and the by-products, barley bean, barley feed (from pearled barley) screenings, malt combs, and brewers' grains are used as stock feeds. Its use for horse feed in the United States is confined to the Pacific coast. For other stock its use is more general. It may be fed alone or with other grain. Barley hay is grown, the crop being cut before the grain is mature. As a forage crop or pasture it may be grown alone or with peas, vetches, or other quick-growing legumes. Barley straw is usually considered as not worth feeding, but may be used as bedding. See MALT.

Barley Break, a game once common, and often mentioned by old English writers. It was played by six young people, three of either sex, formed into couples, a young man and a young woman in each, it being decided by lot which individuals were to be paired together. A piece of ground was then divided into three spaces, of which the central one was profanely termed hell. This was assigned to a couple as their appropriate place. The couples who occupied the other spaces then advanced as near as they dared to the central one to tempt the doomed pair, who, with one of their hands locked in that of their partner, endeavored with the other to grasp them and draw them into the central space. If they succeeded, they were then allowed themselves to emerge from it, the couple caught taking their places. That the game might not be too speedily finished, leave was given to the couple in danger of being taken to break hands and individually try to escape, while no such liberty was accorded to those attempting to seize them.

Bar'leycorn, John, a personification of the spirit of barley, or malt liquor. It is commonly used jocularly, and in humorous verse. Dr. Murray's 'Dictionary' quotes a title in the Pepysian Library, about 1620, "A pleasant new ballad . . . of the bloody murther of Sir John Barleycorn." Burns' ballad on John Barleycorn, 'There was Three Kings into the East,' is well known.

Barlow, Francis Channing, American military officer: b. Brooklyn, N. Y., 9 Oct. 1834; d. 11 Jan. 1896. He studied law in New York, and practised there, but in 1861 enlisted as a private in the 12th Regiment, New York State National Guard, which was among the first troops at the front. He was promoted lieutenant after three months of service; colonel during the siege of Yorktown; distinguished himself in the battle of Fair Oaks, or Seven Pines, for which he was promoted brigadier-general, and fought in almost every subsequent battle of the Army of the Potomac. He was severely wounded at Chancellorsville and at Gettysburg, and was mustered out of the service with the rank of major-general of volunteers. In 1866–8 he was secretary of State of New York; in 1871 became attorney-general; and in 1873 resumed law practice in New York.

Barlow, James William, Irish historian: b. 21 Oct. 1826. He was professor of modern history in Trinity College, Dublin, from 1861, and has published 'Lectures on Mediæval Italy'; 'The Normans in Italy'; 'Eternal Punishment or Eternal Death'; 'The Ultimatum of Pessimism.'

Barlow, Jane, popular Irish novelist: b. Clontarf, Ireland, 17 Oct. 1860. The literary quality is a marked characteristic of all her writing. Her published works include 'Bogland Studies,' verse (1892); 'Irish Idylls' (1892); 'Kerrigan's Quality' (1893); 'The End of Elfintown' (1894); 'The Battle of the Frogs and Mice' (1894); 'Maureen's Fairing' (1895); 'Strangers at Lisconnel' (1895); 'Mrs. Martin's Company' (1896); 'Creel of Irish Stories' (1897); 'From the East Unto the West' (1898); 'From the Land of the Shamrock' (1900); 'Ghost-bereft and Other Stories' (1902); 'The Founding of Fortunes' (1902).

Barlow, Joel, American poet and diplomatist: b. Redding, Conn., 24 March 1754; d. near Cracow, Poland, 24 Dec. 1812. In 1774 he was placed at Dartmouth College, New Hampshire,

and after a short residence entered Yale College, New Haven, where he displayed a talent for versification, which gained him the friendship of Dr. Dwight, then a tutor there. Barlow, more than once during the vacations of the college, served as a volunteer in the army of the Revolution. In 1778 he applied himself to the study of the law, but soon after accepted the position of chaplain in the army, which he held till the close of the war (1783). During this period his songs and addresses were said to have animated and encouraged the soldiers; at this time, too, he planned and partly composed his 'Vision of Columbus.' He went to Hartford, where he started a weekly newspaper, continuing at same time the preparation of his poem for the press. It was published in 1787, and some months after in London. To promote the sale of his poem, and that of a new edition of the Psalms adapted by him, Barlow gave up the newspaper and became a bookseller. In 1788 we find him in France as agent for a number of speculators in land, called the Ohio Company. The Revolution was then in progress, and Barlow went about lecturing and organizing societies in its favor. He went to England in 1791, and was deputed in the following year by the London Constitutional Society to present an address to the French Convention. In 1795 he was appointed American consul at Algiers, a post he only held for two years. Returning to Paris he made some successful commercial speculations and acquired a considerable fortune. He returned, after an absence of 17 years, to his native country (1805). In 1811 he was appointed minister-plenipotentiary to France. In the following year, owing to the fatigues and privations of a journey to Wilna to hold a conference with Napoleon, he died at an obscure village near Cracow. His principal poem, the 'Columbiad,' has never been popular; it is defective in plan and execution, overloaded with philosophical discussions and political tirades; and disfigured by pedantic and uncouth words of his own coinage. His prose writings bear the stamp of an active and energetic intellect, but want that ripeness of judgment required by the complex nature of the subjects he examines. See Todd, 'Life and Letters of Joel Barlow' (1886).

Barlow, Peter, English physicist and mathematician: b. Norwich, October 1776; d. 1 March 1862. He was professor of mathematics in the Royal Military Academy at Woolwich for a period of 40 years. His greatest work is the 'Mathematical and Philosophical Dictionary.' He was also the author of an elaborate work on the 'Machinery and Manufactures of Great Britain' (1837); of a treatise on the 'Force and Rapidity of Locomotives' (1838); and of an 'Essay on Magnetic Attraction,' one of the first works in which the phenomena of magnetism were distinctly enunciated. He invented the Barlow lens.

Barlow, William Henry, English engineer: b. 10 May 1812; d. 14 Nov. 1902. He was educated for the engineering profession, and among his most notable achievements are the St. Pancras terminal station in London and the Tay Bridge, constructed 1880–7. In 1876 he visited the United States as one of the judges of the Centennial Commission. He published 'Illumination of Lighthouses'; 'Diurnal Electric Tides and Storms'; 'The Resistance of Flexure in Beams'; 'The Logograph.'

Barlowe, Arthur, English navigator: b. about 1550; d. about 1620. In 1584 he was sent with Philip Amidas to select a suitable location for Raleigh's proposed American colony. They explored the coast of North Carolina and on their return to England Barlowe wrote an enthusiastic description of the attractions of the land they had visited.

Barm. See Yeast.

Bar'mecides, a celebrated Persian family, whose virtues and splendor form a favorite subject for Mohammedan poets and historians. Two eminent members were Khaledben-Barmek, prime minister of Caliph Abul Abbas Al-Saffah, and tutor of the celebrated Haroun al-Raschid, and his son Yahya, grand vizier of Haroun. The expression Barmecides' Feast, meaning a visionary banquet or make-believe entertainment, originates from a story in the Arabian Nights' Entertainments, of a wealthy Barmecide, to whom a poor man, Schacabac, had applied for charity. On the latter informing him that he was starving, the Barmecide invited him to dinner; and calling for a succession of the most sumptuous viands, although none were provided, urged his guest to fall to and enjoy himself, praising the merits of each dish as it was pretended to arrive on the table. Schacabac, though suffering all the pangs of hunger, entered into the eccentric humor of his host, declared his infinite enjoyment of everything set before him, and by his patience so won the heart of his eccentric entertainer, that the latter not only provided for him immediately an actual and plenteous repast, but likewise took him into his house and intrusted him with the management of his affairs.

Barmecides' Feast. See Barmecides.

Bar'men, a city on the Wupper, in Rhenish Prussia. The town of Barmen is formed by the union of seven villages contained in the valley of Barmen, from which it takes its name, and its western border adjoins the city of Elberfeld. It is the seat of the Rhenish Missionary Society, which has here a large seminary. The valley is remarkable for natural beauty. The United States has a resident consul. Barmen contains the principal ribbon manufactories on the Continent, and its ribbons are sent into all parts of the world. Next to ribbons the most important textile manufactures are zanellas or Indian cloths, satin for lining, and lace. Barmen also possesses numerous large dye-works, besides manufactures of chemicals, plated and other metal wares, buttons, yarns, iron, machines, pianos, organs, soap, etc. The city has six railway stations, and one of its remarkable features is the electric swinging railway over and along the line of the Wupper between Barmen and Sonnborn. Pop. (1900) 142,000.

Bar'mote Court (from *berg,* hill, and *mote,* meeting), a name given to local courts held in the lead-mining portions of Derbyshire, England. Their purpose is the definition of the ancient rights of the inhabitants, and the settlement of disputes connected therewith. They are of ancient origin, but their scope has been much restricted during the Victorian period.

See Bainbridge, 'The Law of Mines and Minerals' (5th ed. 1900).

Barn (Saxon, *berern*, from *bere*, barley, and *ern*, a close place or repository). The word seems originally to have denoted a building for the storing of grain. In modern times it has a wider signification — all structures of any capacity used on a farm for storing crops and sheltering stock being known as barns. In the changeable climate of the United States, with its severe winters, protection to cattle becomes an important item in the operations of husbandry, and as our agriculture becomes more highly developed we construct more expensive, convenient, and useful barns. A well-built barn, embracing all the conveniences needed for the easy and safe storing of crops, and the comfort and well-being of farm stock, will always be one of the safest and best investments a farmer can make. At one time the barns on many estates were capacious enough to contain all the grain raised on them, but recently the practice of stacking grain has gained ground, and it is now considered the better plan — building the grain barn of sufficient size to contain one or two ricks of grain at a time, and all the necessary appurtenances for threshing. The stacked grain is kept in better condition from having a freer circulation of air, and being so disposed as to be free from the attacks of vermin. A regular yard is set apart for stacks, elevated platforms are provided on which the stacks are built, and they are so arranged as to prevent vermin from climbing to them from the ground, and so far separated as to leave each stack isolated. Many such conveniences are known to the American farmer. The skeleton barn, a building but partially enclosed, spaces being left between the boards for the free ingress of air, with a durable roof and projecting eaves, is most used for grain, and for the storing of hay loosely trussed for market. The sheep and stock barns on the continent of Europe are generally of an inferior character, and usually serve also as a residence for the family of the servant or foreman of the farm. The sheep and stock barns of the United States are generally commodious structures, with wide sheds on each side, in which the animals find shelter and receive their provender, or, when built on a side hill, the cellar is appropriated to this purpose. Sheds also surround the whole yard in many instances, while stacks of the poorer quality of hay and threshed straw occupy the centre of the yard, their contents being freely used as bedding and partial food for cattle, the greater bulk finding its way into the manure heap. These are both comfortable quarters for the animals, and profitable for the farmer. Modifications of this general plan are made by each farmer according to his means and peculiar ideas. As a general rule, stock barns are found most profitable when they afford the most ample accommodations. The greater the comfort of his animals, the more uniform the profit of the farmer. Great care should be used in the selection of a place for the farm buildings. The barns should be easily reached, and so arranged as to admit of the economical disposition of both crops and manures. The soil should be dry and porous, or should be thoroughly drained. Ample provision should be made for the saving of manures. Side-hill barns afford cellars in which these may be kept without waste, their bulk augmented, and those changes produced upon them which are so essential to their highest efficacy. If no good springs, streams, or wells can be obtained, cisterns for rain water should be provided. Barns are usually built of wood, some of stone, a few of brick, and of concrete or gravel wall. The gravel wall can be made cheaper than stone walls, and can be built on farms affording only gravel and small stones of a quality too poor to build ordinary stone walls. Barn doors are usually of wood; and when intended for the threshing or handling of grain should be tight and smooth, and kept clean. Oak, beech, and yellow pine form excellent floors. The threshing floors described by Columella were formed by wetting the earth with the lees of oil, mixing in some chaff, and ramming the whole down firmly; chaff was then trodden on the top, and the whole left to dry in the sun. The lees of oil were said to check vegetation, and drive away vermin. The preparation of corrugated iron, at a comparatively cheap rate of cost, suggests that material as one of the best for a well-built barn. The roof deserves more attention than it usually receives at the hands of the farmer who wishes to be truly economical in his expenditure for buildings. Finally, let all farmers remember that ventilation is one of the most important things to be secured, especially in stock barns.

Barn Owl, a widespread but rather uncommon owl (*Strix flammea*) which seems to be known in all parts of the world, and is everywhere recognizable among other owls by the heart-shaped form of the facial disks, which meet in a point below the beak. These give a very quaint expression, which has led to the soubriquet «monkey-faced» in the southern States. It is about 17 inches in length, and its plumage is yellowish-red, irregularly marked with lighter and darker tints. The eyes are small and black and surrounded by cream-colored disks, bordered with rust-red. The legs are long and bear short feathers only. It is more numerous in the southern part of the United States than in the northerly portion, and is rarely seen even where many exist, since it is more completely nocturnal in its habits than are most owls. It makes its nest in hollow trees or a niche in some rocky cliff or earthen bank, and occasionally nests in belfries or old walls, as is a common habit in Europe. The nest is composed of straw and feathers and the eggs are white. H. K. Fisher, author of 'The Hawks and Owls of the United States' (1893), regards this owl as probably the most beneficial of its tribe to the agriculturist, because in America, at least, it subsists almost entirely upon the small rodents so injurious to crops. This is especially true in the South, where it subsists on the cotton rat and the many harmful mice; while in the West, it catches gophers, ground-squirrels, and rabbits, so that it is entitled to gratitude and protection. The same beneficent service is reported for it in other parts of the world. The American is regarded by many ornithologists as a separate species, *Strix pratincola*.

Barn Swallow, one of the most familiar and wide spread of North American swallows (*Chelidon erythrogaster*). Its plumage is lustrous blue, the forehead, chin, and throat dull

chestnut, bounded by a collar-like band of blue across the chest, below which the plumage is pale reddish-brown. By its deeply forked tail it is readily distinguished from the square-tailed cliff-swallow (q.v.), which also throngs about barns, and often is wrongly termed barn swallow; but the latter invariably puts its flask-shaped nests under the eaves outside of the structure, while the true barn swallow invariably nests inside the building. These birds have remarkable wing power, flying for many miles at a time at the rate of more than a mile a minute, with consummate grace and ease; and catching in the air all their food, which consists of winged insects, many of which are injurious or annoying to man, so that their presence is of decided benefit, as well as a pleasant accompaniment of rural life. Before the country was densely populated the swallows made their homes in caves, or in niches of rocks, or hollow trees, but ever since the civilization of the country began, these trustful birds have built their nests close to man's habitation, everywhere frequenting barns and outhouses. Their nest is composed of layers of mud, about an inch thick, plentifully mixed with straw, and lined with feathers. They usually rear two broods a season: the first in May, and the second in July. The eggs are four to six in number, white, with red and purple spots and splashes nearly covering the larger end. When the second brood of young are capable of using their wings, the swallows congregate in flocks of thousands, and migrate southward, traveling by daylight, instead of at night, as is the custom of most migratory birds. In the northeastern part of the country, the barn swallows have been nearly exterminated by the English sparrow, who seize their nest for their own breeding purposes and destroy their eggs and young in a ruthless way, often, apparently, in a spirit of malicious mischief.

Bar'nabas, the surname given by the apostles to Joses, or Joseph, a fellow-laborer of Paul, and, like him, ranked as an apostle. He is said to have founded at Antioch the first Christian community, to have been first bishop of Milan, and to have suffered martyrdom at Cyprus. His festival is held on 11 June. There is an epistle in 21 chapters ascribed to Barnabas by Tertullian and other early Christian writers, but without any support of internal evidence. It was probably written between 119 and 126 B.C. by some one who was not a Jew, and under the influence of Alexandrian Judaistic thought.

Barnabas, Cape, a headland of Alaska, which the navigator, Capt. Cook, discovered on St. Barnabas Day.

Bar'nabites, a religious order, properly called "Regular Clerks of the Congregation of St. Paul," and deriving the name of Barnabites from their church, dedicated to St. Barnabas, at Milan. Their origin is uncertain, but is supposed to date from the pontificate of Gregory XI. (1370–8). A younger branch was founded during the 16th century, for the purpose of preaching and administering the sacraments among the populace of Milan, who had become much corrupted by the continual presence of a multitude of German soldiers in the city, and who were also much afflicted by pestilence. In 1579 their constitutions and rules were fully revised and established under the direction of St. Charles Borromeo. They were expelled from France in 1880 and as an order have greatly declined.

Barnaby, Sir Nathaniel, English naval architect: b. Chatham, 1829. From 1855 to 1885 he was engaged in the designing office of the admiralty in the construction of nearly all the British naval vessels. He brought about the substitution of steel for iron in shipbuilding, and the subsidizing of merchant vessels for use in war. He was made a K. C. B. in 1885.

Barnaby Rudge, a novel by Charles Dickens, published in 1841. The plot is extremely intricate. Some of the most whimsical and amusing of Dickens' character-studies appear in the pages of this novel; while the whole episode of the gathering and march of the mob, and the storming of Newgate is surpassed in dramatic intensity by no passage in modern fiction, unless by Dickens' own treatment of the French Revolution in the 'Tale of Two Cities.' Among the important characters, many of whom are the authors of sayings now proverbial, are Gabriel Varden, the cheerful and incorruptible old locksmith, father of Dolly Varden; Mrs. Varden, a type of the narrow-minded zealot, devoted to the Protestant manual; Miss Miggs, their servant, mean, treacherous, and self-seeking; Sim Tappertit, an apprentice, an admirable portrait of the half-fool, half-knave, so often found in the English servile classes half a century ago; Hugh, the hostler, and Dennis, the hangman; and Grip, the raven, who fills an important part in the story, and for whom Dickens himself named a favorite raven.

Barnacle, Lord Decimus Tite, the name of the nobleman whom Dickens in his 'Little Dorrit' places in charge of the circumlocution office.

Barnacle, a degenerate crustacean, living attached to rocks and the bottoms of ships. The barnacles would at first glance hardly be regarded as Crustacea at all, and were considered to be mollusca, until in 1836, Thompson found that the young barnacle was like the larvæ of other low Crustacea (*Copepoda*). The young barnacle is, as in the common sessile form, a shell-like animal; the shell composed of several pieces or valves with a multivalve, conical, movable lid, having an opening through which several pairs of long, many jointed, hairy appendages are thrust, thus creating a current which sets in toward the mouth. The common barnacle (*Balanus balanoides*) abounds on every rocky shore from extreme high-water mark to deep water, and the student can, by putting a group of them in sea water, observe the opening and shutting of the valves and the movements of the appendages. The structure of the barnacle may best be observed in dissecting a goose-barnacle (*Lepas fascicularis*). This barnacle consists of a body (capitulum) and leathery peduncle. There are six pairs of jointed feet, representing the feet of the cyclops. The mouth, with the upper lip, mandibles, and two pairs of maxillæ, will be found in the middle of the shell. A short œsophagus leads to a pouch-like stomach and tubular intestine. This form, like most barnacles, is hermaphroditic, the ovary lying at the bottom of the shell, or,

in the pedunculated forms, in the base of the peduncle, while the male gland is either close to or some distance from the ovary. There is also at the base of the shell, or in the peduncle when developed, a cement-gland, the secretion of which is for the purpose of attaching the barnacle when in the "cypris" stage to some rock or weed.

While the sexes are generally united in the same individual, in the gerera *Ibla* and *Scalpellum,* besides the normal hermaphroditic form, there are females, and also males called "complementary males," which are attached parasitically both to the females and the hermaphroditic forms, living just within the valves or fastened to the membranes of the body. These complemental males are degraded, imperfect forms, with sometimes no mouth or digestive canal. The apparent design in nature of their different sexual forms is to effect cross-fertilization. The eggs pass from the ovaries into the body-cavity, where they are fertilized, and remain for some time. They pass through a morula condition, a suppressed gastrula or two-layered state, and hatch in a form called a "Nauplius," from the fact that the free-swimming larva of the Entomostraca was at first thought to be an adult Crustacean, and described under the name of Nauplius. The Nauplius of the genuine barnacles has three pairs of legs ending in long bristles, with a single eye and a pair of antennæ, the body ending in front in two horns, and posteriorly in a long caudal spine. After swimming about for a while, the Nauplius attaches itself to some object by its antennæ, and a strange transformation results. The body is enclosed by two sets of valves, appearing as if bivalved, like a cypris; the peduncle grows out, concealing the rudimentary antennæ, and the feet become smaller, and eventually the barnacle shape is attained. The common barnacle (*Balanus balanoides*) attains its full size after becoming fixed, in one season; that is, between April and November.

Barnacle-eater. See FILE-FISH.

Barnacle Goose. See BERNACLE GOOSE.

Barnard, Lady Anne, Scottish poet, author of 'Auld Robin Gray': b. 1750; d. 26 May 1825. She was the eldest daughter of James Lindsay, fifth Earl of Balcarres, and in 1793 married Andrew Barnard, a son of the bishop of Limerick, and colonial secretary to Lord Macartney at the Cape of Good Hope. There Lady Anne lived till 1807, when, losing her husband, she returned to London, her residence till her death. Her famous lyric was written as early as 1772 to sing to an ancient melody; but she first acknowledged its authorship in 1823 to Sir Walter Scott, who two years later edited it for the Bannatyne Club, with two continuations. Her 'Letters' were published in 1901.

Barnard, Charles, American dramatist: b. Boston, Mass., 13 Feb. 1838. He is a journalist and dramatist. His most popular play is 'The County Fair' (1888). Author of 'The Tone-Masters' (New York 1871); 'Knights of To-Day' (1881); 'The Whistling Buoy' (1887); dramas, and books on gardening and electricity.

Barnard, Mrs. Charlotte Arlington, "CLARIBEL," English composer of songs and ballads: b. 1830; d. 1869. She wrote nearly 100 ballads between 1858 and 1860 under the pseudonym of Claribel, many of them becoming very popular, "Won't You Tell Me Why, Robin?" and "Come Back to Erin," being especially well known. In most cases she wrote the words for her songs, and she was also the author of a volume of 'Thoughts, Verses, and Songs.'

Barnard, Daniel Dewey, American lawyer: b. Sheffield, Mass., 16 July 1797; d. Albany, N. Y., 24 April 1861. He was admitted to the bar and began practice at Rochester, N. Y., 1821. He was a representative in Congress, 1827–9, and 1839–45, serving as chairman of the Judiciary Committee. From 1850 to 1853 he was minister to Russia. He gave much time to literary pursuits, publishing several addresses and speeches.

Barnard, Edward Emerson, American astronomer: b. Nashville, Tenn., 16 Dec. 1857. He was astronomer in Lick Observatory, California, in 1887–95, and then became professor of astronomy in Chicago University. His principal discoveries are the fifth satellite of Jupiter in 1892, and 16 comets. He has made photographs of the Milky Way, the comets, nebulæ, etc. The French Academy of Sciences awarded him the Lalande gold medal in 1892, and the Arago gold medal in 1893, and the Royal Astronomical Society of Great Britain gave him a gold medal in 1897. He is a member of many American and foreign societies, and a contributor to astronomical journals.

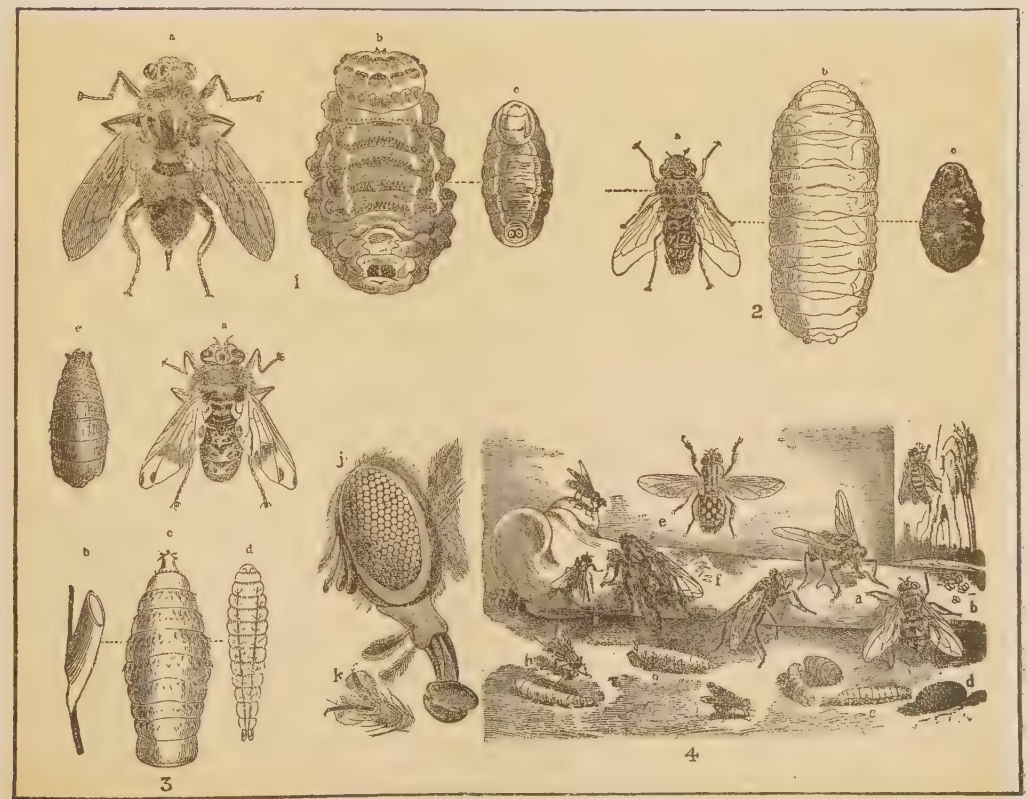
Barnard, Frederick Augustus Porter, American educator: b. Sheffield, Mass., 5 May 1809; d. 27 April 1889. He was graduated at Yale College in 1828; instructor there in 1830; professor of mathematics and natural philosophy in the University of Alabama, 1837–48, and afterward of chemistry and natural history till 1854; professor of mathematics and astronomy in the University of Mississippi, 1854–61; its president in 1856–8; and its chancellor in 1858–61. He was president of Columbia College, New York, in 1864–88. In 1860, he was appointed a member of the expedition to observe the eclipse of the sun in Labrador; was engaged in 1862 in reducing observations of the stars in the southern hemisphere; had charge of the publication of charts and maps of the United States Coast Survey in 1863; was named one of the original incorporators of the National Academy of Sciences in 1863; was one of the United States commissioners to the Paris Exposition in 1867; member of the American Philosophical Society, corresponding member of the Royal Society of Liege, and member of many other scientific and literary associations. Among his publications are: 'Letters on College Government' (1854); 'Report on Collegiate Education' (1854); 'Art Culture' (1854); 'History of the American Coast Survey' (1857); 'University Education' (1858); 'Undulatory Theory of Light' (1862); 'Machinery and Processes of the Industrial Arts, and Apparatus of Exact Science' (1868); 'Metric System of Weights and Measures' (1871); 'Recent Progress of Science'; etc. Barnard College, affiliated with Columbia University, was named in his honor.

Barnard, George Grey, American sculptor of eminence: b. Bellefonte, Pa., 24 May 1863. He studied at the Chicago Art Institute and the École Nationale des Beaux Arts, Paris, 1884–7. He first exhibited at the salon of 1894. In 1900

BARNACLE, BALANOGLOSSUS, ETC.

1. Common Barnacle (Balanus)
2. Larva of Lepas.
3. Mussel (Lepas anatifera).
4. Megalasma striatum.
5. Balanoglossus clavigerus, young specimen.

BOT FLIES AND BLOW FLIES.



1. Cattle Bot Fly. a, Adult; b, Larva; c. Pupa, all enlarged.
2. Sheep Bot Fly. a, Adult; b, Larva, from above; c, Pupa.
3. Horse Bot Fly. a, Adult; b, Egg, attached to a hair.

he received a gold medal at the Paris Exposition. His chief works, largely symbolical in character, are: 'Brotherly Love,' 'The Two Natures' (in the Metropolitan Museum), 'The God Pan' (Central Park), and 'The Hewer.' His studio is in New York.

Barnard, Henry, American educator: b. Hartford, Conn., 24 Jan. 1811; d. 5 July 1900. He was president of the University of Wisconsin (1856–9), and St. John's College, Annapolis, Md. (1865–6); founded the 'American Journal of Education' (1855); was the first United States commissioner of education (1867–70). Among his numerous writings are: 'Hints and Methods for Teachers' (1857); 'Pestalozzi and Pestalozzianism' (1861); 'German Educational Reformers' (1862); etc. In 1886 he began to publish the 'American Library of Schools and Education,' a collection of 800 of his own writings, reports, etc.

Barnard, John, American Congregational clergyman: b. Boston, 6 Nov. 1681; d. 24 Jan. 1770. He was one of the earliest New England dissenters from Calvinism. Ordained colleague minister of Marblehead (1716); he took great interest in the local fisheries and commerce. He wrote 'History of the Strange Adventures of Philip Ashton' (1725), etc.

Barnard, John Gross, American military engineer: b. Sheffield, Mass., 19 May 1815; d. 14 May 1882; brother of F. A. P. Barnard (q.v.). He was graduated at the United States Military Academy in 1833; served from 1835 to 1852 on the coast of the Gulf of Mexico; and was brevetted major in the Mexican war. He subsequently had charge of the fortifications of San Francisco and New York harbors.

Barnard, Joseph Folger, American jurist: b. Poughkeepsie, N. Y., 1823; d. there 6 Jan. 1904. He was graduated from Yale University in 1841; admitted to the New York bar 1844; was elected justice of the State supreme court in 1862, and was re-elected, holding the office until his death.

Barnard College, an educational institution for women in New York, affiliated with Columbia University (q.v.), and founded in 1889. The admission of women to Columbia on the same terms as men had been warmly urged for some years by President F. A. P. Barnard (q.v.), when in 1882 the trustees consented to allow their attendance at the lectures, but declined to grant matriculation or examination. This being found contrary to the statutes of Columbia, on 8 June 1883 a collegiate course duplicating that for the men was opened to women outside the college, but taught by the same instructors, with the same examinations, and rewarded with a degree. The plan was abandoned after five years' trial, and in March 1888 a proposal was made to establish a woman's annex, to be separately financed, but managed under the approval of the trustees of Columbia; the women to pursue the same courses under the same instructors, in such wise as not to interfere with the men's classes, Columbia to appoint the examiners and confer the degrees. This was accepted, and in 1889 the institution was opened under the name of Barnard College, with seven students. Later the rule of common instructors was so far relaxed that the professors in Barnard were only required to have the approval of Columbia, and since then the deans and some professors have been women; still later, each institution assumed the support of three professorships in the other. After a time certain classes of the senior year and many post-graduate classes were opened to women, subject in all cases to the consent of each professor. The growth of Barnard College rendered these provisional arrangements unsatisfactory, and they were modified by making Barnard formally a part of the Columbia system, 19 Jan. 1900. At present the president of Columbia is *ex officio* president and a trustee of Barnard, while the dean of Barnard controls its internal management and has a vote in the council of Columbia. Barnard, however, remains a distinct institution, separately financed, with its own trustees, and supports a complete undergraduate course. Columbia grants all Barnard degrees as its own, and the Columbia library is free to Barnard students, and certain post-graduate courses are open to members of both institutions. Barnard College received 32 new students during its first year, had doubled the number three years later, and 16 years from its foundation, in 1905, had 57 professors and 366 students, and had graduated 455 in all. The productive funds are $28,333 and income $119,157. Barnard was started without further resources than a few four-years subscriptions, but speedily attracted donations and endowments which have enabled it to keep pace with its rapidly growing demands. Up to March 1902, it had an endowment of $250,000; in that month an equal amount was added by John D. Rockefeller, and another $250,000 was the result of lesser gifts. In March 1903, a gift of $1,000,000 was made to the college by Mrs. Elizabeth Milbank Anderson, who had previously given Milbank Hall to the institution. Among its buildings are Brinkerhoff Hall, chiefly built from gifts by Mrs. Van Wyck Brinkerhoff; Fiske Hall, given by Mrs. Josiah M. Fiske; and Milbank Hall, given by Mrs. Abram A. Anderson. The first dean of Barnard was Miss Emily James Smith (who subsequently became the wife of George Haven Putnam, the New York publisher), and in 1901 she was succeeded by Miss Laura Drake Gill.

Barnar'do, Thomas John, English philanthropist: b. Ireland, 1845; d. London, Eng., 19 Sept. 1905. He founded the Barnardo Homes for homeless children, his attention being turned in this direction by the condition of a boy in a ragged school in east London in 1866. Following up the subject, he began to rescue children who had found their only shelter at night under archways, or in courts and alleys. These were introduced to his homes, where they received an industrial training, were saved from a possible career of crime, and enabled to achieve an honorable position in life. In 1899 over 36,000 boys and girls had passed through the homes; at the same time Dr. Barnardo had under his direction in the United Kingdom and the colonies 24 mission branches and 86 distinct homes dealing with every age and class of needy and destitute childhood, including an immigration depot in Ontario, an industrial farm in Manitoba, a home for babies, and a hospital for sick children. Up to 1899 the number of trained and tested boys and girls who had been placed in colonial situations exceeded 10,000.

Barna'to, Barney, or Barnett, South African speculator, whose real name is believed to have been Bernard Isaac: b. London, England, about 1845, of Hebrew parents; d. 14 June 1897. He began business as a dealer in diamonds, and in five years earned enough to buy shares in the Kimberley diamond mines. He established a partnership with Cecil Rhodes, and, when, in 1886, gold was discovered, secured possession of the greater part of the region. He committed suicide by jumping from the deck of the steamer Scot, bound from Cape Town to Southampton. See Isaac's 'Life of Barnett Barnato' (1897).

Barnaul, bär-nowl', a mining town of Siberia, in the government of Tomsk, and 230 miles southwest of the town of that name, on the Barnaulski, near its junction with the Obi. It is well built, and the streets are regular and spacious. The chief edifices are of wood. There is a mining-school, an observatory, a public library, a museum, etc. Lead is smelted from the mines in the neighborhood; there are lime and brick kilns, a mint for copper coins, and manufactories. Pop. (1897) 29,408.

Barnave, bär-nav, **Antoine Pierre Joseph Marie,** French orator: b. Grenoble, 1761; d. Paris, 29 Nov. 1793. He was chosen a deputy of the *tiers état* to the assembly of the states-general, and showed himself an open enemy to the court. The Constituent Assembly appointed him their president in January 1791. After the flight of the king he defended Lafayette against the charge of being privy to this step, and, upon the arrest of the royal family, was sent, with Petion and Latour-Maubourg, to meet them, and to conduct them to Paris. When the correspondence of the court fell into the hands of the victorious party, 10 Aug. 1792, they pretended to have found documents which showed him to have been secretly connected with it, and he was guillotined. See Salvandy, 'Life of Barnave'; Lamartine, 'History of the Girondists.'

Barnburners, a nickname for the progressive section of the New York State Democracy from about 1844 to 1852, which retaliated by calling the other party "Hunkers." They were essentially the same party which from 1835 onward had favored extension of the canal system, while their opponents were the same who wished it restricted to immediately profitable canals; but under these names the division was on the slavery question (see FREE-SOIL PARTY), in which the Barnburners were the Van Buren or Free-Soil wing. They also stood for the local control by the "Albany Regency," as against the Polk "machine" which the new administration was trying to build up in New York, and which favored the extension of slavery into the Territories. About 1852 the nicknames changed into "Softs" and "Hards," corresponding with new issues to the later "Half-breeds" and "Stalwarts." The origin of the name is usually derived from the familiar campaign story of the man who burned his barn to free it from rats.

Barnby, Joseph, Sir, English composer and organist: b. York, 12 Aug. 1838; d. London, 28 Jan. 1896. He was chorister in York Minster; organist St. Andrew's, Wells Street, London, 1863–71; precentor and choir-master St. Ann's, Soho, 1871; precentor and director of musical instruction in Eton College, 1875, and head of the Guildhall School of Music in London from 1892. His cantatas of "Rebekah," a sacred idyll, and "The Lord Is King"; numerous highly interesting services and anthems (such as "King All Glorious"), for the Church, as well as several secular choruses and songs, rendered him famous both in England and the United States. He was knighted in 1892.

Bar'negat Bay, a bay on the east coast of New Jersey, about 25 miles in length, and separated from the ocean by Squan and Island beaches. Barnegat Inlet connects it with the Atlantic. On the south side of the inlet is a lighthouse 150 feet high.

Barnes, Albert, American theologian: b. Rome, 1 Dec. 1798; d. Philadelphia, 24 Dec. 1870. Until the age of 17 he was employed by his father, who was a tanner, in his own occupation. At the age of 22 he graduated at Hamilton College, and after studying theology at Princeton was licensed to preach in 1824, and ordained pastor to the Presbyterian Church of Morristown, N. J., in February 1825. In 1830 he was removed to the pastoral charge of the First Presbyterian Church in Philadelphia, where he remained till his death. He is chiefly known by his 'Notes on the New Testament,' published in 11 volumes between 1832 and 1848; and his 'Notes on the Old Testament,' completed in 1870, which are favorite works with Sunday-school teachers and others engaged in biblical tuition. Other works of his are: 'The Church and Slavery' (1857); 'The Atonement in Its Relations to Law and Moral Government' (1859); 'Evidences of Christianity' (1868); 'Life at Threescore and Ten' (1869). He was tried for heresy on account of his belief in unlimited atonement, and though acquitted, the eventual result of the trial was to divide the Presbyterian body in the United States into the Old and New School branches in 1837.

Barnes, Alfred Smith, American publisher: b. New Haven, Conn., 28 Jan. 1817; d. Brooklyn, N. Y., 17 Feb. 1888. He began his career in the book store of D. F. Robinson & Company in Hartford, Conn., removing to New York with the firm. At the age of 21 he formed a connection with Prof. Charles F. Davies and began publishing the latter's mathematical works, personally canvassing for them every State in the country. In 1840 he removed his business to Philadelphia, but returned to New York in 1855. He confined his publications almost exclusively to school text-books. Retiring from active management in 1880 he left five sons to continue the business. At his death he left large bequests to charities and educational institutions.

Barnes, Barnabe, English poet: b. Yorkshire, about 1569; d. Durham, England, December 1609. He was the son of a bishop of Durham; was educated at Oxford; and went to Normandy in 1591 with the Earl of Essex. His fame rests on a collection of sonnets, madrigals, and odes, called 'Parthenophil and Parthenope' (about 1593). Other books of his are: 'A Divine Century of Spiritual Sonnets' (1595); and 'The Devil's Charter,' a tragedy (1607).

Barnes, Charles Reid, American botanist: b. Madison, Ind., 7 Sept. 1858. He was educated at Hanover (Ind.) College, 1877, and pursued graduate studies at Harvard. He held professorships in Purdue University and the University of Wisconsin, 1880–98, and since 1898 has been professor of plant physiology in the University of Chicago. He is the author of

'Outlines of Plant Life' (1900); joint author of 'Plant Dissection'; and 'Keys to the Genera and Species of North American Mosses' (1890). He has contributed many papers to the 'Botanical Gazette,' of which he has been an editor since 1883.

Barnes, Dame Juliana. See BERNERS, DAME JULIANA.

Barnes, James, American soldier: b. Boston, Mass. 1806; d. Springfield, Mass., 12 Feb. 1869. Appointed to West Point from Massachusetts, he graduated there in 1829, standing fifth in a class which included R. E. Lee, J. E. Johnston, and a number of others who afterward became distinguished. Resigning from the army after seven years' service, he became a railroad engineer and built, either wholly or in part, the Rome & W., Sacketts' H. & E., the Buffalo, C. & N. Y., the Terre Haute, A. & St. L., and the Potsdam & W. R.R.'s, between 1848 and 1857. During the Civil War he was colonel of the 18th Massachusetts Volunteers 1861–2, and brigadier-general of United States Volunteers 1862–5. He was present at the battles of Antietam, Fredericksburg, Chancellorsville, and Gettysburg, where he was severely wounded. Exposure and wounds so impaired his constitution that he was unable to engage actively in his profession after the War.

Barnes, James, American author: b. Annapolis, Md., 19 Sept. 1866. He was graduated from Princeton University in 1891, and has been connected in an editorial capacity with 'Scribner's Magazine' and 'Harpers' Weekly.' During the Boer war he acted as a correspondent in the field for the 'Outlook.' His books are: 'Naval Actions of 1812'; 'For King or Country'; 'Yankee Ships and Yankee Sailors'; 'A Loyal Traitor'; 'The Hero of Erie' (1898); 'A Princetonian'; 'David G. Farragut' (1899); 'Drake and His Yeomen' (1899); 'Great War Trek with the British Army on the Veldt' (1901); 'With the Flag in the Channel' (1902).

Barnes, Joseph K., American surgeon: b. Philadelphia, 21 July 1817; d. Washington, D. C., 5 April 1883. He was educated in the medical department of the University of Pennsylvania; became assistant surgeon in the army in 1840, and served at various posts through the Mexican war. At the beginning of the Civil War he was summoned from Oregon and assigned to duty in the office of the surgeon-general. In 1863 he was appointed a medical inspector, with the rank of colonel, and in September of the same year was promoted to brigadier-general. In 1865 he was brevetted major-general, United States Army. He was surgeon-general of the army from 1864 till 1882, when he was retired.

Barnes, William, English dialect poet and philologist: b. Rushay, Dorsetshire, in 1800; d. 7 Oct. 1886. Of humble birth, he first entered a solicitor's office, then taught a school in Dorchester, and having taken orders became rector of Winterbourne Came in his native county, and died there. He acquired a knowledge of many languages, and published 'An Anglo-Saxon Delectus'; 'A Philological Grammar,' grounded upon English; 'Grammar and Glossary of the Dorset Dialect,' etc., but is best known by his 'Poems of Rural Life,' in the Dorset dialect, and 'Rural Poems,' in common English.

Barnesville, Ohio, town in Belmont County, on the B. & O. R.R., 32 miles west of Wheeling. It is the centre of an extensive tobacco and fruit region and has numerous manufactories. It has a national bank, schools, churches and several newspapers. Pop. (1900) 3,721.

Bar'net, or **High Barnet,** a town of England, in Herts, 11 miles from London. Pop. (1901) 7,900.

Barneveldt, bär'nĕ-vĕlt, **John van Olden,** Dutch statesman: b. 1549; d. 13 May 1619. He early showed himself zealous for the independence of the United Provinces, and as advocate-general of the province of Holland displayed profound views and great skill in business. He preserved his country against the ambition of Leicester; penetrated the secret plans of Maurice of Nassau, whom his fellow-citizens had elevated to the post of stadtholder; and his marked distrust of this prince placed him at the head of the Republican party, which aimed to make the stadtholder subordinate to the legislative power. Spain at that time made proposals for peace through the archduke, governor of the Netherlands. Barneveldt was appointed plenipotentiary on this occasion, and evinced alike the skill of a statesman and the firmness of a republican. Maurice of Nassau, whose interest led him to prefer war, labored to prevent the establishment of peace; and Barneveldt was induced only by the most urgent solicitations of the states to retain the office which had been assigned to him, concluding in 1609 an armistice with Spain for the term of 12 years, in which the independence of Holland was acknowledged. His influence now became still greater, and he was more and more an object of jealousy to the house of Nassau. The hostile spirit of the opposite parties in the state was further increased by theological difficulties. In order to prevent a civil war Barneveldt proposed an ecclesiastical council, which resolved upon a general toleration in respect to the points in question. The states acceded at first to this wise measure, but at a later period the Nassau party persuaded them to adopt other views. This party represented the Arminians as secret friends of Spain. Maurice insisted upon a general synod, with a view, as he pretended, of putting an end to all religious quarrels; but Barneveldt persuaded the states to oppose this measure. Troops were now levied, without the consent of Maurice, to re-establish order in the cities where the Gomarists had excited disturbances. On the other side, the Nassau party redoubled its attacks upon Barneveldt, who, in answer to them, published that celebrated memorial in which he warns the United Provinces of the danger which threatened them from the other party. Maurice, however, procured the assembling of a synod at Dort, in 1618, to which almost all the Calvinistic churches of Europe sent deputies. They condemned the Arminians with the most unjust severity, and Maurice was encouraged by their sentence to adopt violent measures. He caused Barneveldt and other leading men of the Arminians to be arrested; and 26 bribed judges condemned to death as a traitor the man to whom his country owed its political existence. The old man of 72 ascended the scaffold, and

suffered death with the same firmness which he had evinced under all the circumstances of his life. His two sons formed a conspiracy against the tyrant; William escaped, but Reinier was taken and executed. His mother, after his condemnation, threw herself at the feet of Maurice to beg for mercy, and to his question why she humbled herself thus for the sake of her son when she had not done it for her husband, made the memorable reply: "I did not ask pardon for my husband, because he was innocent; I ask it for my son, because he is guilty." See Motley, 'John of Barneveldt' (1874).

Barney, Joshua, American naval officer: b. Baltimore, Md., 6 July 1759; d. 1 Dec. 1818. He was captured by the British in March 1778, but exchanged in August of the same year; was captured again and held a prisoner till he escaped in 1781. In April 1782, he took the British ship General Monk, off Cape May; in November 1782, he carried dispatches to Dr. Franklin in France, and brought back a sum of money lent by the French government. In 1794 he went with Monroe to France, and for six years served in the French navy. In 1814 he commanded the fleet stationed in Chesapeake Bay.

Barnfield, Richard, English poet: b. Norbury, Shropshire, 1574; d. 1627. His lyrics, 'As It Fell Upon a Day' and 'If Music and Sweet Poetry Agree,' were long ascribed to Shakespeare and were included in 'The Passionate Pilgrim' (1599). Barnfield's works include: 'The Affectionate Shepherd' (1594); 'Cynthia, with Certain Sonnets and the Legend of Cassandra' (1595); 'The Encomion of Lady Pecunia' (1598).

Barni, bär-nē, **Jules Romain,** French scholar and critic: b. Lille, 1 June 1818; d. Mers, 4 July 1878. His efforts to propagate the Kantian philosophy through the medium of 'Observations on the Sense of the Sublime and Beautiful' (1836); 'Foundations of Ethical Metaphysic' (1848), and 'Kantian Philosophy' (1850), earned him distinction; as did also, in another, but contiguous field, a 'History of Moral and Political Ideas in France in the Eighteenth Century' (1866).

Barns'ley, England, a town in the west riding of Yorkshire, 23 miles south by east of Leeds. It occupies the summits and slopes of two hills and is well built. Among the chief buildings are the public hall, built at a cost of over £26,000, and furnishing accommodations for various societies; the offices of the miners' association, the Beckett Hospital, the county court, the offices of the Barnsley Banking Company, the parish church, St. George's Church, the Congregational Church, a beautiful edifice, and several other places of worship. Its staple industry is the manufacture of linen in a variety of forms, which is carried on to a great extent, both handlooms and power-looms being used; linens are also printed here in a style similar to the cottons of Lancashire. There are numerous collieries in the neighborhood, among which the Oaks Colliery has been made memorable by several disastrous explosions. The town possesses a beautiful public park containing several monuments. A United States consul is stationed here. Pop. (1901) 41,000.

Barn'stable, Mass., a town, port of entry, and county-seat of Barnstable County, 72 miles southeast of Boston. Within its corporate limits are 12 villages, several of which, such as Hyannis, Osterville, and Cotuit, are well-known summer resorts. The town has several public libraries and a State normal school. Farming, fishing, and cranberry culture are the principal industries. Pop. (1900) 4,364.

Barnstaple, England, a town in Devonshire, 34 miles northwest from Exeter, on the right bank of the Taw, here crossed by a handsome bridge of 16 arches. It is locally styled Barum, and among its public edifices are a large 14th century church, a guildhall, and market buildings, the bridge buildings, Albert clock-tower, etc. Its manufactures consist chiefly of pottery, known as "Barum ware," lace, paper, furniture, toys, leather, gloves, and collars; and ships and boats are built. The trade chiefly depends on the surrounding district. Previous to 1885 the town returned two members to Parliament. Pop. (1901) 14,000.

Barnum, Frances Courtenay (Baylor), American novelist: b. Fayetteville, Ark., 1848. She has written 'On Both Sides,' an international novel (1886); 'Behind the Blue Ridge,' 'Juan and Juanita,' a story for boys and girls; 'Claudia Hyde' (1894); 'The Ladder of Fortune' (1899). She has also been a frequent contributor to magazines, and a writer of short stories. Since her marriage she has lived in Savannah, Ga.

Barnum, Phineas Taylor, American showman: b. Bethel, Conn., 5 July 1810; d. Bridgeport 7 April 1891. He was the son of a tavern-keeper and in his boyhood displayed a remarkable propensity for practical jokes upon his father's customers, as well as a decided turn for trade. Having accumulated a small sum of money he opened a small miscellaneous store. Here he was very successful, and taking advantage of the mania for lotteries which then prevailed throughout the country, he visited New York, and obtained some insight into their management. Returning to his store, he immediately entered into this business upon a large scale, established agencies in various cities and towns, and realized considerable sums from the immense sales of tickets which he was thus enabled to make. The predominating trait in his character would not, however, permit him to settle down as a country store-keeper, and we soon hear of him as the editor of the *Herald of Freedom*, published in Danbury, Conn. In this undertaking he was also very successful in a pecuniary point of view, but his freedom of speech and the boldness of his opinions soon gained him many enemies, and he was several times sued for libel, and once confined in prison for 60 days. In 1834 he removed with his family to New York, having become much reduced in circumstances. Here he tried many ways to obtain a livelihood, but without much success, until 1835, when hearing of Joice Heth, a colored woman, the reputed nurse of George Washington, he visited her owners, and becoming satisfied that here was an opportunity of retrieving his broken fortunes, he became her purchaser for the sum of $1,000, which he had obtained from various friends. By widely advertising this curiosity, considerable excitement was created, and the receipts soon amounted to $1,500 per week. This was Mr. Barnum's first attempt as a public showman, and finding the business

profitable, he collected a small company and traveled through the country, realizing large sums wherever he halted. In 1836 Joice Heth died, and a post-mortem examination proved her to have been but 75 or 80 years old, instead of 161, which was her reputed age. From 1836 until 1839 Mr. Barnum continued in the exhibiting business, but was then obliged to return to New York, again reduced to poverty. He now barely subsisted by writing occasional articles for Sunday papers, and by petty jobs. In 1841, the establishment known as Scudder's American Museum was announced for sale, and with a boldness almost unparalleled in mercantile transactions, Mr. Barnum negotiated for its purchase; without owning a dollar he made satisfactory arrangements with its holders and took possession. Here his fortune turned; at the end of a year he was able to pay all the obligations which he had entered into on account of the museum. In 1848 he had added to it two other extensive and valuable collections, beside several minor ones, and single curiosities without number. It now became the most popular place of amusement in the United States. In 1842 he heard of Charles S. Stratton, of Bridgeport, then 5 years old, less than 2 feet high, and weighing only 16 pounds. The boy became known to the world as Gen. Tom Thumb, and was exhibited in the United States with astonishing success until 1844, when Mr. Barnum sailed with him for England. Throughout Great Britain he was received with a popularity surpassing even that of America, and for four months the receipts averaged $500 per day. Tom Thumb was presented to the royal families of England, France, and Belgium, courted and caressed by the nobility, and presented with costly gifts. In Coventry Barnum purchased the "Happy Family" of birds and animals, for which he paid $2,500. In 1847 he returned to America, where the "General" was again exhibited for a year with increased success, the receipts in the United States and Havana amounting to $150,000. Barnum conceived the idea of inducing Mlle. Jenny Lind to visit America, and entered into an agreement with her, by which he engaged her to sing in America for 150 nights at $1,000 per night, the expenses of herself and troupe to be defrayed by him. Jenny Lind arrived in New York 1 Sept. 1850. The excitement upon this occasion has perhaps never been equaled in America. She gave her first concert at Castle Garden, and from that time until June 1851, gave 93 concerts, which were a succession of triumphs, the gross receipts for the whole amounting to over $700,000. The tickets were generally sold at auction, the highest price paid for one ticket being in Providence, R. I., namely, $650. He continued before the public with varying success until 1855, when having built himself an extensive villa at Bridgeport, Conn., he retired from business and published his life, giving a full account of the various enterprises in which he had been engaged. He also devoted much of his time to farming, and made many improvements in Bridgeport. Two museums of his were burned, in 1865 and 1868, and in 1871 he established "The Greatest Show on Earth," a combination of traveling circus and menageries. He was defeated for Congress in 1866, but was four times a member of the Connecticut legislature. Besides his 'Autobiography' (1854), he published 'The Humbugs of the World' (1865), and 'Struggles and Triumphs' (1869).

Barnum, William H., American politician: b. Boston Corners, N. Y., 17 Sept. 1818; d. 30 April 1889. He received a public school education and amassed large wealth in manufacturing; was a member of Congress from Connecticut in 1866–76, when he was elected United States Senator to complete the term of Orris Ferry (deceased). In 1880 and 1884 he was chairman of the Democratic National Committee.

Barn'well, Robert Woodward, American statesman: b. Beaufort, S. C., 10 Aug. 1801; d. 25 Nov. 1882. He was graduated from Harvard University in 1821; became a lawyer; was a member of Congress from South Carolina in 1829–33; a United States senator from that State, 1850–1; commissioner from South Carolina to confer with the Federal government regarding the proposed secession of the State in 1860; member of the Provisional Confederate Congress, 1861–2; a Confederate senator in 1862–6; and then president of the University of South Carolina (an office he had held in 1835–41) till 1873.

Barnwell, Robert Woodward, American bishop of the Episcopal Church: b. Beaufort, S. C., 27 Dec. 1849; d. Selma, Ala., 24 July 1902. He prepared for the Episcopal ministry at the General Theological Seminary in New York, and was rector of Trinity Church, Demopolis, Ala., 1876–80; and of St. Paul's, Selma, Ala., 1890–1900. In 1900 he was consecrated Bishop of Alabama.

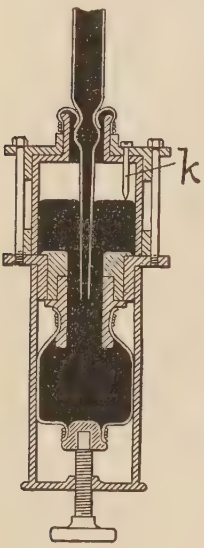
Baroccio, bä-rōch'ō, or **Barocci, Fiori Federigo,** Italian painter: b. Urbino, 1528; d. there 31 Sept. 1612. In his youth he studied the works of Titian, and, in 1560 he was entrusted by Pius IV. with the decoration of the Belvedere palace. Some of the Roman painters, envious of his genius, invited him to a banquet, where they gave him poison. For four years he was not able to touch his pencil, and afterward could only work two hours a day. His later pictures are in the style of Correggio. His 'Last Supper,' 'Descent from the Cross,' 'St. Francis Stigmatized,' 'Christ and Magdalen,' and 'Annunciation,' are among his best productions.

Baroche, bä-rōsh, **Pierre Jules,** French statesman: b. Paris, 1802; d. Jersey, 1870. In 1847 he was elected member of the Chamber of Deputies for the department of Charente-Inférieure, where he steadily opposed the ministry of Guizot. He signed the *Acte d' Accusation,* drawn up by Odillon Barrot 23 Feb. 1848, in which they were accused of violating the rights of citizens, and of systematic corruption. On 2 Dec. 1851, Baroche was nominated president of the Council of State; an office in which he exhibited much ability and tact, and subsequently filled the offices of minister of foreign affairs (1860), and minister of justice (1863). He was made a senator in 1864.

Baro'da, a city of Hindustan, in the province of Gujerat, capital of the native state of Baroda, 240 miles north of Bombay, on the left bank of the Viswamitra, here spanned by four stone bridges. The city proper is surrounded by a wall, outside of which are large suburbs. The houses in general are very mean, but there are several palaces, some handsome houses belonging to the wealthy inhabitants, government offices,

a high school, and numerous temples. It is a place of considerable trade, and the seat of a British resident. Pop. (1901) 103,800. The state of Baroda, which has been tributary to Great Britain from 1802, has an area of 8,100 square miles and a population (1901) of 1,953,000.

Barometer (Greek, "weight-measure"), an instrument invented by the Italian physicist Torricelli, and used for determining the pressure of the atmosphere. (For an account of its early history see ATMOSPHERE.) In its simplest form the mercurial barometer consists essentially of a vertical glass tube about a yard in length, closed at the top and open at the bottom, and partially filled with mercury, into a vessel of which its lower end also dips. In preparing the instrument for use, the tube is first completely filled with mercury; but as soon as it is free to do so the column of mercury in the tube sinks (leaving a vacuous space at the top of the tube) until it stands at a height (usually about 30 inches) such that the pressure of the column exactly balances that of the atmosphere. A graduated scale of metal or glass is provided, by means of which the difference in level between the top of the column and the surface of the mercury in the open vessel (called the "cistern") at the bottom can be measured with precision. In the Fortin instrument (the design commonly adopted for all but the most refined work) the cistern is closed below by a piece of flexible leather, which can be raised or lowered by means of a screw, in order to bring the surface of the mercury in the cistern to a certain fixed level, before the reading is taken. A pointed index, *k*, preferably of ivory, projects downward into the cistern from the upper cover, the position of its tip, with respect to the scale on the barometer tube above, being known. The mercury in the cistern being first brought accurately into contact with the extremity of *k*, the position of the upper end of the barometric column is read from the scale. The "apparent" height of the barometer is then known; but in order to deduce the "true" height, certain corrections must be applied. The most important of these is the correction for temperature. The scale from which the height of the column is read is longer when the temperature is high than when the temperature is low; and the mercury in the column is also less dense at higher temperatures than at lower ones. These two sources of error partially compensate each other; for at a high temperature the reduced density of the mercury tends to make the column stand too high, while the greater length of the scale at such a temperature tends to make the reading too small. The compensation is not perfect, however, and when the coefficient of expansion of the scale is known, a table of temperature



corrections must be calculated, to reduce the direct reading to what it would have been if it had been taken at some fixed standard temperature. The temperature of melting ice is adopted, by universal consent, as the standard to which the "apparent" reading is to be reduced. Another important correction must be applied in order to allow for the variations of gravity with the latitude and elevation of the place of observation. Where gravity is relatively weak, a longer column of mercury will be required to balance a given atmospheric pressure than would be required to balance the same pressure in a region where gravity is stronger. All the barometric readings taken at the International Bureau of Weights and Measures, near Paris, are reduced to the values they would have if made at the level of the sea, in latitude 45°; and this practice is growing in favor among physicists generally. To reduce a barometric reading to sea-level and to latitude 45°, it is merely necessary to multiply the observed height of the column (after applying the correction for temperature) by the expression $(1 - .00259 \cos L)(1 - .00000006 H)$, where L is the latitude of the place of observation, and H is its height above the sea, in feet. Several secondary corrections have also to be considered, when great refinement is desired. Prominent among these is the correction for "capillarity," which is made necessary by the fact that the mercury does not stand as high in a small barometric tube as it does in a larger one, on account of the surface tension (q.v.) of the liquid. No simple formula for this correction can be given, and it varies somewhat according as the barometer is rising or falling at the time of the observation. Tables for finding the capillary correction are given in Guyot's meteorological and physical tables, published under the direction of the Smithsonian Institution at Washington. An excellent table is also given in Guillaume's 'Thermométrie de Précision,' where the elaborate precautions taken in filling the modern precision barometer are also described.

The barometer is a simple instrument, and of the greatest use in all kinds of scientific work. The greatest fault of the mercurial instrument is the difficulty of transporting it without breakage and without destroying the vacuum in the upper part of the tube by the admission of air bubbles. Instruments like the Fortin type may be transported by screwing up the leather bottom until both the cistern and the tube are completely filled with mercury, then reversing the barometer, and carrying it to its destination bottom side up. The "aneroid" barometer, although not nearly so accurate as the mercurial instrument, possesses the advantage of portability, since, as its name signifies, it does not contain any liquid; and it is therefore used to a considerable extent in the determination of the heights of places above the sea. (See HYPSOMETRY.) Various forms of the aneroid exist. One of these consists of a cylindrical metal box, exhausted of air, and having a lid of thin, corrugated metal. The lid, which is highly elastic, yields to every change of atmospheric pressure, and delicate multiplying levers transmit its motions to an index that moves over a graduated scale, whose divisions are marked on the dial empirically, by comparison with a mercurial barometer. For further information concerning the barometer and its

Barometric Light, a name sometimes given to the faint glow (first observed by Jean Picard in 1675) produced in the vacuous space of a mercurial barometer when the instrument is agitated. The light is given off by the mercurial vapor (or other highly attenuated gas) that is present, under the influence of the electricity generated by the friction of the mercury against the glass. Advantage has been taken of this phenomenon in the construction of "self-acting" Geissler tubes, the electricity required to excite them being generated, when they are inverted or shaken, by the friction of a small quantity of mercury introduced before the exhaustion. No very brilliant results can be obtained in this way, however.

Baron, bä-rôñ, **Michel,** or **Boyron,** French comedian: b. 1653, and long attached to Molière's company. For nearly 30 years he played with great success, and retired from the stage in 1691 without any apparent reason. In 1720, however, he again returned, and was received with immense enthusiasm, playing, with great success, even the most youthful parts. In 1729 he was taken ill while on the boards, and died shortly after.

Baron. In the feudal system of the Middle Ages, at first, the immediate tenant of any superior was called his Baron. In old records the citizens of London are so styled, and the members of the House of Commons, elected by the Cinque-Ports, were called barons. This title was introduced into England by William the Conqueror to signify an immediate vassal of the Crown, who had a seat and vote in the royal court and tribunals, and subsequently in the House of Peers. It was the second rank of nobility, until dukes and marquises were introduced and placed above the earls, and viscounts also set above the barons. It is now the lowest rank of the peerage, and is held by prescription, patent, or tenure. The barons were anciently divided into greater barons, or such as held their lands of the king *in capite;* and lesser barons, such as held their lands of the greater barons by military service. In Germany the ancient barons of the empire were the immediate vassals of the Crown. They appeared in the imperial court and diet, and belonged to the high nobility. But these ancient feudatories were early elevated to the rank of counts or princes. A baron has the title of "right honorable lord," etc., and should be addressed as "my lord" or "your lordship." His wife claims also the title of "right honorable," and may be addressed as "madam," or "your ladyship." The coronation robes of a baron differ from those of the other peers in having but two rows of spots on the mantle; and the parliamentary robes, in having but two guards of white fur, with rows of gold lace. The right of wearing a coronet was first conferred on barons by Charles II. It is adorned with six pearls, set at equal distances, of which four are usually shown. In England, the four puisne judges of the court of exchequer bear the title of baron, and the chief judge that of Lord Chief Baron of the Exchequer. They are addressed as My Lord, but have no seat in the House of Lords, unless by being previously made a member of the peerage. See also PEER.

Baronet, a hereditary dignity in Great Britain and Ireland next in rank to the peerage, originally instituted by James I., 22 May 1611. The first person to receive the honor was Sir Nicholas Bacon of Redgrave, whose successors in the title have ever since held the rank of premier baronet of the kingdom. Baronets are created by letters-patent, under the great seal, and the honor is generally given to the grantee and the heirs male of his body lawfully begotten, though sometimes it is entailed on collaterals. The order was created nominally to assist in the plantation of Ulster, but really in order to raise money for the king, and each baronet, on his creation, was obliged to pay into the treasury a sum amounting to a little less than $5,500. According to the terms of its foundation the dignity could be conferred only on those who had the right by inheritance from at least a grandfather to wear coat-armor, and whose income from lands was not less than $5,000 per annum. In 1622 there were 200 baronets in England, this being the number to which the order was originally limited. Charles I. and subsequent sovereigns disregarded altogether the original limitation of the number. Precedence is given to baronets before all knights, except those of the Garter, bannerets created on the field, and privy-councilors. An order of Baronets of Ireland was also instituted by James I., for the same purpose and with the same privileges as the baronets of England. Since the union, in 1801, none have been created otherwise than as baronets of the United Kingdom. Charles I. instituted an order of Baronets of Scotland and Nova Scotia in 1625, for the purpose of advancing the plantation of Nova Scotia, in which the king granted a certain portion of land to each member of the order. Since the union the power of the Crown to create new baronets specially connected with Scotland is held to have ceased.

Baro'nius, Cæsar, Italian ecclesiastical historian: b. Sora, 1538; d. 30 June 1607. He was educated at Naples; in 1557 went to Rome; was one of the first pupils of St. Philip of Neri, and member of the oratory founded by him; afterward cardinal and librarian of the Vatican Library. He owed these dignities to the services which he rendered the Church by his edition of the Roman Martyrology, 'Ecclesiastical Annals,' in reply to the Protestant 'Magdeburg Centuries,' comprising valuable documents from the papal archives, on which he labored from the year 1580 until his death. They were continued, though with less power, by other writers, of whom Raynaldus takes the first rank.

Barons' War, the war carried on for several years by Simon de Montfort and other barons of Henry III. against the king, beginning in 1263. See also MONTFORT, SIMON DE.

Barony, the lordship or fee of a baron, either temporal or spiritual. Originally every peer of superior rank had also a barony annexed to his other titles. But now the rule is not universal. Baronies in their first creation emanated from the king. Baronies appertain also to bishops, as formerly to abbots. William the Conqueror having changed the

spiritual tenure of frank-almoyn, or free alms, by which they held their lands under the Saxon government, to the Norman or feudal tenure by barony. It was in virtue of this that they obtained seats in the House of Lords. The word is commonly applied in Ireland to a subdivision of a county.

Barotse, bä-rŏt'sę, a South African people inhabiting a region in the west of Rhodesia, extending from the Chobe River northward to the Kabompo. They are a branch of the Bechuanas who have migrated northward, and it would appear that they were long subject to a Basuto tribe called the Makololo. About 1860, however, they threw off the yoke of their oppressors and almost exterminated them, but they still speak the language of the Makololos. Their country is a treeless, alluvial plain, over 150,000 square miles in extent. From 1890 King Lawanika acknowledged the virtual supremacy of Great Britain, and in 1898 the British South African Company obtained complete administrative powers.

Barou'che, a four-wheeled carriage with a falling top. There are usually two inside seats in which four persons can sit.

Barquesimeto, bär-kę-sę-mā-tō, a city of Venezuela, capital of the state of Lara; is situated in a high plain, on the Barquesimeto River. It was founded by the Spaniards in 1552. The soil of the neighborhood is very fertile. Coffee of excellent quality is grown here. The town is well built, and has wide streets, and among its prominent buildings are the government palace, barracks, market and Cathedral. Pop. (1899) about 40,000. Previous to the earthquake of 1812 it contained 15,000 persons, but that calamity destroyed 1,500 lives, and left scarcely a house standing.

Barr, Amelia Edith, (Huddleston), Anglo-American novelist: b. Ulverstone, Lancashire, England, 29 March 1831. She was the daughter of the Rev. William Huddleston, and in 1850 married Robert Barr. She came to the United States in 1854, and lived for some years in Texas; but after her husband's death (1867) removed to New York, where her first book, 'Romance and Reality,' was published in 1872. She is a prolific writer, and her more than 30 novels are very popular. Among them are 'Jan Vedder's Wife' (1885); 'A Daughter of Fife' (1885); 'A Bow of Orange Ribbon' (1886); 'A Border Shepherdess' (1887); 'Friend Olivia' (1890); 'A Sister to Esau' (1891); 'Remember the Alamo'; 'Prisoners of Conscience' (1897); 'I, Thou, and the Other One' (1899); 'Trinity Bells' (1899); 'The Maid of Maiden Lane' (1900); 'The Lion's Whelp' (1901); 'Souls of Passage' (1901).

Barr, James, Canadian author: b. Wallacetown, Ontario, 1862. He engaged in journalism in that province, the United States, and in London; and under the pen-name of Angus Evan Abbott has contributed much to magazine literature. Among his separate publications are 'American Humorous Verse' (1891), and the American volume in the 'International Humorous Series' (1893), the last containing a biographical index of nearly 200 American and Canadian humorists. He is a brother of Robert Barr (q.v.).

Barr, Robert, Scottish novelist: b. Glasgow, 16 Sept. 1850. He spent his childhood in Canada, drifted into journalism, and in 1876 joined the staff of Detroit *Free Press,* and wrote under the name of Luke Sharp. He went to London in 1881 and in 1892 founded *The Idler* with Jerome K. Jerome, but retired in 1895 to devote himself to fiction. He is author of 'In a Steamer Chair' (1892); 'In the Midst of Alarms' (1894); 'The Face and the Mask' (1895); 'One Day's Courtship' (1896); 'A Woman Intervenes' (1896); 'Countess Tekla' (1899); 'The Unchanging East' (1900); 'The Victors' (1901); 'A Prince of Good Fellows' (1902).

Barra, a small Mandingo kingdom of western Africa, near the mouth of the Gambia, with an estimated population of 200,000, its men being remarkable for their fine proportions. The surface, which is fertile, but rather marshy, is well cultivated. The territory about the mouth of the river belongs to the British, who have built the port of Albreda on the south bank, from which considerable trade is carried on. The chief town is Barrinding, where the so-called king resides.

Bar'ra, a Scottish island, forming part of the Outer Hebrides, eight miles long and from two to five wide, and almost entirely composed of gneiss, which on the west coast forms huge rocky barriers. On these the Atlantic, beating with all its force, has hollowed out vast caves and fissures. In the interior not merely the hollows and valleys, but many of the loftiest hills are clothed with fine pasture, on which large herds of cattle and flocks of sheep are reared. The coasts abound with fish, and the island forms a fishing centre of some importance. There are many standing stones and other antiquities. Pop. (1891) 2,131.

Bar'racan, strictly, a thick, strong fabric made in Persia and Armenia, of camel's hair, but the name has been applied to various wool, flax, and cotton stuffs.

Barracand, bă-ra-cŏn, **Leon Henri,** French poet and novelist: b. Romans, Drôme, 2 May 1844. He gave up the law when a very young man in order to write verses; but he was not much known as a poet until 'Dananiel' (1886) appeared, under the pseudonym of Leon Grandet, followed by a sequel, 'Doctor Gal' (1870). He had already, however, attracted attention by some fictions, and has steadily risen in importance as a novelist — 'Yolande' (1867); 'Hilaire Gervais' (1885); 'The Second Lieutenant's Manuscript' (1887); and 'The Cousin' (1888), being perhaps best known. His 'Lamartine and the Muse' (1883) was crowned by the French Academy.

Barrack Room Ballads, a book of verse by Rudyard Kipling, published in 1892. It deals with the various experiences of Tommy Atkins, the British private, and no such vivid portraiture of the common soldier with his dullness, his unhesitating obedience, and his matter-of-fact heroisms has appeared elsewhere.

Barrackpur, bă-răk-poor', a town and cantonment in Hindustan, on the Hooghly, 15 miles north of Calcutta. In the vicinity is the suburban residence of the Viceroy of India, within a park four miles in circuit. A sepoy mutiny, the prelude to the great outbreak at

Meerut in May, took place here in February 1857. A mutiny had previously taken place in 1824. Barrackpur is also known as North Barrackpur to distinguish it from South Barrackpur or Agarpara, midway between it and Calcutta. Pop. 18,000.

Barracks, a name originally given to temporary accommodation for troops, but now designating permanent and commodious erections, in which troops are lodged in fortified towns or other places. The introduction of barracks into England was opposed as dangerous to liberty, by estranging the soldier from the citizen, and fitting him to become a tool of despotism; but the billeting of soldiers upon citizens had grown to be so burdensome to communities that after the close of the 18th century extensive barracks were built at convenient stations all over the United Kingdom. Much improvement has been effected in the construction and arrangement of English barracks during the last half-century; and separate quarters are now provided for married soldiers. The construction and repair of barracks is part of the duty of the royal engineers; their equipment and allotment is intrusted to a barracks section of the Army Service Corps. In the United States the term is officially used to designate important military posts, such as the Columbus Barracks, San Diego Barracks, Washington Barracks, and others.

Barracoon, a negro barrack or slave depot, formerly plentiful on the coasts of Africa, Cuba, and Brazil.

Barracuda, băr-ra-koo'da, an oceanic fish of the family *Sphyrænidæ,* of which about 20 species inhabit the warm seas of the whole world. All are elongate, pike-like fishes, with long, pointed jaws filled with sharp teeth. They are often of large size, are powerful swimmers, active and voracious, and, like the bluefish, prey upon schools of smaller fishes. Several species occur on the American coasts. The great barracuda "picuda," or "becuna" (*Sphyræna picuda*), is common throughout the West Indies and northward to South Carolina, and reaches a length of six feet. It is the largest and most voracious of the genus, is as fierce as a shark, and is sometimes dangerous to bathers. Other West Indian species are those called guaguanche, and picudilla. These are smaller, as is a third species also, which is common along the Atlantic coast of the United States. Two or three species are found on the Pacific coast from California southward. One of these (*S. argentea*) is a long and slender species, known as the California "barracouta," and highly valued for food. It closely resembles the typical European barracuda (*S. sphyræna*), locally known as "spet" and "sennet," and one of the important food-fishes of the Mediterranean.

Barramunda, băr-ra-mŭn'da, or **Burnett Salmon,** names in Australia for a mud-fish (*Ceratodus*), remarkable as a survival of the very ancient group Dipnoi. See Lung-Fish.

Barrande, ba-räńd, **Joachim,** French geologist: b. Sangues in the department of Haute Loire, 11 Aug. 1799; d. Vienna, 5 Oct. 1883. His specialty was the Silurian formations in Bohemia, his writings including 'Système Silurien du Centre de la Bohême' (1852 and 1887); 'Colonie dans le Bassin Silurien de la Bohême' (1860); 'Documents sur la Faune Primordiale et la Système Taconique en Amérique' (1861); 'Representation de Colonies de la Bohême dans le Bassin Silurien du nordouest de la France' (1853); 'Céphalapodes, Etudes Générales.'

Barran'dite, a mineral occurring in rounded concretions exhibiting a concentric structure as well as indistinct radial fibres. It is gray, usually with tinges of color, and has a hardness of 4.5 and a specific gravity of 2.58. Its composition is $(Al,Fe)PO_4 + 2H_2O$, the iron and aluminum being present in the ratio of about 4 to 3. It is found mainly at Cerhovic in Bohemia.

Barranquilla, bär-ran-kē'lya, the chief commercial centre of Colombia, some 15 miles from the mouth of the Magdalena. The bar at the mouth of the river has been improved so as to enable sea-going vessels to pass up to Barranquilla, which possesses excellent wharfage accommodation. The inland traffic by river steamers is important. The trade is mainly in the hands of Germans. It is the seat of a United States consulate. Pop. about 40,000.

Barrantes y Moreno, bär-ran'tā-se-mō-rā'-nō, **Vicente,** Spanish writer: b. Badajoz, 24 March 1829. He first studied theology, but in 1848 settled in Madrid to pursue literature; held responsible government offices; became a member of the Academy in 1872. Among his works are the stories 'Always Late' (1851); 'Juan de Padilla,' 'The Widow of Padilla,' and a series of historical studies, dealing with strictly local Philippine and Estremaduran topics. His 'Tales and Legends' are well chosen and well written; but a work on 'The Defects and Dangers of Universal Suffrage,' partly fiction and partly satire, is ineffective.

Barras, bä-räs, **Paul François Jean Nicolas, Comte de,** French statesman: b. Fox-Amphoux (Var), 30 June 1755; d. January 1829. When the Revolution broke out he immediately showed himself an opponent of the court, and had a seat in the *tiers-état,* while his brother was sitting among the nobility. He took part in the attacks upon the Bastile and the Tuileries, was elected a juryman at the tribunal of Orleans, and in September a member of the national convention, where he voted for the death of Louis XVI. Although he had established his reputation as a patriot, yet he displeased Robespierre, who resolved to involve him in the great proscription which he then meditated. Barras therefore joined those determined to overthrow Robespierre, and took an important part in the events of the 9th Thermidor (27 July 1794). He was entrusted with the chief command of the forces of his party, repelled the troops of Henriot, and made himself master of Robespierre. On 4 Feb. 1795 he was elected president of the convention. The 13th Vendémiaire (5 Oct. 1795), when the troops of the sections which favored the royal cause approached the convention, Barras for a second time received the chief command of the troops of the convention, and the battalion of the patriots, who hastened to their assistance. On this occasion he employed Gen. Bonaparte. In his report he attributed the victory to this young general, and procured for him the chief command of the army of the interior. His important services promoted him to the Directory.

Barras soon perceived that Bonaparte would give a decisive superiority to him who should obtain an influence over him; and therefore he displaced Carnot from the War Department and took possession of it himself. This separated them, and Carnot for some time took part with the council, where a party had been formed to restrain the power of the Directory, and particularly that of Barras. The rupture could only terminate with the ruin of one of the parties: that of the council fell by the events of the 18th Fructidor (4 Sept. 1797), in which Barras took a leading part. From this period he governed absolutely until 13 June 1799, when Siéyès entered the Directory. Nevertheless Barras succeeded in preserving his seat, but he became a victim of the 18th Brumaire (9 Nov. 1799). In a letter which he sent to St. Cloud he resigned his office, and received a passport to his estate. He afterward retired to Brussels, where he lived for several years; but finally received permission to repair to the south of France. His memoirs were published in French and English (1895-6).

Barrass, Edward, Canadian clergyman: b. Durham, England, 22 July 1821. He entered the ministry in 1840, and removed to Toronto in 1853. He became the assistant editor of the *Christian Guardian,* and published, among other works, 'A Gallery of Deceased Ministers' (1853); 'Class Meetings: Their Origin and Advantages' (1865); 'A Gallery of Distinguished Men' (1870); and 'Smiles and Tears: or, Sketches from Real Life' (1879).

Bar'ratry, a law term applied to (1) the offense committed by the master of a vessel of embezzling or injuring goods committed to his charge for a voyage. Barratry has also been defined to be an unlawful or fraudulent act, or very gross or culpable negligence, of the master or mariners of a vessel in violation of their duty as such, and directly prejudicial to the owner, and without his consent; (2) the offense of frequently exciting and stirring up law suits or quarrels among one's neighbors or in society generally. An indictment for this offense must charge the offender with being a common barrator, and the proof must show at least three instances of offending. An attorney is not liable to indictment for maintaining another in a groundless action. In New York, and some other States, barratry is defined to be the practice of exciting groundless judicial proceedings, and is a misdemeanor.

Barre, bär, **Antoine le Fèvre de la,** French naval officer: b. about 1600; d. 4 May 1688. He was appointed governor of Guiana in 1663, and re-took Cayenne from the Dutch. In 1667 he defeated the English in the Antilles, forcing them to raise the blockade of St. Christopher. In 1682 he was appointed to the governorship of Canada, taking the place of the Count de Frontenac. He was, however, recalled in 1684, for having by his irresolution caused the failure of the expedition to treat with the savages.

Barré, Isaac, British officer: b. Dublin, 1726; d. London, 20 July 1802. He was wounded at Quebec, was beside Wolfe when he fell, and figures in West's picture of 'The Death of Wolfe.' He entered parliament in 1761, and held office successively under Lord Butte, Pitt, Rockingham, and Lord Shelburne. In Pitt's second administration he exposed the corruptions of the ministry, was a strong opponent of Lord North's ministry, and opposed the taxation of America. The town of Barre, Mass., was named in his honor.

Barre, bär'rā, a group of Arawakan tribes dwelling along the Upper Rio Negro in northwestern Brazil and the adjoining districts of Venezuela. They are extremely aggressive, and their language is extending rapidly throughout that region.

Barre, băr'rę, Mass, a town in Worcester County, on the Ware River, 21 miles northwest of Worcester. An institute for feebleminded children is established here, and there are cotton, woolen, and straw factories. It was named for Col. Isaac Barre (q.v.). Pop. (1900) 2,059.

Barre, Vt., a city in Washington County, on the Central V., the Barre, and the Montpelier & W. R. R.R.'s; six miles southeast of Montpelier. Barre received a city charter in 1894; and has a reputation as one of the most important seats of the granite industry in the United States. It contains, besides granite quarries, several industrial plants connected therewith; a national and two savings banks; a public library; opera house, Goddard Seminary; a home school for young men and women, with four courses of study; Spaulding High School; daily and weekly newspapers; an assessed property valuation exceeding $2,500,000, and a total debt of about $150,000. It was incorporated in 1894. Pop. (1900) 8,448.

Barreiro, bą-rā'e-rō, **Juan Baptista Hernandez,** Cuban lawyer: b. Havana, about 1842. He acquired a liberal education, and amassed large wealth in the practice of his profession. He was professor of Roman law in the University of Havana for 30 years; and more recently was dean of the law faculty in the university. In February 1900, while acting as first assistant mayor of Havana, he was appointed a member of the new Cuban Civil Cabinet, and given the portfolio of public education.

Barrel, a hollow vessel made of staves, set on end, arranged around a circle, and bound together with hoops. By each stave being made wider in the middle and tapering a little toward the ends, the barrel is of larger diameter, or bulges, in the middle. The bevelled edges of the staves cause them to fit closely together, making a tight joint along their length. The ends are closed by circular heads, the edges made thin to fit into a groove cut to receive them near the ends of the staves, in which they are held fast by driving the hoops upon the swell of the barrel. The construction of the barrel is ingeniously adapted for combining great strength with lightness. It resists pressure from without by the arched arrangement of the staves; and the hoops secure it from the expansive force of gases often generated in its contents. Its form is the most convenient for transportation, admitting of the vessel being rolled or rapidly swung by hooks placed under the chine or ends of the staves. In the form of kegs, firkins, liquor casks, butts, hogsheads, etc., they are met with everywhere. Yet the Chinese, with all their ingenuity, it is said, have never made a barrel. Formerly barrels were constructed entirely by hand, the cooper shaving the staves with the draw knife, and shaping them

by clamps. But machines are now applied to this purpose, by which the work is done much more expeditiously. See COOPERAGE.

As a measure of capacity, the barrel is of variable dimensions, differing in size with the materials it is designed to hold. In wine measure the barrel must contain 31½ gallons. A barrel of beer in England is equal to 36½ imperial gallons. In the United States a barrel of flour must contain 196 pounds; and a barrel of beef or pork, 200 pounds. The measure of capacity called barrel bulk is five cubic feet. Barrel is also used to express any thing long and hollow, as a gun-barrel. It is also applied to the cylinder in a watch, about which the spring is coiled; and in anatomy, to the «cavity of the tympanum» of the ear.

Barren Grounds, the name given to a large tract in the Northwest Territories of Canada, extending northward to the Arctic Ocean between Great Bear and Great Slave lakes and Hudson Bay. It consists largely of swamps, lakes, and bare rock, and a comparatively small part of it is yet well known. The vegetation chiefly consists of dwarf birches and willows, mosses and lichens. The animals include the reindeer, musk-ox, beaver, polar bear, wolves, foxes, etc.

Barren Island, a volcanic island in the Andaman Sea, about lat. 12° 15′ N.; lon. 93° 54′ E. Its diameter is about two miles, with submarine slopes plunging rapidly to a depth of more than 800 fathoms. There is an ancient crater over a mile in diameter, from the centre of which a newer cone rises to a height of 1,015 feet. The volcano was active in 1789 and 1803, but is now dormant. A small island near Coney Island, New York, is also known as Barren Island.

Barren Measures, the name given to certain groups of strata associated with the coal measures, but which contain no workable deposits. In the United States there are two so-called barren stages, a lower intervening between the lower productive and the upper productive measures, and an upper lying at the base of the Permian System.

Barrès, bą-rĕs, **Maurice,** French novelist: b. Charms-sur-Moselle, 1862. His earlier writing as exemplified in his 'Sous l'œil des Barbares' (1888); 'Un Homme Libre' (1889); and 'Le Jardin de Bérénice' (1891), is more or less decadent in character, but his later work is much more forceful, and inculcates a healthful spirit of nationalism. 'Les Déracines' (1897) is among the best of his latest writings.

Barrett, Benjamin Fisk, American Swedenborgian clergyman: b. Dresden, Me., 1808; d. Germantown, Pa., 6 Aug. 1892. He was graduated from Bowdoin College in 1832, and held Swedenborgian pastorates in New York, Cincinnati, and Philadelphia. He was a voluminous writer and industrious editor of books and periodicals relating to Swedenborgianism. Chief among them are: 'Life of Swedenborg' (1841); 'Letters on the Divine Trinity' (1860; 4th ed. 1873); 'Catholicity of the New Church' (1863); 'Episcopalianism' (1871); 'New View of Hell' (1870; 5th ed. 1886); 'Swedenborg and Channing' (1878); 'Heaven Revealed' (1885).

Barrett, George Hooker, American actor: b. Exeter, England, 9 June 1794; d. 5 Sept. 1860. He left England with his mother, an actress of some celebrity, and arrived at Boston in October 1796; he made his first appearance the same year in the part of Cora's child, in 'Pizarro,' at the age of two years. He commenced playing in New York in 1806, at the Park Theatre, in the part of 'Young Norval,' and became manager of the Bowery Theatre, New York, in 1826, in company with E. Gilbert. He afterward visited England, and in 1837 performed at Drury Lane Theatre, London, under the management of Alfred Bunn. He was also manager of the Tremont Theatre, Boston, and in 1847 opened the Broadway Theatre, New York, but he did not retire from the stage. His favorite characters were in genteel comedy, but he also acted in farce and low comedy with great success. From his elegance and stateliness he was known by the sobriquet of «Gentleman George.»

Barrett, John, American diplomatist: b. Grafton, Vt., 28 Nov. 1866. He was graduated at Dartmouth College in 1889, and the same year went to the Pacific coast and engaged in journalism till 1894. During 1894–8 he was United States minister-resident and consul-general at Bangkok, Siam, and, afterward represented several American newspapers in Manila, Philippine Islands. After the American victory in Manila Bay he made a special study of conditions in the Philippines, and, returning by way of London, addressed a joint assembly of members of the House of Commons and the London Chamber of Commerce, on the condition of trade in the Far East. He returned to the United States in the summer of 1899, and did much in support of the action of the Federal government in the Philippines.

Barrett, John Kelly, Canadian official: b. Hamilton, Ontario, 5 June 1860. He was graduated at Holy Cross College, Worcester, Mass., in 1872, and after serving as principal of St. Mary's Model School in Hamilton entered the public service, principally in the line of education. He became conspicuous in 1890, when the authorities of Manitoba abolished the Roman Catholic schools and the official use of French in that province, by defending the claims of the Roman Catholic minority and by bringing suit against the city of Winnipeg to test the constitutional power of the Provincial Government in passing the School Act of 1890.

Barrett, Lawrence, American actor: b. Paterson, N. J., 4 April 1838; d. 21 March 1891. His first appearance on the stage was in 1853, in 'The French Spy.' In 1856 he appeared as Sir Thomas Clifford in 'The Hunchback' at Chambers Street Theatre, New York, and in 1857 he supported Burton, Charlotte Cushman, Edwin Booth, and other eminent actors. He served as a captain in the 28th Massachusetts Infantry in the early part of the Civil War. Later he acted at Philadelphia, Washington, and at Winter Garden, in New York, where he was engaged by Mr. Booth to play Othello to his Iago. After this he became an associate manager of the Varieties Theatre in New Orleans, where for the first time he played the parts of Richelieu, Hamlet, and Shylock. In 1864 he secured 'Rosedale' from Lester Wallack, and after appearing in its leading character at New

Orleans, began his first tour as a star actor. In 1867 he played at Maguire's Opera House in San Francisco, and was then manager of the California Theatre till 1870. Late in 1870 he went with Mr. Booth, playing in alternate characters in Booth's Theatre. In 1871–2 he was manager of the New Varieties Theatre in New Orleans, and in December 1872 acted Cassius to Booth's Brutus in New York. During 1873–4 he made tours through the United States. In 1875 he appeared as Cassius in 'Julius Cæsar,' in Booth's Theatre, and later as King Lear. He was the first actor to appear as Daniel Druce in the United States in Mr. Gilbert's play. In 1882 he brought out 'Francesca di Rimini,' at the Chestnut Street Theatre in Philadelphia. In 1883 this play ran for nine weeks at the Star Theatre, in New York. In 1887 he began his first joint engagement with Edwin Booth in Buffalo. Mr. Barrett's last production of a new play was 'Guido Ferranti' by Oscar Wilde, brought out in 1890, at the Broadway Theatre, New York. His last appearance was on 18 March 1891, in the character of Adrian du Mauprat to the Richelieu of Mr. Booth. He wrote 'Life of Edwin Forrest.'

Barrett, William Alexander, English journalist and musician: b. London, 15 Oct. 1834; d. 17 Oct. 1891. He was musical critic of the London *Morning Post* from 1867 till his death, and edited several musical journals. He published a 'Life of Balfe'; 'The Choristers' Guide'; 'English Church Composers'; 'English Folk Songs, Glees, and Madrigals,' and a 'Dictionary of Musical Terms' (with Stainer.)

Barrett, William Fletcher, English scientist: b. Jamaica, West Indies, 10 Feb. 1844. He assisted Prof. Tyndall at the Royal Institution, London, 1862–6, and in 1873 became professor of experimental physics in the Royal College of Science, Dublin. He was one of the founders of the Society for Psychical Research, and is widely known for his original researches in magnetism and radiant heat. He has published 'Lessons in Science' (1880); 'Early Chapters in Science' (1899); 'A Monograph on the So-called Divining Rod' (1897–1900).

Barrett, Wilson, English dramatist and actor: b. Essex, 18 Feb. 1846; d. London, 22 July, 1904. He went upon the state in 1863. In 1874 he became manager of the Amphitheatre in Leeds, and later lessee of the Grand Theatre in Leeds; in 1879 manager of the Court Theatre, London; and in 1881, of Princess' Theatre, London. He visited the United States in 1886, and, returning to England in 1887, became manager of the Globe Theatre; revisited the United States in 1888, and again in 1889; in 1896 became manager of the Lyric Theatre, London; and in 1899, of the Lyceum. His dramas include 'The Sign of the Cross'; 'Pharaoh'; 'Now-a-days'; 'The Daughters of Babylon'; 'In Old New York'; etc.; and he adapted for stage purposes such well-known novels as 'The Deemster'; 'The Bondman'; 'The Manxman'; and 'Quo Vadis.'

Barr'head, a manufacturing town of Scotland, seven miles southwest of Glasgow. The chief industries are the printing of cottons, the spinning of cotton yarn, dyeing, bleaching, iron and brass founding, and the making of machinery and sanitary appliances. Pop. (1901) 9,900.

Barrias, ba-re-as, **Felix Joseph,** French painter: b. Paris, 13 Sept. 1822; a pupil of Leon Cogniet. His most successful works are 'Cincinnatus' (1844); 'Sappho' (1847); and 'Death of Chopin' (1885). He was awarded the Grand Prix de Rome, 1844; Legion of Honor, 1859; first medal at the Paris Exposition, 1889.

Barrias, Louis Ernest, French sculptor: b. Paris, 1841; d. 4 Feb. 1905. His first success was the 'Spartains' for the Tuileries in 1871. Among his latest works are the Carnot Memorial for the city of Bordeaux (1896), and the bronze statue of Laboisier for Paris (1900).

Barricade, an obstruction hastily improvised to defend a narrow passage (for instance, a street, a bridge, etc.), serving to retard an enemy and afford an opportunity of firing upon them with effect. Carriages, casks, chests, furniture, beams — in short, everything which is at hand is used for this purpose; and if it is necessary that the enemy, when consisting principally of cavalry, should be checked in the pursuit, though it be but for a moment, the baggage wagons may be employed with effect. Barricades, constructed of the first materials that came to hand, were used in popular insurrections during the Middle Ages, and Paris has obtained notoriety as the city in which they have been most frequently employed. In 1358 its streets were barricaded against the Dauphin. The first "Battle of the Barricades" took place on the entry of the Duke of Guise into Paris, 12 May 1588. It was followed, during the War of the Fronde, by another contest of a somewhat similar character, 26 Aug. 1648, when Anne of Austria ordered the arrest of three popular members of the parliament. In July 1830, the elder branch of the Bourbons, and in February 1848, the Orleans branch of the same family, were driven from the French throne, after a struggle at the barricades. Gen. Cavaignac, in defense of the provisional government, waged a fearful contest with the insurgents, who had erected barricades, 23–26 June 1848, in which he was at length victorious. The killed and wounded amounted to 15,000, and about 8,000 of the rebels were taken prisoners.

Napoleon III. widened and macadamized many of the principal streets of Paris, partly with the express purpose of rendering the successful erection of barricades next to impossible; but nevertheless in the second siege of Paris (1871), the Communists threw up numbers of strong barricades. There was a remarkable barricade erection in London in 1821. The ministry desired that the body of Queen Caroline should be conveyed out of the country to Germany, for interment without the populace having the opportunity of making any demonstration. On the matter becoming known, a vast barricade was erected at the point where the Hampstead Road joins the New Road; and as nothing but the use of artillery could have forced the way, the officer in charge of the funeral changed his course. In 1848 and 1849 barricades were successfully carried in Paris, Berlin, Vienna, and Dresden, by taking the defenders in the rear.

Barricades, The Days of the, a phrase employed to denote popular Parisian revolts. See also BARRICADE.

Barrie, James Matthew, popular Scottish author: b. Kurriemuir, Forfarshire, 9 May 1860. He graduated from Edinburgh Univer-

sity in 1882, and went to London in 1885, to engage in journalism. His peculiar talent for depicting Scottish village life and rustic characters with fidelity, pathos, humor, and poetic charm, has brought him fame. 'Better Dead' (1887) and 'When a Man's Single' (1888) were followed by 'Auld Licht Idylls' (1888) and a Window in Thrums' (1889), which first made him widely known; 'An Edinburgh Eleven' (1890); 'My Lady Nicotine,' humorous essays on smoking (1890); 'The Little Minister' (1891); 'Sentimental Tommy' (1896); 'Margaret Ogilvy' (1896), a biography of his mother; 'Tommy and Grizel' (1900); 'The Little White Bird' (1902), etc. He has also written numerous short sketches, and the following dramatic works: 'Walker, London' (1892); 'Jane Annie' (1893); and 'The Professor's Love Story' (1895). 'The Little Minister' was dramatized in 1897, and was played with success in the United States. See Hammerton, 'James Matthew Barrie and His Books' (1900).

Barrie, Canada, town and county-seat of Simcoe County, Ontario; on the Grand Trunk Railway, at the western extremity of Lake Simcoe; 64 miles north-northwest of Toronto. Barrie was founded in 1832 and incorporated in 1871. It is a popular and beautiful summer resort, and the starting point of the Lake Simcoe steamers. The chief industrial establishments are planing and grist mills, carriage works, breweries, brick-yards, engine and boiler works, and wicker works. The waterworks and electric light plant are owned by the corporation. There are 10 churches, a collegiate institute and business college. In 1896 Allandale, a railway centre, was annexed to the town, and the Grand Trunk Railway has here a large roundhouse, machine shops, etc. A United States consular agent is stationed here. Pop. (1901) 5,949.

Barrier Reef, The Great, a coral reef or line of reefs extending for 1,260 miles off the northeast coast of Australia, at a mean distance from land of 30 miles. It rises precipitously from a great depth, no bottom having been found at some places with a line of 285 fathoms.

Barrier Treaty. When, by the Peace of Utrecht, the Spanish Netherlands were ceded to Austria, 1715, this cession was agreed to by the Dutch, who had conquered these provinces in alliance with England, only on condition that they should have the right (in order to secure their borders and give them a barrier against their powerful neighbor, France) to garrison several fortresses of the country, and that Austria should engage to pay yearly to Holland 350,000 dollars for the support of these garrisons. The treaty which was concluded between Austria, England, and Holland was called the Barrier Treaty. In 1781 the Emperor Joseph II. declared it void.

Barrière, bȧ-ryăr, **Jean François,** French historical writer: b. Paris, 12 May 1786; d. there, 22 Aug. 1868. His energies were first directed to periodical literature; but he subsequently produced 'The Court and the City Under Louis XIV., Louis XV., and Louis XVI.,' besides editing a numerous series of memoirs of personages connected with the Grand Monarch.

Barrière, Théodore, French dramatist: b. Paris, 1823; d. there, 16 Oct. 1877. In collaboration with others he supplied the French stage with a great number of dramas and comedies, some of which met with much favor, especially 'Bohemian Life' (1848, with Murger); 'The Maids of Marble' (1853, with Thiboust), a counterpart to Dumas' 'The Camelia Lady,' and 'The Spurious Men of Honor' (1856, with Capendu), a scathing satire, and his masterpiece.

Barriers, Battle of The, an engagement between the French and the Allies in front of Paris, March 1814, in which the former were defeated. Its immediate result was the abdication of Napoleon.

Barrili, bär-rē'lę, **Antonio Giulio,** Italian novelist: b. Savona, 14 Dec. 1836. Engaging in journalism when only 18, he assumed the management of *Il Movimento* in 1860, and became proprietor and editor of *Il Caffaro* in Genoa in 1872. He had taken part in the campaigns of 1859 and 1866 (with Garibaldi in Tyrol) and in the Roman expedition of 1867, and sat in the Chamber of Deputies in 1876–9. He is one of the most prolific writers of modern Italy, and among his numerous stories are 'Elm Tree and Ivy' (1868); 'The Vale of Olives' (1871); 'As in a Dream,' 'The Devil's Portrait' (1882); 'The Eleventh Commandment,' 'A Whimsical Wooing.' He has published several volumes of criticism, among which may be named: 'Ilrinnovamento Letterario Italiano' (1890).

Barring-out, a practice once common in some English schools and rendered familiar to many from forming the subject of one of the tales in Miss Edgeworth's 'Parent's Assistant.' It generally took place a few days before the holidays, when the boys barred the doors of the school and defied the masters from the windows. It was commonly understood that the pupils might dictate terms as to holidays for the ensuing year if they could prevent the masters' entrance for three successive days. The origin of the practice is not known; but its observance is enjoined in the statutes of Witton School, Cheshire, founded in 1588, by Sir John Deane.

Bar'ringer, Daniel Moreau, American statesman: b. in the county of Cabarrus, N. C., 1807; d. White Sulphur Springs, Va., 1 Sept. 1873. He graduated at the University of North Carolina in 1826, established himself in the practice of law in 1829, and, after gaining distinction as a lawyer, was, in 1843, elected a representative to the National Congress. He was twice re-elected, and was minister to Spain, 1849–53. He was a delegate to the National Union Convention in Philadelphia in 1866.

Barringer, Rufus, American lawyer and soldier: b. Cabarrus County, N. C., 2 Dec. 1821; d. Charlotte, N. C., 3 Feb. 1895. He graduated from the University of North Carolina, 1842, and settled in the practice of law at Concord. Though a strong Union man he followed his State into the Confederacy, raised a company of cavalry, and by June 1864, had risen to the rank of brigadier-general. He was in 76 actions, and was severely wounded on several occasions. At the close of the war he returned to the practice of law, advocated the acceptance of the reconstruction acts, and took a prominent part in State politics until his retirement in 1884.

Bar'rington, Daines, English lawyer, antiquary, and naturalist: b. 1727; d. March 1800. After preparatory studies at Oxford and the

Inner Temple, he was called to the bar, and held several offices previous to his being appointed a Welsh judge in 1757. He was subsequently second justice of Chester till 1785, when he resigned that post, and thenceforward lived in retirement, chiefly at his chambers in the Inner Temple, where he died. His publications were numerous, but his name is now best known as a correspondent of White of Selborne, whose famous letters on natural history he is said to have suggested. He was an eager, curious antiquary, uncritical and the subject of many hoaxes.

Barrington, George, Irishman, noted author and notorious thief: b. 1755; d. about 1840. His most notable act of thieving was the robbing of a Russian prince in Covent Garden Theatre. He took from him a gold snuff-box said to be worth $150,000; but, as the prince refused to prosecute, he was dismissed from trial. In 1790 he was sentenced to seven years' penal servitude at Botany Bay; but having given information of an intended mutiny of the other convicts on the voyage, at the end of two years he was discharged, on the first warrant of emancipation ever issued. He was made superintendent of convicts, and later high constable at Paramatta. He was a wit, and of some literary genius: one couplet in a prologue he wrote for Young's play 'Revenge,' produced by the convicts on the opening of the Sydney Theatre, remains an enduring classic:

> "True patriots we; for be it understood,
> We left our country for our country's good."

He wrote also 'Voyage to Botany Bay' (1801), 'History of New South Wales' (1802), 'History of New Holland,' i. e. Australia (1808).

Barrington, John Shute, English lawyer and theologian: b. London, 1678; d. Becket, Berkshire, 14 Dec. 1734. He was created first Viscount Barrington in 1720. He was a disciple and friend of Locke, a friendship which is thought to have been brought about by the publication of his (Barrington's) work, 'The Interest of England,' etc. He was devoted to theology and wrote extensively in that science. His chief works have been collected under the title 'The Theological Works of the First Viscount Barrington.'

Barrington, Sir Jonah, Irish jurist: b. County Queens in 1760; d. Versailles, France, 3 April 1834. He became judge in the Court of Admiralty, and was a steady opponent of the Act of Union in 1800. As the result of several peculations, upon petition of both Parliamentary houses, he was deprived of his office, and in 1830 left England. He was the author of 'Personal Sketches' (1827); 'Historic Memoirs of Ireland' (1832); 'The Rise and Fall of the Irish Nation' (1833), etc.

Barrington, William Wildman, English statesman, second Viscount Barrington: b. 15 Jan. 1717; d. 1 Feb. 1793. He was sworn a member of the privy council in 1755, and in the same year accepted the office of secretary of war. In 1761 he was appointed chancellor of the exchequer, but in 1765 reassumed the post of secretary of war, which he held till 1778, when, in consideration of long public and personal services, he was retired.

Barrington, Can., a seaport of Nova Scotia in Shelburne County, 173 miles west of Halifax by rail. Its industries are ship-building, fishing, and the shipping trade. A United States consul resides here. Barrington Passage is a small fishing suburb. Pop. 1,900.

Barrios, bär'rę-ōs, **Gerardo,** Central American statesman: b. about 1810; d. 1865. He became president of Salvador in 1860. During his administration, education, commerce, and public works progressed remarkably, his presidential management being unusually liberal. He was deposed by Duenas as the outcome of the war with Guatemala, and, while endeavoring to bring about a revolution in order to become president again, was captured and executed.

Barrios, Justo Rufino, Guatemalan statesman, of Spanish-Indian blood: b. San Lorenzo, Guatemala, 17 July 1835; d. Chalchuapa, 2 April 1885. He was educated for the law, but the political punishment of his father led him to become a guerrilla revolutionist, and finally chief lieutenant of García Granados, who by his help ousted Vicente Cerna (the decisive battle being fought 29 June 1871) and became president, Barrios being commander-in-chief. The revolution was a democratic and anti-clerical one, and the new government began by expelling the Jesuits; to which Barrios added the suppression of religious orders during an acting presidency, and after he had, on 4 June 1873, succeeded Granados as president. There had been incessant revolts of the reactionists, which shortly after his accession he quelled once for all, establishing a system of terrorism and espionage which at least gave the country quiet and enabled him to carry out his wonderful reforms and improvements. He maintained internal peace, and supremacy in Central America, by a thorough system of militia drill for all but the pure-blooded Indians; keeping an army of some 30,000 men in constant reserve, with 3,000 to 4,000 in the capital, which he made one of the best ordered cities of Spanish America. He reorganized the postal and organized the telegraphic service also on the reports of men sent to examine the United States systems. He built the first telegraph and the first railroad in Guatemala, and started a line to the coast, compelling every citizen earning over $8 a month to hold stock in it; constructed street railway lines in the capital; improved the roads and built solid bridges. He remodeled the educational system, established collegiate institutes, normal and industrial schools, and made knowledge of French and English a condition of license to practise law or medicine. He built two modern penitentiaries. In a word, he transformed Guatemala into one of the most habitable and progressive countries south of the United States. But the foremost purpose of his life was to form Central America into one united state, for power and prosperity and the ending of the miserable wars that wasted its vitality. On 15 Jan. 1876 he assembled a diet from all the states in Guatemala city to frame a plan of consolidation; but as it could not agree upon one, he therefore determined to set up governments in the other states favorable to his plans. Honduras was racked by a civil war and offered no difficulties, Salvador was too small to resist the union of the two, and thenceforward till 1884 Barrios disposed of the resources of all three republics. On 1 March 1880, the first constitution of Guatemala went into operation, and Barrios was re-elected for a

six-year term. On 24 Feb. 1883 he issued a circular to the liberal party, pledging himself to effect the unification only by peaceful means and with the consent of all the republics. In March 1884 he called a meeting of five delegates from each republic, but Costa Rica and Nicaragua still held back. Finally, on 28 Feb. 1885, he with his assembly, issued a decree proclaiming the union of the five states, relying on Honduras and Salvador to help him put down resistance in the others. But the president of Salvador refused to employ force, and on Barrios persisting, joined Nicaragua and Costa Rica in a league to resist him, appealing to Mexico and the United States for help. President Diaz of Mexico remonstrated with Barrios, and the United States viewed the movement with disfavor; but on the Salvador troops, which expected Mexican help, invading Guatemala, Barrios drove them back into Salvador, and while entering Chalchuapa was struck down by a sharpshooter's bullet. His widow removed to New York, and his son became a cadet in the United States army.

Bar'rister, in England, an advocate or pleader, who has been admitted by one of the Inns of Court, namely, the Inner Temple, Middle Temple, Lincoln's Inn, or Gray's Inn, to plead at the bar. Before a student can be admitted to the bar he must have been a member of one of those societies, and have kept 12 terms there by dining sufficiently often in the hall of the society to which he belongs, and must also pass a public examination. The examinations, which had dwindled into mere forms, have in recent years been made more stringent. Barristers are sometimes called utter or outer barristers, to distinguish them from queen's (or king's) counsel, who sit within the bar in the courts, and are distinguished by a silk gown. Barristers are also spoken of as counsel, as in the phrase opinion of counsel, that is, a written opinion obtained from a barrister before whom the facts of a case have been laid. The duties of a barrister are honorary, and he can maintain no action for his fees. It is the barristers who speak before all the higher courts, being instructed in regard to the facts of the case they have in hand by means of the brief which they receive from the solicitor engaging their services. In the United States there is no distinct order of counsel corresponding to the English barrister, the same person performing the duties of attorney, solicitor, counsel, or advocate. See also ADVOCATE.

Barron, James, American naval officer: b. Virginia, 1769; d. 21 April 1851. He entered the navy in 1798, and commanded the Chesapeake in 1807, when it was attacked by the British ship Leopard as a result of his refusal to allow the Chesapeake to be searched for deserters. The Chesapeake, which was quite unprepared, discharged one gun previous to striking her colors. She was captured and three alleged deserters were found. Barron was court-martialed for neglect of duty, though only partially to blame for the surrender of his vessel, and suspended for five years. The court closed its finding on the subject of the personal conduct of the accused, in the following language: «No transposition of the specifications, or any other modification of the charges themselves, would alter the opinion of the court as to the firmness and courage of the accused; the evidence on this point is clear and satisfactory.» Such was the fate of Commodore Barron, but it is more than probable that under the state of public feeling, demanding a victim, those who were really responsible for the efficiency of the Chesapeake, escaped unpunished. Upon his restoration, as the outcome of a long correspondence with his personal enemy, Commodore Decatur, a duel was fought and Decatur was killed. Barron became senior officer in the navy in 1839, though never again in active service and never regained full public esteem. See CHESAPEAKE AND LEOPARD.

Barron, Samuel, American naval officer: b. Hampton, Va., 1763; d. 29 Oct. 1810. In 1805 he commanded a squadron of 10 vessels in the expedition against Tripoli. On his return to the United States he was appointed commandant of the Gosport Navy Yard, but died immediately afterward.

Barros, bär-rōs, **Arana Diego,** Chilean scholar and historian: b. Santiago, 16 Aug. 1830. Ill health obliging him to give up legal studies, he early devoted himself entirely to historical and literary pursuits, and soon became an authority on the history of his native country. The favor with which his historical sketch of the campaigns of 1818–21 was received encouraged him to begin an extensive 'History of Chilean Independence' (1854–8). He spent several years investigating the government archives and private libraries of South America and Europe in search of material bearing on the history of South America. His chief works in addition to the above are: 'Vida y Viajes de Hernando de Magallanes' (1864); 'Histoire de la Guerre du Pacifique' (1881), written by order of the government; and his monumental 'Historia General de Chile' (12 vols. 1884–93). In Simancas he discovered the manuscript of the 'Purén Indomito,' an historical poem on the Araucanian war, and published an edition of it at Leipsic in 1860.

Barros, João de, eminent Portuguese historian: b. Viseu, 1496; d. Pombal, 1570. His first work, an historical romance, entitled the 'Emperor Clarimond,' appeared in 1520. Barros presented it to the king, who urged him to undertake the history of the Portuguese in India, which was issued 1552–62. King John III. appointed Barros governor of the Portuguese settlements in Guinea, and afterward general agent for these colonies. In 1530 he presented Barros with the province of Maranham in Brazil for the purpose of colonization. Barros lost a great part of his fortune by the enterprise, and returned the province to the king, who indemnified him for his losses. His work 'L'Azia Portugueza,' is much admired for its style and erudition. He wrote besides a moral dialogue, 'Rhopicancuma,' in which he shows the pernicious consequences of accommodating principles to circumstances; but this work was prohibited by the Inquisition. He wrote also a dialogue on false modesty, and a Portuguese grammar, the first ever published.

Barro'sa, or **Borosa,** a village in Spain, near the southwest coast of Andalusia, 16 miles south-southeast of Cadiz. On a knoll to the east of it a battle was fought in 1811, in which the British under Gen. Graham, when abandoned by the Spaniards, defeated a superior

French force under Victor. No decisive results were obtained from the battle, however.

Barrot, bą-rō', **Camille Hyacinthe Odilon,** French statesman: b. Villefort, Lozère, 19 July 1791; d. Bougival, near Paris, 6 Aug. 1873. At 19 he pleaded before the ordinary tribunals, and at 23, by a special dispensation, before the Court of Cassation, Paris, and early acquired a high reputation for eloquence. In the political arena his oratory soon made him one of the most influential leaders of the liberal opposition. He became president of the "Aide-toi" Society in 1830, and at the July revolution in that year was one of three commissioners appointed to conduct the dethroned Charles X. to Cherbourg, on his way to England. Returning he was appointed prefect of the department of the Seine and member of the Council of State, but in a few months resigned his offices to lead the opposition to Casimir Périer and the reactionary ministers who followed him. He supported Thiers from his accession to office in March 1840, to his fall in October, when he resumed his opposition to the ministry of Guizot. He took a conspicuous part in the reform movement of 1847, and spoke eloquently at several of the provincial reform banquets which led to the revolution of February 1848. Made president by Thiers in his short-lived ministry, he advised the king to withdraw his troops and thus remove the last obstacle to the downfall of his throne. In the last sitting of the Chamber of Deputies he supported the claim of the Count de Paris to the throne and the regency of the Duchess of Orleans. The February revolution considerably abated his ardor for public liberty. He held office for some time under the presidency of Louis Napoleon, but retired from active political life after the *coup d'état,* 2 Dec. 1851, and accepted no office under the Second Empire. In July 1872 he was made a councilor of state and vice-president of the council, 6 Aug. 1873. His 'Mémoires Posthumes' appeared at Paris (1875-6).

Barrow, Frances Elizabeth, American author: b. Charleston, S. C., 22 Feb. 1822; d. 7 May 1894. She was educated in New York, where she was married to James Barrow. She wrote, under the name of Aunt Fanny, numerous books for children; among them 'Six Nightcaps,' which has been translated into French, German, and Swedish. Another, 'The Letter G' (1864), was widely known and very popular. She also wrote a novel, 'The Wife's Stratagem.'

Barrow, or **Borrowe, Henry,** English ecclesiastical reformer, often considered as one of the founders of Congregationalism: d. 1593. He was a member of Gray's Inn, London, in 1576 and there became interested in the writings of Thomas Browne, the founder of the Brownists. On account of his advocacy of Church reform he was imprisoned and with his co-reformer, Greenwood, was hanged at Tyburn. He was the author of 'Brief Discourse of the False Church' (1590). See Dexter, 'Congregationalism of the Last Three Hundred Years' (1880).

Barrow, Isaac, eminent English mathematician and theologian: b. London, 1630; d. May 1677. At the Charterhouse, where he was educated, he was chiefly remarkable for fighting and neglect of study, but being removed to a school at Felsted, in Essex, he began to show some earnest of his future great reputation. He was subsequently entered a pensioner of Trinity College, Cambridge, in 1645, of which he was chosen a scholar in 1647. The ejection of his uncle, the Bishop of St. Asaph, from his fellowship of Peterhouse, in consequence of his adherence to the royal party, and the great losses sustained by his father in the same cause, left him largely unprovided for. His good disposition and great attainments, however, so won upon his superiors that, although he refused to subscribe to the Covenant, he was very highly regarded. Finding that opinions in church and state opposite to his own now prevailed, he proceeded some length in the study of anatomy, botany, and chemistry, with a view to the medical profession. He, however, changed his mind, and to the study of divinity joined that of mathematics and astronomy. In 1652 he graduated M.A. at Oxford, and being disappointed in his endeavor to obtain the Greek professorship at Cambridge, engaged in a scheme of foreign travel. He set out in 1655, and during his absence his first work, an edition of Euclid's 'Elements,' was published at Cambridge. He visited France and Italy, where he embarked for Smyrna, and from Smyrna he proceeded to Constantinople, returning in 1659 by way of Germany and Holland, and was soon after episcopally ordained by Bishop Brownrigg. In 1660 he was elected Greek professor at the University of Cambridge, without a competitor. The following year he received the degree of B.D. He was in 1662 chosen professor of geometry in Gresham College, and in 1663 the Royal Society elected him a member of that body in the first choice after their incorporation. The same year he was appointed the first Lucasian professor of mathematics at Cambridge, on which occasion he delivered an excellent prefatory lecture on the utility of mathematical science. In 1669, on a conscientious principle of duty, he determined to give up mathematics and adhere exclusively to divinity. Accordingly, after publishing his celebrated 'Lectiones Opticæ,' he resigned his chair to the great Newton. In 1670 he was created D.D. by mandate, and in 1672 the king nominated him to the mastership of Trinity College, observing that he had bestowed it on the best scholar in England. He had before this refused a living, given him with a view to secure his services as a tutor to the son of the gentleman who had it to bestow, because he deemed such a contract simoniacal; and he now, with similar conscientiousness, had a clause in his patent of master allowing him to marry, erased, because incompatible with the intentions of the founder. In 1675 he was chosen vice-chancellor of the University of Cambridge; but the credit and utility expected from his labors were frustrated by his untimely death.

The works of Barrow, both mathematical and theological, are of the highest class. Of the former the following are the principal: 'Euclidis Elementa' (1655); 'Euclidis Data' (1657); 'Lectiones Opticæ' (1669); 'Lectiones Geometricæ' (1670); 'Archimedis Opera' (1675); 'Apollonii Conicorum, lib. iv.'; 'Theodosii Sphericorum, lib. iii., novo methodo illustrata et succincte demonstrata' (1675); 'Lectio in qua Theoremata Archimedis de Sphæra et

Cylindro per Methodum Indivisibilium Investigata, etc.' (1678); 'Mathematicæ Lectiones' (1683). All his English works are theological; they were left in manuscript, and published by Dr. Tillotson (1685). 'Isaaci Barrow Opuscula' appeared in 1697. As a mathematician, especially in the higher geometry, Barrow was deemed inferior only to Newton; as a divine he was singularly distinguished for depth and copiousness of thought. A fine specimen of his characteristic copiousness is quoted by Addison from his sermon on 'Vain and Idle Talking,' in which the various forms and guises of wit, —a faculty for which Dr. Barrow was himself celebrated,— are enumerated with a felicity of expression which it would be difficult to parallel.

Barrow, Sir John, eminent English traveler and geographer: b. near Ulverstone, Lancashire, 1764; d. 23 Nov. 1848. When 14 years old he entered an iron foundry in Liverpool as clerk and overlooker. Two years afterward he gave up this situation and made a voyage in a whaler to Greenland. He was subsequently employed as a teacher of mathematics in a school at Greenwich, and in that capacity attracted the attention of Sir George Staunton, who appointed him nominally comptroller of the household to Lord Macartney in his embassy to China in 1792, though his real employment was to take charge of the philosophical instruments carried out as presents to the Chinese emperor. Of this journey he afterward published an account under the title of 'Travels in China' (1804). On Lord Macartney being appointed governor of the Cape of Good Hope in 1797, he made Mr. Barrow his private secretary; and on quitting the Cape in 1798 left him auditor-general of public accounts. During his residence there he made several journeys into the interior of South Africa, and on his return to England published an account of them under the title of 'Travels in Southern Africa.' In 1804 Barrow was appointed second secretary to the admiralty. The duties of this post he discharged with the most exemplary industry and activity, and he took an ardent interest in promoting geographical and scientific discovery, and more especially the expeditions to the Arctic Seas. His leisure hours were employed in literary work, and the numerous volumes published by him attest the profitable use he made of his time. These include, in addition to the books of travel already mentioned, the 'Life of Earl Macartney' 'Life of Lord Anson'; 'Life of Lord Howe'; 'Voyages of Discovery and Research within the Arctic Regions'; Autobiographical Memoir' (1847) 'Sketches of the Royal Society.' In 1835 he was created a baronet, and in 1845 retired from his office at the admiralty. He originated the Royal Geographical Society in 1830 and was its vice-president at the time of his death. Barrow Strait, Cape Barrow, and Point Barrow, in the Arctic regions, were named in his honor.

Barrow, a navigable river of Ireland, province of Leinster. Its course is generally southward, and after about 900 miles it joins the Suir to form the estuary called Waterford Harbor. It is navigable for vessels of 200 tons to New Ross, 25 miles from the sea, and for barges to Athy in Kildare County, where it is joined by a branch of the Grand Canal.

Barrow, Cape or **Point,** a term applied to three prominent localities of the Arctic region, in honor of Sir John Barrow. (1) Point Barrow, on the north coast of Alaska, in lat. 71° 23′ N., and lon. 156° 31′ W., long considered as the most northerly spot on the American mainland. (2) Cape Barrow, on the coast of Canada, or Coronation Gulf, is in lat. 68° N., lon. 111° W. (3) Barrow Strait, the earliest of Parry's discoveries, leading to the west out of Lancaster Sound, which Parry's immediate predecessor, Captain, afterward Sir John Ross, had pronounced to be landlocked in that direction. Besides its main course to Melville Sound, Barrow Strait throws off Prince Regent's Inlet to the south and Wellington Channel to the north. The passage averages about 50 miles in breadth, extending nearly along the parallel of 74° N., from 85° to 100° W.

Barrow, an artificial mound or tumulus of stones or earth, piled up over the remains of the dead. Such erections were frequently made in ancient times in our own land, and they are met with also in many other countries both in the Old and New World. In Scotland they are called cairns. When opened they are often found to contain stone cysts, calcined bones, etc. Burial in barrows, commencing amid the mists of remote antiquity, seems to have been practised as late as the 8th century A.D. One of the finest barrows in the world is Silbury Hill, Wiltshire, near Marlborough. It is 170 feet in perpendicular height, 316 along the slope, and covers about five acres of ground. See also Mound Builders.

Barrow-in-Furness, an English seaport, and county borough, in the district of Furness, situated opposite to and including the island of Walney, Lancashire. In 1848 or 1849 it was but a hamlet with 100 inhabitants, whose chief support was fishing; in 1901 its population was 57,584. This extraordinary prosperity is due to the working of the rich mines of red hematite iron-ore which abounds in the district, and to the extension of the railway to Barrow, by which its excellent natural position and capabilities of development as a seaport have been taken advantage of. There are now four docks completed, and the depth of water is sufficient to admit the largest ships at present afloat. Much timber is imported from the north of Europe and from Canada and Norway, large numbers of cattle are brought from Belfast, and an extensive trade is done in grain and flour. Iron-ore and pig-iron are largely shipped from the port. There is a large passenger traffic with the Isle of Man and Belfast. The chief industrial occupations are the manufacture of iron and Bessemer steel, ship-building, iron-founding, and the making of ropes, sails, bricks, and large jute-works, paper-pulp works, and salt-works have been established. Barrow owes a great deal of its prosperity to the discovery of the Bessemer process of steel-making, and to the fact that the hematite ores of the district are specially adapted to this process. The yearly output of pig-iron is said to be 350,000 tons, with 200,000 tons of Bessemer and Siemens-Martin steel. Messrs. Vickers, Sons, and Maxim, Limited, employ some 8,000 persons, and have built some of the largest merchant and war-vessels afloat. They also manufacture ordnance. The **town** is laid out on a regular

plan, mostly in rectangles, is substantially built, and well drained and supplied with gas, water, and electricity. It contains churches, chapels, and schools for the various denominations, a free public library, workmen's institute, and a town-hall, built at a cost of over £60,000. The Redistribution Act of 1885 erected it into a parliamentary borough, returning one member. The interesting ruins of Furness Abbey, which was founded in 1127, lie within two miles of the town.

Barrows, Elijah Porter, American clergyman and educator: b. Mansfield, Conn., 1807; d. 1888. He was professor of sacred literature in Western Reserve College, Ohio, 1837–52, and of Hebrew in Andover Theological Seminary, 1853–66. In 1872 he became professor of Hebrew at Oberlin College, Ohio. Beside many contributions to the 'Bibliotheca Sacra,' he published 'Companion to the Bible' (1867); 'Sacred Geography and Antiquities' (1872); 'Manners and Customs of the Jews' (1884).

Barrows, John Henry, American educator: b. Medina, Mich., 11 July 1847; d. Oberlin, Ohio, 3 June 1902. He was graduated at Olivet College in 1867; subsequently studied in Yale College, Union and Andover Theological Seminaries, and at Göttingen; was pastor of the First Presbyterian Church, in Chicago, for 14 years; organized and was president of the World's Parliament of Religions, at the World's Columbian Exposition in Chicago, in 1893. He delivered a course of lectures on Christianity in the principal universities in India, under the patronage of the University of Chicago, 1896–7, and became president of Oberlin College in 1898. He published 'The Gospels are True Histories' (1891); 'Life of Henry Ward Beecher' (1893); 'Christianity the World Religion'; 'The World Pilgrimage'; 'History of the Parliament of Religions' (1893); 'The Christian Conquest of Asia,' (1899).

Barrows, Samuel June, American clergyman and author: b. New York, 26 May 1845. After a varied early career he became private secretary to William H. Seward in 1867, went to Utah in 1870 with Chaplain Newman of the United States Senate, and reported the debate with the Mormons. He was graduated at Harvard Divinity School in 1875, and while an undergraduate accompanied as correspondent of the New York *Tribune* Gen. Stanley's Yellowstone expedition in 1873, and Gen. Custer's Black Hills expedition in 1874, taking part in the battle of the Big Horn. He was pastor of the First Unitarian Church, Dorchester, Mass., 1876–81; editor of the *Christian Register* (1881–97); secretary of the United States delegation to the International Prison Congress, Paris, 1895; and United States representative on the International Prison Commission, 1896. In 1897 he was elected to Congress from the 10th Massachusetts district. He has written 'The Doom of the Majority of Mankind' (1883); 'Shaybacks in Camp'; 'Crimes and Misdemeanors in the United States'; 'A Baptist Meeting House'; 'Isles and Shrines of Greece' (1898).

Barrundia, bär-roon'dē-ą, **José Francisco,** Central American statesman: b. Guatemala, 1779; d. New York, 4 Aug. 1854. He was sentenced to death for treason in 1813, but escaped, and became leader of the Revolutionary Party, in 1819. In 1823–4, as a member of the Constitutional Convention of Central America, he brought forward the decree for the abolition of slavery. He became president of the Central American Republic in 1829; retaining office for over a year, and in 1852 was again elected president. He came to the United States in 1854, as minister from Honduras, to propose the annexation of that territory to the United States, but died suddenly before anything was accomplished.

Barry, Alfred, English prelate: b. London, 15 Jan. 1826. He was a son of the architect Sir Charles Barry, and was educated at Cambridge. He was headmaster of Leeds grammar-school, 1854–62; principal of Cheltenham College, 1862–8, and of King's College, London, 1868–83. He was canon of Worcester, 1871–81, of Westminster 1881–4. He became primate of Australia and bishop of Sydney in 1884, but resigned his see in 1889 and returning to England was rector of St. James, Piccadilly, London, 1895–1900. He has published 'Introduction to the Old Testament' (1850); 'Life of Sir C. Barry' (1867); 'Boyle Lectures' (1876–8); 'Christianity and Socialism' (1891); 'England's Mission to India' (1894); 'Hulsean Lectures' (1895).

Barry, Ann Spranger, English actress: b. Bath, 1734; d. London, 1801. She was several times married. Her first great success was in the character of Cordelia, at Drury Lane, London (1767). Her farewell was as Lady Randolph, at Covent Garden (1797). Equal to Mrs. Woffington and Mrs. Cibber in tragedy, she surpassed them both in comedy. As Desdemona she had, during her whole career, no competitor. She is buried in Westminster Abbey.

Barry, Sir Charles, distinguished English architect: b. London, 23 May 1795; d. May 1860. At a very early age he displayed a taste for drawing and design, and while a youth, exhibited at the Royal Academy. Having resolved to devote his energies to architecture, he employed the little property left him in visiting Italy, Greece, and the East. He left England in 1817, and remained abroad upward of three years. After his return he entered on his professional career. He executed numerous important buildings, such as the Traveler's and Reform Club-houses, London; St. Edward's School, Birmingham, etc.; and in 1836 was appointed architect of the new Houses of Parliament at Westminster. On this building his fame as an architect rests, and with its execution he was employed almost unintermittently to the day of his death, extending over a period of more than 24 years. In 1852 he received the honor of knighthood. He had been admitted a Royal Academician in 1841. As an architect he belonged to the eclectic school, and adopted indifferently the Gothic or classic styles according as he might be required or circumstances rendered it expedient.

Barry, Edward Middleton, English architect, son of Sir Charles Barry: b. 1830; d. 1880. He had already distinguished himself in his profession, and succeeding to his father's business, completed his great work the Houses of Parliament. He designed a large number of buildings, many of them of national magnitude and importance, such as the Covent Garden Theatre, the opera house at Malta, and the New

National Gallery in London. He was elected a Royal Academician in 1869, and in 1873 succeeded Sir G. G. Scott as professor of architecture to the Academy.

Barry, Elizabeth, English actress: b. 1658; d. London, 7 Nov. 1713. She was said to be the daughter of Col. Barry, a prominent royalist in the civil war. She made her debut on the stage under the patronage of the Earl of Rochester; and her first performance is said to have been witnessed by Charles II. and the Duke and Duchess of York. Her reputation was won chiefly in the line of tragedy, in the roles of Monimia and Belvidera. She was known as «the great Mrs. Barry»; and is said to have created over 100 roles. See Galt, 'Lives of the Players' (1831).

Barry, James, Irish painter and writer on his art: b. Cork, 11 Oct. 1741; d. 12 Feb. 1806. By one of his first paintings in oil, 'The Conversion of St. Patrick,' exhibited at Dublin, he attracted the attention of Burke, who carried him, in his 23d year, to London. The brothers Burke provided him with the means for visiting Paris and Rome, whence he went to Florence, Bologna, and Naples. He remained about four years in Italy, returning in 1770. Having exhibited some important pictures he was elected an associate of the Royal Academy in 1772, and a full academician the following year. In 1777–83 he executed his chief work, the paintings which adorn the great hall of the Society of Arts. In 1775 he published 'An Inquiry into the Real or Imaginary Obstructions to the Increase of the Arts in England.' He was appointed professor of painting to the Academy in 1782; but in 1799, after he had alienated the respect of his fellow-academicians by his peculiar manners, and by his savage attacks upon them, he was expelled on the occasion of a violent pamphlet issued by him under the title of a 'Letter to the Society of Dilettanti.' He was distinguished more by vigor of conception than by accuracy of execution, and his paintings have not maintained their reputation.

Barry, John, the first American commodore: b. Wexford, Ireland, 1745; d. Philadelphia, 13 Sept. 1803. He early displayed a great partiality for the sea, and at the age of 11 adopted America as his home, and made a number of voyages in merchant ships, until the commencement of the Revolution. He at once embraced the cause of the colonies, offered his services, and was one of the first officers commissioned by Congress in the naval service. After a successful cruise in the Lexington, he was transferred, in the latter part of 1776, to the Effingham, one of three large frigates built in Philadelphia. When the American vessels of war were lying near Whitehill, whither they had been sent when the city and the forts of the river had fallen into the power of the British, Commodore Barry conceived the daring plan of annoying the enemy by means of small boats, properly armed, which being stationed down the river and bay might intercept supplies, and in case of danger take refuge in the creeks. He accordingly manned the boats of the frigates, descended the river with muffled oars under cover of the night, and appeared unexpectedly before the city. He effected his object by intercepting a large stock of provisions, and capturing several vessels laden with military munitions and valuable stores for the British officers. He was afterward transferred to the Alliance, a frigate of 36 guns, which was placed under his orders. 25 December 1781 the Alliance sailed from Boston with the Marquis de la Fayette and Count de Noailles on board, who were proceeding to France on public business. During the rest of the war Barry served with credit to himself and benefit to his country, and after the cessation of hostilities, was appointed to superintend the building of the frigate United States in Philadelphia, which was designed for his command. He retained the command of the United States until she was laid up in ordinary.

Barry, John Arthur, Australian journalist: b. 1850. He led a roving life for many years, but finally settled in Sydney, N. S. W. His writings include: 'Steve Brown's Bunyip' (1893); 'The Great Deep' (1895); 'The Lack of the Native Born' (1898); 'A Son of the Sea' (1899); 'Against the Tides of Fate' (1899); 'Old and New Sydney' (1901); 'Red Lion and Blue Star' (1902).

Barry, John Daniel, American novelist: b. Boston, Mass., 31 Dec. 1866. He has written 'A Daughter of Thespis'; 'The Intriguers'; 'Mademoiselle Blanche'; 'The Princess Margarethe, a Fairy Tale'; etc.

Barry, Sir John Wolfe, English engineer of eminence, youngest son of Sir Charles Barry: b. London, 7 Dec. 1836. He built the present Blackfriars Bridge in London, the Tower Bridge, the Barry Dock at Cardiff, and planned the railway in Argentina from Buenos Ayres to San Rosario. He has published 'Railway Appliances' (1876); 'Lectures on Railways and Locomotives' (1882); 'The Tower Bridge' (1894).

Barry, Martin, English physiologist: b. Fratton, Hampshire, 1802; d. Beecles, Suffolk, April 1855. He studied at the medical schools of London, and at several on the Continent, and took his degree of M.D. in Edinburgh, in 1833. He wrote much on physiological subjects, and especially on animal development and embryology. He was elected a member of the Royal Society in 1840. In 1844 he was appointed house-surgeon to the Royal Maternity Hospital, Edinburgh. His means being ample, he gave his professional services largely to the poor.

Barry, Patrick, American horticulturist: b. near Belfast, Ireland, May 1816; d. Rochester, N. Y., 23 June 1890. He came to the United States at 20 and settled at Rochester in 1840. He was a member of the nursery firm of Elwanger & Barry. He published a much valued work called 'The Fruit Garden,' and at various times edited the 'Horticulturist' and the Genesee *Farmer*.

Barry, Spranger, Irish actor, the great rival of Garrick: b. Dublin, 1719; d. London, 1777. He was brought up as a silversmith; but was attracted to the stage. He first appeared (1744) at the Theatre Royal, Smock Alley, Dublin; and in 1746 was engaged at Drury Lane, London, as alternate to Garrick, in 'Hamlet' and 'Macbeth.' Having aroused Garrick's jealousy by his success as Romeo, he was engaged (1749) at Covent Garden, where his supremacy in 'Romeo and Juliet' was generally

conceded. He spent 1754–66 trying to found a theatre at Dublin. In 1767 he reappeared at London in the part of Othello. From 1774 till his death he acted at Covent Garden. He is buried in Westminster Abbey.

Barry, Thomas Henry, American soldier: b. New York, 13 Oct. 1855. He graduated at West Point, 1877, and passed through the various grades of the service to his appointment as brigadier-general, United States volunteers, 18 June 1900. From August 1898 to February 1900 he was adjutant-general of the 8th army corps in the Philippines, and became chief of staff, Division of the Philippines, 1900–1, and became Brigadier-General 18 Aug. 1903.

Barry, William Farquhar, American military officer: b. New York, 18 Aug. 1818; d. 18 July 1879. He first saw actice service in the Florida war (1852–3), and in the Mexican war acted as aide-de-camp to Gen. Worth. At the outbreak of the Civil War he was made chief of artillery, and organized the artillery of the Army of the Potomac. He subsequently became chief of artillery to Sherman, and took part in the march to the sea. In 1865 he was brevetted major-general. In 1867 he had charge of the Artillery School at Fort Monroe. He was part author with J. G. Barnard of 'Engineer and Artillery Operations of the Army of the Potomac, 1861–2,' and of 'Tactics for the Field Artillery of the United States.'

Barry, William Francis, English Roman Catholic priest, theologian, and novelist: b. London, 21 April 1849. He was educated at Oscott and the English College, Rome; was professor of philosophy at Birmingham Theological College, 1873–7; professor of divinity at Oscott, 1877–80; and has been rector of a parish in Dorchester, Oxfordshire, from 1883. Besides writing much on metaphysical themes in English reviews, he is the author of several brilliant novels, including: 'The New Antigone' (1887); 'The Place of Dreams' (1894); 'The Two Standards' (1898); 'Arden Massiter' (1900); 'The Wizard's Knot' (1901); 'Ernest Renan' (1905). He has also published 'The Papal Monarchy' (1902).

Barry, William Taylor, American statesman: b. Lunenburg, Va., 5 Feb. 1784; d. Liverpool, England, 30 Aug. 1835. He graduated at William and Mary College (1803), and was soon after admitted to the bar. In 1810 he became a member of Congress from Kentucky. He served in the War of 1812; and from 1814–16 was United States senator from Kentucky. In 1828 he was appointed postmaster-general under Jackson; and was on his way abroad as minister to Spain at the time of his death. He was the first postmaster-general who had a seat in the Cabinet.

Barry Cornwall. See PROCTER, BRYAN WALLER.

Barry, a seaport and railway terminus of south Wales, county of Glamorgan, seven miles southwest of Cardiff. It has been practically brought into existence by the construction (1884–9) of a dock of 70 acres area here, between Barry Island and the mainland, at a cost of about £850,000, the entrance being between two breakwaters respectively 2,600 and 700 feet in length. Barry possesses churches and chapels, market-hall, public-hall, seamen's institute, etc., and carries on a large export trade in coal. As a municipality it is markedly progressive. Pop. (1901) 27,000.

Barry Lyndon, the best of Thackeray's shorter novels. It was originally written as a serial for 'Fraser's Magazine,' and was published in book form in 1844. It is cast in the form of an autobiography. The hero is an Irish gambler and blackleg, but of audacious courage and of picturesque versatility. He tells his story in a plain matter-of-fact way, without concealment or sophistication, glorying in episodes which would seem shameful to the most rudimentary conscience, and holding himself to be the greatest but most ill used of men.

Barrymore, Maurice, American actor: b. India, 1847; d. Amityville, L. I., 25 March 1905. He was educated at Cambridge. Having gone upon the stage he came to America and made his first appearance in 1875. Since then he has been most of the time in this country, acting as leading man with Modjeska, Mrs. Langtry, Mrs. Bernard Beere, and Olga Nethersole. He has also written several plays, among them 'Nadjeska.'

Bar'sabas, the son of Alpheus, brother of James the Less and of Jude, and one of the candidates nominated for the apostolical office left vacant by the treachery and suicide of Judas. According to tradition he was afterward appointed bishop of Eleutheropolis, a town of Palestine, about 20 miles from Jerusalem, and suffered martydrom. Another Barsabas, surnamed Judas, and supposed to be the brother of the above, is mentioned in the Acts as one of the companions of Paul and Barnabas when they went to preach the gospel at Antioch. He is supposed to have returned to Jerusalem, and died at a very advanced age.

Barsu'ma, or **Barsumas,** Nestorian bishop who flourished in the 5th century. He became bishop of Nisibis and Metropolitan in 435. He established a theological school which sent out many missionaries, and is regarded as the founder of the Nestorian faith in Persia and eastern Asia.

Bartan, bär-tän', a town of Asia Minor, at the junction of the river Bartan and a smaller stream, the former navigable for small vessels entering the Black Sea a few miles below. It is surrounded by a ruinous wall, and consists of about 800 houses, built on two low hills of cretaceous limestone. The houses, on account of the marshy character of the surrounding country, are all built of two stories, only the upper one of which is inhabited. For the same reason the streets are carefully paved with large limestone slabs. It has several mosques, khans, and baths; and carries on an active trade with Constantinople, from which it imports various kinds of merchandise, sending in exchange hemp, fruit, and building-timber. Pop. 4,000.

Bartas, bär-ta, **Guillaume de Salluste du,** French soldier, diplomatist, and man of letters: b. Montfort, 1544; d. 1590 of wounds received at the battle of Ivry. His chief poem, 'The Divine Week,' gives an account of the creation, and is said to have had a considerable influence on Milton's 'Paradise Lost.' Thirty editions of the work passed through the press in six years. Joshua Sylvester (1563–1618) translated

into English 'Du Bartas, His Divine Weeks and Works' (1598). Mrs. Anne Bradstreet, the earliest American woman of letters, was an ardent admirer of his strained pedantic style and modeled her own verse upon it.

Bartenstein, bär'tĕn-stīn, **Treaty of,** a treaty between Prussia and Russia against France, concluded at Bartenstein, Prussia, 26 April 1807, soon after the battle of Eylau. The objects of the alliance were to re-establish Prussia within the limits of 1805; to dissolve the Rhine Confederation; to restore Tyrol and Venice to Austria; to secure the co-operation of England and Sweden; to aggrandize Hanover at the expense of France; to restore the House of Orange; and to obtain from France indemnities to the kings of Sardinia and Naples. The terms of this alliance are chiefly important for their similarity to the terms offered Napoleon at Prague (1813). The town of Bartenstein has manufacturing interests of importance. Pop. (1900) 6,779.

Barter, a term used in commerce and political economy, to express the exchange of one commodity for another, as contrasted with the sale of commodities for money. It is simply a primitive form of exchange carried on in countries in which the use of money has not yet been introduced, or is not prevalent. It was an economic stage through which all communities must have passed. Even yet in many rude countries barter is very common; and European travelers find it convenient to take with them weapons, tools, and ornaments to exchange with the natives for their commodities. In civilized communities barter is a very exceptional thing, having been superseded by the use of money in various forms.

In law, barter, or exchange, as it is now more generally called in law books, is a contract for transferring property, the consideration being some other commodity; or it may be described as a contract for the exchange of two subjects or commodities. It thus differs from sale, which is a contract for the transference of property in consideration of a price in money. See also SALE.

Bartfeld, bärt'fĕlt, a town in Hungary, 156 miles northeast of Budapest, on a rising ground near the banks of the Tepla and Lauka. It is one of the oldest towns in Hungary, and is well built; has several Roman Catholic churches, a Lutheran church and school, a Franciscan monastery, military academy, hospital, theatre, paper-mills, potteries, etc. Some acidulous chalybeate springs and baths, near the town, are much frequented. The trade in wine, hemp, linen cloth, and woolen yarn is considerable. Pop. 5,069.

Barth, bärt, **Auguste,** French Oriental scholar: b. in Strassburg, 22 May 1834. He is a member of the French Institute and his annual reports in 'Revue de l' Historie des Religions' are much esteemed. His most important work is 'Les Religions de l' Inde' (1879; English translation 1882).

Barth, Heinrich, distinguished geographer and African traveler: b. Hamburg, 16 Feb. 1821; d. 25 Nov. 1865. He received his education partly in his native town, and partly at the University of Berlin, and having determined to explore all the countries bordering on the Mediterranean, set out with this intention in the beginning of 1845. After his return in the end of 1847 he wrote an account of his travels, which he published with the title 'Wanderungen durch die Küstenländer des Mittelmeeres' (Berlin, 1849). In less than two years after his return from his first travels he was invited by the English government to join Dr. Overweg in accompanying the expedition that was about to proceed under James Richardson to Central Africa. The expedition having landed at Tripoli in the end of 1849, set out thence for the interior of Africa in February 1850. His explorations, which extended over an area of about 2,000,000 square miles, hitherto almost entirely unknown, were continued for more than five years, in spite of the death both of Richardson and Overweg, and he did not return to Tripoli till the autumn of 1855. The chief geographical results of these travels consist in the light they throw on the true nature of the Desert of Sahara, in showing that the eastern upper branch of the Niger, the Benuwe, is not connected with Lake Chad, and in the determination of the course of the Niger between Say and Timbuctoo. The result of these travels, entitled 'Travels and Discoveries in North and Central Africa,' was published in English (1857–8). Immediately after its publication he set out upon a new series of travels through the countries bordering on the Mediterranean, the last of which occupied the summer of 1865. Besides the works mentioned, he published 'Sammlung und Verarbeitung Central-afrikanischer Vokabularien' (1862–3).

Barth, or **Bart, Jean,** French seaman: b. Dunkirk, 20 Oct. 1650; d. there, 27 April 1702. He was the son of a fisherman, and at an early age evinced a love of adventure, which led him to follow the sea. He desired to enter the royal service, but at this period the lower classes were never commissioned in the French royal navy, and Barth was constrained to take the command of a privateer. In this position opportunities soon occurred for distinguishing himself, and his name became known to Louis XIV., who commissioned him to cruise in the Mediterranean. His bravery soon raised him in the favor of the king, and he was appointed captain of the squadron in 1697. France being now at war with the Dutch, a field was opened of which Barth was not slow to take advantage, and the most unexampled feats of daring soon made him the terror of his enemies. On one occasion, a famine existing in France, Barth recaptured from the Dutch 100 sail of vessels, loaded with grain. At another time when Dunkirk was blockaded, taking advantage of a fog, he sailed through the English and Dutch fleets, and destroyed 86 merchantmen: then making a descent near Newcastle, Northumberland, he destroyed 200 houses, and returned safely with property valued at 500,000 crowns. Barth was rough in manners, and entirely uneducated; indeed, he could with difficulty scrawl his own name; but he was as simple-minded and honest as he was brave. A statue to his memory, by David d'Angers, was erected at Dunkirk in 1845. See Badin, 'Jean Bart' (1867); Landelle, 'Jean Bart et son fils' (1874).

Barth, Paul, German sociologist: b. Baruthe, Silesia, 1 Aug. 1858. He is a professor in the University of Leipsic and in addition to his much-valued 'Philosophie der Ge-

schichte als Sociologie' (1897), is the author of 'Geschichte Philosophie Hegels und die Hegelianer bis auf Marx und Hartmann' (1890); 'Beweggründen des Sittlichen Handelns' (1889); Tiberius Gracchus' (*2* ed. 1893).

Barth, a seaport of Prussia, in the province of Pomerania, northwest of Stralsund. Its chief industries are ship-building and fish curing and packing, and it has also a good trade in grain and wool. Its church dates from the 13th century. Pop. (1900) 7,100.

Barthélemy, bär-tā-l'-me, **Auguste-Marseille,** French poet and politician: b. Marseilles, 1796; d. there, 23 Aug. 1867. Educated at the Jesuit College of Juilly, he went to Paris in 1822, and soon made himself famous by a series of vigorous and pointed political satires in verse, directed against the Bourbons, and full of suggestive regrets for the glories of the empire. In 'Napoleon in Egypt' (1828), and still more in his elegy for Napoleon's son, 'The Son of the Man' (1829), he spoke out his imperialism more boldly, and the latter occasioned his imprisonment on the eve of the revolution of July. His liberation, of course, was immediate; and with his friend Méry, he celebrated the victory of the people in a poem dedicated to the Parisians, entitled 'The Insurrection.' During all the changes which followed, Barthélemy was indefatigable as a brilliant versifier on the political events of the day; though, in his later years, his popularity somewhat declined. He was, from the first, a warm supporter of the second Napoleonic régime. Some of his sayings are memorable, as the oft-quoted "L'homme absurde est celui qui ne change jamais." He died in Marseilles, of which city he was librarian.

Barthélemy, François, Marquis de, French diplomatist: b. Aubagne (Provence), 20 Oct. 1747; d. Paris, 3 April 1830. He was brought up by his uncle, the author of 'Anacharsis'; and the protection of the Duke of Choiseul established him in diplomacy. The Revolution did not hinder his success in life; in 1793 he was minister plenipotentiary to Switzerland. He successively negotiated the Peace of Basel with Prussia, Spain, and the elector of Hesse, the first treaties concluded by the French republic. This won for him an enviable reputation; but he was especially popular among the *Clichyen* or royalist party, by which he was, in 1797, elected member of the directory; consequently on the republican *coup d'état* of the 18th Fructidor, he was ejected from the government, arrested, and transported with Pichegru and Ramel, to Guiana, whence he escaped to the United States. Shortly afterward he was in England, and after the 18th Brumaire was recalled by the first consul, who made him a senator. On the establishment of the Empire he received the title of count and showed great devotion to Napoleon during the course of his prosperity, but as soon as misfortune threatened Barthélemy sided at once with his enemies. He was made a minister of state and a marquis by Louis XVIII. and in 1819 proposed the restriction of the electoral franchise.

Barthélemy, Jean Jacques, French antiquarian: b. Cassis, near Marseilles, 20 Jan. 1716; d. 30 Jan. 1795. He received a good education from the fathers of the oratory at Marseilles, and was about to prepare himself, under the Jesuits, for holy orders; but becoming disgusted with his teachers declined all offers of clerical promotion, and only accepted the title of *abbé,* in order to show that he belonged to this class. He became deeply interested in the study of Oriental languages and antiquities, and his indefatigable industry and acuteness soon enabled him to communicate to the learned new discoveries in this Oriental study, among which the 'Alphabet of Palmyra,' published 1754, holds a principal place. In 1747 he was chosen member of the Academy of Inscriptions at Paris. About this time he became acquainted with the Count Stainville (afterward the minister Choiseul), who was on the point of departing as ambassador for Rome, and invited Barthélemy to accompany him. Having been appointed director of the Cabinet of Medals in 1753, he accepted the offer and went, in 1754, to Rome. He traveled through Italy, collected antiquities, and occupied himself, after his return, with learned works and with the arrangement of the cabinet which had been intrusted to his care, and to which he added a great number of costly and rare medals. Among his works none are so distinguished for learning and beauty of description as the 'Travels of the Younger Anacharsis in Greece,' on which he had labored 30 years, and which was translated into English, German, and other languages. He himself was modest enough to call this an unwieldy compilation, but all the learned men of France and foreign countries received it with the greatest applause. Barthélemy, in his advanced age, resolved to compose a complete catalogue of the Royal Cabinet of Medals, but was interrupted in 1788 by the storms of the Revolution. In 1789 he received a place in the Académie Française. In 1793 he was arrested on a charge of aristocratic leanings, but was soon after set at liberty. When the chief librarian of the national library, the notorious Carra, was executed, 31 Oct. 1793, Barthélemy received the offer of his place but declined it.

Barthélemy-Saint-Hilaire, Jules, French politician and philosopher: b. Paris, 19 Aug. 1805; d. there, 25 Nov. 1895. On completing his studies he received an appointment in the ministry of finance, being at that time also on the staff of the *Globe* newspaper. After the revolution of 1830 he founded a journal called *Bon Sens,* and continued to support the liberal party in the press. In 1834 he became examiner in French literature at the École Polytechnique, and four years later he was appointed to the chair of Greek and Latin philosophy in the Collège de France. He played a part on the side of the moderate party in the revolution of 1848, and was elected to the constituent assembly for Seine-et-Oise. The *coup d'état* of December 1852 caused him to forsake political life for a considerable time and to resign his professorship. From this retirement he emerged in 1869, the year of his election as deputy for the first circumscription of Seine-et-Oise. He was shortly afterward sent to the National Assembly as the representative of that department, and during the troublous times of 1870–1 he was closely associated with M. Thiers. In 1875 he became a life senator, and in the cabinet of M. Jules Ferry, constituted 1880, he was appointed minister of foreign affairs. The chief event of his tenure of this office was the occu-

pation of Tunis. In 1881 he again abandoned public life for study and literary work. His greatest work is his complete French version of Aristotle (1837–93); and among his other writings are 'De la Logique d'Aristote' (1838); 'Des Védas' (1854); 'Du Bouddhisme' (1855); 'Letters on Egypt' (1856); Le Bouddha et sa Religion' (1862); 'Mahomet et le Coran' (1865); 'De la Métaphysique' (1879); 'L'Inde Anglaise' (1887); 'La Philosophie dans les rapports avec les Sciences et la Religion' (1889); 'Etude sur Francis Bacon' (1890); 'Victor Cousin' (1895); and other works on Hindu religions, philosophy, etc.

Barthez, bär-tās, **Paul Joseph,** distinguished French physician: b. Montpellier, 11 Dec. 1734; d. 15 Dec. 1806. He was the founder of a medical school at Montpellier which acquired a reputation throughout all Europe. Later he received high honors at the hands of Napoleon. Among his numerous writings may be specially mentioned the 'Nouvelle Mécanique des Mouvements de l'Homme et des Animaux.'

Bartholdi, Frédéric Auguste, distinguished French sculptor: b. Colmar, Alsace, 2 April 1834; d. Paris, 4 Oct. 1904. While a student in painting under the celebrated Ary Scheffer, he showed a greater bent and aptitude for sculpture, and devoted his energies to this branch of art, exhibiting numerous works at the salons. After the Franco-German War of 1870–71, in which he fought on the staff of Garibaldi, he came into prominence by the gigantic 'Lion of Belfort' carved out of the red rock on the hill which towers over the Alsatian city, and commemorates its celebrated siege and defense. His statue of 'Lafayette Arriving in America,' now in Union Square, New York city, was presented to the metropolis by France as a testimonial of gratitude to Americans for sympathy and service during the Franco-German War. During the days of the Commune when unable to pursue his studio work in Paris, Bartholdi visited the United States, and when arriving in the beautiful harbor of New York, conceived the idea of the colossal statue of 'Liberty Enlightening the World,' erected on one of the islands of the harbor to welcome with its flaming torch all arrivals in the Land of Liberty. On his return to France he divulged his plan, and a body of distinguished Frenchmen formed a society to carry out his project. Bartholdi gave 20 years of devoted effort to the work, personally superintending the raising of the subscription of $400,000 with which the French nation gave the statue to the United States. The donations came mainly from the pence of the poor, requiring enormous attention and detail, and when subscriptions lagged, Bartholdi pledged his own private fortune to defray the running expenses and practically impoverished himself over the work. Patiently overcoming all difficulties and obstacles, he had the satisfaction to see the statue dedicated with imposing ceremonies by President Cleveland 28 Oct. 1886. (See LIBERTY, STATUE OF.) Bartholdi was a prolific sculptor, and among the most notable of his other works are the figures of Washington and Lafayette on the Place des États-Unis in Paris, the Bartholdi fountain of the Botanical Gardens in Washington, the bronze group of the 'Lyre among the Berbers, a Souvenir of the Nile,' exhibited at the Salon of 1857; 'Genius in the Talons of Misery,' Salon of 1859; 'Portrait of General Schramm, the Modern Martyr' (1864); 'Portrait of Laboulaye' (1866); 'The Leisures of Peace' (1868); 'Young Alsatian Grape Grower' (1869); an equestrian statue of Vercingetorix (1870); portraits of Messieurs Erckmann-Chatrian; his well-known 'Curse of Alsace' (1872); and 'Swizerland Assuaging the Sorrows of Strasbourg, Siege of 1870' (1873).

Bartholin, bär'tō-len, **Kasper,** Danish physician: b. Malmo, Sweden, 12 Feb. 1585; d. Soröe, 13 July 1630. He traveled in Germany, France, England, and Italy, and taught medicine at Padua, Wittemberg, and Copenhagen. He was for many years rector of the university of Copenhagen, and his 'Institutiones Anatomical' was a text-book in general use in Europe in the 17th century in various translations.

Bartholin, Thomas, Danish physician, the most distinguished of the sons of the preceding: b. Copenhagen, 20 Oct. 1619; d. 4 Dec. 1680. After traveling throughout Europe, he became professor of anatomy in the University of Copenhagen, and made several discoveries in this science. He revised his father's 'Anatomy' and was a firm believer in Harvey's theory of the circulation of the blood. His son, Kaspar (1654–1704), was a famous anatomist, and his son Thomas (1650–90) was an antiquarian writer whose 'Antiquitatum Danicarum Libri Tres' (1689) is of much value.

Bartholin's Glands (named after their discoverer, Kaspar Bartholin (q.v.), are the vulvo-vaginal glands, two in number, situated inside the vaginal opening. They secrete a mucous secretion and are subject to infection, forming abscesses. See also BARTHOLINITIS; COWPERITIS.

Bartholomew, of the Martyrs, archbishop of Braga in Portugal: b. 1527; d. 1590. He wrote several treatises on spiritual subjects, was an intimate friend of Saint Charles Borromeo, and did for the Church in Portugal what Saint Charles did for religion in Italy. He was one of the most influential members of the Council of Trent, and the enactment of most of the reformatory decrees in that Council was due to his zeal and perseverance. Consult his 'Life' translated by Lady Herbert.

Bartholomew, Edward Sheffield, American sculptor: b. Colchester, Conn., 1822; d. 2 May 1858. He studied in New York and in Rome, where he lived during the latter part of his life. Among his works are 'Blind Homer, Led by His Daughter,' 'Eve,' 'Youth and Old Age,' 'Ganymede,' and 'Evening Star.'

Bartholomew, Saint (son of Tolmai), the apostle, probably the same person as NATHANAEL, mentioned in the Gospel of St. John as an upright Israelite, and one of the first disciples of Jesus. The name «Tholmai» was not a patronymic, but a surname given to the apostle, a common practice, owing to the well-known scarcity of Hebrew family names. He is said to have taught Christianity in the south of Arabia, into which, according to Eusebius, he carried the Gospel of St. Matthew in the Hebrew language. Chrysostom mentions that he preached in Armenia and Asia Minor, and tradition tells that he was flayed alive and crucified head downward. His day is the 24th of August.

Bartholomew, Saint, archbishop of Nakschiwan, "Apostle of Armenia," b. Bologna; d. 1333. Having learned of his missionary zeal, Pope John XXII. consecrated him bishop of Maraga in Armenia. He belonged to the Dominican Order and established a province of the same in Armenia. With the assistance of confreres he translated into Armenian the Psalter, the Missal, the moral tracts of Saint Augustine, and Saint Thomas' four books, 'Contra Gentiles.'

Bartholomew Fair, a celebrated fair formerly held in West Smithfield, London, on Saint Bartholomew's Day, 24 August. It was first established in the reign of Henry I., and was originally devoted mainly to the purposes of business and traffic. It was finally abolished in 1855.

Bartholomew, Saint, one of the Leeward Islands, in the West Indies, 120 miles to the northwest of Guadeloupe, belonging to France (to which it was transferred by Sweden in 1877), about 8 square miles in area, and rising to the height of about 1,000 feet. It produces tobacco, sugar, cotton, indigo, cassava, drugs, etc., with some excellent woods (including lignum vitæ), and limestone. All the fresh water which can be procured is saved in cisterns, as there are no springs. The climate is healthy. The island is encompassed by formidable rocks, which render it dangerous of access to shipping. Pop. 2,835. The only town is Gustavia or Saint Bartholomew. In the South Pacific Ocean are two other islands of the same name.

Bartholomew, Massacre of Saint, the slaughter of French Protestants in Paris and other cities in France on various dates between 24 Aug. and 3 Oct. 1572. After the death of Francis II., Catherine de Medici had assumed the regency for her son, Charles IX., then only 10 years old, and in spite of the opposition of the Guises she issued an edict of toleration in favor of the Protestant party, 1562, which she had favored in many ways. The party of the Guises now persuaded the nation that the Roman Catholic religion was in the greatest danger. Religious dissension grew rife, and each party, Roman Catholic and Huguenot, under pretext of religion, treated the other with cruelty. Prince Condé took up arms; the Guises had recourse to the Spaniards, Condé to the English, for assistance. Both parties were guilty of the most atrocious cruelties, but finally concluded peace. The queen-mother caused the king, who had entered his 14th year, to be declared of age, that she might govern more absolutely under his name. Duke Francis de Guise had been assassinated by a Huguenot, at the siege of Orleans; but his spirit continued in his family, which considered the Admiral Coligny as the author of his murder. The king had been persuaded that the Huguenots had designs on his life, and had conceived an implacable hatred against them. Meanwhile the court endeavored to gain time, in order to seize the persons of the prince and the admiral by stratagem, but was disappointed, and hostilities were renewed in 1565, and still again after the Peace of Lonjumeau, 1568, this time with greater cruelty than ever. In the battle of Jarnac, 1569, Condé was made prisoner and shot by Capt. de Montesquieu. Coligny collected the remains of the routed army; the young Prince Henry de Béarn (afterward Henry IV., king of Navarre and France), the head of the Protestant party after the death of Condé, was appointed commander-in-chief, and Coligny commanded in the name of the Prince Henry de Condé, who swore to avenge the murder of his father. The advantageous offers of peace at St. Germain-en-Laye (8 Aug. 1570) satisfied the chiefs of the Huguenots, particularly Admiral Coligny, who was wearied with civil war. The king appeared to have entirely disengaged himself from the influence of the Guises and his mother; he invited the old Coligny, the support of the Huguenots, to his court, and honored him as a father. The sister of the king was married to the Prince de Béarn (18 Aug. 1572); this union opened up a field for the most distinguished Huguenots in Paris. Meanwhile the queen had allied herself to the Guise family, and jealous of the influence of Coligny with the king, determined to have him assassinated. On 22 August a shot from a window wounded the admiral. The king hastened to visit him, and swore to punish the author of the villainy; but on the same day he was induced by his mother to believe that the admiral had designs on his life. "God's death!" he exclaimed: "kill the admiral; and not only him, but all the Huguenots; let none remain to disturb us!" The following night Catherine held the bloody council which fixed the execution for the night of St. Bartholomew, 24 Aug. 1572. After the assassination of Coligny a bell from the tower of the royal palace, at midnight, gave to the assembled companies of 2,000 burghers the signal for the general massacre of the Huguenots. The Prince of Condé and the king of Navarre saved their lives by choosing mass rather than death, and pretending to embrace the Roman Catholic religion. Roman Catholics as well as Huguenots fell victims to the political and personal hatred of the slayers. By the king's orders the massacre was extended through the whole kingdom; and if, in some provinces, the officers had honor and humanity enough to disobey the orders to butcher their innocent fellow citizens, yet instruments were always found to continue the massacre. This horrible slaughter continued over 40 days; the victims are calculated from 10,000 to 100,000. The Calvinist martyrology cites 786 names; 2,000 is the number computed by late historians. At Rome the massacre was reported as a victory over a great Huguenot conspiracy against the king; it was for this reason the Pope ordered the Te Deum to be chanted and a medal struck commemorating the event. Those of the Huguenots who escaped fled into the mountains and to Rochelle. The Duke of Anjou laid siege to that city, but, during the siege, received the news that the Poles had elected him their king. He concluded a treaty, 6 July 1573, and the king granted to the Huguenots the exercise of their religion in certain towns. See also HUGUENOTS. See Loughnan, 'The Month' (1892).

Bartholomew's Hospital, Saint, formerly the priory of St. Bartholomew, and made a hospital by Henry VIII. in 1547. It contains 676 beds, and, on an average, 6,000 patients are annually admitted to the hospital, while about 100,000 out-patients are relieved by it.

Barthol'omites. See BASILIANS.

Bar'tizan, a battlement on the top of a house or castle; a small overhanging turret projecting from the angle on the top of a tower, or from the parapet or other parts of a building; or, the battlement surrounding a spire or steeple, or the roof of a cathedral or church.

Bartlett, Elisha, American physician and author: b. Smithfield, R. I., 1805; d. there, 18 July 1855. He graduated from the medical department of Brown University in 1826, and delivered the course of lectures on pathological anatomy at the Berkshire medical institute in Pittsfield, Mass., in 1832. In. 1836 or 1837 he was elected the first mayor of Lowell. He subsequently lectured at Dartmouth College, and in Transylvania University and the universities of Maryland and New York. In 1851 he became professor of materia medica and medical jurisprudence in the College of Physicians and Surgeons in New York, which place he held until his death. He published 'Essay on the Philosophy of Medical Science' (1844); 'Fevers of the United States' (1850); and a volume of poems, entitled 'Simple Settings in Verse for Portraits and Pictures in Mr. Dickens' Gallery' (1855).

Bartlett, Edwin Julius, American chemist: b. Hudson, O., 16 Feb. 1851. He was graduated at Dartmouth College in 1872, and at Rush Medical College in 1879; made associate professor of chemistry in Dartmouth in 1879, and full professor in 1883. He is a member of the American Chemical Society, and the New York Medico-Legal Society, and an honorary member of the New Hampshire Medical Society. He is the author of many papers on chemical subjects.

Bartlett, Sir Ellis Ashmead. See ASHMEAD-BARTLETT.

Bartlett, Homer Newton, American composer: b. Olive, N. Y., 28 Dec. 1846. He began his public career when 9 years of age, and at 10 composed violin music, piano duos, songs, and vocal duets. He has written a large number of anthems, quartets, and glees for vocal rendering, and pieces for the flute, stringed instruments, and military bands and orchestras. His best compositions include a three-act opera, 'La Valliere'; a cantata, 'The Last Chieftain'; an oratorio, 'Samuel,' etc.

Bartlett, Ichabod, American lawyer: b. Salisbury, N. H., 1786; d. 19 Oct. 1853. He graduated at Dartmouth College in 1808, commenced the practice of the law in Durham, but soon removed to Portsmouth, where his skill and ability soon commanded success. He is celebrated as an opponent of Webster and Mason. He was frequently a member of the State legislature, and of the United States House of Representatives for three terms, 1823–9.

Bartlett, John, American author and publisher: b. Plymouth, Mass., 14 June 1820; d. Cambridge, Mass., 3 Dec. 1905. He entered the university book-store, became a publisher in Cambridge in 1836, and senior partner in the house of Little, Brown & Company, in 1878. His works include: 'Familiar Quotations' (1854; 9th ed. 1891); 'New Method of Chess Notation' (1857); 'The Shakespeare Phrase-Book' (1882); 'Catalogue of Books on Angling, Including Ichthyology, Pisciculture, etc.' (1882); 'The Complete Concordance to Shakespeare's Dramatic Works' (1894); and 'Poems.'

Bartlett, John R., American naval officer: b. New York, 1843; d. Saint Louis, 22 Nov. 1904. He was appointed an acting midshipman in the navy from Rhode Island in 1859; entered the United States Naval Academy, where he remained till the beginning of the Civil War, when he was assigned to the West Gulf Blockading Squadron. He took part in the bombardment and passage of Forts St. Philip and Jackson, and the Chalmette batteries, and the capture of New Orleans and attack on Vicksburg in June 1862. He was promoted lieutenant in 1864; took part in the bombardment of Fort Fisher in December, and the assault on its works in January. Subsequently he was on surveying duty in Nicaragua and on the United States Coast Survey; was promoted to captain, 1 July 1892; and was retired 12 July 1897. After the declaration of war against Spain, in 1898, he was recalled to active service, and on 9 July succeeded Rear-Admiral Erben as commander of the Auxiliary Naval Squadron, organized for the protection of the Atlantic coast cities.

Bartlett, John Russell, American author: b. Providence, R. I., 23 Oct. 1805; d. 28 May 1886. He was educated for a mercantile career, and after 1837 entered the book-importing trade in New York. In 1850, he was appointed one of the commissioners to determine the Mexican boundary. In 1855 he was made secretary of State of Rhode Island. He published various valuable records, genealogies, local histories, etc., but his best known work is his 'Dictionary of Americanisms' (1850).

Bartlett, John Sherren, Anglo-American journalist, founder of the *Albion* newspaper in New York: b. Dorsetshire, England, 1790; d. 24 Aug. 1863. He was educated as a physician in London; was appointed surgeon in the royal navy in 1812; sailed to the West Indies on board the packet Swallow; was captured by the American frigates President and Congress, under Commodore Rodgers, and remained a prisoner at Boston until discharged in 1813. At the close of the war he married a lady of Boston and established himself there as a physician. The *Albion,* commenced by him in New York, 22 June 1822, as an English organ of conservative politics, gained a wide and profitable circulation. Bartlett subsequently commenced one or two other papers of a similar character at a cheaper price, and on the beginning of Atlantic steam navigation also established at Liverpool the *European,* a weekly compendium of the latest news for American circulation. Owing to the failure of his health, he withdrew from the *Albion* in 1848. He subsequently published the *Anglo-Saxon,* a weekly paper at Boston, which he continued about two years. In 1857 he served as English consul at Baltimore.

Bartlett, Joseph, American wit, poet, and adventurer: b. Plymouth, Mass., 1763; d. Boston, 27 Oct. 1827. He began the study of law at Salem, but soon gave it up for a voyage to England. Here he pursued the career of an adventurer, gambled, spent, got into prison, wrote a play for his release, and went upon the stage himself. From an actor he became a merchant, and having sailed for America with

a large supply of goods on credit, was shipwrecked on Cape Cod. In 1799 he delivered a poem on 'Physiognomy' before the Phi Beta Kappa society of Harvard, satirical and clever, and said to touch upon the traits of individuals at the time. To the edition of this poem, published in 1823, were appended a number of 'Aphorisms on Men, Principles, and Things,' the results of his various experience. The same year he delivered a Fourth of July oration at Boston, and afterward recited a poem, entitled the 'New Vicar of Bray,' which obtained considerable celebrity. He next attempted the practice of law and of politics in Maine, was elected to the State legislature, and nearly secured an election to Congress by his active exertions as a speaker and newspaper writer. He then practised law at Portsmouth, N. H., and finally closed his improvident life, a burden to his friends, at Boston. See Duyckinck's 'Cyclopædia of American Literature.'

Bartlett, Josiah, American statesman: b. Amesbury, Mass., November 1729; d. 19 May 1795. He commenced the practice of medicine in 1750, at Kingston, and established a reputation, during the prevalence of the *angina maligna* in 1754, by treatment with Peruvian bark, in opposition to the usage of other physicians. He received several appointments from the royal governor, John Wentworth, but lost them in 1775, for being a zealous Whig. Being chosen delegate to the Continental Congress, he was the first who voted for, and the first, after the president, who signed the Declaration of Independence, his name being first called as representative of the most easterly province. He accompanied Stark in 1777 to Bennington. He was appointed chief justice of the common pleas in 1779, justice of the supreme court in 1784, and chief justice in 1788. He was an active member of the convention called to adopt the Federal constitution in 1788. In 1790 he was president of New Hampshire, and in 1793 was chosen the first governor under the new State constitution. He was also president of the medical society established in 1791, by his exertions. In all his various offices his duties were ably and faithfully discharged.

Bartlett, Paul Wayland, American sculptor: b. New Haven, Conn., 1865. He entered the École des Beaux Arts, Paris, 1880; became chevalier of the Legion of Honor, 1895. His principal works are: an equestrian statue of Gen. McClellan in Philadelphia; one of Lafayette in Paris (presented to France by the school children of the United States); a statue of Gen. Joseph Warren in Boston; statues of Columbus and Michel Angelo in the Library of Congress, and 'The Bear Tamer,' in the Metropolitan Museum of New York.

Bartlett, Samuel Colcord, American educator: b. Salisbury, N. H., 25 Nov. 1817; d. 16 Nov. 1898. He was educated at Dartmouth College, and became a teacher there and at Andover Theological Seminary. He had charge of a church at Monson, Mass.; subsequently becoming professor of philosophy in Western Reserve University, Ohio. He afterward became pastor of a church in Manchester, N. H., and later of the New England Church in Chicago. In 1858 he was made professor of biblical literature in the Chicago Theological Seminary, where he remained until 1873, when he spent a year of travel in the East. In 1877 he accepted the presidency of Dartmouth College, which he held until 1892, when he resigned. He was the author of a number of works, including: 'From Egypt to Palestine' (1879); 'Sketches of Missions of the American Board'; 'Sources of History in the Pentateuch'; and 'The Veracity of the Hexateuch'; and also wrote a part of the American edition of 'Smith's Dictionary of the Bible.'

Bartlett, William Francis, American military officer: b. Haverhill, Mass., 6 Jan. 1840; d. 17 Dec. 1876. He was a student at Harvard University at the outbreak of the Civil War, but left to enter the army. He was wounded in the battle of Ball's Bluff, suffering the loss of a leg; but continued in the service; was twice wounded at Port Hudson; and in the battles of the Wilderness, while leading the 57th Massachusetts regiment, was again wounded, taken prisoner, and sent to Libby Prison. At the close of the war, he was made a major-general of volunteers for distinguished services in the field.

Bartlett, William Henry, English artist: b. Kentish Town, London, 29 March 1809; d. 25 Sept. 1854. He served an apprenticeship with the distinguished architectural antiquary, John Britton, who employed him to make drawings for his 'Cathedral Antiquities' and 'Picturesque Antiquities of English Cities.' Bartlett subsequently traveled extensively abroad, and the works which he published, descriptive of the countries visited by him, obtained great success with the public. They include 'Walks About Jerusalem' (1844); 'Forty Days in the Desert' (1848); 'The Nile Boat or Glimpses of Egypt' (1849); 'Footsteps of Our Lord and His Apostles in Syria, Greece, and Italy' (1851); 'The Pilgrim Fathers' (1853); 'Jerusalem Revisited' (1855).

Bartlett, William Holmes Chambers, American soldier and scientist: b. Lancaster County, Pennsylvania, 1809; d. 11 Feb. 1893. He was educated at West Point, and as lieutenant of engineers, was assistant professor there, 1827–9. He was engaged on the construction of Fort Munroe and Fort Adams; was assistant engineer at Washington, 1832–4; and again at West Point as assistant professor, 1834–6. When he resigned his lieutenancy in 1836, he was made full professor of philosophy at West Point, and held this position until he retired in 1871. He was a member of the Natural Academy of Sciences and other scientific societies, and wrote several scientific books, including 'Treatise on Optics' (1839); 'Synthetical Mechanics' (1850–8); 'Acoustics and Optics' (1852–9); 'Analytical Mechanics' (1853–9); and 'Spherical Astronomy' (1858–9).

Bartley, Elias Hudson, American chemist: b. Bartleyville, N. J., 6 Dec. 1849. He was graduated at Cornell University in 1873; was an instructor there in 1874–5; professor of chemistry at Swarthmore College, 1875–8; lecturer at the Franklin Institute, Philadelphia, in 1877–8. He removed to Brooklyn in 1879; graduated at Long Island College Hospital in 1879; was lecturer there on physiological and practical chemistry in 1880–5; and then became professor of chemistry and toxicology. He was made chief chemist of the health department of Brooklyn, in 1882. He is the author

of several articles in Wood's 'Household Practice of Medicine' (1885), and of 'A Text-Book of Medical Chemistry.'

Bar'tok, Ludwig von, a Hungarian poet and dramatist: b. 1851. 'Carpathian Songs' includes his happiest verse. As a playwright, he is even more distinguished; the comedy of 'The Most Beautiful' (1880), and the historical tragedy, 'Margareta Kendi,' as well as 'Anna Thuran,' a historical drama, having been frequently acted.

Bartol, Cyrus Augustus, American Unitarian clergyman: b. Freeport, Me., 30 April 1813; d. 17 Dec. 1900. He was graduated at Bowdoin College in 1832, and at Cambridge Divinity School in 1835; became colleague pastor with Dr. Charles Lowell of the West Church (Unitarian),) in Boston, 1837, and full pastor in 1861. He was a member of the Transcendental Club. His works include: 'Discourses on the Christian Spirit and Life' (1850); 'Discourses on Christian Body and Form' (1854); 'Pictures of Europe Framed in Ideas' (1855); 'History of the West Church and Its Ministers' (1858); 'Church and Congregation' (1858); 'Word of the Spirit to the Church' (1859); 'Radical Problems' (1872); 'The Rising Faith' (1874); 'Principles and Portraits' (1880).

Bartoli, bär'tō-lē, **Adolfo,** Italian historian: b. Fivizzano, 19 Nov. 1833; d. 1894. He has long been a recognized arbiter of taste and the elegancies in connection with his country's literature; his 'First Two Centuries of Italian Literature' (1870–80), and 'History of Italian Literature' (1878-89) being masterpieces. In 1874 he became professor of Italian literature in the Institute of Florence.

Bartoli, Daniello, a learned Italian Jesuit: b. Ferrara, 12 Feb. 1608; d. Rome, 13 Jan. 1685. He was the author of a celebrated history of the order of the Jesuits, published at Rome in six volumes (1653–75). Bartoli had access to many curious manuscripts in the Vatican, of which he availed himself. This gives to his work peculiar interest, and portions of it, as for instance that on Asia, passed through several editions. The first edition of 1667 contains also an interesting account of the mission to Mongolia, and a sketch of the life of Father Acquaviva. He also wrote on physics and philology. A new edition of his complete works in 12 volumes appeared at Turin in 1825, and a select edition of the most striking passages at Milan in 1826.

Bartoli, Pietro Santi, sometimes called Perugio, Italian painter and engraver: b. about 1635; d. Rome, 1700. He was a pupil of Nicolas Poussin. His engravings, numbering over 1,000, are scarce and valuable. His skill as a copyist was so great that he could counterfeit the effects of time on the colors of pictures. The 'Admiranda Romanorum Antiquitatem Vestijia,' a collection of engravings much esteemed archæologically, is his most important work.

Bartolini, bär-tō-lē'ne, **Lorenzo,** celebrated Italian sculptor: b. Vernio, 1777; d. Florence, 1850. In his youth he was a pupil of Desmarets, a French painter, and made considerable progress; but the bent of his genius leading him rather to handle the chisel than the brush, he proceeded to Paris and entered the studio of the sculptor Lemot. Napoleon intrusted him with a multitude of works, among others a colossal bust of the emperor placed above the entrance of the French Institute, and a magnificent statue of him, which, in consequence of the events of the restoration, was never delivered to government, and is now in America. On the fall of the empire he returned to Florence, where he continued to exercise his profession. Among his greater works may be mentioned his groups of Charity, and Hercules and Lycas, and the beautiful monument in the cathedral of Lausanne, Switzerland, erected in memory of Lady Stratford Canning, who died there in 1817. Bartolini ranks next to Canova among modern Italian sculptors. See Canova, 'Schools and Masters of Sculpture' (1898).

Bartolommeo, bär-tō-lŏm-mā'ō, **Fra,** or **Baccio Della Porta,** one of the most distinguished of the Florentine painters: b. Savignano, 1469; d. Florence, 1517. He learned in Florence the first principles of painting from Cosimo Roselli, and acquired a more perfect knowledge of art by studying the works of Leonardo da Vinci. He was an admirer and follower of Savonarola, on whose death, in consequence of a vow made during the peril of persecution, he took the Dominican habit in 1500, and assumed the name of Fra Bartolommeo. For the space of four years he did not touch his pencil, and employed it afterward only on devotional subjects. Raphael visited Florence in 1504 and gave instructions to Bartolommeo in perspective, receiving in return his lessons in coloring. Some years afterward the latter visited Michael Angelo and Raphael at Rome. After his return to Florence he executed several religious pictures, among which were a Saint Mark and Saint Sebastian, which are greatly admired. His style is severe and elevated, but very graceful in youthful figures; his coloring, in vigor and brilliancy, comes near to that of Titian and Giorgione. But he particularly excels in drapery, which none before him represented with equal truth, fulness, and ease. His pictures are preserved in the gallery of the Grand-Duke at Florence and in the palace of Pitti. See Jameson, 'Memoirs of the Early Italian Painters' (1887); Symonds, 'The Renaissance in Italy' (1885); Radcliffe, 'Schools and Masters of Painting' (1898); Cartwright, 'The Painters of Florence' (1901).

Bartolozzi, bär-tō-lōt'sę, **Francesco,** a distinguished Italian engraver: b. Florence, 21 Sept. 1728; d. Lisbon, Portugal, April 1813. In Venice, in Florence, and Milan, he etched several pieces on sacred subjects, and then went to London, where he received great encouragement and accommodated himself entirely to the national taste, so as even to work in the popular red dotted manner. His pieces were so universally sought for that a complete collection of them was valued at £1,000. He was elected a member of the Royal Academy of Arts in London. After 40 years' residence in London he went to Lisbon to engrave on copper the portrait of the regent, where he received, in 1807, the order of Christ. With accuracy of design he united great delicacy of execution. Among his best engravings is the 'Death of Lord Chatham,' after Copley, and the 'Virgin and Child.' His works, among which are imitations

in etching of drawings of the great masters, amount to more than 2,000. See Clement, 'Painters, Sculptors, and Engravers' (1899).

Bar'tolus, Osso, or **Bartolus A. Saxofferrato,** a celebrated Italian jurist: b. Sasso Ferrato, in the Marches of Ancona, about 1313; d. Perugia, 1356. He took his degree of doctor of law at Bologna, became professor, first at Pisa, and then at Perugia, was ennobled and honored with other distinction and privileges by the emperor Charles IV., and not only published many important works such as treatises 'On Procedure,' 'On Evidence,' and commentary on the 'Code of Justinian,' but distinguished himself in various other branches of knowledge.

Barton, Andrew, Scottish naval commander, who flourished during the reign of James IV., and belonged to a family which for two generations had produced able and successful seamen. In 1497 he commanded the escort which accompanied Perkin Warbeck from Scotland. After doing considerable damage to English shipping, he was killed in an engagement with two ships which had been especially fitted out against him (1512).

Barton, Benjamin Smith, American naturalist: b. Lancaster, Pa., 10 Feb. 1766; d. Philadelphia, 19 Dec. 1815. He studied the natural sciences and medicine in Philadelphia, Edinburgh, and London, and took his degree at Göttingen. He practised medicine in Philadelphia, and held successively the chairs of botany and natural history, materia medica, and theory and practice of medicine in the university there. He became president of many learned societies, was a correspondent of Humboldt, and, among other works, wrote 'Elements of Botany' (1812–14); 'Collections for an Essay toward a Materia Medica of the United States' (3d ed. 1810); and 'Flora Virginica' (1812).

Barton, Bernard, English poet, often styled the Quaker poet: b. London, 31 Jan. 1784; d. 19 Feb. 1814. In 1806 he removed to Woodbridge, in Suffolk, where he entered into a business in coals and corn; but subsequently gave up this occupation, and in 1810 became clerk in a bank at Woodbridge, a situation which he held till not long before his death. In 1824 a reading society founded by him at Woodbridge presented him with £1,200, and he afterward received a pension of £100 through Sir Robert Peel. His first appearance as an author was in 1812, when he published a small volume of poems under the title of 'Metrical Effusions,' which led to a correspondence with the poet Southey. This was followed in 1818 by 'Poems by an Amateur,' and in 1820 by a volume entitled simply 'Poems,' which became popular, and gained him the friendship of Lamb and Byron. Of his other productions the chief were: 'Napoleon, and other Poems' (1822); 'Poetic Vigils' (1824); 'Devotional Verses' (1826); 'A New-Year's Eve, and other Poems' (1828); besides many contributions to the annuals and magazines. His last work was 'Household Verses' (1845). His daughter, Lucy, published 'Selections from the Poems and Letters of Bernard Barton,' in 1849. His poetry, though deficient in force, is pleasing, fluent, and graceful, animated by a love of nature, and by a pure religious spirit.

Barton, Clara, American philanthropist: b. Oxford, Mass., 1830. She early became a teacher, and founded at Bordentown, N. J., a free school, opening it with six pupils. In 1854 it had grown to 600, when she became a clerk in the patent office in Washington. On the outbreak of the Civil War she resigned her clerkship and became a volunteer nurse in the army hospitals and on the battle-field. In 1864 she was appointed to the charge of the hospitals at the front of the army of the James. She was present at several battles, and in 1865 was placed by President Lincoln in charge of the search for missing men of the Union armies, having already devoted much time to that work at her own expense. On the breaking out of the Franco-Prussian war in 1870, she aided the Grand Duchess of Baden in preparing military hospitals, assisted the Red Cross Society, and, at the request of the authorities, superintended the distribution of work to the poor of Strasburg in 1871, after the siege, and in 1872 did a like work in Paris. At the close of the war she was decorated with the Golden Cross of Baden and the Iron Cross of Germany. On the organization of the American Red Cross Society in 1881 she was made its president, and in that capacity in 1884 had charge of the measures to relieve sufferers from the Mississippi and Ohio floods. In 1883 she was appointed superintendent of the Reformatory Prison for Women at Sherborn, Mass. In 1889 she had charge of movements in behalf of sufferers from the floods at Johnstown, Pa.; in 1892 distributed relief to the Russian famine sufferers; in 1896 personally directed relief measures at the scenes of the Armenian massacres; in 1898, at the request of President McKinley, took relief to the Cuban reconcentrados, and performed field work during the war with Spain; and in 1900 undertook to direct the relief of sufferers at Galveston, but broke down physically. She resigned from the Red Cross Society in 1904. She has published 'History of the Red Cross' (1883); 'History of the Red Cross in Peace and War' (1898).

Barton, David, American legislator: b. probably in Waco County, Ky., 1785; d. Booneville, Mo., 27 Sept. 1837. He was one of the earliest settlers in Missouri; presided over the convention that drew up the State constitution in 1820; and was a United States Senator from that State in 1821–31.

Barton, Elizabeth, English religious impostor (commonly called the Holy Maid of Kent): b. about 1506; d. 20 April 1534. She was used as an instrument by the adherents of Queen Catherine to excite the English nation against the proposed divorce of Henry VIII. from his first wife, and the apprehended separation of the English Church from Rome, with which the king then threatened the Pope. Her delirious utterances, in a nervous illness, were made use of by the parson of Aldington, Richard Maister, and by a canon of Canterbury named Bocking, to persuade her that she was a prophetess inspired by God. Among other things she prophesied that Henry, if he persisted in his purpose of divorce and second marriage, would die a shameful death and be succeeded by Catherine's daughter. Her revelations, published and distributed by the monk

Dering, produced such a fermentation among the people that Henry ordered the apprehension and examination of Elizabeth and her accomplices before the star-chamber. After they had there confessed the imposture they were condemned to make a public confession and to imprisonment; and the Maid, Bocking, Maister, Dering, and three others were afterward adjudged guilty of high treason for a conspiracy against the king, and executed. The venerable Bishop Fisher and Sir Thomas More were among those accused of holding correspondence with the Holy Maid; and the former was pronounced guilty of misprision, or concealment, of treason in consequence.

Barton, George Hunt, American geologist: b. Sudbury, Mass., 8 July 1852. He was assistant on Hawaiian Government survey, 1881–3; assistant in geology in the Massachusetts Institute of Technology in 1883–4; then assistant professor of geology there; he also occupied the corresponding chair in Boston University and the Teachers' School of Science; and was assistant geologist of the United States Geological Survey. In 1896 he was a member of the sixth Peary expedition to Greenland. He is a member of the Boston Society of Natural History, the National Geological Society, and the Geological Society of America, and the author of many technical papers.

Barton, William, American military officer: b. Warren, R. I., 26 May 1748; d. Providence, R. I., 22 Oct. 1831. He joined the Revolutionary army soon after Bunker Hill, and on the night of 10 July 1777, he performed the exploit which made him famous. Leading a small party of men, in four whale-boats, across Narragansett Bay, he surprised and captured the British general, Prescott, at his headquarters, and hurried him away to Washington's camp in New Jersey. Barton received a sword from Congress, and was brevetted colonel. He was afterward a member of the State convention which adopted the Federal Constitution.

Barton, William Paul Crillon, American botanist: b. Philadelphia, Pa., 17 Nov. 1786; d. 29 Feb. 1856, a nephew of Benjamin Smith Barton (q.v.). He was educated at Princeton College, and in the medical school of the University of Pennsylvania; was surgeon in the United States navy and became professor of botany in Jefferson Medical College, in 1815. He was author of 'Flora of North America' (1818–24); 'Vegetable Materia Medica of the United States' (1817–25); 'Compendium Floræ' (1818).

Bartram, John, an eminent American botanist: b. Chester County, Pa., 23 March 1699; d. 22 Sept. 1777. He is frequently called the "father of American botany," and he founded at Kingsessing the first botanical garden in America. Linnæus termed him "the greatest natural botanist in the world." He published 'Observations of the Inhabitants, Climate, Soil, Diverse Productions, Animals, etc., Made in His Travels from Pennsylvania to Lake Ontario,' and a similar volume on eastern Florida (1766). He was in constant correspondence with European botanists, to whom he sent large collections of American plants and would readily undertake a journey of a hundred miles to see a new plant.

Bartram, William, American botanist and ornithologist: b. Kingsessing, Pa., 9 Feb. 1739; d. there 22 July 1823; a son of John Bartram. He spent five years in the southern States studying natural history, and published the results in 'Travels Through North and South Carolina and East and West Florida.' He compiled a list of American birds, which was the best of its kind up to the time of Wilson.

Bartsch, bärtsh, **Adam von,** Austrian engraver and art writer: b. Vienna, 17 Aug. 1757; d. there, 21 Aug. 1821. At the age of 16 he brought himself into the notice of the Austrian government by a series of engravings of the gold and silver medals issued during the reign of Maria Theresa, and, in 1781, was appointed keeper of the prints of the royal collection. In 1803 he produced the first volume of his well-known and authoritative work, 'Le Peintre-Graveur,' in 21 volumes, giving a description of the principal engravers of Europe, and criticisms on their works. He etched upward of 500 pieces, and published several catalogues of works of art.

Bartsch, Karl Friedrich Adolf Konrad, German philologist: b. Sprottan, Silesia, 25 Feb. 1832; d. 19 Feb. 1888. He was professor at Rostock, where he established the earliest Germanic seminary in Germany, 1858–71; and for the remainder of his life was head of the department of German and Romance philology at the University of Heidelberg. He was an extremely brilliant, versatile, industrious scholar whose attention was chiefly given to Middle High German and Provençal poetry, and was an original poet also, publishing a volume of lyrics in 1874. Beside an important study of the 'Nibelungenlied' (1865), he published 'The Song of Roland' (1874); a translation of Burns ((1865); and of Dante's 'Divina Commedia' (1867), as well as introductions to the study of Provençal and old French, etc.

Barttelot, bär-tlō', **Edmund Musgrove,** English soldier: b. 1859; d. 1888. Entering the Indian army he served in the Afghan campaign, and as major in the Egyptian army, joined the Stanley expedition for the relief of Emin Pasha in 1887. In June 1888 he began a journey into the heart of Africa and in the course of a mutiny among his followers was shot by one of his men. He was accused of barbarous cruelty in his command by Stanley, a charge oposed by Barttelot's brother in his 'Life of Edmund Musgrove Barttelot' (1890).

Baru, ba-roo', Philippines, a town of Leyte, 31 miles from the capital of the province, Taclobam. Pop. 12,322.

Baru (Maylay), a wooly material found at the base of the leaves of a sago palm-tree, *saguerus saccharifer*. It is much used in stuffing cushions and calking ships.

Baruch, bā'rŭk (Hebrew, "the blessed"), the name of several individuals, of whom the most celebrated was the son of Neriah, scribe and assistant to the prophet Jeremiah. During the reign of Jehoiakim, about 607 B.C., Jeremiah while in prison, having been divinely commissioned to put all his prophecies in writing, dictated them to Baruch, who inserted them in a roll, which he was ordered to read both within and at the entrance of the temple. Jehoiakim on hearing its commencement cut it in pieces

and threw it into the fire. At the captivity, after the destruction of Jerusalem, Jeremiah and Baruch were permitted to remain in Palestine, but were afterward carried into Egypt, 588 B.C. The subsequent life of Baruch is little known. One of the apocryphal books bears the name of Baruch. The Council of Trent gave it a place in the canon, but its authenticity was not admitted either by the ancient Jews or the early Christian fathers.

Ba'rus, Carl Hazard, American physicist: b. Cincinnati, O., 19 Feb. 1856. He studied at Columbia College and the University of Würzberg; was physicist of the United States Geological Survey in 1880–92; professor of meteorology in the United States Weather Bureau, 1892–3; and physicist of the Smithsonian Institution, in 1893–5. In 1895, he became professor of physics at Brown University. He is a member of the National Academy of Sciences; was vice-president and chairman of the section of physics in the American Association for the Advancement of Science in 1897; and is a corresponding member of the British Association for the Advancement of Science. He contributes to the American Journal of Science, and has written also valuable monographs for the United States Geological Survey.

Bary, bä're, **Heinrich Anton de,** German physician and botanist: b. Frankfort-on-the-Main, 26 Jan. 1831; d. 19 Jan. 1888. He is noted for his investigations in cryptogamic botany, and was professor of botany at Freiburg in 1855, at Halle in 1867, and at Strasburg in 1872. Among his works are 'Die Mycetozen' (1859); 'Vergleichende Morphologie und Biologie der Pilze, Mycetozen und Bacterien' (1884); 'Vorlesungen über Bactorien' (1885).

Barye, ba-re, **Antoine Louis,** noted French sculptor: b. Paris, 24 Sept. 1795; d. there, 25 June 1875. He studied engraving with Fourrier and a goldsmith named Beinnais; in 1812, was a topographical engineer, and is supposed to have modeled a number of relief maps now in the French war office. In 1816 he studied drawing with the painter Gros, and sculpture with Basio; and, in 1819, took the second prize for a 'Milo di Crotona,' which was awarded him at a Concours of the Beaux Arts. From 1823 till 1831 he worked under Fauconnier, jeweler to the Duchesse d'Angouleme. In 1831 he exhibited the celebrated 'Tiger Devouring a Crocodile,' and was then employed by M. Lefuel to make four groups for the pavilion on the Place du Carrousel. He was an officer of the Legion of Honor, a member of the Institute, and a professor at the Jardin des Plantes. See Brownell, 'French Art' (1892).

Bary'ta, barium monoxid. See BARIUM.

Barytes, a common name for BARITÉ (q.v.).

Baryton (viola di Bardone), a chamber instrument, very popular in the 18th century, but now obsolete. It was somewhat like the viol di gamba in tone, but had a broader finger-board, with six or seven gut-strings, while under the neck there were from 9 to 24 strings of brass wire, which were pinched with the point of the thumb, to produce a sound, while the gut-strings were acted on by a bow.

Barytone. See BARITONE.

Bas, or **Batz,** a French island in the department of Finisterre, 2½ miles from the coast in the English Channel. Although but three miles long and two miles wide it is defended by two forts and four batteries. It has a lighthouse at an elevation of 212 feet, and three fishing villages. Pop. (1896) 1,286.

Bas-relief, bä-re-lēf' (in Italian, *basso-rilievo,* or low relief), as applied to sculpture, a representation of one or more figures, raised on a flat surface or background, in such a manner, however, as that no part of them shall be entirely detached from it. *Alto-rilievo,* or high relief, is that in which the figures project half of their apparent circumference from the background. *Mezzo-rilievo,* or middle relief, is a third species, between the two. But, generally speaking, the first term is made to comprehend both the others. The term itself was invented in Italy, about the 11th or 12th century, on the revival of the arts; for the Greeks called such works simply carved (*anaglypta*); and to what is now called high relief they only applied the term rounded (*toreutikē*).

Bas-relief is particularly allied to architecture and under its dominion, since any considerable work of this kind must be made for the pediment, frieze, or panel of a building, or for some other architectural work, such as a tomb, sarcophagus, pedestal, or column. Bas-reliefs seem to have been invented in the earliest ages by the Egyptians, for the whole of their ancient monuments are covered with them, being executed in the same way as the hieroglyphics on their sepulchral chambers, obelisks, and temples. This has been finely illustrated by the drawings and models of the tomb of Sethi I., originally discovered near the ancient Thebes by Belzoni, and which has since become familiar to many persons; all the walls of that extraordinary excavation being covered with thousands of figures in low relief, colored, and exhibiting the religious and warlike ceremonies of that wonderful people. Bas-reliefs, too, are found in India, decorating the subterraneous temples of Ellora and Elephanta in an astonishing profusion. The subjects are, of course, sacred, and in the style of drawing resemble very strongly those of the Egyptian monuments, but are evidently inferior, having larger heads and disproportioned bodies and limbs. Both these temples have been well illustrated and described by Thomas Daniell, R.A., and Capt. Scaley; and for further information their respective works may be consulted. The Persians, too, like other ancient nations, employed bas-relief as a figured writing, thereby recording and representing the symbols of the power and energy of the Divinity, their own religious ceremonies, and warlike achievements. The sculptures still existing on the ruins of the palace of Persepolis and the royal tombs accord in many striking particulars with those taken to England by Belzoni. In both the figures are arranged in lines, either horizontal or perpendicular, to suit the double purpose of decoration and description. In both of them the natives of Egypt are distinguished by the hood with lappets, the mitre, the full hair artificially curled, the close tunic, the apron of papyrus; the Hindus, by the necklaces, bracelets, and anklets; the Hebrews, by their long beards, and hair in spiral ringlets, their caps, full tunics, with regular folds and large sleeves; the Medes, again, by their close tunics; while the Persians themselves, in many particulars, resemble the

Hebrews. The comparison may be easily made by looking over the prints in Sir Robert Ker Portre's 'Travels in Persia,' and those in Le Bruyn's 'Travels,' and then the engravings of Denon's and Belzoni's large works.

Since it has been well observed that the Greeks commenced in works of art precisely where the Egyptians left off, we find that the early bas-reliefs of Greece resemble pretty accurately those of Egypt. The objects are represented in the same hard and simple manner, and the marbles taken to England from the temple of Ægina serve to fill up the history of sculpture, in the interval between its first introduction into Greece and its full development under Phidias, at Athens, when that glorious work, the Parthenon, was produced under the auspices of Pericles.

The draperies in these early bas-reliefs are thin and meagre, showing the forms of the body and limbs; the folds regular, small, and distinct, consisting chiefly of perpendicular and **zigzag** lines. Some of the head-dresses consist of small curls, very like the fashions of barbarous nations; and in a bronze patera in the British Museum the club of Hercules is ornamented with spiral flutes, like one brought by Capt. Cook from the Sandwich Islands.

The best examples of bas-relief now in existence are to be found within the walls of the British Museum. We mean, of course, those of the Elgin Marbles, which are executed in this manner. And in the same collection are the tombstone of Xanthippus, and a man curbing a horse, both conjectured to be of the age of Phidias, and which formed part of the Townley collection. In the collection of the Marquis of Lansdowne is a Greek bas-relief of Calchas, the size of life. At Wilton there is a beautiful representation of the 'Death of Meleager,' and a small but curious 'Hercules and Æglé'; a bas-relief composed of mosaic in natural colors, which is supposed to be unique. The celebrated Barberini vase, formerly in the possession of the Duke of Portland, is of dark-blue glass, bearing figures in bas-relief of white enamel or glass of admirable workmanship. Fragments of bas-reliefs of similar materials have been found in the ruins of Cæsar's palace at Rome, where they had been fixed in the walls. The two triumphal columns of Trajan and Antonine are covered with bas-reliefs, containing several thousand figures (the first, indeed, has 2,500 human figures, according to Vasi), without reckoning horses, elephants, mules, and the implements of war.

Basaiti, bä-sä-ē'tē, **Marco,** celebrated painter of Greek extraction: b. Friuli about the middle of the 15th century. He settled in Venice, where several of his paintings, remarkable for the brilliancy of their coloring, and distinguished by other excellences, are seen. His masterpiece, now in the Venetian Academy, is 'The Calling of St. Andrew and St. Peter.' He was the contemporary, and not unfrequently the successful rival, of Gian Bellini.

Basalt', a class of rocks belonging to the volcanic series and characterized by augite and plagioclase feldspar as essential constituents, and by iron ores (magnetite and ilmenite) as accessory minerals. Olivine is also present in typical basalts; among the rarer minerals are orthorhombic pyroxene, black mica, hornblende, quartz, leucite, and nepheline. Those varieties which contain notable quantities of olivine are known as olivine basalts, while the presence of leucite and nepheline characterizes the leucite basalts and the nepheline basalts. In texture the basalts vary from a finely crystalline apparently homogeneous mass to coarsely crystalline aggregates; but the normal type is a fine-grained, black rock, in which olivine is the only mineral that can be recognized without the microscope. The ground mass of the denser varieties contains more or less glass, due to the rapid cooling of the magma from the molten state. Basalts are extremely abundant especially in those regions which have undergone volcanic disturbance within geologically recent times; in fact most of the volcanoes of the present day erupt basaltic materials. In the United States they occur mostly in the region west of the Mississippi River, where great areas have been flooded by fissure eruptions. The tendency of basalt to assume a columnar structure often lends a characteristic appearance to scenery, as is illustrated by the famous Giants' Causeway on the north coast of Ireland.

Basanite, baz'a-nīt (Gr. *basanos,* "touchstone"). See TOUCHSTONE.

Bascinet, or **Basnet,** a light helmet, sometimes with but more frequently without a visor, and worn by knights at times when, though apprehension of danger was not imminent, it might not have been safe to be altogether unarmed. It resembled a basin, and hence its name. It was in general use for English infantry in the reigns of Edward II. and III., and Richard II., and is frequently mentioned in Parliamentary and other public records.

Bas'com, Florence, American educator, daughter of Dr. John Bascom (q.v.). She was educated at the University of Wisconsin and at Johns Hopkins University, receiving from the first the degree of B.A. and B.L. in 1882, B.S. in 1884, and M.A. in 1887; and from the latter that of Ph.D. in 1892. She was the first woman to whom Johns Hopkins granted a degree, and the first to receive a Ph.D. from any American college. She had much difficulty in securing admission to Johns Hopkins as a graduate student, the only concession to her sex being that she might attend the lectures on geology, and use the laboratory apparatus in that branch. She had previously applied herself to geology, and her thesis on receiving her Ph.D. was on inorganic geology, palæontology and chemistry being minor subjects. Subsequently she was engaged in teaching; was assistant editor of the 'American Geologist'; became professor at Bryn Mawr College; and in 1899 was chosen to supervise the geological survey of Chester County, Pa.

Bascom, Henry Bidleman, American clergyman: b. Hancock, N. Y., 27 May 1796; d. 8 Sept. 1850. He was licensed to preach in 1813, and made chaplain to Congress in 1823; president of Madison College, Pennsylvania (1827–9), and of the Transylvania University, Ky., 1842. In 1850 he was made a bishop of the Methodist Episcopal Church. He edited the 'Quarterly Review,' 1846–50. His writings were published in 1856.

Bascom, John, American educator and philosophical writer: b. Geneva, N. Y., 1827. He was president of the University of Wiscon-

sin, 1874-87, and in 1900 was professor of political science in Williams College. He has written a number of philosophical works, among them 'Philosophy of English Literature' (1874); lectures before the Lowell Institute; 'Comparative Psychology' (1878); 'Sociology' (1887); 'An Historical Interpretation of Philosophy' (1893); 'Growth of Nationality in the United States' (1899); and 'God and His Goodness' (1901).

Base. In *architecture:* (*a*) The part of a column between the bottom of the shaft and the top of the pedestal. In cases in which there is no pedestal, then the base is the part between the bottom of the column and the plinth. (*b*) A plinth with its moldings constituting the lower part (that which slightly projects) of the wall of a room.

In *botany,* a term applied to the part of a leaf adjoining the leaf-stalk, to that portion of a pericarp which adjoins the penduncle, or to anything similarly situated.

In *chemistry,* a body capable of replacing the hydrogen of an acid so as to produce a new compound, called a "salt," which contains the base and all the elements of the acid except the displaced hydrogen. The name was given by Rouelle in 1744, and is now loosely used to signify a metal, a salt-forming oxid or hydroxid, or an organic body, such as an alkaloid, an amide, an amine, pyridine, quinoline, etc., which is capable of combining with an acid to form a salt. When oxids combine with acids their oxygen unites with the liberated hydrogen of the acid, to form water. A body (like caustic potash, KOH), is said to be strongly basic when it forms salts that are very stable and are not altered by hot or cold water.

In *fortification,* the exterior side of a polygon, or the imaginary line connecting the salient angles of two adjacent bastions.

In *geometry:* (*a*) The base of an ordinary triangle is its third side, not necessarily the one drawn at the bottom of the diagram, but the one which has not yet been mentioned, while the two others have (Euclid, book i., prop. 4, Enunciation). (*b*) The base of an isosceles triangle is the side which is not one of the equal two (*Ibid.* prop. 5, Enunciation). (*c*) The base of a parallelogram is the straight line on which in any particular proposition the parallelogram is assumed to stand (*Ibid.* prop. 35). It also is not necessarily drawn the lowest in the figure (*Ibid.* prop. 47). (*d*) The base of a cone is the circle described by that side containing the right angle which revolves (Euclid, book xi., def. 20). (*e*) The bases of a cylinder are the circles described by the two rotary opposite sides of the parallelogram, by the revolution of which it is formed (*Ibid.* def. 23).

In *heraldry,* the lower part of a shield, or, more specifically, the width of a bar parted off from the lower part of a shield by a horizontal line. It is called also base-bar, baste, and plain point ('Glossary of Heraldry').

In *military affairs,* see TACTICS.

In *ordnance,* the protuberant rear portion of a gun between the knot of the cascabel and the base-ring.

In *sculpture,* the pedestal of a statue.

In *trigonometry, surveying,* and *mapmaking,* a base or base-line is a straight line measured on the ground, from the two extremities of which angles will be taken with the view of laying down a triangle or series of triangles, and so mapping out the country to be surveyed.

In *zoology,* that portion of anything by which it is attached to anything else of higher value or signification (Dana).

Base of Operations. See TACTICS.

Baseball, a popular sport in the United States, of such general interest as to be known as "the national game." It had its origin in the old English game of "rounders," but developed on American soil into a very different sport. In Philadelphia an early form was played under the name of "town-ball," and a similar game was known in Upper Canada as early as 1838. It was in the neighborhood of New York, however, that baseball received its greatest development, regularly organized clubs contesting in the "Elysian Fields," at what is now the site of the city of Hoboken, N. J., as early as 1845. It was not until 1857, however, that the first baseball convention was held for the purpose of framing uniform rules out of the various methods of each district and club, and in the following May the first "National Baseball Association" was organized.

The first real series of games played between organized clubs was that between teams picked from the various clubs of New York and Brooklyn on the old Fashion Racecourse at Flushing L. I., in 1858, the first authorized code of rules being formulated and published for their direction. From the present view-point these rules were crude. For instance, the regulation ball weighed 6½ ounces and measured 10½ inches in circumference. It was a lively ball (anticipating by 50 years the latest development of the golf-ball), being made with 2½ ounces of rubber, covered with yarn and leather. The bat was unlimited as to length, but was decreed not to exceed 2½ inches in diameter. In the delivery of the ball there was a greater difference than in any other respect as compared with the later development of the game: for the ball could only be pitched; all throws and jerks being prohibited. The pitcher was at liberty to take any number of steps before delivery, and his limit was anywhere behind a line 12 feet across, and 45 feet from the home base. Then, too, he could pitch his ball almost without limitation so long as he pitched "as near as possible to the home base."

As then played, none but amateurs participated; indeed, no one could represent his club unless he had been a member for 30 days, and "money, place, or emolument" was a bar. Games were originally played on free grounds, but on the establishment of the Union Ball Ground and the Capitoline Club of Brooklyn in 1863, the admission money went to the proprietor, the players later having a share, and thus was laid the foundation of professional play. So matters drifted for six years, with a gradual tendency to greater restrictions in rules, greater skill in play, and more and more professionalism, until 1869, when for the first time a salaried team, the "Red Stockings of Cincinnati," began a tour of games, and naturally carried everything before them. Through 1869 and up to June 1870, they played without losing a single game.

The delivery of the pitcher had been gradually developing. As early as 1860 the disguised underhand throw had come into vogue, and by 1866 Arthur Cummings, of the Excelsior Junior

Nine, introduced a curved delivery. With the advent of the swifter-playing professional, and the reduced size and weight of the ball, came into necessity, and therefore into use, the various safeguards, of padded gloves, catchers' mitts, breast-pads, and masks.

By 1871 the game had become so extensive and the professional element so popular that a "National Association of Professional Baseball Players" was formed, and in 1875 the various club-owners took control of the professional players and organized "The National League of Professional Ball Clubs," which continued in undisputed possession of the professional field until 1890, when a rival association, "The American League," was founded. There are several other leagues of minor importance. Baseball naturally found favor in American universities and colleges, but its technique in the early days was crude, even among the best teams. Team play as now interpreted was almost unknown, the hitting was harder, and the fielding poorer, the outfielders played much farther afield. As late as the middle sixties scores of 50 runs were not uncommon, and a hard-hitting college team would make over 100. As late as 1867, when two college nines made, respectively, 13 and 8, it was considered a phenomenon. There is no intercollegiate championship in the ordinary sense; each college plays a set of games with other colleges. A full and exact knowledge of the game can be acquired only by a study of the official rules. Briefly, the game is played between two teams of nine men each, on a field in which a diamond-shape with sides of 90 feet each has been marked out according to certain technical rules, the angles being named, respectively, the home plate and first, second, and third bases, reckoning to the right from the home plate. The pitcher's "box" is situated near the centre of the diamond, about 60 feet from the batsman's stand, and from that point the pitcher is required to deliver balls to the batsman, pitched according to definite rules. The catcher stands behind the batsman; his principal office is to catch unhit balls and return them to the pitcher, or to throw to the baseman when the batsman is making a run. The fielders are known as the *infield,* consisting of first, second, and third basemen and short-stop; and the *outfield,* or left right, and centre fielders. The office of the first section is to catch batted or thrown balls, and to touch therewith the batsman running between bases, or, failing in this, to return the ball to the pitcher; that of the second section may be stated generally as the stopping or catching of batted balls and returning them to the pitcher or throwing them to the baseman for the purpose of putting out running batsmen. The positions and duties of the fielders are defined with strict limitations by the rules. The aim of each team is to make as many runs as possible. To score a run a player must make a complete circuit of the bases, but not necessarily at one hit. With his own hit he may get as far as first base; then may get to second base while the pitcher is delivering a ball to the second batter, and to the third base on the hit of that man, or even on the hit of the third batsman. When three men are put out, one inning is finished; and the other team takes its turn, with three men one after the other, and so on until there have been nine innings on each side. A batsman is out who is touched by the ball after leaving one base and before he reaches another, or whose batted ball is caught by one of the fielders before it reaches the ground. The batsman is also declared out when hit by a batted ball; or when being forced to run for a base by reason of all bases being occupied, the ball is held by the fielder at the base for which he is making. The batsman must not step out of his box, and must strike at every ball that crosses "the plate" on a level between his knees and shoulders — such are called "fair balls." If he fails either to strike at or to hit it counts as a "strike" against him, and if he fails three times he is out, providing the third ball is caught by the catcher before it reaches the ground. If the pitcher delivers a ball which does not pass over the plate in the defined zone, it is counted as "one ball" in favor of the batsman, and after four such balls he is entitled to go to the first base unmolested. Baseball has been re-transplanted back to England, but without much success. In Australia it has become popular.

The principal authorities on the game are Spalding's 'Baseball Guide'; 'The Art of Pitching and Fielding, Batting and Base-Running,' by Henry Chadwick (1886); 'Baseball,' in the Oval Series (1896); and 'Baseball,' by J. M. Ward (1888).

Basedow, bä'zę-dō, **Johann Bernhard,** often called by himself Bernard von Nordalbingen; German educator: b. 11 Sept. 1723; d. 25 July 1790. He had in Dessau an institution for education called Philanthropinon. The chief features of Basedow's system are the cosmopolitan character which he endeavored to instil into his pupils, and the full development of the faculties of the young at which he aspired, in pursuance of the notions of Locke and Rousseau. With Salzmann, Campe, etc., he established some good institutions, and deserves special credit for his efforts for the education of the lower classes.

Basedow's Disease (also called Graves' Disease), a peculiar affection of the sympathetic nervous system, characterized by rapid and irregular heart-action, large protruding eyeballs, swelling of the neck, extreme nervousness, and marked muscular tremor. Its exact cause is unknown, but it seems to be associated with some variation in the function of the thyroid gland. It usually occurs in young females and is not infrequently a curable affection, although some patients are incurable. Surgical operations on the cervical sympathetic have cured some cases. (See Goitre.) Consult: Osler, 'Practice of Medicine'; Nothnagel, 'System of Medicine.'

Basel, bä'zel, **Basle,** or **Bale,** bäl, Switzerland; one of the largest cities in the federation and capital of canton Baselstadt, 43 miles north of Bern. It consists of two parts, situated on opposite sides of the Rhine, and communicating by a long wooden bridge. It is walled and irregularly, though fairly well built; and has an ancient cathedral. Basel was formerly a free imperial city, but joined the Swiss Confederacy in 1501. Buxtorf, Wetstein, Hermann, the Bernouillis, and Euler were born in Basel. Erasmus also lived there several years, and lies buried in the cathedral. Among the institutions of the city are the university, founded in 1459; various collections of paintings, a seminary for missionaries, and a German Bible Society. In 1849 a large museum was completed,

which contains the university library (now consisting of about 80,000 volumes), with 4,000 manuscripts, and all the collections belonging to the town. Its manufactures consist principally of ribbons, silk goods, cotton prints, linen, gloves, leather, jewelry, and turnery ware. Its advantageous position on the Rhine, a little below the point where it becomes navigable, and at the terminus of the French and German railways, has made it a centre of trade, and starting point for travelers in Switzerland. It is the seat of a United States consulate. Pop. (1900) about 113,000.

Basel, Confession of, a Calvinistic confession introduced by Œcolampadius at the opening of the Synod of Basel (1531). It was adopted by the Protestants of Basel in 1534. Simple and comparatively moderate in its terms, it occupies an intermediate place between Zwingli and Luther.

Basel, Council of, a council announced at the Council of Constance, and convoked by Pope Martin V., and his successor Eugenius IV. It commenced its sittings 14 Dec. 1431 under the presidency of the cardinal legate Juliana Cæsarini of St. Angelo. The objects of its deliberations were to extirpate heresies (that of the Hussites in particular), to unite all Christian nations under the Roman Catholic Church, to put a stop to wars between Christian princes, and to reform the Church. The Pope, having learned that the Fathers were about to reopen a discussion upon Hussite doctrines already definitely pronounced upon, and also because of the expressed wish of the Greek bishops to reopen negotiations for reunion at a council to be held on Italian soil, instructed the cardinal legate to dissolve the Council. That body opposed the claims of the Pope, with severe animadversions on his neglect of the welfare of the Church, and, notwithstanding his repeated orders to remove to Italy, continued its deliberations under the protection of the Emperor Sigismund, of the German princes, and of France.

In order to secure itself against the attacks of Eugenius IV. it re-enacted the decrees of the Council of Constance concerning the power of a general council (in matters of faith, of schism, and of reformation) to command the Pope, as well as all Christendom, and to punish the disobedience of the clergy, and even of the Pope, by virtue of its judicial character as the representative of the universal Church. It likewise pronounced all the doings and remonstrances of the Pope against its proceedings of no force, and began a formal process against him after he had issued a bull for its dissolution; appointed him, term after term, to appear before its tribunal, and exercised as much as possible the papal prerogatives in France and Germany.

Meanwhile it concluded, in the name of the Church, a peace with the Hussites (whose deputies appeared 6 Jan. 1433, with 300 horse, in Basel), by which the use of the cup in the communion was granted to them. This peace was ratified 20 Nov. 1433, by the Calixtines, the most powerful and finally prevailing party of the Hussites. The council deviated on this point, indeed, from the decrees of the Council of Constance, but was obliged so to do in order to assist its most faithful protector, the Emperor Sigismund, to the acquisition of Bohemia by this compromise with the Hussites, who were not to be subdued by force. Eugene IV. revoked in 1433 his decree of dissolution, and at the sixteenth session, 5 Feb. 1434, was read a document subscribed to by the Pope, in which it was declared that the Council had been lawfully convened. In return the Fathers recalled everything that had been said against the person of the Pope or the dignity of his office. The council, proud of this victory over the Pope, then attempted to interfere in the quarrels of the German princes, but was reminded by Sigismund, who protested against its intermeddling in the affairs of the Crown, of its proper point — the reformation of the Church. Toward the limitation of the power of the Pope, a proceeding which naturally evoked papal opposition, it had already made an important step by depriving him of the disposal of the prebends of cathedral and collegiate churches, which had been obtained by his predecessors; by restoring to the chapters the free election of their officers, and by obliging the Pope to confirm them gratuitously. It proceeded to the reformation of the clergy by ordaining that the excommunicated should not incur the penalties of their sentence before its publication; that interdicts should never be granted at the request of single individuals; and that repeated appeals should not be allowed, on account of their complaints (20th session, 22 Jan. 1435); that the *annates* (q.v.), the sums paid for the *pallia,* etc., should be regarded as simoniacal, and should not, under any pretext, be demanded or paid in future; that the divine service, the mass, and the canonical hours should be regularly observed by the clergy of each class; that disturbances of public worship should be prevented by a good ecclesiastical police; that the Feast of Fools and all irreverent celebrations customary in the Church about Christmas should be abolished (21st session, 9 June 1435).

In the 23d session (25 March 1436) the form of election, the confession of faith, and the official oath of each Pope, by which he bound himself to obey the decrees of the council, and the annual repetition of the same, were provided for; all preferment of the relations of a Pope was forbidden, and the college of cardinals was limited to 24 prelates and doctors of all nations, who should be elected by the free votes of the college, should be entitled to half of the revenues of the states of the Church, should watch over the Pope, and always sign his bulls. They granted him only the right to dispose of the prebends belonging to the diocese of Rome, and abolished the investiture of Church preferments in reversion.

In the 26th session it again summoned him to appear, on account of his disobedience of its decrees, declared him guilty of contumacy, and, after Eugenius had opened his counter-synod at Ferrara, decreed his suspension from the papal chair in the 31st session (24 Jan. 1438). In the same session it forbade appeal to Rome without resort to the intermediate jurisdictions, left to the papal disposition but 1 out of 10 and 2 out of 50 prebends of a church, and destined the third part of all canonries which might become vacant to men who had taken regular degrees. The removal of Eugenius, however, seemed to be so questionable a pro-

ceeding that some prelates, who till then had been the boldest and most influential speakers in the council (for example, the cardinal legate Juliano, and the great canon Nicholas of Cusa, Archdeacon of Liége, with the most of the Italians), left Basel and went over to the party of Eugenius. The Archbishop of Arles, Cardinal Louis Allemand, a man of superior spirit, courage, and eloquence, was now made first president of the council, and directed its proceedings with much vigor.

Although its number was diminished, its most powerful protector, the Emperor Sigismund, deceased, and its authority doubted by several princes and nations on account of its open rupture with the Pope; yet, in the 33d session (16 May 1439), after violent debates, in which the Archbishop of Palermo, Nic. Tudeschi (known under the name of Panormitanus, as the greatest canon of his time), who was the delegate of the king of Aragon and Sicily, took the part of the Pope — it declared Eugenius, on account of his obstinate disobedience of its decrees, a heretic, and formally deposed him, in the following session, as guilty of simony, perjury, violation of the laws of the Church, and bad administration in his office. In the 34th session, June 1439, the council pronounced the deposition of Eugene. At this session there were but two representatives of Spain and Italy, and the total number of prelates including abbots was 39.

Notwithstanding the plague, then raging in Basel, which continually diminished its number, it proceeded in a regular conclave (17 Nov. of the same year) to elect the Duke Amadeus of Savoy to the papal chair. This prince then lived in retirement at Ripaglia, on the Lake of Geneva, and seemed particularly qualified for the office on account of his piety, his riches, and his connections. But Felix V.,— this was the name he adopted,— was acknowledged by only a few princes, cities, and universities. The chief powers, France and Germany, assented to the decrees of the council for the reformation of the Church, but they chose to remain neutral in the contest with Eugenius. Meanwhile he acquired new credit by the union concluded with the Greek deputies at Florence (but afterward rejected by the Greek Church) and the friendship of the Emperor Frederic III. The council on the other hand, denounced by Eugenius and deserted by its protectors, gradually declined under its feeble Pope, and, consulting only appearances and the personal safety of its members, held its 45th and last session 16 May 1443, after an inaction of three years interrupted only by a few insignificant decrees. At this session the place of meeting was changed to Lausanne. Here some of the prelates remained together under the cardinal Louis Allemand until 1449, when, after the death of Eugenius and the resignation of Felix V., they gladly accepted the amnesty offered by the new Pope, Nicholas V., and pronounced the council closed. The decrees of the Council of Basel are admitted into none of the Roman or official collections, and by the Roman Church are considered of no authority. They have been regarded, however, as of authority in points of canon law, in France and Germany, as their regulations for the reformation of the Church were to some extent adopted in both countries, and, as far as they regard clerical discipline, were actually enforced. Some concordats concluded at subsequent dates have modified the application of them, but never formally and entirely annulled them. The Council of Basel was one of the most important in the history of the Church. The spirit of the councils of Pisa (1409) and of Constance (1414–18) was formulated in the decrees of Basel, and led to a twofold result; on the one hand the many salutary decrees of reform, on the other the clear expression of many dangerous principles in regard to the organization of the Church. Its history has often been misrepresented by historians, some seeing in it only an unhappy tendency from the true centre of unity; others regarding it as a great progressive movement, but forgetting that it was simply the growth of an expediency due to exceptional conditions. To know it impartially it must be studied in the original sources.

Consult: Hardouin; Labbé; Cossart; Mansi's collection consists of 31 folios; Alzog, 'Church History'; and Parsons, 'Studies in Church History.'

Basel, Treaties of Peace at, 5 April and 22 July 1795, between Prussia, Spain, and France, in which Prussia and Spain separated themselves from the coalition against France and acknowledged the republic. France retained the Prussian provinces on the left bank of the Rhine until the general peace, and accepted the mediation of Prussia, when any German princes wished to conclude separate treaties of peace with it. A secret article was inserted in the treaty, the object of which was to secure compensation to Prussia in case the left bank of the Rhine should remain with France at the general peace. The landgrave of Hesse-Cassel afterward concluded a treaty with the French republic at Basel, 28 Aug. 1795, by which the latter retained possession of the territories of Hesse-Cassel on the left bank of the Rhine until the general peace. By the Peace of Basel all the conquests of France beyond the Pyrenees were restored to Spain, in exchange for which that country ceded to France the Spanish part of the island of St. Domingo.

Basel, University of, an institution opened in 1460. After the Reformation it became strongly Protestant and exerted a widespread influence in behalf of the new faith. Among its professors were Erasmus, Œcolampadius, Euler, and the Bernoullis. It is at present the principal theological school in Switzerland, with departments of medicine, law, and philosophy. Its library contains 230,000 volumes and 1,500 MSS.

Basel'la, or **Malabar Nightshade,** a monotypic but very variable genus of tropical herbs of the natural order *Chenopodiaceæ*. *B. rubra,* a twining annual or biennial plant, native of India, where it is cultivated as a pot herb, is often raised in Europe, and has been introduced into the United States as a substitute for spinach, which it succeeds in season (July until frost). It is decidedly mucilaginous when cooked. Sometimes it is used as a greenhouse climber. One variety bears edible tubers, and another furnishes a purple dye.

Basement, in architecture, the base or lowest story of a building. It should have externally an appearance of strength, but its height

and proportion to the rest of the edifice are very various, depending on the character of the apartments on the ground floor.

Basey, bä'sā, Philippines, a town in Samar, with a population in 1898 of 13,756.

Bashahr', one of the Punjab hill states, on the lower slopes of the Himalayas, traversed from east to west by the Sutlej; area, 3,320 square miles. The rajah and upper classes in the southern parts are Rajputs, and the people generally are of the Hindu race, but their observance of Hinduism is very partial. The rajah pays tribute to the British government, for which he is required to raise troops in time of war, and by which his sentences of death must be confirmed. Pop. 75,727.

Bashan, bā'shăn or ba-shän' (meaning uncertain, perhaps "soft, rich soil"), the name in Scripture for a singularly rich tract of country lying beyond the Jordan, between Mount Hermon and the land of Gilead. These two regions, Bashan and Gilead, attracted the attention of those tribes that desired to continue the pastoral life to which they and their fathers had been accustomed; and Gilead was accordingly divided between Reuben and Gad, while Bashan was given to the half-tribe of Manasseh. Its forests contain magnificent oaks, and the "strong bulls of Bashan" of ancient times are still represented by vast herds of black cattle. Bashan had been the kingdom of the Canaanite giant Og, whom Moses destroyed; and one district of the country, Argob, had at that time 60 fenced cities, with walls, gates, and bars, besides many unwalled towns, remains of which are yet to be seen. Among the cities of this region were Edrei, Kenath, Golan, and Bozrah. After the captivity it is mentioned as divided into Trachonitis (the ancient Argob), Gaulanitis (Golan), Auranitis (Hauran, mentioned by Ezekiel), and Batanæa, or Bashan proper.

Bashford, James Whitford, American clergyman: b. Fayette, Wis., 27 May 1849. He was graduated at the University of Wisconsin in 1873, and at the Theological School of Boston University in 1876; became instructor of Greek at the University of Wisconsin in 1874, and president of the Wesleyan University of Ohio in 1889. His works include 'Science of Religion,' numerous published sermons, and contributions to periodical literature.

Bashi-Bazouks', irregular troops in the pay of the Turkish Sultan. They are a wild, turbulent body of men, mostly from Turkey in Asia, and in the duties with which they are entrusted resemble the Cossacks in the Russian army. In the spring of 1876 the Bashi-Bazouks were guilty of great atrocities in checking a threatened insurrection in the district around Philippopolis in eastern Rumelia.

Bashi' Islands. See Batan Islands.

Bashkirs', or **Bashkeers',** a tribe of half-civilized people subject to Russia, and inhabiting the banks of the Ural and Volga. They are probably descended from the Nogay Tartars and resemble them in their manners. They formerly roamed about, under their own princes, in southern Siberia. To avoid the Siberian khans they settled in their present territory, extended themselves along the Volga and the Ural, and submitted to the khan of Khasan. At the time when this state was overthrown by Ivan II. they voluntarily took refuge under the Russian sceptre; but their frequent revolts long prevented their increase and kept them in a weak condition. They number about 500,000, and inhabit chiefly the governments of Orenburg, Perm, and Samara. They are Mohammedans, and live chiefly by hunting, the breeding of cattle and horses, and keeping of bees. They prepare from mare's and camel's milk a fermented beverage, *koumiss* (q.v.), which is their favorite drink. They furnish the Russian army with a body of irregular cavalry.

Bashkirtseff, bäsh-kērt'sēf, **Marie,** Russian author: b. Russia, 1860; d. Paris, 1884. She came of a noble and wealthy family, went to Italy to study singing, and to Paris to study art. Her fame rests on her private 'Journal,' which seems to have been written with ultimate publication in view. It begins with her 13th year and continues through her later life. According to her own words, it was intended to be "the transcript of a woman's life." It appeared in Paris in 1885, and was abridged and translated into English in 1889, and was called by Gladstone "a book without a parallel." Like Rousseau's 'Confessions,' it claims to be an absolutely candid expression of individual experience. From the age of three years she cherished inordinate ambition, and felt herself destined to become great as singer, writer, artist, or queen of society. Admiration was essential to her, and she records compliments to her beauty or her erudition with equal pleasure. Her life was a curious mixture of the interests of an attractive society girl with those of a serious student. Her chronic discontent was due to the disproportion between her aspirations and her achievements. She was never unself-conscious, and her book reveals her longings, her petty vanities, and her childish crudities, as well as her versatile and brilliant talents.

Basic Slag, the slag of refuse matter which is obtained in making basic steel, and which, from the phosphate of lime it contains, is a valuable fertilizer.

Basic Steel. See Steel Manufacture.

Basil, bā'zĭl or băz'ĭl, **Saint,** surnamed The Great, Bishop of Cæsarea, Cappadocia: b. about 326; d. 380. He was studying in Athens in 355, and there became the friend of Gregory, afterward Bishop of Nazianzen. He was baptized in 357, and after extensive travels retired to the desert of Pontus and there founded an order of monks named Basilians. He succeeded Eusebius in the see of Cæsarea in 370, and by his opposition to Arian doctrines greatly offended the Emperor Valens. The liturgy of St. Basil is still used in the Eastern Church.

Basil I., emperor of Constantinople: b. Macedon, of poor parents, about the beginning of the 9th century; d. 886, from a blow given him by a stag while hunting. In his 25th year he made his way to Constantinople, and gained the favor of an archimandrite, who procured him service with an officer of the court of the Emperor Michael III. Later he was appointed head-chamberlain to the emperor. Despite intrigues against him he advanced so rapidly in the emperor's favor that he was adopted as his colleague. He murdered his chief rival, Bardus, and knowing that Michael had rendered himself odious by his cruelty and debauchery, he headed

a body of conspirators and murdered him in his bed in 867, and assumed sole occupancy of the throne. Notwithstanding his criminal acts, he proved an able and equitable sovereign; paid equal attention to the internal administration and the foreign relations of the empire, and, not overlooking even its religious interests, sent an archbishop into Russia and laid the foundation of that ascendency which the Greek Church has so long possessed in that country. He compiled a body of laws called the Basilica, which, augmented by his son and successor, Leo the Philosopher, were in force till the fall of the empire. Basil I. deprived Photius of the see of Constantinople, and restored Ignatius; but on the death of the latter he recalled Photius. He successfully carried on war with the Saracens. The versatility, if not the depth of his intellect, is strikingly displayed in his exhortations to his son Leo, which are still extant.

Basil II., emperor of the East: d. 1025. On the death of his father, the Emperor Romanus the Younger, in 963, he was kept out of the succession for 12 years by two usurpers; the first, Nicephorus II. (Phocus), who died in 969, and the second, Johannes (John) Zimisces, who associated Basil and his brother Constantine with him in the empire in 975, and died the following year, leaving the whole power to Basil although Constantine was still his colleague in name. His reign was almost a continuous warfare, in which the contending parties seemed to vie with each other in committing deeds of cruelty. In 1014, after a great victory over the Bulgarians, in which he had taken 15,000 prisoners, he had 99 out of every 100 deprived of their eyes and thus sent home. This horrible cruelty caused the death of Samuel, king of the Bulgarians. The war ended in 1019 by the complete conquest of Bulgaria.

Basil (*Ocimum*), a genus of fragrant annual herbs of the natural order *Labiatæ*, natives of warm climates, cultivated for culinary purposes and for ornament. The species generally raised are sweet basil (*O. basilicum*), bush or dwarf basil, (*O. minimum*), (considered by some botanists a form of *O. basilicum*), and tree basil (*O. gratissimum*). The name basil is also applied to certain species of several other related genera; for instance, *Pycnanthemum* and *Calamintha*. For culture and uses, see Herbs (*Culinary.*)

Basilan, bä-sē'län, Philippines, the largest island of the Sulu Archipelago. It is of oblong form, about 36 miles long and situated south of Mindanao, from which it is separated by a strait nine miles wide. The island is very mountainous, and most of it is covered by virgin forests. The soil is extremely rich and produces a variety of valuable crops, including cotton, coffee, sugar, chocolate, tobacco, indigo, and spices of all sorts. Basilan has about 15,000 inhabitants and three excellent harbors. The name is also applied to the whole group of 34 adjacent islets. The leading port is Isabela, on Basilan Strait.

Basil'ean Manuscripts, two manuscripts of the Greek New Testament, now in the library of Basel: (1) a nearly complete uncial copy of the Gospels of the 8th century; (2) a cursive copy of the whole New Testament except the Apocalypse, of the 10th century.

Basil'ian Liturgy, that form for celebrating the eucharist drawn up, toward the close of the 4th century, by Basil the Great, still used in the Greek Church.

Basilian Monks, a monastic order, chiefly belonging to the Greek Church, which strictly follow the rules of St. Basil (q.v.), who, after visiting the monasteries of Egypt, Syria, and Palestine, induced many to enter and even to found convents. His rule was confirmed by Pope Liberius in 363. In 379 there were at least 80,000 in the Eastern monasteries. Many convents were dispersed in the 8th century, during the Iconoclast persecutions, and all began to languish about the time of the Eastern schism. The order comprises priests, lay-brothers, cenobites living in community, anchorites in cells, and hermits in solitudes. They are governed by an archimandrite who has several convents under his jurisdiction, and by exarchs deputed by the archimandrite to visit the convents. The order has developed more extensively in Russia than in other countries. In Austria, Poland, and Hungary there are many communities, known as Ruthenians, in union with Rome. In Italy also they had convents in Calabria, Sicily, and Naples. In Spain they flourished for nearly two centuries until 1835. The communities of Sisters of this name were founded by St. Maerina, sister of St. Basil. Other communities following the rule of St. Basil are the Melchites, with about 600 houses in Libanus; the Bartholomites of the Armenian rites, so called because, after taking refuge in Genoa in 1307, they had possession of St. Bartholomew's church there until 1659. This name is likewise given to a community of secular priests founded by Bartholomew Holzhauser in Germany in 1640, and once propagated in Hungary, Poland, and Spain, but now extinct. There are but six Basilians in the United States (in Chicago) affiliated to the provincial house in Toronto, Canada.

Basil'ica (literally, a royal hall, originally the hall occupied by the *archōn basileus* or "king archon" among the ancient Athenians), the name of buildings belonging to classical antiquity, which acquired their characteristic form among the Romans. In the first centuries of the Christian era the Roman basilicas were splendid public buildings, of an oblong shape, commonly adorned with columns and statues, where the citizens collected to consult for their common welfare, the merchants exposed their wares, young orators exercised themselves in declamation, etc. Constantine the Great gave some basilicas to the Christians in Rome for their worship. Thence it happened that the first Christian churches obtained the name of *basilicæ*. But in the 4th century after Christ the ancient form of the basilica began to be modified and developed. (See Christian Architecture.) The chief changes that from that time onward were gradually made in its construction consisted in the raising of the nave above the rest of the building, the introduction of upper windows, the addition of the transepts, and the decoration of the interior with works of mosaic. At a later time towers were introduced, and still later vaulted roofs instead of the flat timber roofs with which they were formerly provided. The original church on the site of which St. Peter's is built was a basilica, and hence the

name is often applied to the present church, which is not, strictly speaking, a basilica.

Basilica, a code of laws founded on the code of Justinian, supposed to have been named after the Greek emperor Basilius I., in whose reign its compilation was begun. It was finished by Leo the Philosopher, and revised by order of his son Constantine Porphyrogenitus in 945. It consisted of 60 books, but we no longer possess them in a complete form. The principal editions are those of Fabrot (7 vols., Paris, 1647), and Heimbach (Vols. I–V, Leipsic, 1833–50).

Basilicata, bä-zĭl-ē-kä′ta, the ancient Lucania, in southern Italy, composed solely of the province of Potenza; so called after the Emperor Basilius II., who reconquered it from the Saracens and Lombards in the 11th century. It is mountainous, several peaks rising to upward of 4,500 feet (Monte Pollino, 7,375 feet). The Apennines here divide into two parts, which branch off to the east and west. From these the rivers Bradano, Basento, Salandrella, Agri, and Sinni take their source, and, after draining this fertile district, fall into the Gulf of Taranto in the Ionian Sea. There are also many lakes, some of volcanic origin. The chief are Monticchio, Pesole, Maorno, and Santa Palagina. The bulk of the people are poor and ignorant, and talk a dialect called *basilisco*. Its coast line being for the most part marshy, and, as a consequence, unhealthful, the province derives next to no commercial benefit from it. The orange and lemon grow well near the coast. Other products are cotton, flax, silk, honey, wax, licorice, dried fruit, saffron, tobacco, etc. Mineral springs are many, chiefly sulphurous. There are marble quarries at Avigliano, Latronico, Muro, Lucano, and Picerno; chalk at Mauro Forte and Montemuro; transparent quartz at Lagonegro; tufa at Matera; and excellent lignite at San Chirico Raparo and Rotonda. Area, 3,845 square miles; pop. (1901) 490,000.

Basilicon, ba-zil′ĭ-kŏn, a name of several ointments, the chief ingredients of which are wax, pitch, resin, and olive oil.

Basilicon Do′ron (the royal gift), the title of a book written by King James I. in 1599, and printed in Edinburgh in 1603, containing a collection of precepts on the art of government, and maintaining the claim of the king to be sole head of the Church.

Basilides, ba-sĭl′ĭ-dēz, founder of one of the most remarkable sects of ancient Alexandria. He lived under the reigns of Trajan, Adrian, and Antoninus, but the place of his birth, supposed to be in Persia, Syria, or Egypt, is unknown. He was well acquainted with Christianity, but, under the pretense of freeing it from corruption, corrupted it still more by mixing it up with the wildest dreams of the Gnostics and peopling the earth and the air with multitudes of æons. He had numerous followers, who spread from Syria and Egypt into Italy, and even as far as France, but they suddenly sank into obscurity and are scarcely heard of after the 4th century.

Basil′io da Gama, gä′mä, **José,** a Brazilian poet: b. San José, 1740; d. Lisbon, 1795. His principal poem gives a picturesque and romantic account of the bloody wars which the Portuguese waged, in 1756, against the natives of Paraguay. He was a protégé of the Brazilian minister Pombal, who gave him employment in his Cabinet. He shared Pombal's exile, and also dedicated verses to him in token of his gratitude. On his return to Rio de Janeiro he was favorably received by the authorities and the literary notabilities, and with their co-operation he became one of the founders of the first Brazilian academy. In 1790 he again had to resort to flight, and he succeeded in escaping to Lisbon. He was the author of many lyrical pieces and sonnets, and of a poem, 'Quitubia,' written on an African chieftain whose devotion to Portugal engaged the poet's sympathy; but the most abiding monument of his genius is his 'Uruguay,' which is still popular wherever the Portuguese language is known.

Basilis′cus, brother of Verina, wife of Leo, emperor of the East: d. 477. In his youth he obtained some successes against the Scythians, and in 468, through the influence of his sister, was appointed to command the immense armament fitted out at Constantinople against Genseric, king of the Vandals in Africa. This expedition consisted of upward of 1,100 vessels, conveying soldiers and sailors to the number of more than 100,000 men, and its equipment is said to have cost about $25,000,000. But this vast fleet, after reaching the coast of Africa in safety, was altogether destroyed or dispersed by Genseric, through the incapacity or treachery of its leader. Basiliscus escaped to Constantinople, and obtained the pardon of the emperor only by the earnest intercession of the empress. After the death of Leo, and of his successor, Leo II., in 474, Basiliscus usurped the imperial throne. But he was unable to sustain himself in this position, and was not long after overthrown and put to death by Zeno, the legitimate heir.

Basilisk, băz′ĭ-lĭsk, according to Pliny (lib. viii. c. 21), a kind of serpent found in the African deserts, named *basiliskos,* or little king, because its body was marked with bright spots, and those on the head had the appearance of a crown or diadem. It had a very pointed head, with fiery eyes, and was of a dark color, verging to blackness. All other snakes were said to fly from the sound of its hissing; and instead of trailing along like other serpents the basilisk raised its body nearly erect, and, as it passed along, killed the herbs and fruits by its touch, and even by its breath. Yet this monster was destroyed by weasels. If these fables had reference to any real animal, it is probable that it was a species somewhat similar to the *cobra de capello,* or the asp viper. Both are accustomed to erect a very considerable part of the body, though not to move forward in this way. It is highly probable that the basilisk of the ancients was merely a creature of fiction.

The name is now applied to one of the Central and South American lizards of the family *Iguanidæ* and genus *Basiliscus,* remarkable for the high and erectile crests which are developed along the back and tail of the males. They have long legs and long flexible toes, enabling them to climb trees with great activity. They prefer such trees as overhang the water, into which they plunge at any sign of danger. They feed entirely upon vegetable matter. The best-known species is *Basiliscus americanus,* which

has a length of nearly three feet, three fifths of which is tail. In color the basilisks are green and brown, with dark cross-bars on the back, and the crest of the males is red. In early spring they lay about a dozen eggs in a hole among the roots of a tree. See also IGUANA.

Basilosaurus. See ZEUGLODON.

Ba'sin, in physical geography, the whole tract of country drained by a river and its tributaries. The line dividing one river basin from another is the watershed, and by tracing the various watersheds each country is divided into its constituent basins. The basin of a lake or sea comprises as well all the territory drained by the rivers which run into it. Such hydrographic basins owe their origin either to erosive action or to a depression of the earth's crust. When rivers become established upon a new land surface they proceed to deepen and widen their channels, and in course of time may appreciably lower the level of the drainage area. Glaciers are also important agents in the establishment of hydrographic basins, as is illustrated by the numerous rock basins (now occupied by lakes) that were hollowed out by the great ice-sheets that once invaded northern North America and Europe. Other depressions have been formed by vertical movements of the strata comprising the earth's crust. The Great Basin lying between the Rocky Mountains and the coast ranges, and many of the lake basins of central Africa, originated in this way. In geology a basin is the synclinal arrangement of strata so that they dip or are inclined toward a common centre. The Paris Basin and the London Basin are familiar instances. See RIVER; LAKE; VALLEY; etc.

Bas'ingstoke, England, a town and parish of Hampshire, situated near the source of the Loddon, 18 miles north-northeast from Winchester. Its streets are well built, paved, and lighted, and the town is amply supplied with water. It has a town-hall, containing a spacious corn-market and ball-room. It has also a fine Gothic church, erected in the time of Henry VIII.; several other places of worship; a mechanics' institute, with good library; and numerous charities. A considerable trade is carried on in corn and malt. Population of municipal borough (1901) 9,810.

Bas'kerville, John, English printer and artist: b. Wolverley, Worcestershire, 1706; d. 1775. Inheriting a small estate, he was brought up to no profession, but, acquiring great skill in penmanship and carving letters on stone, at the age of 20 he settled at Birmingham as a writing-master. He subsequently engaged in the manufacture of japanned works, and in 1750 entered upon his great career as printer and typefounder, in which he displayed extraordinary ability, as well as in the manufacture of the ink and paper used in his productions. His first great work was an edition of Virgil, in royal quarto, 1756, which was followed by many of the Latin classics, and some English ones, in quarto and smaller sizes. After his death his types and matrices were sold to Beaumarchais at Paris for £3,700.

Basket, a vessel made of osier twigs or other flexible materials, as rushes, strips of wood, splits of bamboo, rattan, etc., and used for holding and carrying all sorts of commodities. The word is of Britanno-Celtic origin and still subsists in the Welsh language in the form *Basgawd,* from *Basg,* plaiting, net-work: it was adopted into the Latin language in the 1st century with form little altered — *Bascauda.* The baskets made in Britain were highly prized by the Romans, and the poets Juvenal and Martial make mention of them as articles of no trifling value. They were evidently regarded as rare exotic curios in Juvenal's day, for the poet, in drawing an exaggerated picture of the shipwreck in which his friend Catullus threw overboard his most cherished possessions, couples Bascaudæ (baskets) with articles of chased silver wrought by famous artists (Sat. xii.). And Martial (xiv. 99) makes the British basket say of itself:—

Barbara de pictis veni bascauda Britannis,
Sed me jam mavult dicere Roma suam —
"The Basket Barbaric, I'm come from the painted Britanni,
But Rome now would choose rather to title me Roman."

In primeval times basket-making was a branch of the art of weaving, and both of these arts grew out of the still more primitive one of wattling, first employed in making enclosures. Tylor ('Early History of in making enclosures. Tylor ('Early Hist. of Mankind') notes the existence of wicker-weaving among primitive tribes throughout the world. This is the first step in the art of weaving textile fabrics. It is practised, or rather was practised, by the natives of New Zealand and of northwestern America, and as late as 1856 by an Indian tribe living northwest of Lake Huron. In the lake habitations of Switzerland have been found specimens of wicker-weaving work consisting of strands of untwisted fibre, probably hemp, bound together by transverse strands wattled in among them; and in the same localities have been found specimens of the same kind of weaving but of a progressively higher and finer type. There is even a genetic relation between the arts of basket-making and pottery, proved by specimens of rude pottery found in all quarters of the world: in these are seen the impresses of the basket-work on which the clay was molded and which was burnt away in the kiln. Even after the art of molding the clay without the basket-work frame was invented, the potters seem to have imitated the markings left by it. Among the Indians of the Mississippi valley along the gulf, all pottery vessels of large size used to be modeled in baskets of willow or splints, which, being burnt off, their markings remained. Shields of basket-work covered with hide were in use among the Britons at the time of Cæsar's invasion, and similar shields are still employed by primitive peoples wherever they live in savage isolation. Boats, too, of basket-work, with a covering of hide (coracles), were used by the ancient Britons, and boats of the same type were seen by Herodotus (I. 194) navigating the Euphrates. These were of round form, without distinction of bow and stern, and similar boats are still in use on some rivers in India. On account of its lightness, combined with strength and durability, basket-work is preferred to joinery in the manufacture of various commodities, as window-screens, pony-carriage bodies, chairs, tables, etc. In South America the natives weave of rushes baskets capable of holding liquids, and those of Tasmania, now

extinct, used to weave of leaves water-tight vessels. The material most commonly employed in basket-making is the willow or ozier twig, and the production of this material is an important industry in France, Germany, Belgium, Holland, and Britain. The product of France and Britain is the most highly esteemed for firmness, toughness, and evenness; that of Germany is reputed inferior to the French; the Dutch product is in least esteem, being soft and pithy. Besides ozier twigs, a great variety of other materials are employed in basket-making. In this country coarse, strong baskets are made of shavings or long broad splits of various tough woods. In China and Japan the usual materials are bamboo and rattan, and the Chinese and Japanese excel in the manufacture of wares of these materials, their products being unrivaled for fineness, elegance, and finish; and some of their work, as in the encasing of the egg-shell porcelain of the Japanese is marvelous for the delicacy of the manipulation: even the examples seen in our marts, of common little porcelain saucers so encased in basket-work, are worthy of admiration for painstaking workmanship. The fronds of the Palmyra palm, originally employed in India in making «Cajan» baskets, now afford a staple material for use in the art throughout the world. So, too, *Phormium tenax,* native of New Zealand, which yielded to the natives of that country their peculiar basket-making material, is now employed in all countries for the same purpose.

Basket-making is one of the simplest of the mechanic arts; and the workman, in making baskets designed for use, not for ornament or to please the fancy, has no absolute need of tools or apparatus beyond those requisite for cutting the rods and interlacing them — a knife and a bodkin, with a mallet to beat them into place. The process can be learned in principle by inspection of a basket-maker at work in fashioning a basket from the foundation to the rim. Having provided a sufficient quantity of rods or splints of much greater length than the proposed dimensions of the finished work, he lays a number of them on the floor in parallel pairs at small intervals in the direction of the longer diameter of the basket: this is the woof, so to speak. Then these are crossed at right angles by two of the largest osiers, with their thick ends toward the workman, who sets his foot upon them; next, each of these is woven alternately over and under the lengthwise parallel pieces, and thus the parallel pieces are held fast; this is the «slath,» — the foundation. Now the end of one of the two transverse rods is woven over and under the lengthwise rods all round the bottom till that whole rod is worked in; and the same is done with the other transverse rod, and then additional long oziers are woven in till the bottom is of the required size. The bottom is now finished and work begins on the superstructure by driving the sharpened large ends of a sufficient number of long, stout oziers between the rods at the bottom from the edge toward the centre: these are the ribs or skeleton, being set up in the direction of the sides; between these ribs other rods are woven in till the structure reaches the desired height. To finish the edge the ends of the ribs are turned down over each other and thus compactly united. A handle is added by forcing two or three sharpened rods of the requisite length down through the weaving of the sides, close together, and pinning them fast a little below the brim; the rods are then either bound or plaited in any way the workman chooses.

Our North American Indians were once among the most expert basket-weavers in the world. Now only the older Indians know the art, and certain tribes whose work was incomparably fine and beautiful have already lost it. After much pauperizing under the abominable reservation system, it was decided that the Indians needed an industry to save them from sinking still lower. Lace-making, after Brussels and French patterns, was first superimposed on a Minnesota reservation, whence it has spread. Now, lace-making, which has been developed by the European woman, fits her like a glove; and quite as truly, basket-making fits the Indian like a moccasin. Yet the Indians have succeeded at making lace, for they have remarkable skill with the fingers. An enlightened administrator of Indian affairs has taken up the task of human development in the right way and has made plans to revive basket-making by introducing it into the Government Indian schools, where the children, who now know nothing of this beautiful art, may learn from the only masters capable of teaching them — their own people, directed by white teachers who know the needs of the constantly widening market. Hundreds of thousands of dollars' worth of baskets are imported from Japan and Germany every year — money which by every right should be earned by our capable and needy Indians; and better than the money they will earn is the satisfaction of doing what they do with surpassing skill.

Basket-ball, a distinctly American game. Its history begins in 1891, when a lecturer in psychology at the Young Men's Christian Association Training School in Springfield, Mass., suggested, as an exercise of inventiveness, a game that would comply with certain conditions. One of his pupils, James Naismith, taking note of the hypothetical conditions indoors,— limited area, limited number of contestants, equally applicable to either sex, etc.,— applied his mind to meet those conditions, and invented « basket-ball.»

It is played on a marked oblong square containing not more than 3,500 feet of actual playing-space, by teams of five each, known respectively as centre, left, and right forwards, and left and right backs. The ball is round and inflated, not less than 30 nor more than 32 inches in circumference, and very like that with which «Association» foot-ball is played. The goals are hammock nets of cord, suspended from metal rings 18 inches in diameter, and placed 10 feet from the ground, in the centre of the ends of the playing-space. The time of playing, for seniors, is two halves of 20 minutes, with an interval of 10 minutes; and for juniors, two halves of 15 minutes, with a similar interval. No kicking of the ball with the foot, or hitting with the fists, is permitted; the ball must be held by the hands only.

For rules, and much other necessary information for actual playing, consult Hepbion's 'Official Basket-Ball Rules.'

Basket-fish, a name given about 1670 by John Winthrop, governor of Connecticut, to the *Astrophyton agassizii.* It belongs to the

group *Euryalida*, and is allied to the sand-stars, but differs in the arms being much branched and ending in long slender tendrils which are so much interlaced as to suggest basket-work. It is very large, the disk being two inches across, and the entire animal often a foot in diameter. It lives off the coast of New England in from 10 to 100 fathoms of water. Other names are "Medusa's-head," and "Sea-basket."

Basket-worm. See BAG-WORM.

Baskett, James Newton, American zoologist: b. Kentucky, 1 Nov. 1849. He was graduated at the Missouri State University in 1872. He has devoted himself to the study of comparative vertebrate anatomy, with ornithology as a specialty. In 1893 he presented a paper on 'Some Hints at the Kinship of Birds as Shown by Their Eggs' at the World's Congress of Ornithologists in Chicago. Among his publications are 'The Story of the Birds'; 'The Story of the Fishes'; 'The Story of the Amphibians and Reptiles'; 'The Story of the Mammals'; 'At You-All's House' (a novel); 'As the Light Led' (a novel), etc.

Basking-fish, or **Basking-shark.** See SHARK.

Basle. See BASEL.

Basnage, bä-näzh, a family of French Protestants, remarkable for the number of able men and eminent writers whom it has produced.

1. NICOLAS, who, having espoused the doctrines of the Reformation, was compelled by persecution to take refuge in England, where he became the minister of a congregation at Norwich. When, by the accession of Henry IV., a better era began to dawn, he returned to his country and officiated, till his death, as minister of a church at Carentan.

2. BENJAMAN, son of the former: b. 1850; d. 1652. He succeeded his father in his charge, and held it for the long period of 51 years. He long held a prominent place among the reformers of France; presided in the assembly held at Rochelle in 1622; undertook the dangerous task of negotiating for English aid; traveled into Scotland to arouse the Protestant feeling in that country; and on his return took the lead in the important synods held at Charenton in 1623 and 1631, and at Alençon, in 1637. His principal work, entitled, 'Treatise on the Church,' is a good specimen of his talents.

3. HENRY DE FRANQUENAY: b. 1615; d. 1695. He was the youngest son of Benjamin, studied for the bar, and as a provincial advocate in Rouen long stood at the head of his profession. His eloquence, learning, and unsullied integrity secured him the esteem, not only of the Protestants, whose views he held, but even of those most violently opposed to him. His complete works, confined to juridical subjects, were published at Rouen in 2 vols. folio in 1778.

4. JACQUES, eldest son of Henri: b. Rouen, 1653; d. 1723. He is the best-known and perhaps the ablest member of the family. He studied theology at Geneva and Sedan, and in 1676 became minister of the Protestant Church at Rouen. In 1685 his church having been closed by decree of Louis XIV., he removed to Holland and officiated as minister, first at Rotterdam, and then permanently at The Hague. Among his works may be mentioned 'History of the Church,' 2 vols. folio; 'History of the Jews,' 15 vols. 12 mo.; 'Annals of the United Provinces,' 2 vols. folio; and 'The Holy Communion.'

Basques, bäsks, or **Biscayans,** in their own language, EUSCALDUNAC; a remarkable race of people dwelling in the southwest corner of France, and in the north of Spain, on both sides of the Pyrenees. They are probably descendants of the ancient Iberi, who occupied Spain before the Celts. The French Basques (Gascons) settled, at the end of the 6th century, on the north side of the Pyrenees, between those mountains and the Garonne. After long struggles they submitted to the kings of the Franks. Under the Carlovingian race they elected their own dukes, but after the extinction of that family they fell under the dominion of Aquitania in the 11th century, and with it under that of France in 1453. The Basques preserve their ancient language, former manners, and their national dances, and make admirable soldiers, especially in guerrilla warfare, to which their native temperament inclines, and their frequent expeditions in carrying on the smuggling, to which they are much addicted, inure them. They are good seamen, and were the first Europeans who engaged in the whale-fishery, which they have, however, long since relinquished. They occupy, in Spain, the provinces of Biscay, Guipuzcoa, and Alava; in France, the departments of the Upper and Lower Pyrenees, Ariége and Upper Garonne. See BISCAY.

Basrah. See BASSORA.

Bass, Edward, first Protestant Episcopal bishop of Massachusetts: b. Dorchester, Mass., 23 Nov. 1726; d. Newburyport, Mass., 10 Sept. 1803. He was graduated at Harvard in 1744; was ordained in England in 1752; and later became pastor of the church at Newburyport, Mass. During the Revolution he omitted from the church service all reference to the royal family and the British government. For this he was expelled from the Society for the Propagation of the Gospel. In 1797 he was consecrated bishop of Massachusetts, and finally also of New Hampshire and Rhode Island.

Bass, Michael Thomas, English brewer: b. 1799; d. 1884. He became head of the Burton brewing firm of Bass & Company upon the death of his father, and was a member of Parliament from 1848 to 1883. His benefactions were very numerous, and included the building and endowing of St. Paul's Church, Burton (the total expenditure on the parish being about $500,000); and the establishment of recreation grounds, a free library, and swimming baths for Derby, at a cost of $185,000. Of simple tastes, he more than once declined a baronetcy and a peerage.

Bass, the name of various trimly shaped, active, gamy fishes of both fresh and salt water, mostly in northern regions. The term was originally applied to the *Morone labrax* of the west coast of Europe, and was thence transferred to many other fishes having a real or fancied likeness to this in appearance and qualities. This fish represents the sea-perch family, *Serranidæ*, is perch-like in form, usually 12 to 18 inches long, and frequents the shoal shore-waters in great numbers, being noted for its fierceness and voracity. Its flesh is excellent. The same family and genius are represented in North America by many species, of which the

nearest relative is the yellow bass (*M. interrupta*) of the southern Mississippi valley. It is a brassy-yellow with seven very distinct black longitudinal lines, those below the lateral line being interrupted posteriorly, the posterior parts alternating with the anterior. Its body is oblong-ovate with the back much arched. The dorsal fin and anal spines are stout. It is a light fish for its length, ordinarily weighing one to two pounds, but often measuring 12 to 18 inches, and weighing five pounds. It is very gamy, and is esteemed by some anglers the equal of the black bass in this respect.

In the same family falls the well-known striped bass or "rock fish" (*Roccus lineatus*), of the northeastern Atlantic, which approaches the coast and enters fresh water only at spawning-time, when its ascends the rivers. It was absent from the Pacific coast until planted there artificially, since which it has multiplied from Puget Sound to lower California. The largest fish are to be found in Chesapeake Bay, where they average from 30 to 50 pounds in weight, and occasionally reach double that. In color they are brassy-olive, the fins and sides rather pale, and the latter marked with seven or eight blackish stripes. The favorite way of fishing for the striped bass is by casting a "squid" through the surf, using as a bait pieces of clam, shrimp, or crab; but they will rise to a fly; and on the Pacific coast are easily lured by a shining spoon-bait.

The white bass (*R. chrysops*) is a near relative of the striped bass, and inhabits the Great Lakes from the St. Lawrence to Manitoba, and southward in the Mississippi valley to Arkansas. Its preference is for still waters, and it is even lighter in weight for length than the yellow bass. It is generally taken with bait, though it will rise to the fly. It is silvery in its color, tinged with golden below, with dusky lines along the sides.

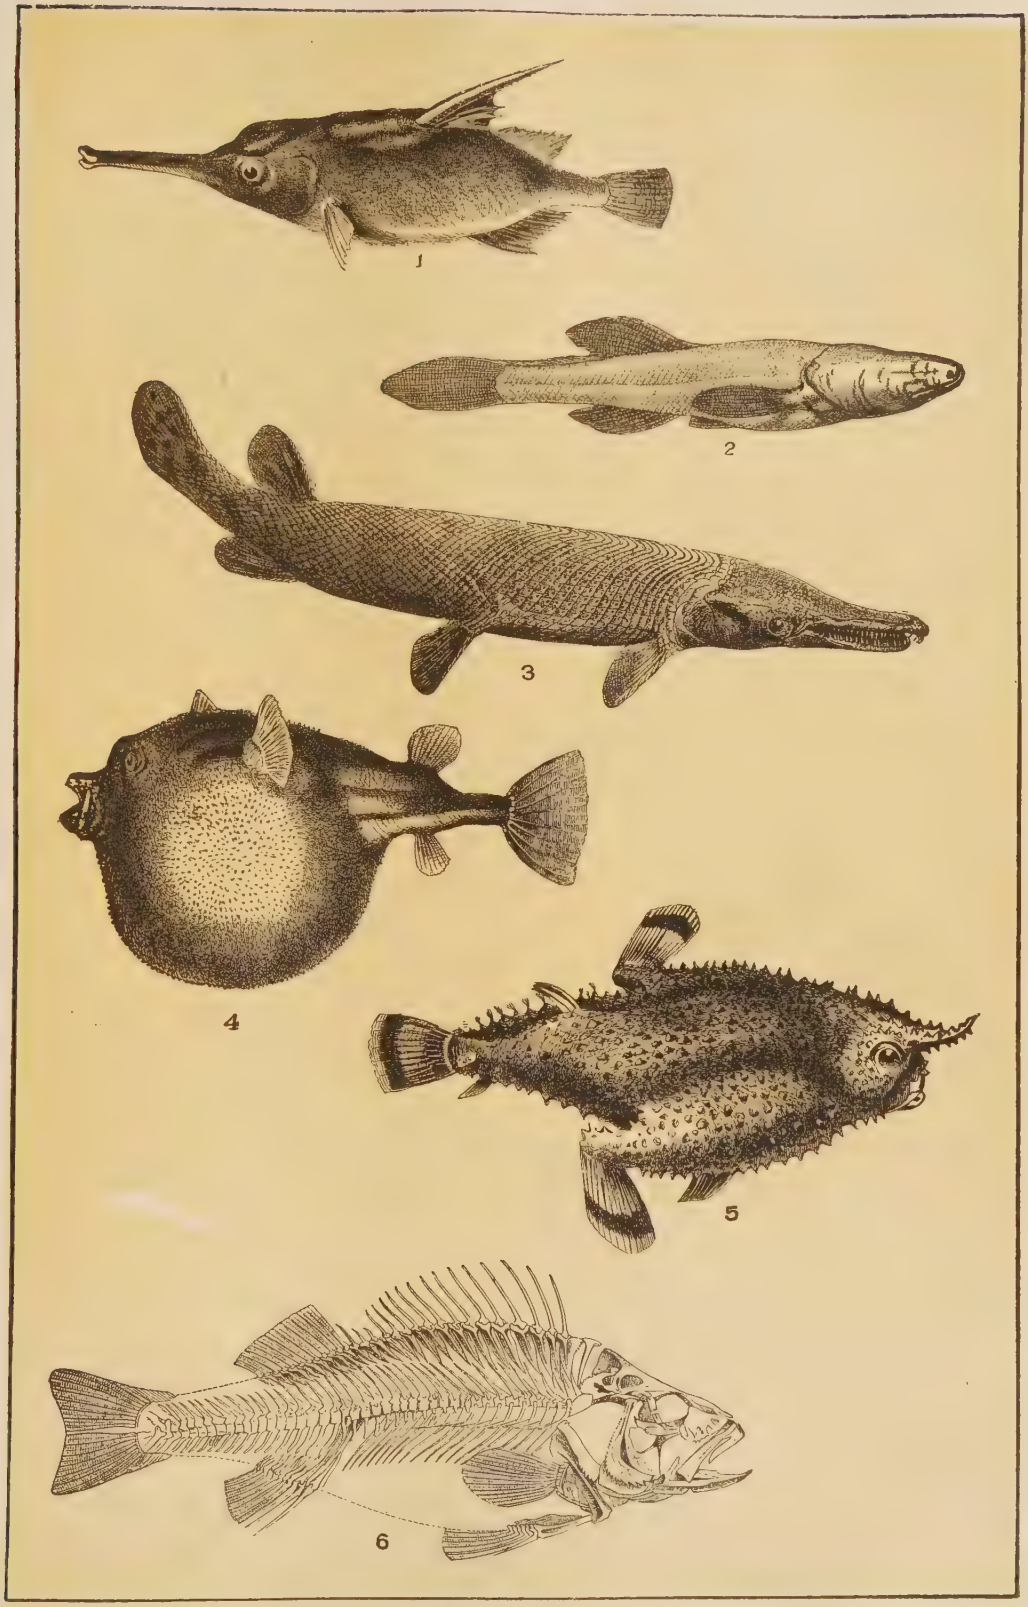
The most important of the American fresh-water bass are the black bass — two species of percoid game fishes of the distinctly American family *Centrarchidæ,* which also contains the various sunfish (q.v.). One is the "big-mouthed" and the other the "small-mouthed" black bass. Both were originally confined to the waters of the upper Mississippi valley, and Great Lakes region, but in 1853 they were introduced into the head waters of the Potomac River, whence they have spread into all the rivers that empty into Chesapeake Bay. More recently bass have been introduced into New England and into many of the far western States; as well as transported into England, France, Germany, and other countries. The body is oblong, compressed, the back not much elevated, head oblong-conic, lower jaw prominent, teeth on jaws, vomer and platines in broad villiform bands, the inner depressible, usually no teeth on tongue. Black bass vary greatly in size in different waters. The small-mouthed, however, seldom exceeds six pounds in weight, while the large-mouthed, especially in the South, is larger, running as high as 14 pounds. In color both are dull golden-green with a bronze lustre, the scales on the cheeks are more minute than those on the body, and the dorsal fin is deeply notched. In the small-mouthed species (*Micropterus dolomieu*) the maxillary does not extend beyond the eye, and the scales on the cheek are arranged in 17 rows. In the large-mouthed (*M. salmoides*) the maxillary extends beyond the eye and there are but 10 rows of scales on the cheeks. The lateral line in both is nearly straight, passing from the upper edge of the gill-cover to the centre of the base of the caudal fin. The small-mouthed has the wider range, extending from the Red River of the North to Texas and Mexico. Both varieties are free, but capricious, biters, and both are game fighters. They are taken with artificial flies, such as the "Rube Wood," "Seth Green," "silver doctor," and "Parmachenee bell," as well as by casting with a wide range of natural baits, such as crayfish, minnows, worms, and small frogs; or they may be taken by trolling from a boat, using a stiff rod, especially in lakes, with any standard silver or golden spoon-bait. In some districts the large-mouthed bass is called "straw" bass; in others "slough," "lake," "marsh," or "Oswego" bass, or "green trout," "welchman," etc.

Another species deserving mention is the "rock-bass," one of the sunfish (*Ambloplites rupestris*), found in practically every lake, pond, and stream east of the dry plains. It does not usually attain more than half a pound in weight, is easily caught, and is the least persistent fighter of any of the family. In color it is mottled-olive or brassy-green.

Consult: Henshall, 'Book of the Bass' (1889); and Jordan and Evermann, 'American Food and Game Fishes' (New York 1902).

Bass, bās (It. *basso,* deep, low), the lowest part in the harmony of a musical composition. It is the most important of all the parts, the foundation of the harmony, and the support of the whole composition. Different forms of bass are: *Basso concertante,* or *Basso recitante,* the bass of the little chorus; the bass which accompanies the softer parts of a composition, as well as those which employ the whole power of the band. This part is generally taken by the violoncellos. *Bass-counter* or *contra-bass,* the under bass; that part which, when there are two basses in a composition, is performed by the double basses, the violoncellos taking the upper bass or *basso concertante. Basso repieno* (Ital.), the bass of the grand chorus; that bass which joins in the full parts of a composition, and, by its depth of tone and energy of stroke, affords a powerful contrast to the lighter and softer passages or movements. *Figured bass,* a bass which, while a certain chord or harmony is continued by the parts above, moves in notes of the same harmony. *Fundamental bass,* that bass which forms the tone or natural foundation of the harmony, and from which that harmony is derived. *Ground bass,* a bass which starts with some subject of its own, and continues to be repeated throughout the movement, while the upper part or parts pursue a separate air and supply the harmony. *Thorough bass,* the system in which words are denoted by placing figures over the bass note. *Bass clef,* the character put at the beginning of the stave, in which the bass or lower notes of the composition are placed, and serving to determine the pitch and names of those notes.

Bass (bās) **Rock,** a remarkable trap-rock island, at the mouth of the Firth of Forth, three miles from North Berwick. It is of circular shape, about a mile in circumference, and rises precipitously to a height of 420 feet. It is inac-



1. Bellows Fish (Centriscus scolopax).
2. Cave Fish (Amblyopsis spelaeus).
3. Bill Fish (Lepidosteus osseus).
4. Balloon Fish (Tetrodon fahaka).
5. Bat Fish (Malthe vespertilio).
6. Skeleton of a Bass (Perca fluviatilis).

cessible except on one flat shelving point on the southeast. Its summit is estimated at about seven acres, and this supports a few sheep, the mutton of which is considered a great delicacy. Solan geese and other sea-fowl in myriads cover its rocks, and fly around it in clouds. The surrounding water is of great depth on the northeast, but shallow on the south. Among the historical ruins on the island are the remains of a fortalice commanding the landing-place, capable of accommodating upward of 100 men, formerly accessible only by ladders or buckets and chains; and the ruins of a chapel about halfway up the acclivity. The Bass was purchased by the English government in 1671, and its castle, long since demolished, was converted into a state prison in which several eminent Covenanters were confined. It was the last place in Britain that held out against William III., its small band of gallant defenders yielding only to starvation. The island anciently belonged to a family of the name of Lauder, whose head was styled Lauder of the Bass.

Bass (băs) **Strait,** a channel beset with islands, which separates Australia from Tasmania, 120 miles broad, discovered by George Bass, a surgeon in the British navy, in 1798.

Bass (bās) **Viol,** a stringed instrument resembling the violin in form, but much larger. It has four strings and eight stops, which are subdivided into semi-stops, and is played with a bow. See VIOL.

Bas'sa, Africa, a district on the west coast forming part of the negro state of Liberia (q.v.).

Bassanio, bä-sä'nĕ-ō, the lover of Portia in Shakespeare's 'Merchant of Venice.'

Bassano, băs-sä'nō, **Hugues Bernard Maret, Duc de,** French publicist and statesman: b. Dijon, 1763; d. 1839. On the first outburst of the French Revolution he enthusiastically embraced its principles, published the *Bulletin de l' Assemblée,* and soon after was appointed editor of the *Moniteur.* He became acquainted with Bonaparte, and was made by him chief of division in the ministry of foreign affairs. In 1811 he was created Duke of Bassano and appointed minister of foreign affairs; and in 1812 he conducted and signed the treaties between France, Austria, and Prussia, preparatory to the fatal expedition to Russia. When the emperor was sent to Elba in 1814, Bassano retired from public life; but immediately after Napoleon's return he joined him, and was very nearly taken prisoner at Waterloo. On the emperor's final overthrow Bassano was banished from France, but at the Revolution of July 1830 he was recalled and restored to all his honors. In 1838 he was made minister of the interior and president of the council, but the ministry of which he formed a part survived only three days.

Bassano, Jacopo, (real name GIACOMO DA PONTE), Italian painter: b. Bassano (whence his surname), 1510; d. 1592. He painted historical pieces, landscapes, flowers, and portraits; among the latter those of the Doge of Venice, of Ariosto, Tasso, and other persons of eminence. Several of his best works are in the churches of Bassano, Venice, Vicenza, and other towns of Italy. He left four sons, all painters, of whom Francesco was the most distinguished.

Bassano, Italy, a city in the province of Vicenza, on the Brenta (lon. 11° 43′ E.; lat. 45° 46′ N.). Its 30 churches contain beautiful paintings. A stone bridge, 182 feet long, unites the town with the large village Vincantino. Vines and olives are cultivated in the vicinity and there is considerable trade in silk, cloth, and leather. Its principal manufactures are straw hats, porcelain, and wax. Napoleon made Bassano a duchy, with 50,000 francs yearly income, and granted it to his minister of foreign affairs, Maret (see BASSANO, HUGUES). Near Bassano, 8 Sept. 1796, Bonaparte defeated the Austrian general Wurmser. Bassona was the birthplace of the famous printer Mauritius, as well as of the historical painter Giacomo da Ponte (see BASSANO, JACOPO), and a short distance away lies the village of Possagus, the birthplace of Canova. Pop. (1902) 15,443.

Bassein, băs-sān', India, a decayed town in the presidency of Bombay, at the south end of a small island of the same name, 28 miles north of Bombay, and separated from the Island of Salsette by a narrow channel. It was fortified by the Portuguese in 1536, and remained in their possession until captured by the Mahrattas in 1739. During this period it rose to be a fine and wealthy city of over 60,000 inhabitants, with many stately buildings, including a cathedral, 5 convents, 13 churches, and handsome private residences. Pop. (1901) about 11,000.

Bassein, Burma, a town in the Irrawaddy division on the left bank of the Bassein River, one of the mouths of the Irrawaddy, with a suburb on the right bank; lat. 16° 46′ N.; lon. 94° 48′ E. The English fort with the court-houses, treasury, police-office, etc., are on the left bank. In the suburb on the right bank are the rice-mills and store-yards of the principal merchants. The river is navigable up to the town for ships of the largest burden, and Bassein is now a place of considerable trade, exporting large quantities of rice, and importing coal, salt, cottons, etc. It is the seat of a consul of the United States. Pop. about 30,000.

Basselin, bäs-lăn, or **Bachelin, Oliver,** French poet: b. Val-de-Vire, Normandy, about 1350; d. about 1419. It has been asserted that the vocabulary of theatrical and poetical literature is indebted to him for the word «vaudeville.» He seems to have been a cloth-fuller or presser, much given to versified narration and iteration of convivial themes in rhymed fragments dubbed *vaux-de-vire* in honor of the poet's birthplace. In the 'Book of New Songs and Vaux-de-Vire' (1610) appears a collection of these bacchanalian stanzas, the most touching of which is addressed by the singer 'To My Nose,' the rubescence thereof being tastefully and exquisitely celebrated.

Basses-Alpes, bäs-ălp («lower Alps»), a department of France, on the Italian border. See ALPS.

Basses-Pyrénées, bäs-pē-rā-nā («lower Pyrenees»), a French department bordering on Spain and the Bay of Biscay. See PYRENEES.

Basset, a game of cards, formerly much played, especially in France. It is very similar to the modern faro. Severe edicts were issued against it by Louis XIV., and it was afterward played under the name of *pour et contre.* De

Moivre, in his 'Doctrine of Chances,' has calculated many problems connected with this game.

Basset-horn, a wooden wind-instrument (called also CORNET by reason of its curvature), believed to have been invented in Passau in 1770. It was afterward perfected by Theodore Lotz in Presburg. It is, properly considered, an enlarged clarinet; and, notwithstanding the difference of its form, it resembles that, not only in its qualities and tone, but also as regards its intonation, the mode of holding it, and fingering; so that every clarinet player can perform on it. Besides the mouthpiece it is formed of five pieces — the head-piece, two middle pieces, the trunk, and the bell, the last of which is usually of brass. It differs from the clarinet chiefly in having four additional low keys worked by the thumb of the right hand. Its compass is three and a half octaves, from lower F in the bass to double C of the treble. It is seldom used in the orchestra; though it is found in Mozart's 'Requiem' and some other pieces. It may also be used as a bass instrument.

Basset-hound, a dog with many hound-like characteristics, somewhat used for rabbit-hunting, clumsy in shape, and allied to the dachshund (q.v.). Its head is as massive and solemn-looking as that of a bloodhound, which it also resembles in the length of its ears. Its body is as bulky as that of a foxhound, to which it is also similar as regards color, hair and form, save that its fore legs are but four inches high and crooked at the knee. Below this point is a wrinkled ankle terminating in a massive paw, each toe of which stands out distinctly. Its coat is short, smooth, and fine, with the gloss of a thoroughbred race-horse; and its colors are black and white and tan. In weight it varies from 40 to 45 pounds. It is probably of French origin.

Basseterre, bäs-tār, the name of two towns in the West Indies. (1) The capital of the Island of St. Christopher's, a seaport situated at the mouth of a small river, on the south side of the island, and on the edge of the fertile vale of Basseterre, a tract yielding rich crops of sugar and fruits. The town was destroyed by fire in 1867, but has been rebuilt with better houses and wider streets than before. It is a place of considerable commercial importance, with a population of about 8,000. (2) The capital of the Island of Guadaloupe, situated near the south end of the island, and consisting of one principal long street stretching along the seashore. It is defended by forts Royal and Matilda. The anchorage is unsheltered and exposed to a constant swell. Pop. about 10,500.

Bas'sett, James, American missionary: b. Hamilton, Canada, 31 Jan. 1834. He was graduated at Wabash College 1856, and at Lane Theological Seminary 1859; was chaplain in the Union army 1862–3; and later pastor of Presbyterian churches in Newark and Englewood, N. J. In 1871 he went to Persia as a missionary, and in a short time acquired such a familiarity with the language that he composed a volume of hymns in Persian ('Teheran,' 1875; 1884). Other of his writings are: 'Among the Turcomans' (contributed to the 'Leisure Hour,' 1879–80); 'Note on the Simnuni Dialects ('Journal of the Royal Asiatic Society,' 1884); 'Persia, the Land of the Imams' (N. Y. 1886). He has also translated the Gospel of St. Matthew into Gaghatti Tartar (London 1880).

Bassett, John Spencer, American historian: b. Tarboro, N. C., 10 Sept. 1867. He was graduated at Trinity College, Durham, N. C., in 1888, and took Ph.D. at Johns Hopkins in 1894. His works include 'Constitutional Beginnings in North Carolina'; 'Slavery and Servitude in the Colony of North Carolina'; 'Anti-Slavery Leaders of North Carolina'; 'Slavery in the State of North Carolina'; 'The War of the Regulation,' etc. In 1900 he was professor of history in Trinity College, N. C.

Bassford, William Kipp, American musician: b. New York, 23 April 1839. He has composed many songs and pianoforte numbers: as, Mass in E flat (1894), and a two-act opera, 'Casilda,' still in manuscript. He completed the opera 'Estrella,' left unfinished by the composer, William Vincent Wallace, at his death.

Bassi, bäs'sē, **Laura Maria Caterina,** Italian philosopher: b. Bologna, 29 Oct. 1711; d. 20 Feb. 1778. She received a doctor's degree as an acknowledgment of her attainments, and delivered public lectures on experimental philosophy. She also lectured in the Philosophical College, where she was appointed professor. Her correspondence with the most eminent scholars of Europe was very extensive. She married Giuseppe Verrati in 1738 and had several children.

Bassi, bäs'sē, **Ugo,** Barnabite monk, and distinguished Italian patriot: b. Cento, in the Roman states 1804, of an Italian father and Greek mother. He was much distinguished among the brethren for his extraordinary learning and talents. The liberality of his political opinions, however, rendered him obnoxious to the papal court, and he was sent into exile in Sicily, from which he returned on the accession of Pius IX. in 1846. On the breaking out of the Lombard revolution in 1848 he greatly distinguished himself by his valor in battle and his untiring services in the hospitals. On the capitulation of Treviso he went to Venice, where he fought in the ranks against her Austrian besiegers. Thence he went to Rome and joined Garibaldi's legion as chaplain. On the fall of Rome he was one of those who followed Garibaldi when he made a last attempt to fight his way to Venice, which still held out against the Austrians. The little band was, however, dispersed and cut up by Austrian troops, and Garibaldi himself escaped with great difficulty. Bassi was taken prisoner, carried to Bologna, and condemned to death 18 Aug. 1849. He was the author of a work on 'The Church After the Image of Christ,' and an unfinished poem called 'Constantine, or the Triumph of the Cross.' His talents were universal. He was an accomplished musician and composer, wrote his own language in remarkable perfection, and was a perfect master of Greek, Latin, English, and French. He was equally remarkable for his personal beauty and his eloquence as an *improvisatore,* while his memory was so prodigious that he is said to have been capable of reciting the whole of Dante's 'Divina Commedia.'

Bassia, a genus of tropical trees found in the East Indies and Africa, of the natural order *Sapotaceæ.* One species (*B. parkii*) is supposed to be the shea-tree of Park, the fruit of which

yields a kind of butter that is highly valued and forms an important article of commerce in the interior of Africa. There are several other species, of which *B. longifolia,* or Indian oil-tree, and *B. butyracea,* or Indian butter-tree, are well known examples, yielding a large quantity of oleaginous or butyraceous matter. The wood is as hard and incorruptible as teak. See also BUTTER-TREE.

Bassompierre, bä-sôñ-pē-ār, **François** (fräṅ-swär) **de,** marshal of France, one of the most distinguished men of the courts of Henry IV. and Louis XIII., descended from a branch of the house of Clèves: b. Lorraine, 1579; d. 1646. In his youth he studied philosophy, jurisprudence, medicine, and the military art. After traveling through Italy he appeared at the court of Henry IV., where his taste for splendor, play, and gallantry soon made him conspicuous. In 1600 he made his first campaign against the Duke of Savoy, and fought with equal distinction in the following year against the Turks. His love of France soon called him back; he aspired to the hand of the daughter of the Constable de Montmorency, whose charms had excited the most violent passion in Henry IV. Bassompierre yielded to the solicitations of his king and renounced his intended union with her. In 1622 Louis XIII. appointed him marshal of France, and became so much attached to him that Luynes, the declared favorite, alarmed at his growing influence, insisted upon his removal from court. Bassompierre therefore accepted an embassy, and held this position successively in Spain, Switzerland, and England. After his return he entered again into the military service and was present at the siege of Rochelle and Montauban. Cardinal Richelieu, who soon after obtained entire control of the king and the country, feared the boldness of Bassompierre and his secret connection with the house of Lorraine; and the machinations of the latter served him as a pretext for sending Bassompierre, in 1631, to the Bastille, from which he was not released till 1643, after the death of the cardinal. During his detention he occupied himself with his memoirs (first published at Cologne, 1665), and the history of his embassies in Spain, Switzerland, and England, which sheds much light on the events of that time.

Bassoon′, a wooden reed instrument which forms the natural bass to the oboe, serving as a continuation of its scale downward. The reed is fixed to a crooked mouthpiece issuing from the side of the bassoon. The holes are partly closed by the fingers, partly by means of keys. It was formerly used as an accompaniment to the oboe, but it is now so far improved with keys as to be susceptible of being played solo. Its compass is more than three octaves, from low B flat to A flat in the treble; but its scale is complicated, and much depends upon the player and even upon the individual instrument. It consists of four tubes (besides the mouthpiece), bound together somewhat like a fagot. Hence the Italians term it *fagotto,* and from them the Germans *fagott.* It forms, when put together, a continuous tube about eight feet long, but as the bore is bent abruptly back on itself its height is only about four feet. In music designed for wind-instruments it often forms the bass. It is capable of very fine effects, and has been much employed by some of the best composers, sometimes as a tenor or even alto instrument.

Bassora, bäs-sō′rä, or **Basrah,** bäs′rä, Turkey, a city situated between two and three miles on the west side of and on a navigable canal leading from the Shat-el-Arab, as the united stream of the Tigris and Euphrates is called, about half way between the Persian Gulf and the junction of the two rivers. The Shat-el-Arab is navigable for vessels of 500 tons to Bassora, 70 miles. Merchants from Arabia, Turkey, Armenia, and Greece, also Jews and Indians, reside here, and it is the station of a United States consul. The Arabs are more numerous than the Turks, and their language is chiefly spoken. The city is surrounded by a wall about 10 miles in circuit, 20 to 25 feet thick. The houses are generally mean, partly constructed of clay, and the bazaars are miserable edifices. A considerable trade is carried on. Mail steamers run between Bombay and Bassora, and there are also other steamers trading here. Dates form the principal export; camels and horses, galls, gum, carpets, wool, and wheat are also exported; total exports over $5,000,000 annually. The imports are coffee, rice, spices, textiles, etc. The trade of the interior is conducted by means of caravans. The town is dirty and unhealthy; the environs are very fertile. The modern Bassora arose in the 17th century, and does not occupy the site of the older town, whose ruins lie about nine miles southwest of it. Pop. about 30,000. The vilayet of Bassora has an area of 16,482 square miles, and a population of about 200,000.

Bassora Gum, a gum brought from Bassora; supposed to be derived either from a cactus or a mesembryanthemum.

Bassorin, a kind of mucilage found in gum tragacanth (sometimes called adraganthin), which forms a jelly with water but does not dissolve in it. A clear, aqueous-looking liquid, apparently of the nature of Bassorin, exists in the large cells of the tubercular roots of some terrestrial orchids of the section *Ophyreæ.* It is formed of minute cells, each with its cytoblast; the whole being compactly aggregated in the interior of the parent cell.

Bassville, bäs-vēl, **Nicolas Jean Hugon de,** French journalist and diplomatist. As editor of the *Mercure National* he attracted attention to himself and was appointed secretary to the legation at Naples in 1792. Soon after this he was despatched to Rome, where he was killed, in 1793, by the populace for attempting, under orders of the French government, to oblige all French residents to wear the tricolor cockade. The death of Bassville has furnished the subject for many compositions in both prose and verse, in French and Italian.

Basswood, the American linden, or lime-tree (q.v.).

Bast, or **Bass,** the thin layer of fibrous tissue formed by, but outside the layer of cambium (q.v.), or in popular phrase the inner bark of dicotyledonous shrubs and trees. Less frequently it occurs in the leaves and pith of dicotyledonous herbs and in the stems of certain monocotyledonous plants in which it is not easily distinguished from the wood. By extension the term is also applied to the phloem portion

of the vascular system (q.v.) of flowering plants and ferns. For the plant, as well as for mercantile purposes, bast is highly important, for until it becomes changed into wood, it conducts the elaborated food from the green tissue to regions of use or storage. The bast cells are disposed and developed variously in different plants; occurring in rows, wreaths, more or less spread bundles, or single within the parenchyma. In some plants bast is formed but once, in others every year. Some fibres are simple, others branched; some primary, others secondary; some ever limber, and some change to wood. They are most developed toward the outside of the stem. While young they contain a granulary liquid, which disappears by the thickening of their walls. Young bast cells when treated by a solution of iodine and chloride of zinc, become pale blue, the older ones violet, the full-grown pink. Thickened cells are plainly stratified, and their walls often become contiguous by the disappearance of the cavity. The walls exhibit various designs, spiral or other lines, more or less constantly, according to the species of the plant. By microscopical examination and chemical analysis the nature of the various fabrics made of bast may be determined. Thomson and F. Baur have thus demonstrated the sheets around Egyptian mummies to be of linen. The degree of contraction, of twisting, the length, density, and form of the single cells of the bast vary in different plants. They are very long in flax, hemp, in some nettles, spurges, etc., very short in cinchona. Cotton consists of long hairs, and not of bast cells, which it very much resembles otherwise. The bast cells of monocotyledenous plants are mostly lignified. They conduct elaborated food but a short time, become filled with air, and thus dead to the plant. The unlignified are very hygroscopic and often contain chlorophyll. No bast cell has pits, but the coniferæ have sieve pores or canals. The uses of bast are manifold. Flax bast is soft, flexible, seldom with swellings; hemp bast is very long, stiffer and thicker than flax, more stratified; nettle (*Urtica dioica*) bast resembles cotton, has swellings and is thicker than hemp. Branched and lignified bast cells of great beauty are found in the mangrove tree (*Rhizophora mangle*) and the secondary ones of *Abies pectinata*. Among the monocotyledonous bast fibres, those of the New Zealand flax (*Phormium tenax*) are the most remarkable, being formed in bundles near the margin of leaves. They resemble hemp, are very white, sometimes yellowish, very long, and contain much lignin, in consequence of which they are somewhat stiff, but very tough and fit for stout ropes. In palms a highly developed body of lignified bast surrounds the vascular bundles, while bast bundles are found also in the bark, leaves, and interior of the stem. A similar disposition exists in the *Dracaena reflexa*, and in some *Aroideæ*. Everybody knows the tenacity of the bast of the lime tree, which is hence called basswood. The Chinese grass-cloth is made of *Boehmeria nivea* or *B. tenacissima*. Manila hemp comes from *Musa textilis;* rice bags are made in East India from *Antiaris toxicaria*. From the use of bast in ancient times for writing upon, the Latin name of bast, *liber*, has been applied to designate book. See also Fibre; Flax; Hemp; Jute; Ramie.

Bast, in Egyptian mythology, a goddess represented with the head of a cat or lioness. Bubastis, in Egypt, was the city where she held a high place, similar to that of Neith in Sais. Nearly a million Egyptians made annual pilgrimages to her shrine. Great numbers of bronze images of Bast were purchased in Bubastis.

Bastable, C. F., Irish political economist: b. Charleville, County Cork, Ireland, 1855, and since 1882 a professor of political economy in Dublin University. He is the author of 'An Examination of Some Objections to the Study of Political Economy' (1884); 'The Commerce of Nations' (1892); 'Public Finance' (1895); 'The Theory of International Trade' (1897).

Bastar, a feudatory state of British India, joined with the Chanda district of the Central Provinces. It has an area of 13,062 square miles. Pop. (1891) 310,884.

Bastard, one begotten and born out of lawful wedlock, or born during wedlock where the husband was under the age of puberty, or where the husband had died at such a time that there was no possibility of his being the father, or where there was no possibility of access on the part of the husband on account of his absence from the country, or where the husband labored under a disability due to some natural infirmity.

The Romans distinguished two kinds of natural children — *nothi,* the issue of concubinage, and *spurii,* the children of prostitutes; the former could inherit from the mother, and were entitled to support from the father; the latter had no claims whatever to support. Both were often raised to all the rights of legitimate children by affiliation. The Athenians treated all bastards with extreme rigor. By the laws of Solon, they were denied the rights of citizenship, and a law of Pericles ordered the sale of 5,000 bastards as slaves. What rendered these regulations more severe was, that not only the issue of concubinage and adultery, but all children whose parents were not both Athenians, were considered bastards at Athens. Thus Themistocles, whose mother was a native of Halicarnassus, was deemed a bastard. The law, as might be expected, was often set aside by the influence of powerful citizens. Pericles himself had it repealed in favor of his son by Aspasia, after he had lost his legitimate children by the plague. The condition of bastards has been different in different periods of modern history. Among the Goths and Franks, they were permitted to inherit from the father. Thiery, the natural son of Clovis, inherited a share of his father's conquests. William the Conqueror, natural son of Robert I., Duke of Normandy, and of Arlette, daughter of a furrier of Falaise, inherited his father's dominions. He called himself *Willelmus, cognomento Batardus.* The celebrated Dunois styled himself, in his letters, the Bastard of Orleans. In Spain, bastards have always been capable of inheriting. The bastardy of Henry of Transtamare did not prevent his accession to the throne of Castile. In France, the condition of bastards was formerly very different in the different provinces. Since the Revolution, it has been regulated in a uniform manner by the general law of the kingdom. The *code civil* thus fixes their rights: If the father or mother leave legitimate descendants, the bastard is entitled to one third of the portion he would

have inherited had he been a lawful child; if the father or mother die without descendants, but leave ascendants, or brothers or sisters, he is then entitled to one half of such a portion; if the father or mother leave no ascendants nor descendants, nor brothers nor sisters, he is entitled to three quarters of such a portion; and if the father or mother leave no relations within the degrees of succession, he is entitled to the whole property. These regulations do not apply to the issue of an incestuous or adulterous connection.

By the common law of England, a child born after marriage, however soon, is legitimate, or at least he is presumed to be so; for one born in wedlock, and long enough after the marriage to admit of the period of gestation, may still be proved illegitimate, under some circumstances, and this is the general rule in the United States. According to the common law, a bastard is not the heir of any one; and, on the other hand, his only heirs are his children born in wedlock, and their descendants. According to the Roman law, one born out of wedlock might be legitimated by subsequent marriage and acknowledgment of his parents. In 1236 the English prelates proposed the introduction of the Roman law, in this respect, into England, to which the nobility made the celebrated reply, *Nolumus leges Angliæ mutare* (We are unwilling to change the laws of England). See Schouler, 'Treatise on the Law of Domestic Relations.'

Bastard Bar, the ordinary name given to the heraldic mark used to indicate illegitimate descent. Properly speaking, it is not a bar at all, which is a band stretching horizontally across the shield, but a baton sinister; that is, it stretches diagonally across the shield in the direction of the sinister chief and the dexter base, but is couped or cut short at the ends, so as not to touch the corners of the shield. This circumstance serves to distinguish the bastard bar from the bend sinister, as well as the fact that the former is only one fourth of the breadth of the latter. When belonging to the illegitimate descendants of royalty it may be of metal; but in other cases it must be of color, even when on another color. This mark in heraldry is of comparatively recent origin, bastards in earlier times, not having been allowed to bear the arms of their fathers. It cannot be removed until three generations have borne it, and not even then unless replaced by some other mark assigned by the king of arms, or unless the coat is changed. Sometimes permission was granted to a bastard or one of his descendants to bear it dexter instead of sinister, although he was not allowed to cancel it altogether.

Bastard of Orleans, the name given to the natural son of Louis, brother of Charles VI. of France, Jean Dunois b. 1402; d. 1468. On account of his exploits in the Hundred Years' war he was created Count of Orleans.

Bastarnae, the earliest Teutonic people mentioned in history. They migrated from the region of the Vistula to the Lower Danube about 200 B.C. See Keane, 'Man: Past and Present' (1899).

Bastia, the former capital of the island of Corsica, 98 miles northeast of Ajaccio by rail. It is badly built, has narrow streets, a strong citadel near the sea, and a spacious but not very well sheltered harbor. The inhabitants carry on a considerable trade in manufactured goods, hides, wine, oil, wax candles, liquors, and maccaroni. The stilettoes manufactured here are held in great esteem by the Italians. In 1745 Bastia was taken by the British, and in 1768 was united with France. On the new division of the French territories (1791) Bastia was made the capital of the department of Corsica, of which at present Ajaccio is the capital. Bastia is still, however, the commercial and industrial capital of the island and a United States consul is stationed here. Pop. (1900) 22,522.

Bastian, Adolf, German traveler and anthropologist: b. Bremen, 26 June 1826. He has made extended journeys throughout Australia, Asia, America, and West Africa at various periods of his career, and his explorations have been prosecuted in such widely sundered countries as Yucatan, New Zealand, and Persia. At the age of 70 he started on an exploring voyage to the Malay Archipelago. He has been professor of ethnology in the University of Berlin, director of the Museum für Völkerfunde, and in 1901 became editor of the 'Ethnographisches Notizblatt,' published in Berlin. His nearly 60 works deal with the various aspects of anthropology, his range being broad and his services in behalf of science of the greatest value. Among his many volumes may be named 'Der Mensch in der Geschichte' (1860); 'Ethnographische Forschungen' (1871–3); 'Der Buddhismus in seiner Psychologie' (1882); 'Der Fetisch an der Küste Guineas' (1884); 'Vorgeschichtliche Schöpfungslieder' (1893); 'Die Nikronesischen Kolonien' (1899–1900); 'Die Völkerkunde und der Völkerwerkehr' (1900).

Bastian, Henry Charlton, English physician and biologist: b. Truro, 26 April 1837. He obtained the degree of M.A. in 1861 from the University of London, graduating subsequently in medicine at the same university. In 1864–6 he was a medical officer in Broadmoor Criminal Lunatic Asylum, and in the latter year was appointed lecturer on pathology and assistant physician in St. Mary's Hospital. In 1867 he became professor of pathological anatomy in University College, and in 1878 he was also appointed professor of clinical medicine. In 1887–95 he was professor of the principles and practice of medicine. Apart from numerous contributions to medical and other periodicals, and to Quain's 'Dictionary of Medicine,' his works include 'The Modes of Origin of Lowest Organisms' (1871); 'The Beginnings of Life' (1872); 'Evolution and the Origin of Life' (1874); 'Lectures on Paralysis from Brain Disease' (1875); 'The Brain as an Organ of Mind' (1880), which has been translated into French and German; 'Paralysis: Cerebral, Bulbar, and Spinal' (1886); 'A Treatise on Aphasia and other Speech Defects' (1898). He is a recognized authority in the pathology of the nervous system and an advocate of the doctrine of spontaneous generation.

Bastiat, Frédéric, a distinguished French political economist: b. Bayonne, 19 June 1801; d. Rome, 24 Dec. 1850. He entered in 1818 the counting-house of his uncle at Bayonne, but he

felt no enjoyment in the routine of mercantile life, and in 1825 retired to a property at Mugron, of which he became possessor on the death of his grandfather. Thus withdrawn from society he devoted himself with eagerness to meditation and study, mastering the English and Italian languages and literatures, speculating on the problems of philosophy and religion, and digesting the doctrines of Adam Smith and Say, of Charles Compte and Dunoyer. In 1845 he came to Paris in order to superintend the publication of his 'Cobden et la Ligue, ou l'agitation Anglaise pour la liberté des échanges,' and was very cordially received by the economists of the capital; from Paris he went to London and Manchester, and made the personal acquaintance of Cobden, Bright, and other leaders of the league. When he returned to France he found that his writings had been exerting a powerful influence; and in 1846 he assisted in organizing at Bordeaux the first French Free Trade Association. He wrote in rapid succession a series of brilliant and effective pamphlets and essays, showing how socialism was connected with protection, and exposing the delusions on which it rested. While thus occupied he was meditating the composition of a great constructive work, meant to renovate economical science by basing it on the principle that "interests left to themselves tend to harmonious combinations, and to the progressive preponderance of the general good." The first volume of this work, 'Les Harmonies Économiques,' was published in the beginning of 1850. The life work of Bastiat, in order to be fairly appreciated, requires to be considered in three aspects. (1) He was the advocate of free trade, the opponent of protection. The general theory of free trade had, of course, been clearly stated and solidly established before he was born, and his desire to see its principles acted on in France was quickened and confirmed by the agitation of the Anti-Corn-Law League for their realization in England, but as no one denies it to have been a great merit in Cobden to have seen so distinctly and comprehensively the bearing of economical truths which he did not discover, no one should deny it to have been also a great merit in Bastiat. He did far more than merely restate the already familiar truths of free trade. He showed as no one before him had done how they were applicable in the various spheres of French agriculture, trade, and commerce. Now the abstract theory of free trade is of comparatively little value; its elaboration so as to cover details, its concrete application, and its varied illustration are equally essential. And in these respects it owes more, perhaps, to Bastiat than to any other economist. In the 'Sophismes Économiques' we have the completest and most effective, the wisest and the wittiest exposure of protectionism in its principles, reasonings, and consequences which exists in any language. (2) He was the opponent of socialism. In this respect also he had no equal among the economists of France. He alone fought socialism hand to hand, body to body, as it were, not caricaturing it, not denouncing it, not criticising under its name some merely abstract theory, but taking it as actually presented by its most popular representatives, considering patiently their proposals and arguments, and proving conclusively that they proceed on false principles, reasoned badly, and sought to realize generous aims by foolish and harmful means. Nowhere will reason find a richer armory of weapons available against socialism than in the pamphlets published by Bastiat between 1848 and 1850. These pamphlets will live, it is to be hoped, at least as long as the errors which they expose. (3) He attempted to expound in an original and independent manner political economy as a science. In combating first the protectionists and afterward the socialists, there gradually rose on his mind a conception which seemed to him to shed a flood of light over the whole of economical doctrine, and, indeed, over the whole theory of society, namely, the harmony of the essential tendencies of human nature. The radical error, he became always more convinced, both of protectionism and socialism, was the assumption that human interests, if left to themselves, would inevitably prove antagonistic and anti-social, capital robbing labor, manufactures ruining agriculture, the foreigner injuring the native, the consumer the producer, etc.; and the chief weakness of the various schools of political economy, he believed he had discovered in their imperfect apprehension of the truth that human interests, when left to themselves, when not arbitrarily and forcibly interfered with, tend to harmonious combination, to the general good. Such was the point of view from which Bastiat sought to expound the whole of economical science. The sphere of that science he limited to exchange, and he drew a sharp distinction between utility and value. Political economy he defined as the theory of value, and value as "the relation of two services exchanged." The latter definition he deemed of supreme importance. It appeared to him to correct what was defective or erroneous in the conflicting definitions of value given by Adam Smith, Say, Ricardo, Senior, Storch, etc., to preserve and combine what was true in them, and to afford a basis for a more consistent and developed economical theory than had previously been presented. It has, however, found little acceptance, and Roscher, Cairnes, and others seem to have shown it to be ambiguous and misleading. A consequence of it on which he laid great stress was that the gratuitous gifts of nature, whatever be their utility, are incapable of acquiring value — what is gratuitous for man in an isolated state remaining gratuitous in a social condition. Thus, land, according to Bastiat, is as gratuitous to men at the present day as to their first parents, the rent which is paid for it,— its so-called value,— being merely the return for the labor and capital which have been expended on its improvement. In the general opinion of economists he has failed to establish this doctrine, failed to show that the properties and forces of nature cannot be so appropriated as to acquire value. His theory of rent is nearly the same as Carey's, that is, decidedly anti-Ricardian. His views on the growth of capital and interest, on landed property, competition, consumption, wages, and population, are independent, and, if not unqualifiedly true, at least richly suggestive.

Bastide, Jules, French statesman: b. Paris, 21 Nov. 1800; d. 1879. Early a democrat, he could never cease to labor for the downfall of the Bourbon monarchy, and fought hard in the revolution of July 1830. He was also opposed to the Orleans monarchy. Condemned to

death for his share in the insurrection of 5 June 1832, he escaped from prison and fled to England, where he resided two years. He returned in 1834, and was acquitted. After the death of Armand Carrel he became chief editor of the *National* newspaper. This place he resigned in 1846 and founded the *Revue Nationale* in 1847. He rendered great assistance to Lamartine in the office of the ministry of foreign affairs, and was minister for foreign affairs from 10 May to 20 Dec. 1848. He retired to private life after the *coup d'etat* of 1852. He was the author of 'La république française et l'Italie en 1848' (1858); 'Guerres de religion en France' (1859).

Bastien-Lepage, bäst-yen'-le-päzh, **Jules,** French painter: b. Damvilliers, 1 Nov. 1848; d. 10 Dec. 1884. He studied under Cabanel, and early began to attract notice by his impressionist pictures in the Salon. Some of his more important works were 'In Spring,' 'The First Communion,' 'The Shepherds,' 'The Potato Harvest,' 'The Wheat-field,' 'The Beggar,' and 'Joan of Arc Listening to the Voices.' His most striking portraits were those of his grandfather, his father and mother, Sarah Bernhardt, André Theuriet, and the Prince of Wales. He was made a chevalier of the Legion of Honor in 1879. See Theuriet, 'J. Bastien-Lepage, l'homme et l'artist' (1885).

Bastile, the state prison and citadel of Paris, built to protect the palace of Charles V. against the incursions of the Burgundians, and destroyed by the mob in the beginning of the Revolution in 1789, after an existence of over four centuries. It was founded by Hugues d'Aubriot in 1369, and completed by the addition of four towers in 1383.

Lettres de cachet were issued in the name of the king, but the names of the individuals were inserted by the ministers, who were the depositaries of these letters. Of the origin of this custom we may perhaps find the explanation in Montesquieu's Esprit des Lois, where it is said, «Honor is the virtue of monarchies, and often supplies its place.» A nobleman was unwilling to be dishonored by a member of his family. Filial disobedience and unworthy conduct were probably not more uncommon among the nobility of France than elsewhere. But in such cases fathers and relations often requested the confinement of the offender until the head of the family should express a wish for his release. At first this privilege was limited to the chief families of the country. The next step was, that the ministers of government considered themselves entitled to the same privileges as heads of families among the nobility. If an offense was committed in their offices or households, which, if known, would have cast a shadow upon the ministers themselves, they arrested, *motu proprio,* the obnoxious individuals, and often made use of their privilege to put out of sight persons whose honest discharge of duty had excited their displeasure, or who were acquainted with facts disgraceful to the ministers themselves. It sometimes happened that no further examination of the prisoners was held, and the cause of their detention nowhere recorded. In such cases an individual remained in prison sometimes 30 or 40 years, or even till his death, because succeeding officers took it for granted that he had been properly confined, or that his imprisonment was required for reasons of state. The invention of the *lettres de cachet* immediately opened the door to the tyranny of ministers and the intrigues of favorites, who supplied themselves with these orders, in order to confine individuals who had become obnoxious to them. These arrests became continually more arbitrary, and men of the greatest merit were liable to be thrown into prison whenever they happened to displease a minister, a favorite, or a mistress. On 14 July 1789 the Bastile was surrounded by a tumultuous mob, who first attempted to negotiate with the governor Delaunay, but when these negotiations failed, began to attack the fortress. For several hours the mob continued their siege without being able to effect anything more than an entrance into the outer court of the Bastile; but at last the arrival of some of the Royal Guard with a few pieces of artillery forced the governor to let down the second drawbridge and admit the populace. The governor was seized, but on the way to the hôtel de ville was torn from his captors and put to death. The next day the destruction of the Bastile began, and a bronze column now marks its site. The event considered by itself was of no great national importance, but it marked the beginning of the French revolution.

Much exaggeration took place in relation to the discoveries said to be made in its demolition, especially those in relation to one Count de Lorges; but it is sufficiently established that there was no such person in existence, much less in the Bastile. No exaggeration, however, was needed. Seven persons only were found in its cells and dungeons; one, the Count de Solage, a prisoner since his 11th year; another, Tavernier, the son of Paris Duverney, who, after 10 years at the Isles Marguerites, had passed 30 years in the Bastile, and who reappeared on his liberation, bewildered, with a broken intellect, like a man awakened from a sleep of 40 years, to a new world compared with that on which he had closed his eyes. Records of horrors even worse than this were found inscribed on the registers of the prison. Two will suffice. They are the names of Father Theodore Fleurand, of Brandenburg, a Capuchin, retained many years on suspicion of being a spy; and of one Lebar, arrested at 76 and dead at 90 years. Nearly 50 years before Cagliostro scrawled on the walls of his cell: «The Bastile shall be demolished, and the people shall dance on the area where it stood.» This prophecy, at least, of the empiric and impostor, was realized to the letter. It was the Carmagnole which they danced about the liberty trees to the tune of the 'Ça Ira.' See Arnold, 'Histoire de la Bastile' (1845–59); Bingham, 'The Bastile' (1888); Funck-Brentano, 'The Bastile' (1900).

Bastinado, a punishment employed by the Turks, which consists of blows upon the back or soles of the feet, applied with a light wooden stick or with a knotted string.

Bastion, a flanking tower in mediæval fortification, from which archers and war machines could direct their projectiles on the storming enemy while he was held in check by the ditch. On the introduction of artillery into Europe towers were made considerably larger than formerly, and ultimately, in the beginning

of the 16th century, the Italian engineers made them polygonal instead of round or square, thus forming a bastion. This is an irregular pentagon, one side of which is turned inward toward the tower, so that the opposite salient angle faces the open field. The two longer sides, enclosing the salient angle, are called the faces; the two shorter ones, connecting them with the town wall or rampart, are called the flanks. The faces are destined to reply to the distant fire of the enemy, the flanks to protect the ditch by their fire. The first Italian bastions still showed their descent from the ancient towers. They kept close to the main walls; the salient angle was very obtuse, the faces short, and the parapet revetted with masonry to the very top. Bastions are built in very different ways. Some are entirely filled with earth; some have a void space inside; some are straight, some curved, some double, some have even three or four flanks, one over the other; some have *fausse-brayes*, or low ramparts of earth outside; sometimes they have casemates, destined for the retreat of the garrison, or for batteries; sometimes cavaliers or orillons, etc. In modern times, among the fortifications built according to the system of bastions, those on the plan of Cormontaigne and the modern French works, are considered best adapted for defense. They are spacious; the flank of the side bulwark, which is perpendicular to the prolongation of the face of the principal bulwark, is not farther distant than 300 paces from its point; it is also straight, and orillons and other artificial contrivances are banished.

Baston, Robert, English poet: b. in the 13th century near Nottingham; d. about 1320. He became prior of a Carmelite convent at Scarborough, and is said to have accompanied Edward II. into Scotland, with the view of celebrating the anticipated victories of his sovereign, but having been taken prisoner, was compelled to change his strain, and wrote in honor of Robert Bruce. Besides poetry he left several works in Latin, one entitled 'De Variis Mundi Statibus,' and another, 'De Sacerdotum Luxuriis.'

Bastwick, John, English physician: b. Writtle in Essex, 1593; d. 1654. He settled at Colchester, but instead of confining himself to his profession entered keenly into theological controversy, and in 1624 procured the publication in Holland of a treatise which he had written, entitled 'Elenchus Religionis Papisticæ,' which, as he declares on the title-page, he proves it to be neither apostolic nor catholic, nay, not even Roman. He afterward published 'Flagellum Pontificis et Episcoporum Latialium,' which acquired some notoriety as a fervid attack on Episcopacy in general, and attracted the attention of the high-commission court, who called the author before them, and condemned him to a fine and two years' imprisonment. Bastwick became more zealous than before, however, and published a defense addressed to the English prelates and a new "litany," in which his former offenses were boldly repeated. A second sentence mercilessly condemned him to a much heavier fine, to exposure on the pillory, the loss of his ears, and imprisonment for life. The ascendency of the Parliament in 1640 procured his freedom; the sentence was formally repealed, and the amount of the fines imposed on him was afterward refunded. He appears to have been a stanch Presbyterian, for in 1648 we find him attacking the Independents.

Basutoland, an English crown colony of South Africa, lying to the east of the Orange River Colony, and on the northeast of Cape Colony. The Basutos belong chiefly to the great stem of the Bechuanas, out of one of the chief branches of whom, along with the survivors of various other Caffre tribes, they have arisen. Their countenance is better formed than that of the negroes, although they have the flat nose, protruding lips, and woolly hair of the latter. Their figure is slender and well-proportioned, the color of their skin a very dark brown, and their disposition cheerful, mild, and pacific. Their land, called by themselves Lesuto, is very fertile, and is cultivated with great industry; but its fertility has long exposed them to the encroachments of their neighbors. Under their chief Moshesh, who died in 1869, they were raised from a state of utter barbarism to a certain degree of civilization, and the land was thrown open to missionaries. Being exposed, however, to constant attacks of their warlike neighbors, Moshesh was at last induced to request the English government to adopt them as subjects. This was acceded to, and in 1868 Basutoland was declared English territory, being annexed to Cape Colony in 1871. In 1884, however, Basutoland was placed under the direct authority of the home government. It has an area of about 10,300 square miles, and the exports, which consist chiefly of grain, cattle, and wool, in 1900 amounted to $669,320. Pop. (estimated) about 260,000. See Widdicombe, 'Fourteen Years in Basutoland' (1892); Barkley, 'Among Boers and Basutos' (1900); Bryce, 'Impressions of South Africa (1899).

Bat, one of a group (order *Cheiroptera*) of small mammals adapted to life in the air by the possession of wings formed of a membrane stretched between the greatly prolonged bones of the arm and hand. The general organization of bats allies them to the *Insectivora*. The bones of the spine, hinder limbs, and tail are of a normal character; the chest is much enlarged to admit of the increased size of the lungs and heart, necessary to the relatively violent exertion necessary to flight, the breast bone is keeled as in birds, and the muscles of the fore limbs are much enlarged. The fore limbs themselves consist of the normal number and arrangement of bones, but all are greatly elongated, especially those of the fingers, which are so lengthened out as often to be equal to the total length of the spine. The thumb, however, is comparatively small, stands at right angles to the other bones, and terminates in a strong claw of great service in clinging to supports. The whole extent of the arm and hand in the bats is inclosed within a membrane which consists of leathery skin, more or less furry upon the outside, which stretches between the fingers, arm bones and body, forming an extensible membrane, or parachute, and constituting an effective instrument of flight. In some bats a similar membrane (which is only an extension of the skin and is of double thickness) stretches from the heel of each hind foot, where it is supported by a bony spur, to the tip of the tail, but in many bats the tail is free from any such mem-

1. Flap-nose Bat (Rhinopoma microphyllum).
2. Pigmy Bat (Vesperugo pipistrellus) (natural size).
3. Water Bat (Vespertilio daubentonii).
4. Horse-shoe Nose Bat (Rhinolophus ferrum-equinum),

brane. The tail is very variable in length, but is never prehensile nor bushy. The hinder limbs of bats are peculiar in being twisted in such a way that the knee bends backward, making walking very difficult.

The membranous wings of the bat are not only an organ of flight, enabling it to perform feats in the air probably not exceeded by any bird or insect, but are also a means of informing the creature as to its surroundings. Bats are mainly nocturnal and their eyes, though highly organized, are very small, imbedded in fur and comparatively useless in the dark, yet no animal seems more thoroughly wide awake and able to take care of itself, even in almost complete darkness, than this one, which habitually lives in gloomy caves and seeks its food only after daylight has departed. The ability which it displays in catching its prey by extraordinary agility in pursuit, and in avoiding obstacles as it darts about among the trees, seem to be due largely to an extreme sensitiveness in the wings. These are not only supplied with a great number of blood vessels and nerves, but their surfaces abound in minute sense-organs, each the terminus of a nerve fibrilla. This armature has evidently arisen as an added means of information, giving the animal a sense of touch more exquisite than we know of elsewhere in the animal kingdom. The well-known experiments of the Italian Spallanzani toward the end of the 18th century, which have been verified by more recent investigations, make it plain that bats depend very largely upon these sense-organs in their wings to guide them in their devious flight through the darkness. It was found that bats whose eyes were sealed up with varnish, or even completely destroyed, made their way with apparent ease not only through dark rooms, but in places where strings had been stretched across the path in various directions, and other obstacles had to be avoided. These blinded bats never collided with such obstructions, but seemed able to approach a wall at ease, alight upon a perch, or even find a small cavity without apparently searching for it.

For a similar purpose of information many bats are furnished with extraordinary membranous appendages upon the nostrils and ears, which give to some of them the most grotesque appearance. In the large fruit-eating fox-headed bats of the East Indies, which are more nearly diurnal than any others, the ears are of no great size, and the nose is defended only by long hairs about the nostrils and eyelids; but in all the smaller, insect-eating, nocturnal bats, there arise upon the nostrils leaf-like appendages, sometimes very large and complicated, which resemble the leathery substance of the wings, and in such species, the ears are often several times larger in area than all the rest of the face. These great ears must not only collect sounds far too faint for us to hear, but their membranes are as nervous and sensitive as those of the wings, probably being able to feel degrees of density in the air entirely imperceptible to most other creatures.

Bats are divisible into two groups or sub-orders, the *Megachiroptera*, and the *Microchiroptera*. The first group contains the fruit-eating bats whose large size, reddish fur, and fox-like head have given them the name of flying foxes (q.v.). Their chief distinguishing feature, however, is the fact that the molar teeth are not tubercular but are marked with a longitudinal furrow. They live mainly upon fruit and are confined to the tropics of the Old World, and are all included in a single family, *Pteropodidæ*. The *Microchiroptera* have molars with sharp cusps adapted to cutting and crushing the insects upon which they mainly subsist. This group includes all of the ordinary bats, of which those most familiar in North America and Europe belong to the large and typical family *Vespertilionidæ*, of which nearly 200 species are named. Among the most numerous and widespread of the North American bats, are the large hoary bat (*Lasiurus cinereus*) of the north eastern States: but it keeps to the woods and is not often seen; it migrates to the southern States in winter. It is about 5.50 inches long. Another common bat of the woods is the smaller, silver-haired (*Lasionycterus noctivagans.*) The red bat (length 4.40 inches) is numerous in the Alleghanian region, inhabiting caves in great companies; but the "common" bat of the whole country east of the Rockies, is the little, glossy, brown familiar of our homes and gardens, as well as of the woods, which remains with us the year around, hibernating during cold weather in the hollow trees, caves, and crevices about buildings, where they make their home, and whence they emerge at night, to seek their prey about our farmyards and gardens. As the insects caught are mainly mosquitos and similar pests, and as they do no harm, they should be encouraged, rather than feared and persecuted. "Awake at the most," says Cram, "some four out of every 24 hours of their drowsy little lives, they never make any nests or even attempt to fix over the crannies where they hide, and where the little bats are born. These helpless little things are not left at home at the mercy of foraging rats and mice. When the old bat flits off into the twilight, the youngsters often go with her, clinging about her neck. . . . At times, she deposits them on the branch of a tree, where they hang, sheltered by the leaves."

The lower Mississippi Valley has a yellowish bat, called "big-eared" (*Corynorhinus macrotis*) which differs from the others in that its great ears are joined together by their bases in front.

For a systematic account of the bats of the world consult Dobson, 'Catalogue of Chiroptera in the British Museum' (1878), and his subsequent papers, mentioned in Flower's 'Mammalia' (1891). For North American forms consult H. Allen, 'Bats of North America' (Smithsonian Institution, Washington, 1893). For habits, etc., see the writings of Harlan, Audubon, Baird, Godman, E. A. Mearns, C. L. Herrick, G. S. Miller, and especially C. H. Merriam, 'Mammals of the Adirondacks' (Linnæan Society, New York, 1893); Stone and Cram, 'American Animals' (1902); Gosse, 'A Naturalist's Sojourn in Jamaica' (1851). See also Fox-bat; Fruit-bat; Leaf-nosed Bats; Vampire, and similar titles.

Bat-parasites. Besides bugs (see Bed-bug) certain very strangely modified wingless flies are in rare cases found living on bats in Africa and the East Indies. They are somewhat spider like, with a narrow eyeless head, though four ocelli are present in some species, which rests on the back of the thorax, while the legs are large, long, and sprawling, ending in large claws. They are only a line or two in length.

The larva is, like that of the sheep-tick (q.v.) and horse-fly (*Hippobosca*), very peculiar, the maggot being probably nourished in the dilated oviduct of the fly, then attaining its full growth, when it is expelled in the shape of a broad, short puparium, the skin being hardened by the excretion of chitin.

Batabano, bạ-tä-bạ-nō′, Cuba, a town in the province of Havana near the south coast, 37 miles from Havana, by rail. San Cristobal de la Habana was founded on the site of the modern Batabano by Diego Velasquez in 1514. Pop. (1899) 1,025.

Batac, bạ-täk′, or **Batag,** Philippines, an island about one and a half miles off the northeast coast of Samar, the most northerly of that portion of the Philippine islands which goes under the designation of Visaya, or Bisaya. Area 18 square miles.

Batac, or **Batag,** Philippines, a town of Luzon in the province of Ilcos Norte, founded in 1587. It is situated 10 miles south of Laoag. Pop. (1898) 17,625.

Batak, bä′tạk, Bulgaria, a district and town southwest of Philippopolis. The region became prominent in European history in the time of the Bulgarian insurrection against Turkey in 1876. In May of that year the villagers of Batak were preparing to take part in the insurrection, when the place was attacked by a force of Bashi-Bazouks under the command of Achmet Agha of Dopat. After a short struggle, the village was surrendered and the inhabitants gave up their weapons, on the assurance of the Turkish commander that «not a hair of their heads should be touched.» On 9 May 1876 the Turks began one of the most cruel massacres recorded in history; the inhabitants of the unfortunate village were butchered and those who took refuge in the church were burned to death by the Turkish soldiers. Mr. Baring, the English commissioner, visiting the place two months later, found but one survivor, an old woman. The Turkish government rewarded Achmet with a decoration of honor. The news of the massacre at Batak and of other «Bulgarian atrocities,» aroused all Europe and furnished Russia with an excellent pretext for declaring war against Turkey in 1877. See also BULGARIA; SAN STEFANO, TREATY OF; TURKEY.

Bataleur, bạ-tạ-lėr′, a large, voluminously crested eagle of Africa, named *Helotarsus ecaudatus* with reference to the unusual shortness of its tail. It has the handsomest plumage of all the eagles, presenting bold contrasts of rich maroon, black, and gray, with bronzy reflections from the wings. It feeds mainly on lizards and snakes, attacking the latter, even when venomous, by blows of its powerful beak. Its breeding season, which is at the commencement of the hot weather when other birds are busy at other things, seems to be placed with reference to the greater ease with which snakes can then be captured, when the grass dies down or burns off, exposing them to view.

Batalha, bä-täl′ya, a village in Portugal, 69 miles north of Lisbon, famed for its Dominican convent, founded by King John I., in commemoration of a victory over the king of Castile in the year 1385. This convent is one of the most splendid buildings in Europe and is 576 feet long and 443 wide. Its church, in which lie the remains of the founder and the following three kings of the house of Aviz, as well as those of Prince Henry the Navigator, is a beautiful edifice, adorned with many art treasures.

Batan, bä′tạn, Philippines, a province of the island of Luzon, forming the peninsula between the bay of Manila and the China Sea; area, 450 square miles; chief town, Bolanga. It is noted for many excellent varieties of marble, which are extensively used in the churches and public buildings of Manila and other towns of the Philippines. The inhabitants of the towns and coasts of this province are of the Tagalog race, but, besides these, the mountain fastnesses are inhabited by numerous tribes of Negritos.

Batan, Philippines, a town on the island of Panay, in the province of Capiz, 31 miles from Capiz. Pop. (1898) 12,908.

Batan, or **Bashi Islands,** a group of small islands in the Chinese Sea, discovered by Dampier in 1687, and now forming a dependency of the Philippines, north of which they are situated, midway between Luzon and Formosa. American control was established over these islands in March 1900, with Teofilo Costillejo as first governor. The Batans are bounded on the north by Bashi Channel, which divides the Philippines from the Japanese insular territory, and have an area of 125 square miles and a population estimated at 9,500. The principal islands in the group are Itbayal, Basay, Saptan, and Hujos. Santo Domingo de Basco, the principal town and port, is about 500 miles from Manila, and has a population of about 3,000. The other large towns are San Bartolome de Calayan, San Carlos de Marigatao, San José de Ibana, Santa Maria de Mayan, and San Vicente de Saptan. Under Spanish rule Santo Domingo was the residence of a political military governor, a judge and an attorney-general.

Batangas, bạ-tän′gạs, Philippines, a town on the island of Luzon, 58 miles south of Manila. It was founded in 1581, and it situated on the large bay of Batangas, opening into the Strait of Mindoro. It is well-built, containing several spacious streets, in which are many elegant mansions. The city has an excellent harbor, and prior to the war between the United States and Spain was the seat of a large commerce. The province is one of the richest sugar growing districts in the Philippines; but the industry is far inferior to its possibilities owing to the lack of proper machinery and modern methods of treatment. It is also notable for its large production of cocoanut oil, the larger part of which is used for domestic purposes, chiefly lamp oil and lubricating machinery. Such of it as is exported to Europe, after being solidified, is manufactured into soap and candles. Pop. 39,358.

Batatas, bạ-tā′tạs. See SWEET POTATO.

Bata′vi, an old German nation which inhabited a part of the present Holland, especially the island called Batavia, formed by that branch of the Rhine which empties itself into the sea near Leyden, together with the Waal and the Meuse. Their territories, however, extended much beyond the Waal. Their bravery was commended by Tacitus. According to him, they were originally the same as the Catti, a German tribe which had emigrated from their country on

account of domestic troubles. This must have happened before the time of Cæsar. When Germanicus was about to invade Germany from the sea, he made their island the rendezvous of his fleet. Being subjected by the Romans, they served them with such courage and fidelity as to obtain the title of their friends and brethren. They were exempted from tributes and taxes, and permitted to choose their leaders among themselves. Their cavalry was particularly excellent. During the reign of Vespasian they revolted, under the command of Civilis, from the Romans, and extorted from them favorable terms of peace. Trajan and Adrian subjected them again. At the end of the 3rd century the Salian Franks obtained possession of the island of Batavia. See BATAVIAN REPUBLIC.

Bata'via, properly the name of the island occupied by the ancient Batavi, became at a later date the Latin name for Holland and the whole kingdom of the Netherlands. The name Batavian Republic (q.v.) was given to the Netherlands on their new organization, 16 May 1795, and they continued to bear it till the establishment of the kingdom of Holland, under Louis Bonaparte, 8 June 1806.

Batavia, Java, a city and seaport on the north coast of the island, near the west end, and the capital of all the Dutch East Indies; lon. 106° 50′ E.; lat. 6° 8′ S. It is situated on a wide, deep bay, in which are interspersed many low, green islets, within which ships find safe anchorage, the roadstead being sheltered from the northwest monsoon. The largest of these islets is Onrust, at which all ships above 300 tons burden have to anchor. The town consists of two portions. The old is situated in a low, marshy plain near the sea, and intersected by the Great River and sundry canals, is exceedingly unhealthy, and subject to an intermittent fever, very fatal to strangers. Much has been done, however, to diminish the unhealthiness by draining the marshes, and letting currents of water into the stagnant canals. The old is still the business quarter and contains the principal warehouses and offices of the Europeans, the Java Bank, and the exchange. On the west side of the Great River is the Chinese quarter, inhabited entirely by Chinese. Batavia is the chief mart among the islands of the Asiatic Archipelago for the products of the Eastern seas and the manufactures of the West, and its commerce is correspondingly important. Batavia was founded by the Dutch in 1619, and attained its greatest prosperity in the beginning of the 18th century, when it had about 150,000 inhabitants. The most important edifices are the Stadt-house, Calvinistic, Lutheran, and Portuguese churches, some Mohammedan mosques and Chinese temples. Pop. (1900) 115,567. The inhabitants are chiefly of Malay extraction, with a considerable admixture of Chinese, and a small number of Europeans (Dutch, English, and Portuguese). A United States consul resides here. See JAVA.

Batavia, Ill., a town in Kane County, on the Fox River, and on the Chicago & N. W. and Chicago, B. & Q. R.R.'s; 37 miles west of Chicago. Here is the State Asylum for the Insane, and 9 churches, public schools and public library. Among the industries are stone quarries, farm implement works, and wagon factories. Batavia was settled in 1834 and incorporated in 1856. Pop. (1900) 3,871.

Batavia, N. Y., a town and county-seat of Genesee County, on Tonawanda Creek and several railroads; 37 miles east of Buffalo and 32 miles west of Rochester; on the New York C. & H. R., the Lehigh Valley, and Lake Erie & W. R.R.'s. It is in an agricultural region; has manufactories of plows and harvesters, carriage wheels, and shoes, and contains the State institution for the Blind, the Dean Richmond Memorial Library, national banks, daily and weekly newspapers. Batavia was the home of William Morgan, made famous through the Anti-Masonic excitement in 1826. Pop. (1900) 9,180.

Batavian Republic, the name adopted by the Seven United Provinces of the Netherlands soon after the French Revolution, and acknowledged by the powers of Europe. The whole republic was declared one and indivisible; all members of society were declared equal in the eye of the law, without respect to rank or birth; all religious societies, acknowledging a Supreme Being, equally protected by law. Feudality was abolished, all fiefs declared allodial, and possessors of lordships to be indemnified. In 1806 the form of government was changed into that of a kingdom, under the name of Holland; and the Batavian republic fell nominally under the sway of Louis Bonaparte as its sovereign, but really under that of his brother Napoleon. See NETHERLANDS.

Batbie, bä-bē, **Anselme Polycarpe,** French jurist and politician: b. Seissan, 31 May 1828; d. Paris, 30 June 1887. He first belonged to the faculties of law at Dijon and Toulouse, but, in 1862, he became professor of constitutional law at Paris. Elected to the National Assembly (February 1871), he became one of the leaders of the Monarchist party. In Broglie's reactionary cabinet (1873) he was made minister of public instruction. After 1876 he was a member of the Senate. He wrote 'Turgot, Philosopher, Economist, and Administrator' (1860); 'Course of Political Economy' (1864); 'New Course of Political Economy' (1865); 'The Public Credit' (1865); 'Summary of the Course of Public and Administrative Law' (1885), and 'Theoretical and Practical Treatise on Public and Administrative Law' (1885).

Batchelder, Richard Napoleon, American military officer: b. Lake Village, N. H., 27 July 1832. He entered the Union army at the beginning of the Civil War; and was brevetted brigadier-general, United States Volunteers, 13 March 1865; became brigadier-general and quartermaster-general, United States Army, 26 June 1890; and was retired 27 July 1896. He was awarded a Congressional medal of honor for most distinguished gallantry in action during the Civil War.

Batcheller, George Sherman, American jurist: b. Batchellerville, N. Y., 25 July 1837. He was admitted to the bar in 1858; entered the Union army at the beginning of the Civil War; was taken prisoner at Harper's Ferry, and exchanged in 1863; was then appointed deputy provost-marshal-general of the Department of the South; and, in 1865–70 was inspector-general on the staff of Governor Fenton of New York. In 1883 he became president of the International Tribunal of Egypt; in 1889, assistant secretary of the United States Treasury; in 1890,

United States minister-resident and consul-general to Portugal; and in 1897, again a member of the International Tribunal of Egypt. In the last-named year he received from King Humbert the decoration of the great cordon of the Order of the Crown of Italy, in recognition of his services as president of the Universal Postal Congress which met in Washington in May 1897.

Batchelor, George, American Unitarian clergyman: b. Southbury, Conn., 1836. He was secretary of the American Unitarian Association 1893–7, and has since been editor of the 'Christian Register,' published in Boston. He has also been secretary of the National Unitarian Conference 1870–80, and its chairman 1893–4. He is the author of 'Social Equilibrium.'

Batchian, bạt-shyän', or **Batian,** one of the Moluccas, west of the southern peninsula of the large island of Halmahera or Gilolo. Area, 835 square miles; pop. about 11,000. It belongs to the Dutch residency of Ternate, consists of two peninsulas joined by a narrow isthmus, and has many mountains. Batchian produces gold, copper, much coal, sago, cocoanut trees, rice, cloves, and fine timber.

Bate, William Brimage, American legislator: b. near Castalian Springs, Tenn., 7 Oct. 1826; d. Washington, D. C., 9 March 1905. He served as a volunteer through the Mexican war; was graduated at the Lebanon Law School in 1852; elected attorney-general of the Nashville district in 1854; and was presidential elector in 1860. In the Civil War he rose from private to the rank of major-general in the Confederate army, and was three times dangerously wounded. He was an elector-at-large for Tennessee on the Democratic ticket in 1876; was elected governor in 1882 and 1884; and a United States senator in 1887, 1893, and 1899.

Bateman, Kate Josephine, American actress: b. Baltimore, Md., 7 Oct. 1842. About 1851 she and her sister Ellen began to act, being known as the Bateman Sisters. Kate began, in 1861, to play Juliet, Pauline, etc., but was especially successful in Leah. She became rich and famous, and, having married George Crowe, an English physician, identified herself with the management of a London theatre.

Bateman, Newton, American educator: b. Fairfield, N. J., 27 July 1822; d. Galesburg, Ill., 21 Oct. 1897. He graduated from Illinois College, 1843, and studied at Lane Theological Seminary, but began to teach instead of entering the ministry. He was professor of mathematics at St. Charles College, 1847–51; State superintendent of public instruction, 1858–63; member of the State board of health, 1877–97; and president of Knox College, 1875–92, when ill-health caused his retirement. His official reports are of high value in educational literature, and much of the excellence of the Illinois school laws is due to his widom and foresight. He published 'School Laws of Illinois' (1865; 12th ed. 1866); 'School Laws and Common School Decisions of the State of Illinois'; revised by W. L. Pillsbury (1888).

Bates, Alfred E., American military officer: b. Monroe, Mich., 15 July 1840. He graduated at the United States Military Academy in 1865; commissioned a second lieutenant in the 2nd Cavalry; promoted to first lieutenant, 19 Oct. 1865; transferred to pay department with the rank of lieutenant-colonel, 7 Jan. 1897; promoted colonel and assistant paymaster-general, 31 March 1899; and brigadier-general and paymaster-general, 12 July following. He served for several years as military attache to the United States Embassy in London, and was a brigadier-general of volunteers in the war with Spain in 1898.

Bates, Arlo, American author: b. East Machias, Me., 16 Dec. 1850. He graduated from Bowdoin in 1876, when he engaged in literary work in Boston, editing the *Sunday Courier*, 1880–93; and afterward became professor of English Literature in the Massachusetts Institute of Technology. He is author of poems and novels, including 'The Pagans' (New York 1884); 'A Lad's Love'; 'The Wheel of Fire' (1885); 'The Philistines' (1888); 'Berries of the Brier' (1886), poems; 'Told in the Gate' (1892); 'Talks on Writing English'; 'Talks on the Study of Literature' (1897); 'The Puritans' (1899); 'Under the Beech Tree' (1899); 'Diary of a Saint' (1902).

Bates, Barnabas, American clergyman; an active promoter of cheap postage in the United States: b. Edmonton, England, 1785; d. Boston, Mass., 11 Oct. 1853. He came to America at an early age, became a Baptist preacher in Rhode Island, and was, for a time, collector of the port of Bristol. In 1825, having become a Unitarian, he established a weekly journal in New York, called the *Christian Inquirer*. During Jackson's administration he received an appointment under Samuel Gouverneur, postmaster of New York, and for some time performed the duties of postmaster himself. The information gained in this capacity, first interested him in the question of cheap postage. He investigated the subject for years, wrote, published pamphlets, and lectured throughout the country, and finally effected a material reduction in the rates of land postage. He was endeavoring to obtain a corresponding reform in ocean postage at the time of his death.

Bates, Blanche, American actress: b. Portland, Oregon, 1873. She made her first appearance in 1894 in San Francisco, taking a part in Brander Matthews' one-act play 'This Picture and That.' Her first success was as Mrs. Hillary in 'The Senator,' and she has played the leading comedy roles in 'The Last Word,' 'The Railroad of Love,' 'Transit of Leo,' and 'The International Match.' Her acting of Nora in 'A Doll's House' (the first Ibsen play presented on the Pacific coast) was a distinct artistic triumph. She has also taken leading parts in 'The Charity Ball,' 'Sweet Lavender,' 'The Dancing Girl,' and others. Her phenomenal success in 'The Great Ruby' (1899); as Miladi in 'The Three Musketeers' (1899); and in Long and Belasco's 'Darling of the Gods' (1902–3), has given her a place of assured prominence on the American stage. See Strang, 'Famous Actresses of the Day' (1899).

Bates, Charlotte Fiske, American poet and miscellaneous prose-writer: b. New York, 30 Nov. 1838. She was educated in Cambridge, Mass.; assisted Longfellow in compiling 'Poems of Places'; edited the 'Cambridge Book of Poetry and Song' (Boston, 1882); 'The Longfellow Birthday Book'; and 'Seven Voices of Sympathy'; has contributed to magazines; and

has published 'Risk and Other Poems' (1879). She was married in 1891 to Adolphe Rogé.

Bates, Clara (Doty), American author: b. Ann Arbor, Mich., 1838; d. 1895. She lived in Chicago and published many juvenile books; also 'From Heart's Content' (1892).

Bates, David, American poet: b. 1810, d. Philadelphia, 25 Jan. 1870. He was the author of the well-known poem 'Speak Gently.' In 1848 his poems were published under the title, 'The Eolian.'

Bates, Edward, American lawyer: b. Belmont, Va., 4 Sept. 1793; d. 25 March 1869. Having settled in Missouri, he served in the legislature and constitutional convention, and in Congress in 1827–9. He was attorney-general of the United States in Lincoln's first administration; and had been a candidate for the presidential nomination in 1860.

Bates, Harriet Leonora (Vose), better known as Eleanor Putnam, American story writer, wife of Arlo Bates: b. 1856; d. 1886. She wrote 'A Woodland Wooing'; 'Old Salem' (1886); with her husband, 'Prince Vance,' etc.

Bates, John Coalter, American military officer: b. St. Charles County, Mo., 26 Aug. 1842. He entered the regular army as a lieutenant in the 11th United States infantry, 14 May 1861; served on the staff of General Meade from the battle of Gettysburg to the close of the war. On 4 May 1898 he was appointed a brigadier-general of volunteers; on 8 July was promoted to major-general for his services in the Santiago campaign. In February 1899 he was appointed military governor of the province of Santa Clara, Cuba, and in April following, was ordered to duty in the Philippines. In March 1900 he was assigned to the command of the department of southern Luzon, and for his eminent services there and on the Sulu group was promoted major-general, 9 June 1902.

Bates, Joshua, American financier: b. Weymouth, Mass., 1788; d. 24 Sept. 1864. In 1828 he became a member of the house of Baring Brothers & Company, in London, and subsequently its senior partner. In 1854 he was appointed umpire to the joint British and American Commission for the settlement of claims arising from the War of 1812. He was the principal founder of the Boston Public Library, and in 1852, the first year of its existence, he made it a gift of $50,000, and later gave it 30,000 volumes. Its main reading room is named "Bates Hall" in his honor.

Bates, Katharine Lee, American story writer, poet, and educator: b. Falmouth, Mass., 12 Aug. 1859. She was called to the chair of English literature in Wellesley College in 1891; and has edited collections of ballads, etc.; and written juvenile stories, including 'Rose and Thorn' (1889); also 'The English Religious Drama' (1893); and 'The College Beautiful (1887); 'History of American Literature' (1898); 'Spanish Highways and Byways' (1900).

Bates, Samuel Penniman, American historian: b. Mendon, Mass., 29 Jan. 1827. He has been principal of Meadville Academy, Pa.; superintendent of schools in Crawford County, Pa., 1857–60; deputy state superintendent of schools, 1860–6; and State historian, 1866–73. Among his publications are the 'Lives of the Governors of Pennsylvania' (1873); 'Lectures on Mental and Moral Culture' (1859); 'History of the Battle of Gettysburg' (1878); 'History of the Battle of Chancellorsville' (1882).

Bate's Case, an English historical incident of much significance as marking the opening of the struggle of Parliament with the Stuart kings. John Bate, a London merchant, having refused to pay certain duties levied without consent of Parliament, was sent to prison by the royal officers. The Commons supported Bate, but the king's authority to levy impositions on exports and imports was sustained by the Court of Exchequer.

Bates College, Lewiston, Me., was opened in 1863 and chartered in 1864. It grew out of Maine State Seminary, a secondary school opened in 1857. The college was founded by its first president, Rev. Oren Burbank Cheney, D.D. (1863–94), and bears the name of its chief benefactor, Benjamin Edward Bates, a merchant of Boston, and one of the founders of the city of Lewiston. Bates was the first eastern college to afford collegiate education to women, and her first woman graduate (1869) became a professor in Vassar College. Established in the interest of the Free Baptist denomination, she has been notably free from sectarianism — her faculty having been drawn from seven religious denominations and her students representing Protestants, Catholics, and Hebrews. Bates places primary stress upon character, does not tolerate hazing and makes abstinence from intoxicating drinks a condition of student membership. Her courses of instruction cover the range of undergraduate studies as pursued in progressive colleges of to-day. The unusual excellence of her courses in English, including argumentation, is indicated by her eleven victories in twelve intercollegiate debates held with five colleges and universities. To these results her three flourishing literary societies are believed to have contributed. Alone among New England colleges, Bates has no secret fraternities. She has chemical, physical, and biological laboratories, libraries containing 28,000 volumes, and a spacious athletic field. Her campus of 50 acres is of rare natural beauty, and with her nine buildings, has a value of $350,000. Her invested funds amount to upwards of $400,000. Of her 1097 graduates 475 have become educators, 60 of them teachers in colleges and universities. For the last 15 years the number of her graduates at the head of city high schools in New England is believed to have exceeded those of any other college. Bates has 71 scholarships, affording free tuition to their recipients, and she so shapes her entire policy as to help students of small means to meet their own expenses. The college has 22 officers and instructors, and 353 students — an increase of more than 100 per cent. during the last decade. Cobb Divinity School is a department of Bates College, having its own building, faculty, and administration.

George C. Chase, *President.*

Batesville, Ark., a town and county-seat of Independence County: situated on the White River and on a branch of the St. Louis, I. M. & S. R.R. It is the seat of Arkansas College, a Presbyterian institution. The river is navigable for steamboats to this point and the United States government is providing a system of locks and dams to insure navigation for 100 miles above the town. It contains immense

quarries of marble and other stone, and there are woolen mills, flouring mills, furniture factories, etc. Pop. (1900) 2,327.

Batfish, a sea-fish (*Malthe vespertilio*) of low organization, constituting the family *Maltheidæ,* allied to the goosefishes (*Lophiidæ*), which creeps about the bottom like a huge toad and feeds upon whatever comes within its reach. It is numerous in all warm seas, and some related forms inhabit the deeper parts of the ocean. See GOOSEFISH.

Bath, England, a city in Somersetshire, 107 miles west of London. It is beautifully situated on the Avon, in a narrow valley bounded on the northeast and southwest by hills, and widening on the northwest into rich and extensive meadows. The Avon is navigable from Bath to Bristol. Bath is noted for its places of amusement, its fine streets, and the magnificence of its public buildings. The houses are of superior construction, built of freestone, obtained from the hills about the town. The Abbey Church ranks as one of the finest specimens of perpendicular Gothic architecture. Bath is remarkable for its medicinal waters, the four principal springs yielding no less than 184,000 gallons of water a day; and the baths are both elegant and commodious. The temperature of the springs varies from 109° to 117° F. They contain carbonic acid, chloride of sodium and of magnesium, sulphate of soda, carbonate and sulphate of lime, etc. Bath was founded by the Romans, and called by them *Aquæ Solis* (waters of the sun). Among the Roman remains discovered here have been some fine baths. The height of its prosperity was reached, however, in the 18th century, when Beau Nash was leader of the fashion and master of its ceremonies. Since then, although it still attracts large numbers of visitors, it has become the resort of valetudinarians chiefly. Jointly with Wells it is the head of a diocese, and returns two members to the House of Commons. Pop. (1901) 49,817.

Bath, Me., city, port of entry, and county-seat of Sagadahoc County, on the Kennebec River, and the Maine C. R.R.; 12 miles from the ocean and 30 miles south of Augusta and 36 miles northeast of Portland. It is admirably situated as a commercial port; has regular steamboat connections with Boston and Portland; is principally engaged in shipbuilding, both wood and iron; and has manufactories of brass and iron goods, oil cloth, shoes, and lumber. The Bath Iron Works have built the gun-boats Machias and Castine, the ram Katahdin, and several of the modern torpedo boats for the United States navy. Bath has a large coastwise and foreign trade in ice, coal, lumber, hay, iron, and steel; and contains four national banks, public library, a costly system of waterworks, and property valued at $7,000,000. Pop. (1900) 10,477.

Bath, N. Y., town and county-seat of Steuben County, on the Cohocton Creek, 36 miles west of Elmira, on the Buffalo branch of the Erie, and the Delaware, L. & W. R.R.'s. It is the seat of the New York State Soldiers and Sailors' Home, the Davenport Home for Orphan Girls, and Haverling Academy; is principally engaged in agriculture; and has manufactories of shoes, sash and blinds, harness, etc. It is governed by a mayor, annually elected, and a town council. Pop. (1900) 4,994.

Bath and Bathing. The use of the bath is primarily for purposes of cleanliness, but it also subserves various other useful ends. Bathing undoubtedly took place first in rivers and in the sea, but men soon learned to enjoy this pleasure in their own houses. Even Homer mentions the use of the bath as an old custom. When Ulysses enters the palace of Circe, a bath is prepared for him, after which he is anointed with costly perfumes, and dressed in rich garments. In later times, rooms, both public and private, were built expressly for the purpose of bathing. The public baths of the Greeks were mostly connected with the gymnasia, because a bath was taken immediately after the athletic exercises. The Romans imitated the Greeks in this matter, and built magnificent baths in which both males and females could bathe (in separate divisions), and warm or cold baths could be taken; such establishments, indeed, were so extensive that even their ruins excite admiration.

The Cold Bath.— The first effect of the cold bath (at a temperature say from 50° to 70°) is to produce a shock to the nerves of the skin. In the case of the cold bath as ordinarily used, the application is short, and the more near to the temperature of 50° F. the water is the shorter it should be. Following the first action is reaction, during which the blood returns to the skin, the blood vessels of which relax, and a pleasant sensation of glow, spreading rapidly over the surface, is experienced. This reaction is aided by rapid friction of the skin, as by towels, and if, after drying, the body is quickly clothed and exercise engaged in, the total effect of the bath is stimulating, inducing a feeling not only of warmth but also of vigor. The length of time the cold may be applied without interfering with the setting in of a proper reaction depends on the individual. A mere instant's immersion is sufficient for some, others can bear several minutes, while some could not bear complete immersion of the body at all, a feeling of coldness and shivering lasting for hours after it. Obviously for such persons the full cold bath is not suitable, and the cold wet towel, cold wet sponge, wet sheet, etc., may be used instead, and may gradually lead up to the full cold plunge, which may thus be made tolerable and enjoyable. The cold bath is not usually suitable for the old and the delicate. The action of the cold water may be intensified by showering it or spraying it on the body by means of various arrangements of pipes, etc. The morning or early part of the day is the suitable time for all such kinds of baths. Persons who are thus habituated to the use of cold water are less susceptible to the influence of cold and can stand longer exposure than others.

Tepid Baths (temperature 85° to 95°) produce neither depression nor excitement, and are therefore suited for all. They are the best when prolonged immersion is desired, as in the treatment of chronic skin and nervous diseases.

The Warm Bath (temperature 96° to 104°) is particularly serviceable in removing feelings of fatigue. It should quicken only slightly

the circulation, and bring an additional quantity of blood to the skin. It is by this means that it removes the tired feeling from exhausted muscles, for it promotes the removal from the tissues of the waste products, which have accumulated during the period of activity, and whose presence in the muscles is the cause of the feeling of weariness. After prolonged labor, or a long fatiguing walk, or prolonged exposure to damp and cold, or after, for example, the exertion of much dancing, nothing is so restorative and refreshing as a warm bath. When employed for such purposes, the person should end with a spray or douche, or simple sponge of tepid water (70°) if he is about to go to bed, or with a warm spray, quickly reduced to cold, before dressing to go out. Warm baths are largely employed in feverish affections of children for promoting the action of the skin; and they are a safe resort in the convulsions of children, cold being at the same time applied to the head.

The hot bath (temperature 102° to 110°) acts in a more pronounced way upon the heart and nervous system than the merely warm bath. If very hot it powerfully excites the heart, whose action, indeed, it may stimulate to violence. The brain is also influenced by the more copious flow of blood through it, due to the vigorous action of the heart. These effects, however, are largely counterbalanced by the increased flow of blood to the skin. But the prolonged use of hot baths is weakening, and the temporary strain thrown upon the heart and blood-vessels and brain would be hurtful to many. The bather should be immersed to the chin; the hair is damped with cold water, and a thin cold cloth is wrapped about the head. Cold water may be drunk if desired. The bath should last 20 minutes, or less if oppression is felt. It should conclude, as directed for warm bath, with tepid douche or sponging, or with warm spray quickly reduced to cold. The hot bath should not be used in the morning or early part of the day, or at any time except before going to bed, unless the person is properly cooled down before dressing and going out.

The Hot-air Bath is one of the most powerful ways of stimulating the activity of the skin. The person, unclothed, is placed in an apartment which is heated by means of furnaces, the air being dry. In a longer or shorter time, according to the heat of the air and the condition of the bather, the perspiration bursts out upon the skin, becoming very copious, so that the whole body is bathed in sweat. A very high temperature may be borne so long as the air is quite dry, for the sweat passes rapidly off from the body in the form of vapor, removing a large quantity of heat, and thus the temperature of the body does not rise, unless the air is very hot, when the heat of the body usually increases by two or three degrees. The same high temperature could not be borne if the air were moist, as in the case of a vapor bath, for then the air is saturated or nearly so with moisture and cannot take up more, or can take up very little. Marked oppression, difficulty of breathing, fullness in the head, faintness, etc., would then speedily arise. When the air is quite dry, however, a high temperature, for example, that of 180° F., can usually be endured with ease, and even above 212°. Not only the activity of the skin, but the action of the heart and of breathing are greatly increased. It is thus not suited for everyone, certainly not in its full form for anyone with weak heart or vessels, and for very full-blooded persons.

The Turkish Bath.— The hot-air bath is usually obtained with other accessories in the form of the Turkish bath. This bath was adopted by the Turks from the Romans, who derived it from the Greeks. The bather enters the dressing-room (Rom. *vestiarium*) which is heated to an ordinarily comfortable temperature. Beyond this room there are, in the fully-equipped Turkish baths, three rooms, separated from the dressing-room by well-padded doors. The first of these corresponds to the Roman *tepidarium*, the warm room, in which the temperature is from 115° to 120°; beyond this and separated from it by heavy curtains is the hot room, or *calidarium*, in which the temperature ranges from 120° to 140°; and still beyond is the hottest room, called also the flue room, corresponding to the Roman *laconicum*. Here the temperature is not below 150°, usually 175° to 180°, but may be 200° and upward. Every Turkish bath has at least two rooms beyond the dressing-room, one in which the temperature may readily be raised to 140° or thereby, and one beyond it in which the highest temperatures may be obtained.

When a full Turkish bath is taken the following is the usual course: The bather undresses in one of the curtained recesses of the dressing-room, girds a towel or similar cloth round his loins, and carrying a bath-towel over the arm passes into the warm room. Here he stays only long enough to wet the hair with cold water, and perhaps drink of it, and then passes on through the hot room, into the hottest room. Spreading his towel over a chair he reclines on it, wets his head with cold water, and drinks at his pleasure, but not too copiously, of cold water, which the attendant will bring him. Here he remains 5 or 10 minutes. By this time the whole body will be bedewed with perspiration; and the bather passes out into the room next in temperature, the hot room, where he reclines for another 10 or 15 minutes. Then he passes to the warm room, lower in temperature than the former, and here he reclines till the attendant is ready for him, when he proceeds to the washing room. Here he lies on a table and the attendant goes over the whole body, rubbing the surface, and thus removing all loose effete skin, grasping and kneading the muscles, bending joints and so on. He is then rubbed over with soap, scrubbed and washed down, and lastly douched with warm and then tepid and cold water. From this room the bather passes out quickly, plunges through a cold bath, and regains the dressing-room, where he is quickly dried down with warm dry towels. He is then enveloped in a dry bath-towel, and so attired he lies down on his couch in the dressing-room, covered over with a light rug or blanket, till his skin assumes its natural degree of warmth. When the skin is cool and dry, usually in 15 or 20 minutes, the bather dresses deliberately, and may then go out. The ordinary duration of the full bath, from the flue room to the washing room, is from 40 minutes

to an hour. The full bath, however, is suited chiefly for those accustomed to it, for the healthy and robust.

The vapor bath acts upon the body much as the hot-water bath does, but it acts more powerfully, though the effect of the heat is not so quick since vapor is a slower conductor of heat than water. This bath can, therefore, be borne hotter than a water bath, but the high temperature cannot be borne long, for the vapor does not permit of the loss of heat from the body as hot air does. The temperature of the vapor bath cannot be comfortably endured above 120° F. The vapor bath is characteristic of the Russian baths. It is taken in a chamber filled with vapor, which is thus not only applied to the surface of the body but also inhaled. This makes it still more oppressive. It may be used, however, in a simple form, in which the vapor is not breathed, by the person sitting on a chair, surrounded from the neck downward by blankets, which envelop the chair also and hang to the ground. Under the chair is placed a shallow earthenware or metal dish, containing boiling water to the depth of 3 or 4 inches. In the water are placed a couple of red-hot bricks. Or under the chair may be placed a spirit-lamp, supported above it being a shallow pan containing boiling water. Such baths are very useful for catarrh, for rheumatic and neuralgic pains, sciatica, etc., as well as for cases where excessive action of the skin is desired to relieve deeper organs, for example the kidneys. Ten to fifteen minutes are long enough for exposure in the vapor bath.

Sea-Bathing.—Ordinary sea-bathing is of course cold, and produces the stimulating effects described in regard to the cold bath. There is besides the additional stimulus due to the salt, so that sea-bathing acts as an invigorating tonic. It is not, however, suited for everyone, and is taken much too indiscriminately. It is also indulged in without due precaution. It is a very common error for persons to remain in the sea too long, the result being shivering, blueness of the skin, difficulty in recovering warmth, headache, etc. Persons who are anæmic,—that is, of deficient quality of blood,—ought not to indulge in sea-bathing without advice, and failing advice had better try first a salt-water bath at home. Persons who have suffered from any internal complaint ought also to refrain. The best time for sea-bathing is in the morning. It should never be indulged in immediately after a meal, when the business of digestion is going actively forward. A good time is before lunch or early dinner, for which the brisk walk home after the bath will prove an excellent appetizer. Neither should sea-bathing be engaged in immediately after very active exercise, when the body is in a state of very active perspiration or in a condition of fatigue. At the same time, moderate exercise before the bath is unobjectionable, and the body ought to be comfortably warm. The person should undress quickly and plunge in bodily, wetting the whole body at once. During the bath exercise should be active, as in continued swimming. Children, because of the little resisting power of their bodies are readily depressed by sea-bathing. They may be gradually accustomed to it; but they ought not to be forcibly immersed to their aversion and terror. Sea-baths may be imitated at home by the addition of common salt or sea salt to water. The benefits of open-air bathing,—sea or river,—are not limited, of course, to the action of the water, but are increased by the action of the fresh air, the respiration of which is stimulated by the bath, and by the exercise in the open air invariably indulged in afterward.

There are many kinds of medicated baths, which have, or are supposed to have, special properties, valuable for diseased conditions, because of containing various saline substances dissolved in them. Such baths may be artificially prepared by the addition of the salts to the water, or natural mineral waters may be used for the purpose. Mud-baths are recommended for special reasons.

Various arrangements are employed for accentuating the effect of the water, whether used hot or cold, or for applying it to particular parts of the body. The spray is one well-known variety of bath. The douche is a jet of water directed upon some part of the body through a 1½ inch pipe, the force of the water, quantity discharged, and temperature being capable of modification. It at first lowers the vitality of the part to which it is applied, but reaction sets in quickly, so that its whole effect is stimulating, quickening tissue change. The douche may be used hot or cold, or one after the other in rapid succession, a change which is most stimulating of all. In old-standing complaints, thickenings about joints, stiff joints, etc., it is a very useful application. In the case of the descending douche, the pipe is 10 to 15 feet above the floor level, and for the horizontal douche the pipe is 4 feet above floor level. In the former case it is played first on the spine, and then shoulders, hips, arms and legs in succession. At the close it is directed on to the chest and head, the force of the water being broken by the hands. In the latter case the back, chest, arms, and legs are douched in the order named, while the patient rubs himself vigorously. Before beginning the head is wet with cold water, and is douched last, the force of the water being broken. The process should last scarcely two minutes.

The sitz-bath or hip-bath is a means of limiting the application of the water to the hips and neighboring parts. The form of the bathing-tub is such that the person has the bath in the sitting posture, the limbs and upper part of the body being out of the bath. The sitz-bath, hot or cold according to circumstances, is in much use for abdominal and liver complaints, and specially for feminine ailments. Its soothing effects used hot in such disorders are marked. Altogether the use of the bath, in association with treatment by medicine, is of the highest value in numerous disorders, rheumatic, gouty, digestive, febrile, etc. In particular, the Turkish bath, under due superintendence, may produce surprising results, from checking a simple cold upward. See also HYDROTHERAPY.

Bath Brick, or **Bristol Brick,** an artificially manufactured brick, of the usual form, but formed of calcareous earth. It is used for cleaning various kinds of metal work, and in England is manufactured from the silt left in the river Parret in Somersetshire after high tides.

Bath Bun, an English bun, or sweetened cake or biscuit, made generally without currants.

Bath Chair, a small carriage or chair on wheels, drawn by a chairman, and intended for the conveyance of individuals or others for short distances. It is so called because either originally or principally used at Bath, where the steepness of many of the streets rendered such conveyances especially useful.

Bath, History of the. As the most ancient records of the human race refer to the use of the bath it is probably safe to surmise that the prehistoric peoples early discovered the cleansing effect of water and were eager to enjoy it. To the ancient Egyptians, as to the more modern Mohammedans, it is a part of their religious service, while among the early Hebrews it was not only one of the first purificative duties but it was positively prescribed by the Mosaic law in certain specified cases of uncleanness. Thus the Jew who had no bath in the court yard of his house, bathed in the streams, or, later, in the mixed, or public baths, while, besides water, bran was often used for ceremonial cleansing, especially by the women, just as the modern Arabs, when unable to obtain water, rub themselves clean with sand. See ABLUTION.

The earliest and most common form of bathing was, of course, that of swimming in rivers, and bathing in such rivers as the Nile and the Ganges was supposed to possess a religious significance which tended to make the practice a very popular one. The use of oils and the greater luxury of perfumes became customary on occasions of sanitary bathing at a very early period. In later times the more wealthy Romans possessed many kinds of oils and pomades which they brought to the baths, that their bodies might be anointed with them, while even the poorest classes rubbed their bodies with flour of lentils after the bath.

The first reference to such a convenience as that of a public bath occurs in the Bible, where it is stated that the bathing "pools" were sometimes sheltered by porticoes, but this was a simple invention when compared to the perfect bathing facilities which were afterward provided by the Greeks and Romans, while the praise lavished upon the baths of Darius by Alexander the Great indicates that the Persians must also have possessed beautifully appointed bathing facilities.

The public baths, which began to be built in Rome shortly after Clodius had succeeded in supplying the city with water from Praeneste, soon became one of the most popular institutions of the nation and emperors vied with their predecessors to construct the largest and most elaborate establishments. As the result, enormous buildings were erected and these contained not only the bathing apartments but the gymnasia and libraries, or even theatres, and the most able writers of that time admit their inability to describe the magnificence and luxurious appointment of many of these palaces of cleanliness and pleasure. For example, Seneca says, "To such a pitch of luxury have we come that we are dissatisfied if we do not tread on gems in our baths." These baths, or *thermæ,* as they were called, contained swimming baths, warm baths, vapor baths, and baths of hot and cold air.

Wherever the Romans settled they built public baths, and wherever they found hot springs or natural stufæ, they made use of them, thus saving the expense of heating, as at Baiæ and Bath. The charge made at a public bath was only a quadraus, or about one quarter cent.

The delicacy of feeling concerning the bathing together of sexes which is said to have existed in early times certainly did not extend to the days of the Empire, when it was not at all uncommon for men and women to make use of the same bath and it was probably due to this practice that the public baths came to be condemned by the early Christians as places of unbounded license. While admitting the usefulness of the bath from the standpoint of cleanliness and health, the Church fathers insisted that baths should be taken for such purposes only and not for pleasure. It was at this time when the bath reached the height of luxuriousness; when rich citizens had magnificent private baths of their own attached to their villas, and when elaborate private bathing houses might be had for hire in all the cities; conditions which continued until about the 5th century, when the destruction of Rome's water supply by the Huns and the many disasters which accompanied the downfall of the Empire tended to turn popular attention from the delights of the *thermæ.* How thoroughly the bath afterward fell into disuse, however, is a matter which historians have been unable to determine. In the East, of course, where the heat and dust make its use obligatory, there has never been any diminution in the practice, and while in Europe, for a time at least, perfumes were used to offset any disagreeable odors that might arise from uncleanliness of the person, this condition could not have existed for many centuries, for, by the latter part of the 12th century, the popularity of the bath had become so well re-established that there was scarcely any large city in Europe which did not possess well patronized hot air bathing houses. Again in the 17th century, when the Turkish bath was introduced, there was another revival of interest in the matter of personal cleanliness, and people of all classes flocked to the baths, or Hummuns, as they were called, to enjoy the new luxury that had been imported from the East.

While the Turkish bath, not to mention the Russian and Egyptian baths, are so similar to the hot air baths of the Romans that many authorities have regarded them as nothing more or less than an outgrowth from the latter, the fact that the principle of the vapor bath has been known to many nations, and has even been found among savages, or races in an early stage of civilization, has led to the more recent and counter theory that the hot air boxes of the Mexicans, the "medicine sweats" of the American Indians, the small baths of the ancient inhabitants of Scotland and Ireland, and the larger vapor baths of Japan, like those of Turkey and Russia, are of just as independent origin as those of the more ancient Rome. However that may be it is at least certain that, while this luxurious form of bathing was largely responsible for the neglect of the cold

bath and the sea-bathing, the virtues of which have been appreciated only within comparatively modern times, it is largely due to the pleasureable sensations resulting from this form of bath that the various nations of the world have not neglected those principles of cleanliness upon which the good health of a people so vitally depends.

J. R. MEADER,
Editor of 'American Year Book.'

Bath Houses, Public. The public bath-house was a matter of course in the cities of southern Europe down to the end of the Roman empire; one of the chief objects of public expenditure and private munificence. The Romans borrowed it from the Greeks, but vastly improved it, connecting it with a general system of public recreation. Mæcenas under Augustus was the first private citizen to build a splendid specimen and give it to the city of Rome; and after him each succeeding emperor strove to outdo the others in enormous buildings of magnificent architecture and sumptuous fittings, containing not only all kinds of baths,—cold, hot, swimming, vapor, hot air, and shower,—but gymnasia, theatres, and libraries. Private persons also founded them in provincial cities. But after the barbarian deluge, both money and water supply failed, and till very modern times general cleanliness ceased to be a municipal concern. The system first revived in Germany, but only in cold swimming baths; the first enclosed bath houses with hot and cold water were established in Liverpool, in 1842. The movement spread but tardily in Great Britain,—the first legislation of 1846 being little acted on,—till about 1890, when city councils began to take it up energetically with authorization from Parliament; but it then increased so rapidly that almost every town or borough of 50,000 people now has its public bath open the year round, as do very many smaller ones. In Germany about 50 cities have them. On the Continent generally and in Scandinavia, only the large cities are thus provided; but in Russia they are almost universal in places of any size.

In the United States, though public baths have existed for some 40 years in a few great water-side cities, they were till a few years ago confined to cold swimming-baths sunk in the sea or river near the shore, and open only during warm weather; of excellent service for the comfort of those not too far off, but too limited in scope to be of the highest value to the general public. Not only were they closed for more than half the year, but to those who must walk more than half or three quarters of a mile to obtain a bath (their utility being for the poor), their value as refreshment in hot weather was neutralized by the needful exertion to reach them. Their use, therefore, depended on their distribution and relation to the water system. Thus, in Boston, where six were established in 1866, with 300,000 patrons during the first season, and extended to 14 in 1897, they were so located on the Charles River, at City Point, and on South Bay, that a considerable part of the poorer population were within fairly easy distance of them. Only about a dozen United States cities, however, had even these bathing facilities till a few years since, and the first general movement in favor of year-round hot and cold baths was a reflex from Germany, about 1891. In that year the People's Baths were built in New York by a private philanthropic association, and maintained by a small fee; and in 1893 Chicago opened a small municipal bath house. The first compulsory legislation was by New York state in April 1895 (though a bathing and washing association was incorporated there in 1849); it obliged all cities of over 50,000 people to establish public baths and comfort stations, kept open the year round, with both hot and cold water, and 14 hours a day, and under such conditions as the local board of health judged proper; river, lake, or sea baths not to be deemed a compliance with the act. Cities under 50,000, though not compelled, were permitted to use their funds or credit for the same object. The first city to comply, and perhaps the first in the United States to furnish such conveniences in their full extent, was Yonkers, N. Y., not within the compulsory section. This town opened one on Labor Day, 1896; and another of brick, fireproof, in 1898, with accommodations for 400 daily baths. Within the act, Buffalo opened its first in 1897; Albany, Rochester, Syracuse, and Troy, have since complied; and in New York the first one, five years after the act was passed, was opened in Rivington Street in a closely packed quarter, during 1900, at a cost of $100,000. It furnishes 3,000 baths a day of 20 minutes each, from 67 spray baths. In Philadelphia the Public Baths Association was organized in 1895; but the first to be opened was in 1898, in a crowded quarter between Fourth and Fifth streets. It is a building of 2½ stories, 40 by 60, constructed of brick and iron, with concrete floors and iron partitions. It cost about $30,000. It has no swimming pool, but only shower baths — a system rapidly coming into favor from its economy of space and water; the People's Baths and the Baron de Hirsch Fund Baths in New York adopt the same plan. The Philadelphia establishment has a public laundry in connection with its own suit and towel laundry, where women and men in separate compartments can wash their clothing for a small fee, and single men make much use of it to wash their underclothing. Pittsburg, Pa., has recently erected a permanent public bath. Some of the old warm-season baths have since been made permanent, as in Newark, N. J., which so extended two in 1898, and in 1900 voted a third. Boston from 1897 to 1899 increased its public baths to 33 — 14 floating, 10 beach, and 9 others; 17 south of the common and 16 north; and prepared to erect permanent structures in each industrial section of the city. The first of these was opened at Dover Street in 1898 — a fine brick and granite structure, with marble partitions and staircases, the whole with land costing $86,000. It has gymnasiums also, and medical directors for each sex to give courses of training, and for cases of accident or sudden illness. The intention is ultimately to make these baths places of public recreation, corresponding to the summer playgrounds; thus reaching in the 20th century the point at which the Romans had arrived in the first. Brookline, adjoining Boston, has a handsomely appointed permanent municipal bath house and so have Worcester, Mass., and Providence, R. I. St. Paul, Minn., through the public spirit of Dr. Ohage, a German physician, now has a public playground, pavilion, etc., connected with permanent bath

houses on what was till recently a waste island in the middle of the Mississippi, near the business centre of the city and between two main bridges. Like most of the other bath establishments, it is free, save a small charge for soap and towels; has free instruction in swimming, and is open every day, including Sundays. The donor calls it an experiment in municipal socialism, being himself a socialist. A very recent phase of the movement is the connection of the system with the public schools. It began in Germany, Göttingen leading the way in 1885 under the headship of the mayor and a professor in the university. Thus far, in the United States it is nearly confined to Boston and its suburbs; in 1900 a number of baths were put into the Paul Revere school in the North End, and in Brookline swimming is a regular part of the school curriculum. As a means of public sanitation, preventing the spread of disease and purifying the air, where the rooms are full of children from the poorer quarters, it has much to commend it.

Bath, Knights of the, an English order concerning the origin of which antiquaries differ. Henry IV., on the day of his coronation, conferred the degree upon 46 knights. From that time the kings of England have bestowed this dignity previous to coronations, after births and marriages of the royal issue, etc. Charles II. created several Knights of the Bath, but after his time the order fell into neglect, till 1725, when George I. revived it. By the book of statutes then prepared, the number of knights was fixed at 38, namely, the sovereign, and 37 knights companions. The king allowed the chapel of Henry VII., in Westminster Abbey, to be the chapel of the order. The limits of the order were greatly extended by the prince regent in 1815, to reward the distinguished services of officers during the wars; and again in 1847, when it was also opened to civilians. It was further enlarged in 1861. It now consists of three classes, each of which is subdivided into (1) military members; (2) civil members, and (3) honorary members, consisting of foreign princes and officers. The first class consists of Knights Grand Cross (G.C.B.); the second of Knights Commanders (K.C.B.); and the third, of Companions (C.B.). The dean of Westminster is dean of the order. The ribbon of the order is crimson, and its motto, "Tria juncta in uno." The name is conjecturally derived from the initiatory ceremony of bathing once practised at the installation of a knight, as symbolical of the purity thereafter required of him.

Bathom'eter, an instrument for measuring the depth of the sea or any large body of water without a sounding line, the name being derived from *bathos,* depth. It was invented by Dr. C. W. Siemens after 1859 as an adjunct to the laying of submarine telegraphic cables, so as to keep a continuous record of the sea depth below a moving ship. The principle of the instrument is based upon the gravitation of the earth, total gravitation being represented by a column of mercury, which rests upon a thin steel diaphragm embossed in such a way that its centre can move within a small range freely up and down under the influence of the mercury column without encountering any frictional resistance. The column ends in a cup, and mercury is poured into both cup and pipe up to a certain point, the space above being filled with water, alcohol, or a liquid of less density, this latter terminating in a spiral tube laid upon a scale at the top of the instrument. The centre of the diaphragm which supports the column of mercury is carried by two or more carefully tempered steel springs, so adjusted that their elastic pressure balances exactly the dead weight of the column of mercury resting upon the diaphragm, the result being that the diaphragm retains its horizontal position. Inclosed in an air-tight casing closed by a disc of plate glass, the instrument records by an ingenious compensating arrangement the natural balance of the elastic and gravity forces on the scale, from which readings are made. Consult Siemens, 'The Bathometer' (1879).

Bathori, bä'tō-rē, or **Battori,** a celebrated Hungarian family which in the 15th century became divided into two branches, one of which gave Transylvania five princes, and Poland one of its greatest kings:

1. Stephen: b. 1532; d. Grodno, 1586. He entered the army, and so distinguished himself that when the death of John Sigismund Zapolya, nephew of Sigismund II., king of Poland, in 1571, left a vacancy in the sovereignty of Transylvania, Stephen Bathori, without courting the honor, was unanimously elected. When the throne of Poland became vacant by Henry of Valois quitting the country in order to mount the throne of France, Stephen Bathori was elected to succeed him in 1575, and was crowned along with his queen, Anne, daughter of Sigismund Augustus, at Cracow, in 1576. He found the kingdom torn asunder by faction, the people enervated by long peace, the treasury exhausted, and the army without discipline. He therefore gave his first attention to internal improvement, but had no sooner effected it than he determined to recover the Polish territories of which the czar of Muscovy had managed to possess himself by fomenting dissensions. He accordingly declared war against him, beat him at all points, and compelled him to accept a disadvantageous peace. Under Stephen Bathori, Poland enjoyed a comparative tranquillity to which it had long been a stranger, and he was meditating important constitutional reforms, which promised to make that tranquillity permanent, when he died suddenly.

2. Sigismund, nephew of Stephen: d. 1613. He became waiwode or prince of Transylvania in 1581, shook off the Ottoman yoke, and, by the great talents he displayed, had begun to give hopes of reigning gloriously as an independent sovereign, when, from mere fickleness and eccentricity of character, he voluntarily resigned his dominions to the Emperor Rudolph II. in return for two principalities in Silesia, a cardinal's hat, and a pension. With the same fickleness, however, he immediately repented of the act, and, availing himself of an invitation by the Transylvanians, returned, and placed himself under the protection of the Porte. The talent which he had displayed, and the good fortune which had followed him in early life, appeared now to have forsaken him; the Imperialists defeated him in every battle, and he was obliged to throw himself on the mercy of the emperor, who sent him to live out the rest of his days at Prague.

Baths of Agrippa, the earliest of the Roman thermæ; erected by Marcus Agrippa in the reign of Augustus. They stood in the Campus Martius, about 20 feet behind the Pantheon. In 1881, on the removal of some houses, ruins were found of a great hall paved with marble and lined with fluted columns.

Baths of Caracal'la, one of the most magnificent of the Roman thermæ, in the southeast part of the city, in which 2,300 men could bathe at the same time. They were begun in 206 A.D. by Caracalla, and completed by Severus. There were stadia for the athletes, galleries for the exhibition of paintings and sculpture, libraries, conversation halls, lecture-rooms, etc. The mechanical skill displayed in their construction was very great. The ruins which still remain are among the most remarkable in Rome.

Baths of Diocletian, the most extensive of the Roman thermæ; in the northeast part of the city, and covering most of the ground between the Porta Collina and the Porta Viminalis. Over 3,000 persons could bathe in them at the same time. They contained a library, picture-gallery, odeum, etc. Michael Angelo transformed the great hall of the Tepidarium into a nave for the Church of S. Marie degli Angeli. One of the *laconica* (hot rooms) forms the vestibule of the church.

Baths of Titus, a structure on the Esquiline Hill in Rome; built by the Emperor Titus. Considerable ruins are found northeast of the Coliseum.

Bathsheba, băth-shē'bä, or băth'shĕ-ba, wife of Uriah, the Hittite, whose story is told in 2 Sam xi. David committed adultery with her, then caused her husband to be slain, and afterward took her to wife. These sins displeased Jehovah, who sent the prophet Nathan to David with the parable of the ewe lamb. David bitterly repented, but yet was punished. Bathsheba was the mother of Solomon, whose succession to the throne she took pains to secure. She is afterward mentioned in the history of Adonijah, in the title of Psalms li., and among the ancestors of Christ (Matt. i. 6).

Bath'urst, Allen, (Earl), English statesman: b. 1684; d. 1775. He was a zealous opponent of the measures of Sir Robert Walpole's ministry, and the intimate friend of Bolingbroke, Pope, Addison, and other great writers of the time.

Bathurst, Henry (2d Earl), son of the preceding, English statesman: b. 1714; d. 1794. In 1771 he was made lord high chancellor of England. He wrote 'Theory of Evidence,' etc.

Bathurst, Henry (3d Earl), son of the second earl, English statesman: b. 22 May 1762; d. 1834. In 1807 he became president of the board of trade; in 1809 secretary for foreign affairs; and in 1812 secretary for the colonies, a post held by him for 16 years. He was also president of the council under Wellington, 1828–30.

Bathurst, Ralph, English clergyman: b. 1620; d. 14 June 1704. He was dean of Wells, and wrote some elegant Latin poems, and was one of the founders of the Royal Society of London (q.v.), which was incorporated in 1660.

Bathurst, Africa, a town on the island of St. Mary's, near the mouth of the Gambia, and capital of the British colony Gambia. Its trade is chiefly in gum, bees'-wax, ground-nuts, hides, ivory, and gold, bartered for cloths and cutlery. Pop. 6,000.

Bathurst, Australia, the principal town in the western district of the colony of New South Wales, on the south bank of the Macquarie River, 144 miles west of Sydney, 2,153 feet above sea-level, and surrounded by hills. It has wide, well-laid-out streets crossing each other at right angles, with a central square planted with trees. The public buildings include the Anglican and Roman Catholic cathedrals, and churches for the Baptists, Congregationalists, Wesleyans, Presbyterians, and others; court-house, jail, and town-hall; post and telegraph offices; a hospital, numerous schools, a school of arts, etc. There are several tanneries, a coach factory, railway workshops, breweries, and flour mills. Soap, candles, glue, boots and shoes, and furniture are also extensively manufactured. Pop. (1900) 9,069.

Bathurst Inlet, an inlet of the Polar Sea, projecting due south about 75 miles out of Coronation Gulf. It is in a direct line between the magnetic pole and Great Slave Lake, and about 300 miles from each.

Bathurst Island, the name of two islands: (1) An island off the northeast coast of Australia, just west of Melville Island, and separated from the mainland of Australia by Clarence Strait on the south, and from Melville Island by Apsley Strait; (2) an island in the Arctic Ocean, discovered by Parry in 1819, lying due south of Grinnell Land, and the most eastern of the group called Parry Islands. It is separated from North Somerset on the south by Barrow Strait, and from North Devon on the east by Wellington Channel.

Bathyb'ius, the name given by Huxley, in 1868, to a supposed organism, a bit of unorganized protoplasm, found at the sea-bottom at great depths. It was structureless, and contained numerous calcareous concretions. Huxley abandoned the idea that it was a living organism. Afterward Bessels gave the name «protobathybius» to a similar slimy moss dredged in Smith's Sound in 92 fathoms, possibly the remains of protozoa or sponges. Bathybius was not rediscovered by the Challenger expedition, and Sir John Murray suspected that the substance was only a gelatinous precipitate of sulphate of lime from sea water mixed with alcohol.

Bath'ycles, Greek artist, supposed to have flourished in the time of Solon, in the 7th century B.C. He was a resident of Magnesia, in Thessaly, on the Mæander, and constructed for the Lacedæmonians the colossal throne of the Amyclæan Apollo, at Amyclæ, near Sparta. Quatremère de Quincy, in his 'Jupiter Olympien,' has given an interesting view of the splendid god and his superb throne, designed from the description of Pausanias.

Bathym'etry, the art of measuring depths in the sea, especially for the purpose of investigating the vertical range of distribution of plants and animals. An extensive series of such bathymetric measurements was made by H. M. S. Challenger (1872–6), the deepest sounding being 4,575 fathoms. In February 1900 the United States surveying ship Nero reported that in surveying for a proposed telegraphic cable line between Honolulu and Manila by way

of Guam and Yokohama, she encountered the greatest ocean depths on record; two casts showing 5,160 and 5,269 fathoms respectively.

Batiste, bä-tēst, a fine, white, very compact linen, distinguished by its delicate, firm, and uniform threads from every other linen texture. The name is derived either from the Indian material *bastas,* or from one of the early manufacturers of it, Baptiste Chambray, who lived in the 13th century, and from whom it was also called the cloth of Chambray, or Cambray; hence the English word cambric.

Batjan, bät-yän', one of the Molucca Islands, lying southwest of Gilolo. It is governed by a native sultan under Dutch suzerainty. The chief industry is the cultivation of spices. Area, 835 square miles; population from 12,000 to 13,000, of which the majority are Malays or Alfores.

Batley, England, a municipal and parliamentary borough, in the West Riding of York, eight miles south of Leeds, and just north of Dewsbury, with which it is united for parliamentary purposes. The houses are chiefly of stone, and rather irregularly built. Batley has an ancient parish church in the Early English style, a town-hall, a grammar and a technical school, mechanics' institute, etc. The principal manufactures are heavy woolen cloths, Batley being the chief seat of the manufacture of heavy woolens. There are also iron foundries, machine-works, collieries, etc. Pop. (1901) 30,300.

Batlle, Lorenzo, Uruguayan statesman: b. Montevideo, 1812. He commanded a body of infantry in the nine years' siege of Montevideo; was minister of war in 1866–8; president of the republic from 1868 to 1872, when he resigned the office and resumed his place as general in the army.

Batna, bät'na, Algeria, a town of the department of Constantine, situated at the foot of Mount Tugurt. It is an important military and trading post. Pop. 8,381.

Baton, bät-on, or bä-tŏn, a short staff or truncheon, in some cases used as an official badge, as that of a field marshal. The conductor of an orchestra has a baton for the purpose of directing the performers as to time, etc. In heraldry, what is usually called the bastard bar, or bar sinister, is properly a baton sinister.

Baton Rouge, La., city, parish-seat of East Baton Rouge, and capital of the State. The name is derived from the French, meaning red baton or stick. The city is situated on the eastern bank of the Mississippi River, 90 miles northwest of New Orleans, and is on the Texas and Pacific and the Yazoo and Mississippi Valley Railroad. It is picturesquely built on a bluff commanding an excellent view of the surrounding country. The houses are mostly of French and Spanish architecture. The river below the city is bordered by sugar-cane plantations, orchards of tropical fruits, private gardens, and villas. It was the capital of the State from 1847 to 1864, when the seat of government was removed to New Orleans. On 1 March 1882, Baton Rouge was again selected as the capital city. The State capital building here was completed in 1852 at a cost of $246,000. It was partially burned during the Civil War but was rebuilt in 1882. The Louisiana State University was organized here in 1860. The city also contains various State institutions, orphan asylum, penitentiary, deaf and dumb, and blind asylums, State agricultural and mechanical college, and agricultural experiment station. There are among other public buildings, the Court House, City Hall, Post Office, Collegiate Institute, High School building, and a National Soldiers' Cemetery.

There are varied and extensive manufacturing interests, including cotton seed products, lumber, sugar, molasses, brick, artificial ice, and agricultural implements. The city has National and State banks, several daily and weekly newspapers. There is a large and growing trade with the surrounding cotton and sugar growing regions. The city has a real property assessed valuation of $2,000,000, actual valuation $3,500,000, exclusive of the valuable City, Parish and State property which is exempt from assessment. In addition to above the personal assessed property is $1,000,000, making a total assessment of $3,000,000, real value $5,000,000.

Baton Rouge is governed under a charter of 1898, by a mayor, elected every four years and a city council, elected every four years. A majority of the municipal officers are selected by the council. The city was one of the earliest French settlements in Louisiana. A convention which met here 21 Jan. 1861, adopted the ordinance of secession on the 26th; the city was taken by the Federal army 7 May 1862. On 5 August the same year a Confederate force numbering 5,000 under command of General John C. Breckenridge, attacked the Federal garrison under General Thomas Williams, but was repulsed after a fierce contest lasting two hours. Gen. Williams was killed and both sides lost heavily. The city was shortly afterward evacuated but a month later was re-occupied by the Federal troops who remained until the close of the war. A former government arsenal here was destroyed during the war. Pop. (1900) 11,269; (1903 est.) 12,500.

W. H. Bynum,
Mayor of Baton Rouge.

Batoni, bä-tō'nē, **Pompeo Girolamo,** Italian painter: b. Lucca, 1708; d. Rome, 1787. The manner in which he executed his paintings was peculiar. He covered his sketch with a cloth, and began to paint the upper part on the left hand, and proceeded gradually toward the right, never uncovering a new place until the first was entirely finished. Boni, who compares him with Mengs, calls the latter the painter of philosophy; the former, the painter of nature. Batoni painted many altar-pieces and numerous portraits, including those of the Emperor Joseph and the Empress Maria Theresa in the imperial gallery. His greatest work is his 'Fall of Simon the Sorcerer,' which was ordered by Cardinal Albani for the church of St. Peter's at Rome, and was intended to be executed in mosaic. His 'Magdalene,' in Dresden, and his 'Return of the Prodigal Son,' in Vienna, are celebrated.

Batrachia, the frogs and toads of the *Anura* order of *Amphibia* (q.v.), comprising the *Ranidæ* frogs, the *Bufonidæ* ordinary toads, the *Hylidæ* tree frogs, the *Pipidæ* Surinam toads, and similar reptiles with the distinguishing characteristic of development from the tailed and gilled tadpole state to a tailless, but leg and lung provided adult condition.

Bat'ta, Africa, a province of the Congo Free State, formerly independent. Its principal towns are Batta and Cangon.

Batta, Sumatra, a district in the northern part of the island, stretching between Sinkell and Tabuyong, on the west, and the Bila and the Rakan on the east. The soil is fertile, and produces chiefly camphor, gum, benzoin, cassia, cotton, and indigo. The language of the Battas is a settled one, and extensively written. Bark or bamboo staves are used in place of books, being written on from bottom to top. Their literature consists chiefly of tales of witchcraft, riddles, stories, etc. There are three dialects. Pop. about 300,000.

Battalion, the tactical unit of command in infantry — that is, the first body that is, as a rule, used independently, and commanded by a field officer (major or lieutenant-colonel). In the United States army eight companies of cavalry and artillery and 10 of infantry constitute a battalion; each infantry regiment has one battalion and those in the **cavalry** and artillery have two.

English battalions are formed of 10 companies for administrative, and eight for tactical purposes. The first 25 regiments have two battalions, the remainder, originally of one battalion each, are linked in pairs according to their territorial derivation. Linked battalions are interchangeable as regards officers, and each shares the honors and advantages of the other. Two regiments of rifles have four battalions each, and the three regiments of the Guards seven battalions in all. The peace strength of a battalion is about 400 men, but varies; its war strength in the field is 1,000, with one lieutenant-colonel, two majors, eight captains, 16 subalterns, four officers of the regimental staff (adjutant, paymaster, quartermaster, and medical officer), and 50 sergeants. The corporals and lance-corporals fall in with the privates in the ranks, and therefore number among the rank and file.

The French infantry is divided into (1) infantry of the line; (2) regiments of zouaves; (3) regiments of *tirailleurs Algériens;* and (4) battalions of *chasseurs à pied.* The 144 regiments of infantry of the line have each four battalions; a battalion (which is divided into four field companies), consisting of 12 commissioned officers, 54 non-commissioned officers, and 264 soldiers — in all 330 men, raised in time of war to 1,000. The regiments of zouaves have in peace 612 men in a battalion, and in war 1,000. The *tirailleurs Algériens,* who in time of peace are stationed in Algeria, have in peace 652 men in a battalion, and in war 1,000. Finally, the *chasseurs à pied* have in peace 468 men, and in war 1,000.

In Germany, with the exception of the 116th (Hesse) regiment, the 148 line regiments have three battalions. The yägers are formed into 26 separate battalions. To each line regiment is attached a landwehr regiment of two battalions, and these latter bear the same number as the regular regiments to which they are affiliated. The five Prussian Guard regiments have 22 officers and 678 men per battalion in peace time, the remaining regiments having 18 officers and 526 men per battalion, and the yägers 22 officers and 526 men. On mobilization for war all battalions are raised to a strength of 22 officers and 1,000 men, with a regimental staff of one commandant, one extra field officer, and one aide-de-camp. Pioneer battalions are practically field engineer bodies, and are divided into pontoniers (for bridging), and sappers and miners (for siege operations, demolition or construction of artificial defenses). They have each three field and one depot company; the former comprising 15 officers and 650 men.

Battenberg, bät'ĕn-bärg, **Alexander, Prince of,** Bulgarian ruler: b. 1857; d. 17 Feb. 1893. He was the second son of the morganatic union between Prince Alexander of Hesse and the Countess von Hauke, who in 1851 received the title of Countess of Battenberg. In 1879 he was chosen Prince of Bulgaria, and in 1885, without consulting Russia, proclaimed the union of eastern Rumelia with Bulgaria. This action exasperated both Russia and Servia, and the latter took up arms against Bulgaria, but was easily defeated by Alexander in the space of two weeks. In August 1886, however, Russian partisans overpowered Alexander in his palace at Sofia, forced him to abdicate, and carried him off to Reni, in Russian territory. Set free in a few days, he returned; but after a futile attempt to conciliate the czar he abdicated in September, and, assuming the title of Count Hartenau, retired to Darmstadt.

Battenberg, Henry Maurice, British soldier: b. Milan, 5 Oct. 1858; d. 20 Jan. 1896. He was the third son of Prince Alexander of Hesse (see BATTENBERG, ALEXANDER, above), and in 1885 married the Princess Beatrice of England, youngest daughter of Queen Victoria. He joined the British expedition of 1895 against Ashanti, and while on his way home died at sea of a fever contracted during his military service.

Battenberg, Louis Alexander, British naval officer: b. Gratz, 24 May 1854. He was the eldest son of Prince Alexander of Hesse (see BATTENBERG, ALEXANDER, above), and in 1884 married the eldest daughter of the Princess Alice Maud Mary, grand duchess of Hesse-Darmstadt, and second daughter of Queen Victoria.

Battenberg, a village in the Prussian province of Hesse-Nassau, from which the sons of Prince Alexander of Hesse (see BATTENBERG, ALEXANDER, above), derive their title of princes of Battenberg.

Battens, pieces of timber of different lengths, used for making floors, and also, after being divided so as to be 2¼ inches wide and 1¼ thick, placed against walls to separate the laths on which plastering is to be put from the walls. In nautical affairs, battens are (1) strips of wood nailed down over the tarpaulins which cover the hatches; (2) similar strips fastened to portions of the rigging to prevent injury from chafing; (3) light frameworks placed on dining tables to keep the dishes from sliding off by reason of the ship's motion, also called fiddles; (4) thin strips of wood placed in pockets on the leach of a sail to prevent wrinkling or bagging.

Battering Ram (Lat. *aries*), the earliest, simplest, and, until the improved usage of artillery, the most effective machine for destroying stone walls and the ordinary defenses

of fortified towns. Its primitive form was a huge beam of seasoned and tough wood, hoisted on the shoulders of men; who, running with it, at speed, against the obstacle, wall, gate, or palisade, made what impression they might against it. The ancients employed two different machines of this kind — the one suspended, and vibrating after the manner of a pendulum, and the other movable on rollers. The swinging ram resembled in magnitude and form the mast of a large vessel, suspended horizontally at its centre of gravity, by chains or cords, from a movable frame. Ligatures of waxed cord surrounded the beam at short intervals, and cords at the extremity, opposite to the head, served for the purpose of applying human force to give the oscillatory motion. Other cords, at intermediate distances, were also sometimes employed. The rolling ram was much the same as the above in its general construction, except that instead of a pendulous motion, it received only a motion of simple alternation, produced by the strength of men applied to cords passing over pulleys. This construction seems to have been first employed at the siege of Byzantium. These machines were often extremely ponderous. Appian declares that, at the siege of Carthage, he saw two rams so colossal that 100 men were employed in working each. Vitruvius affirms that the beam was often from 100 to 120 feet in length; and Justus Lipsius describes some as 180 feet long, and two feet four inches in diameter, with an iron head weighing at least a ton and a half. In contrasting the effects of the battering-ram with those of the modern artillery, we must not judge of them merely by the measure of their respective momenta. Such a ram as one of those described by Lipsius would weigh more than 45,000 pounds, and its momentum, supposing its velocity be about two yards per second, would be nearly quadruple the momentum of a 40-pound ball moving with a velocity of 1,600 feet per second. But the operation of the two upon a wall would be very different. The ball would probably penetrate the opposing substance, and pursue its way for some distance; but the efficacy of the ram would depend almost entirely upon duly apportioning its intervals of oscillation. At first it would produce no obvious effect upon the wall; but the judicious repetition of its blows would, in a short time, give motion to the wall itself. There would first be a barely perceptible tremor, then more extensive vibrations; these being evident, the assailants would adjust the oscillations of the ram to that of the wall, till at length a large portion of it, partaking of the vibratory impulse, would, by a well-timed blow, fall to the earth at once. This recorded effect of the ram has nothing analogous in the results of modern artillery.

Battersea, a district of London, in Surrey, forming, with Clapham, a parliamentary borough, on the right bank of the Thames, across which there is communication by several bridges. There is a fine public park in Battersea, extending over 185 acres, and containing a considerable sheet of water. There is a Church of England training college for schoolmasters and a Wesleyan for schoolmistresses. Clapham and Wandsworth Commons are fine areas of unenclosed ground. Battersea and Clapham send two members to Parliament — one for each division. Battersea parish is a borough under the London Government Act (1899).

Battershall, Jesse Park, American chemist: b. Troy, N. Y., 26 May 1851; d. Poughkeepsie, N. Y., 12 Jan. 1891. He studied chemistry at the Columbia School of Mines, Göttingen, Leipsic, Geneva, and Tübingen. In 1879 he became head of the analytical department of the United States laboratory in New York, a position held until his death. He has published a translation of Naquet's 'Legal Chemistry' (1876); 'Food Adulteration and Detection' (1887).

Batterson, Hermon Griswold, American clergyman: b. Marbledale, Conn., 28 May 1827; d. New York, March 1903. He was ordained to the ministry of the Protestant Episcopal Church in 1866, and held rectorships in San Antonio, Texas; Wabasha, Minn.; Philadelphia, and Church of the Redeemer, New York, 1891. He published 'Missionary Tune Book' (1868); 'Christmas Carols, and Other Verses' (1877); 'Sketchbook of the American Episcopate' (1878, 2d ed. 1884); 'Pathway of Faith'; 'Vesper Bells.'

Batterson, James Goodwin: b. Bloomfield, Conn., 23 Feb. 1823; d. Hartford, Conn., 18 Sept. 1901. He was educated in the public schools of Litchfield, Conn., and in 1845 became an importer of and dealer in granite and marble, with headquarters in Hartford. His business grew into one of the most extensive of its kind in the United States, controlling large granite quarries in Westerly, R. I. He took important contracts for public and private buildings and supplied the stone for the State capitol and Connecticut Mutual buildings in Hartford, the Mutual Life, Equitable Life Insurance Companies' buildings, and Vanderbilt residence in New York. He was the first to use machinery for polishing granite and devised many other improvements. In 1863 he founded the Travelers' Insurance Company, and was its president until his death. Throughout his life, though never holding political office, he was one of the foremost public figures of his city and State. He was an enthusiastic student of political economy, and wrote numerous articles and pamphlets on the money question. He taught himself Greek and became an acknowledged master of it; and he was equally accomplished in several of the modern European languages, his versatility and capacity for work being extraordinary. In the last year of his life he wrote a poem of some length, 'The Beginnings,' dealing with the origin of the universe and life. Publications: numerous articles in 'The Traveler's Record'; 'Gold and Silver as Currency' (1896).

Battery, The, a park of 21 acres forming the southernmost point of New York, occupying the site of the original Dutch fortifications. In the early days of the city the vicinity of the Battery was a very aristocratic quarter, and some of the old houses are still standing. The park now contains the Barge Office and the Aquarium, formerly Castle Garden (q.v.).

Bat'tery, in electricity, an apparatus for the production of voltaic (or dynamic) electricity, by chemical means, or by the direct transformation of heat energy (as in the thermopile). It is admitted that the first electric battery was constructed by the Italian physicist Volta, about the year 1800. Some 20 years before, Galvani, a professor of anatomy at Bologna, had observed the convulsive twitching of frogs' legs, when their muscles and lumbar nerves were simultaneously touched by different metals that were themselves elsewhere in contact, and he had rightly attributed the phenomenon to electricity. Galvani, however, was of the opinion that the electricity was of physiological origin, its seat being within the frogs' legs. Volta, on the contrary, believed that the electricity was generated by the contact of the dissimilar metals, and in this belief he constructed the apparatus which is known as his *couronne de tasses,* or "crown of cups." Placing a series of cups in a circle, he partially filled them with a solution of salt and water, and introduced into each a pair of metallic plates, one of these being zinc, and the other either copper or silver. He connected the zinc plate of each cup with the copper plate of the next, completing the entire circle in this way except at one place, where he attached wires to the terminals, to lead away the electricity generated. Very shortly afterward he constructed the "voltaic pile" on the same general principle, except that he formed it of disks of copper, zinc, and wet cloth, which he piled up in the order: copper, zinc, cloth, copper, zinc, cloth, etc., the lowest plate of all being copper, and the highest zinc. The wires for leading off the electricity were then connected at the top and bottom of the apparatus. It is commonly believed that the "pile" of zinc and copper disks was the first form of his battery; but according to Niaudet this is an error, the column battery being an afterthought, made with a view to produce an instrument that might be easily transported into hospitals for medical purposes. The phenomena exhibited by Volta's "crown of cups" were remarkable enough to attract the attention of the entire scientific world, and improved forms of battery were soon devised. Cruikshank, Wollaston, Muncke, Young, Faraday, and others contributed in this way, but the most of the changes that were made related to the mode of arranging the plates and other similar details, and, save for the substitution of dilute sulphuric acid for the salt solution, no advance of a fundamental nature was made until 1836, when John Frederick Daniell, an English physicist, invented the battery that bears his name, and which, in some respects, has never been surpassed.

The earlier forms of battery, in which the plates were immersed in a salt solution or in dilute sulphuric acid, gave an electrical current for a short time; but hydrogen gas was deposited upon the copper electrode by the passage of the current, thereby lessening the area of the plate in contact with the liquid, and so increasing the internal resistance of the cell. It was found, too, that the products of decomposition cut down the electromotive force of the cell, by tending to establish an electromotive force in the opposite direction from that in which the battery current first flowed — a discovery that has since been put to good use in the storage battery (q.v.). To remove the hydrogen film that was deposited upon the copper electrode, various artifices were adopted, such as agitating the solution, or vibrating the copper plate so as to disengage the bubbles of gas and allow them to rise to the surface of the liquid and escape into the air, or rubbing the plate with a brush to achieve the same end, or roughening it in some way so that the hydrogen bubbles would not cling to it so closely. All these methods were troublesome, and it was reserved for Daniell to devise a form of cell in which the hydrogen is removed, automatically and very perfectly, by chemical means. Within the usual containing vessel of glass, he placed a smaller one made of unglazed earthenware, and known as the "porous cup." The outer compartment was filled with dilute sulphuric acid, and contained the zinc plate. The copper plate was placed within the porous cup, and the space around it was filled with crystals of copper sulphate, water or dilute sulphuric acid being added until the liquid stood at the same level on both sides of the porous wall of the cup. When the electric current passes in a battery of this type, the chemical action may be described in the following way: The sulphuric acid, H_2SO_4, is decomposed into hydrogen, and the radical SO_4 (known as "sulphion"), the sulphion going to the zinc plate, with which it combines to produce zinc sulphate, $ZnSO_4$, a salt which dissolves as fast as it is formed, leaving a fresh surface of zinc constantly exposed. The hydrogen of the primary decomposition goes to the copper plate, but instead of being deposited there, as in earlier forms of battery, it combines with the copper sulphate present, reducing it to metallic copper and sulphuric acid, according to the formula

$$CuSO_4 + 2H = Cu + H_2SO_4.$$

It is evident that the molecule of sulphuric acid that was originally decomposed has now been re-formed again, so that the total quantity of acid present in the cell has not been diminished. The metallic copper that is set free does not interfere in any way with the continued action of the cell, for it is deposited upon an electrode that is already composed of copper. The actual chemical phenomena that occur in the Daniell battery may possibly be more complicated than here indicated, but the final results are the same as those given above.

The valuable feature of the Daniell cell is the remarkable constancy of its electromotive force. In some other respects, however, later forms of battery are superior to it. Thus its electromotive force, although quite constant, is not very great (about 1.07 volts). In 1839 Sir William Robert Grove modified it by substituting strong nitric acid for the solution of copper sulphate, and (since nitric acid will attack copper) platinum plates for the copper ones in Daniell's form. An electromotive force as high as 1.9 volts has been observed with this type of battery, the hydrogen that goes to the platinum electrode being oxidized by the nitric acid, with the formation of nitrous acid and water. The chief objections to Grove's battery are the nitrous fumes that it gives off, and the expense of the platinum required. In 1843 Robert Bunsen found that the latter objection could be readily overcome by

replacing the platinum electrodes by plates of carbon. Except for this substitution, his battery is identical with Grove's, and will give substantially the same electromotive force. It is said that the idea of using carbon instead of platinum occurred to Grove himself, and that he made several public experiments with carbon; but these were not entirely successful, and when Bunsen showed the feasibility of using it, they had been forgotten. Many modifications of the Daniell battery have been proposed. Of these the "gravity battery" is one of the most interesting. It is identical in general theory with the Daniell cell, but contains no porous cup, the liquids being kept separate by their different densities. The copper electrode is placed in the bottom of the cell, and the zinc is suspended near the top. The containing vessel is nearly filled with a solution of copper sulphate, a small quantity of solution of zinc sulphate being floated on the top. The copper sulphate solution, being the denser, remains in the lower part of the cell, and the surface of separation of the two liquids descends, slowly, as the battery is used, owing to the gradual diminution of the quantity of copper sulphate present, and the corresponding increase in the quantity of sulphate of zinc. Gravity batteries, if carefully installed, are quite serviceable, and need but little attention. They are used to a considerable extent for telegraphic purposes, when dynamo-electric currents cannot be had conveniently. Batteries in which the depolarizing agent is a salt of chromic acid are now used very commonly for work in which a large current is wanted for a considerable time. Bichromate of potassium is the salt commonly employed as the depolarizer, its use having been first suggested by Johann Christian Poggendorff, a noted professor of physics at Berlin. Bichromate of potash batteries are made in various forms, some with porous cups and some without. The commoner type has no cup, but consists of zinc and carbon electrodes, immersed in a solution consisting essentially of one ounce of bichromate of potassium and one fluid ounce of concentrated sulphuric acid, to every 10 ounces of water. It is well to add, also, about 1 grain of mercurous sulphate to each ounce of the solution, in order to keep the zincs well amalgamated. A bichromate battery so constructed has an electromotive force of about 2 volts, and can be run on a comparatively low resistance for some time without greatly falling off in its voltage. It is not to be compared for constancy, however, with the batteries of Daniell, Grove, and Bunsen. All the batteries thus far described should have their zincs well amalgamated, by rubbing with dilute sulphuric acid and mercury till a bright, mirror-like surface is obtained. The mercury does not enter into any chemical relations with the other contents of the cell, but it has the power of dissolving zinc in preference to other substances that may be present as impurities in the electrode to which it is applied, and so keeping a fresh surface of the pure metal constantly exposed to the battery liquid.

The sal ammoniac cell invented by M. Georges Leclanché is exceedingly useful for ringing bells, operating telephones, lighting gas jets, and other work where a transient current is desired, though it "runs down" (or loses its electromotive force) rapidly when used for any considerable time on a closed circuit, recovering again in a short time when left to itself. In its original form it contained a porous cup, in which was a carbon electrode, surrounded by a mixture of pulverized carbon and manganese dioxid. The outer compartment contained the zinc electrode, and the liquid used was a solution of sal ammoniac (ammonium chloride). In recent years the porous cup has been commonly omitted, the depolarizing mixture of carbon and manganese dioxid being compressed into blocks and bound directly to the carbon electrode by means of rubber bands. The electromotive force of the Leclanché cell is about 1.48 volts, when it has been left at rest for some time. In the place of the depolarizing compound given above, a mixture of 55 parts of sulphur, 40 of gas-coke powder, and 5 of shellac is also used. So-called "dry cells" have come into favor greatly during the past few years. These cells are not really dry, except in the sense that they do not contain any free liquid that can run out if the cell is inverted. They contain electrodes of carbon and zinc, the space between which is filled with a paste that acts as a depolarizer. Many different compositions have been recommended for the paste, among them the following, which is said to give excellent results: Charcoal, 3 parts; graphite, 1 part; peroxide of manganese, 3 parts; slaked lime, 1 part; "white arsenic" (arsenic trioxide), 1 part; a mixture of glucose and starch, 1 part; all by weight. These are to be intimately mixed while dry, and then worked into a smooth paste with equal parts of a saturated solution of sal ammoniac and a similar solution of common salt, to which one tenth (by volume) of a saturated solution of corrosive sublimate and one tenth (also by volume) of hydrochloric acid have been added. Dry batteries are not intended for continuous service, but (like the Leclanché element, to which they are closely related) for the production of transient currents, at considerable intervals.

A form of battery, devised by Mr. Latimer Clark for use in laboratories as a standard of electromotive force, is now commonly employed for this purpose in all exact electrical researches, where the precise determination of an electromotive force is important. As described in his original paper ('Philosophical Transactions' 1875), the cell contains zinc, sulphate of zinc, sulphate of mercury, and mercury; the zinc and mercury forming the respective electrodes. All the materials used must be chemically pure, both the mercury and the zinc being distilled. The sulphate of mercury used in the cell is the *mercurous* salt, Hg_2SO_4, which is prepared by treating pure mercury with an equal weight of pure concentrated sulphuric acid, the mixture being warmed, but kept well below the boiling point (212° F.). The white solid that is produced should be removed before all of the mercury disappears, in order to avoid the formation of the *mercuric* sulphate ($HgSO_4$), which is detrimental to the battery, and which may be recognized, when present in any considerable quantity, by its transformation, upon addition of water, into a yellow basic salt (perhaps $HgSO_4.2HgO$), and free sulphuric acid. The mercury sulphate should be thoroughly washed, before use,

to remove the last trace of free acid. The zinc sulphate is used in the form of a saturated solution, prepared by dissolving the compound in boiling water, and then allowing it to cool. The sulphate of mercury is made into a thick paste with the zinc sulphate solution, and the whole is then heated to 212° F., to expel any air that may be present. The bottom of the cell that is to be used is then well covered with mercury (which is to serve as the positive electrode), after which the paste is poured in. The zinc is suspended in the paste, and the vessel is finally sealed with melted paraffin. The positive connection is made by sealing a platinum wire into the bottom of the cell, or by running the wire down through the paste to the mercury, protecting it by a glass tube. When great accuracy is desired, numerous minute precautions must be observed in the manufacture of these cells, and also in their subsequent use. Such details are to be found chiefly in papers that have appeared in the various scientific journals. (See, for example, Glazebrook and Skinner, 'Philosophical Transactions, A,' 1892.) There is still some small difference of opinion among the various authorities as to the exact electromotive force of the Clark cell, but it is certainly very close to 1.433 volts at 60° F., and it varies about 0.00061 volt per Fahrenheit degree, being lower at higher temperatures, and *vice versa*. Various attempts have been made to devise an electric battery in which some substance other than zinc shall be consumed, to furnish the electrical energy. Iron has been used with some degree of success, but, for one reason or another, iron-consuming batteries have never come into general favor. Magnesium batteries have also been used to a limited extent; a magnesium-carbon element, with a bichromate of potassium depolarizing solution, giving an electromotive force as high as 2.95 volts. The expense of batteries consuming magnesium is too great, however, to permit them to be used for any but experimental purposes.

The ideal electric battery would be one in which carbon is the substance consumed, and inventors have turned their attention to this particular problem with great energy, but with no very considerable measure of success, although there does not appear to be any theoretical reason why a practical and serviceable battery of this sort may not be ultimately discovered. A quarter of a century ago, M. Jablochkoff constructed a cell in which the liquid was melted nitrate of soda or nitrate of potash, the negative electrode (or electrode to be consumed) being of coke, while the positive one was of platinum or cast iron. The coke electrode is brought to incandescence over a part of its surface, before being immersed in the liquid. Upon immersion the coke then burns fiercely, obtaining its oxygen from the melted nitrate, and sending forth large volumes of carbon dioxid gas. While the combustion continues, the cell is capable of generating quite a sensible electric current; but it does not appear that its electromotive force has been determined with any great precision. M. Jablochkoff's carbon-consuming battery cannot be regarded as more than a scientific curiosity, but it is nevertheless interesting, because it demonstrates the possibility of a carbon-consuming battery. About 1895 Dr. William W. Jacques devised a form of electric battery which was thought, for a time, to obtain its energy from the oxidation of carbon. Each cell consisted of a cast-iron pot, which served as a containing vessel, and at the same time as the positive electrode. The negative electrode was a stick of carbon, suspended centrally in the cell. The liquid was caustic soda or caustic potash, which was kept in a state of fusion by means of a furnace, and through which a stream of air was blown, by means of a kind of rose nozzle entering at the bottom of the pot. The electromotive force of a single cell of this battery is about 0.9 volt. Dr. Jacques' theory of the cell was that the furnace merely served to keep the caustic melted, while the electric energy furnished by the battery had its origin in the oxidation of the carbon rods in the cells, the oxygen needed for this oxidation being furnished by the blast of air. In the course of some tests carried out by Dr. Jacques and others with this idea in mind, the loss in weight of the carbon rods was compared with the output of electrical energy yielded by the battery, the result being that the apparatus showed an efficiency, in one case, of no less than 87 per cent. Unfortunately, investigations made by others do not justify Dr. Jacques' hypothesis as to the origin of the electrical energy in his battery. Thus Mr. C. J. Reed showed that the disintegration of the carbon is merely incidental, and that the carbon can be replaced by iron, brass, copper, german silver, or other metallic bodies, without detriment to the battery. He also found that the cell works much better and lasts much longer, if the caustic potash is replaced by nitrate of potash; and, finally, he proved that a blast of common illuminating gas may be substituted for the air, without lessening the electrical yield of the apparatus. These results established the fact, beyond doubt, that the Jacques battery is not a galvanic battery at all, but a form of the thermo-electric apparatus, drawing its energy from the fuel that is consumed in the furnace below the pots. The chemical energy of the coal in the furnace is first transformed into heat, and only later into electrical energy. The battery is therefore amenable to the second law of thermodynamics (q.v.), which is the great obstacle that the successful carbon-consuming battery must avoid. See ELECTRICITY; STORAGE BATTERY.

In law, the unlawful beating of another, or even the touching him with hostile intent. It is legitimate for a parent or a master to give moderate correction to his child, his scholar, or his apprentice. A person who is violently assailed by another may strike back in self-defense. He may do so also in defense of his property. But to strike anyone in anger, however gently, without these justifications, exposes one to the liability to be prosecuted for assault and battery, the assault being the menacing gesture and the battery the actual blow. Wounding and mayhem are a more aggravated kind of battery.

In military art, any work in which one or more cannon are planted, and which may be permanent or temporary. See FORTIFICATION.

Batteux, ba-tė, **Charles**, French scholar, honorary canon of Rheims: b. Alland'huy, 1713; d. 14 July 1780. He displayed his gratitude to this city, in which he received his education,

by the ode 'In Civitatem Remensem' (1739), which was much admired. In 1750 he was invited to Paris, where he taught rhetoric in the colleges of Lisieux and Navarre. He was afterward appointed professor of Latin and Greek philosophy at the Royal College. In 1754 he became a member of the Academy of Inscriptions, and in 1761 of the French Academy. Batteux left a large number of valuable works. He did much service to literature and the fine arts, by introducing unity and system into the numerous canons of taste, which had gained a standing among the French by the example of many eminent men, particularly in regard to poetry, and must be regarded as a valuable writer on æsthetics, notwithstanding the higher point of view from which this science is now considered. Some of his most valuable works are: 'Les Beaux-Arts réduits à unmême Principe,' (1747); and 'Cours de Belles-Lettres ou Principes de la Littérature' (1774). These works were translated into several other languages.

Batthyanyi, bŏt'yä-nye, **Count Kasimir,** Hungarian statesman, minister of foreign affairs during the Hungarian revolution: b. 4 June 1807; d. Paris, 13 July 1854. From his earliest childhood he took a lively interest in public affairs, and after having, as member of the Hungarian diet, opposed the Austrian government, he became, at the outbreak of the revolution, one of the prominent champions of Hungarian independence, devoting his wealth and influence to the promotion of this cause, and at the same time distinguishing himself on various occasions by his courage and skill on the battlefield. After having officiated as governor of various provinces, he became minister of foreign affairs, under the administration of Kossuth, and subsequently he shared his exile in Turkey until 1851, when he repaired to Paris, where he died. Although sympathizing with Kossuth in some respects, he differed from him in others, and addressed, in 1851, a series of letters to the London *Times,* in which he reflected rather severely upon Kossuth's character as statesman and patriot.

Batthyanyi, Count Louis, Hungarian patriot: b. Pressburg, 1809; d. 6 Oct. 1849. He entered the army as a cadet at the age of 16, and on coming into possession of a large fortune, abandoned a military for a diplomatic career, and in process of time attained the rank of leader of the opposition in the Hungarian diet. Upon the breaking out of the commotions of 1848, Batthyanyi took an active part in promoting the national cause, and with a company of armed vassals came forward to assist it in the field. On the entry of Windischgrätz into Budapest in January 1849, he was arrested in the house of his sister-in-law, the Countess Karolyi. After being conveyed to various places he was finally brought back to Budapest, tried by court-martial, and condemned to be hanged. The execution of this sentence he prevented by inflicting several wounds with a poinard on his neck, and he was accordingly shot.

Batti'adae, a dynasty of Cyrene which reigned from the 7th to the 5th century B.C. The kings of this dynasty were: Battus I., the founder of Cyrene; Arcesilaus I., his son; Battus II., son of Arcesilaus, who greatly increased the power of Cyrene; Arcesilaus II., son of Battus II.; Battus III., son of Arcesilaus II.; Arcesilaus III., son of Battus III., who submitted to the Persian king; Battus IV., son of Arcesilaus III.; Arcesilaus IV., son of Battus IV., the last king of Cyrene, killed in a revolution. He is celebrated in fourth and fifth Pindaric odes.

Battik, an oriental production of the natives of the Dutch East Indies, who decorate their clothing with it; also made in The Hague for local use and export. Upon a piece of linen various designs are outlined with a pencil. When the design is completed, the ornamented parts of the fabric are covered with a liquid which possesses the quality of stiffening after being applied. The parts not ornamented are dyed the desired color. After the entire fabric has been ornamented in this manner, it is boiled in hot water so as to take the hard stuff out of the battik. The dyed parts will then hold the dye and the battik is ready. The Hague people were the first to introduce battik into Europe It is made on linen, silk, velvet, and leather, and is exported to all the principal cities of Europe.

Battle, Cullen Andrews, American military officer: b. Powelton, Ga., 1 June 1829. He was graduated from the University of Alabama; admitted to the bar in 1852 and practised till 1860; was a Breckenridge and Lane Presidential elector, and accompanied William L. Yancy in his canvass of Alabama. At the outbreak of the Civil War he entered the Confederate army, and during the war was wounded seven times, promoted brigadier-general on the field of Gettysburg, and major-general in October 1864. After the war he engaged in journalism in Newbern, N. C.

Battle, Kemp Plummer, American educator: b. Franklin County, N. C., 19 Dec. 1831. He graduated at the University of North Carolina in 1849; was a member of the State convention of North Carolina in 1861 that passed the ordinance of secession; State treasurer, 1866–8; president of the University of North Carolina 1876–91; and afterward professor of history there. His works include: 'History of the Supreme Court of North Carolina'; 'History of Raleigh, North Carolina'; 'Trials and Judicial Proceedings of the New Testament'; 'Life of General Jethro Sumner,' as well as numerous writings relating to the history of North Carolina.

Battle, England, a market-town in Sussex. It is situated in a valley nearly encircled by wooded hills, seven miles northwest of Hastings, and consists chiefly of one irregular street, in which there are many old-fashioned buildings; it is well supplied with water, and lighted with gas. The church is ancient, and contains some fine specimens of painted glass and numerous antique monuments. There are places of worship also for Wesleyans, Baptists, Roman Catholics, and Congregationalists, and endowed schools. Battle was long celebrated for the manufacture of gunpowder. The original name of this place was Senlac, and it received its present name from the battle of Hastings which was fought here. In memory of the battle William the Conqueror erected a great abbey, the ruins of which have a circumference of about a mile. This building has almost entirely disappeared, but interesting re-

mains of a subsequent building exist, including the gateway, a beautiful specimen of the decorated English style. One portion of this building now forms a mansion, which until very lately was the residence of Lord Rosebery's mother, the Duchess of Cleveland. See Walcott, 'History of Battle Abbey' (1867); Duchess of Cleveland, 'The Roll of Battle Abbey' (1889). Pop. (1901) 2,996.

Battle. The object of a war may be obtained in two different ways: one party either forces the enemy, by skilful manœuvres, marches, demonstrations, the occupation of advantageous positions, etc., to quit the field (which belongs to the province of strategy); or the hostile masses approach each other, so that a battle becomes necessary to determine which shall keep the field. Troops may either meet by design or by chance. When they meet by chance, and are thus obliged to fight, it is called a rencontre. The rules for insuring a successful issue, whether they respect the preparations for the conflict, or the direction of the forces when actually engaged, belong to tactics, in the narrower sense of the word Strategy also shows the causes which bring armies together, and produce battles without any agreement between the parties. It may be sufficient to say, in general, that armies in their marches (and consequently in their meeting) are chiefly determined by the course of the mountains and rivers of a country. In ancient times and the Middle Ages the battle-ground was often chosen by agreement, and the battle was then a mere trial of strength, a sort of duel; but, in our time, such trifling is done away with. War is now carried on for the real or pretended interest of a nation, or of a ruler who thinks or pretends that his interest is that of the nation. Wars are now undertaken for the purpose of fighting, and battles are merely the consequence of pursuing the purpose of the war. They arise from one party's striving to prevent the other from gaining his object. Every means, therefore, of winning the battle is resorted to, and an agreement can hardly be thought of. In this respect a land battle is entirely different from a naval one. The former is intended merely to remove an obstacle in the way of gaining the object of the war; the destruction of the enemy, therefore, is not the first thing sought for. But the object of a naval engagement is, almost always, the destruction of the enemy; those cases only excepted in which a fleet intends to bring supplies or reinforcements to a blockaded port, and is obliged to fight to accomplish its purpose.

As the armies of the ancients were not so well organized as those of the moderns, and the combatants fought very little at a distance, after the battle had begun manœuvres were much more difficult, and troops, when actually engaged, were almost entirely beyond the control of the general. With them, therefore, the battle depended almost wholly upon the previous arrangements, and the valor of the troops. Not so in modern times. The finest combinations, the most ingenious manœuvres, are rendered possible by the better organization of the armies, which, thus, generally at least, remain under the control of the general. The battle of the ancients was the rude beginning of an art now much developed. It is the skill of the general, rather than the courage of the soldier, that now determines the event of a battle.

Battles are distinguished into offensive and defensive. Of course, a battle which is offensive for one side is defensive for the other. Tacticians divide a battle into three periods — that of the disposition, that of the combat, and the decisive moment. The general examines the strength, reconnoitres the position, and endeavors to learn the intention of the enemy. If the enemy conceals his plan and position, skirmishes and partial assaults are often advisable, in order to disturb him, to obtain a view of his movements, to induce him to advance, or with the view of making prisoners, who may be questioned, etc. Since the general cannot direct all these operations in person, officers of the staff assist him; single scouts or small bodies are sent out, and spies are employed. Every means is made use of for obtaining information regarding the enemy, or the ground on which the battle is likely to take place. According to the knowledge thus acquired, and the state of the troops, the plan of battle, or the disposition, is made; and here military genius has an opportunity to display itself. To the disposition also belongs the detaching of large bodies which are to co-operate in the battle, but not under the immediate command of the chief. The plan of the battle itself, the position of the troops, etc., is called the order of battle (*ordre de bataille*). This is either the parallel, or the inclosing (if the enemy cannot develop his forces, or you are strong enough to outflank him), or the oblique. When each division of troops has taken its position, and received its orders, and the weaker points have been fortified (if time allows it), the artillery placed on the most favorable points, all chasms connected by bridges, villages, woods, etc., taken possession of, and all impediments removed as far as possible (which very often cannot be done, except by fighting), then comes the second period — that of the engagement. The combat begins, either on several points at a given signal, as is the case when the armies are very large, and a general attack is intended, as, for instance, at Leipsic, where three fireballs gave the signal for battle on the side of the allies; or by skirmishes of the light troops, which is the most common case. The artillery endeavors to dismount the batteries of the enemy, to destroy his columns, and, in general, to break a passage, if possible, for the other troops. The forces, at the present day, are brought into action mostly in open order, and not, as formerly, in long but weak lines. Here the skill of the commanders of battalions is exerted. Upon them rests the principal execution of the actual combat. The plans and orders of a general reach only to a certain point; the chiefs of battalions must do the great work of the battle. Before the battle, the general places himself upon a point from which he can see the conflict, and where he can easily receive reports. A few men are near him as his bodyguard; others take charge of the plans and maps; telescopes are indispensable. He often sends one of his aides to take command of the nearest body of cavalry, in order to execute a new movement quickly. He receives the reports of the generals under him; disposes of the troops not yet in action; strengthens weak points; throws his force on the enemy where he sees

them waver; or changes, if necessary, with a bold and ingenious thought, the whole order of battle. The general now uses every means to bring on the third period of the battle—the decisive moment.

In the Austro-German campaign of 1866, and the still more important Franco-German campaign of 1870, great changes were developed both in strategy and tactics. The changes in strategy were due chiefly to the ease with which the general could direct detached bodies of troops over a wide area by means of the telegraph, and the facility with which troops, provisions, and ammunition could be moved from point to point by railway. The changes in tactics, again, arose chiefly from the longer range and quicker firing capacity of modern rifles, and the greater importance attached to the massed firing of long-range breech-loading artillery. Still greater changes in tactics and strategy have been brought about by such recent inventions as those of smokeless powder and lyddite shells, and in the Spanish-American and Anglo-Boer wars these changes were made very manifest. See also STRATEGY; TACTICS.

Battle Above the Clouds, The, the name given to that portion of the battle of Chattanooga fought on Lookout Mountain, Tenn., 24 Nov. 1863. See CHATTANOOGA, BATTLE OF.

Battle Axe, a military weapon much used in the early part of the Middle Ages, particularly by those who fought on foot. It was not uncommon, however, among the knights, who used also the mace, a species of iron club or hammer. Both are to be seen in the different collections of old arms in Europe. The Greeks and Romans did not employ the battle axe, though it was found among contemporary nations. In fact, the axe is one of the earliest weapons, its use as an instrument of domestic industry naturally suggesting its application for purposes of offense; but, at the same time, it has always been abandoned as soon as the art of fencing, attacking, and guarding was cultivated; because the heavier the blow given with this instrument, the more will it expose the fighter. It never would have remained so long in use in the Middle Ages had it not been for the iron armor, which protected the body from every thing but heavy blows. In England, Ireland, and Scotland, the battle axe was much employed. At the battle of Bannockburn, King Robert Bruce clave an English champion down to the chin with one blow of his axe. The Lochaber-axe remained a formidable weapon in the hands of the Highlanders to a recent period, and was used by the old city guard of Edinburgh. A pole axe is a long-handled battle axe.

Battle of the Books, The, a famous work by Jonathan Swift, written in 1697, but remaining in manuscript until 1704. It was a travesty on the endless controversy over the relative merits of the ancients and moderns, first raised in France by Perrault. Its immediate cause, however, was the position of Swift's patron, Sir William Temple, as to the genuineness of the 'Letters of Phalaris.' The work, was not taken with entire seriousness by Swift's contemporaries.

Battle of the Salient. See SPOTTSYLVANIA COURT HOUSE, BATTLES OF.

Battle Creek, Mich., a city of Calhoun County, situated on the Kalamazoo River at its junction with the Battle Creek, and on the Grand Trunk Western, Michigan Central, and Detroit, Toledo & Milwaukee Railroads, 121 miles west of Detroit and 163 miles east of Chicago.

Industries, Banks, Etc.—Battle Creek is located in the midst of the best farming section of the State and agriculture and fruit-growing are carried on extensively. It is as a manufacturing city, however, that Battle Creek is best known, having more than 70 factories in active operation employing about 5,000 people. The weekly pay-roll of factories alone is over $100,000. There are large plants which make more threshing machines, traction engines and steam pumps than are made in any other city in the world. There are also planing mills, boiler works, brick yards, flouring mills, foundries, cigar factories, bot'ling works, ice plants, ironworks, candy factories, a brewery, pipe-organ factory, etc. The city is also noted for the manufacture of cereal foods. The Grand Trunk Western shops are located here, this being the only division between Port Huron and Chicago. There are two national, two State and one private banks, with a combined capital of $450,000, surplus $226,000, and deposits $4,216,000.

Societies, Buildings, Education, Etc.—Battle Creek has over 50 secret and fraternal societies, a Nature Club, a Musical Union, a Woman's Club, a Woman's League which owns a business block and has a noon-day rest and free dispensary, a Y. W. C. A. and Y. M. C. A., a company of State militia and the Athelstan Club, a social organization, composed of business and professional men. The Young Men's Christian Association building is the gift of the late Charles Willard and cost $40,000. The new public library costing $70,000 is also the gift of Mr. Willard. A fine hospital costing $35,000 was presented to the city by the late John Nichols. Other interesting buildings are the Post Theatre (costing $60,000), Post Tavern, the Phelps Sanatorium, and Battle Creek Sanitarium (q.v.). The city has over 20 churches and is known as one of the largest centres of the Seventh Day Adventists (see ADVENTISTS). There are 10 public schools, 100 teachers and over 4,000 children of school age, a Catholic parish school, and three business colleges. Over $90,000 was spent for school maintenance in 1903. There are daily and weekly papers and a number of monthly publications, some of them published in foreign languages.

History, Government, Etc.—Battle Creek was first settled in 1832 by families from New York and New England and has always been noted as a distinctively American city, the percentage of foreign born citizens being relatively small. It was incorporated as a city in 1859 and its government is under a general charter and a council of 10 members, five of whom are elected each year for a term of two years. The city owns its own water system with a capacity of over 1,500,000 gallons of water per day; has paid fire and police departments, electric light and gas plants, and two telephone systems. The city owns a splendid park at Lake Goguac, and is an attractive summer resort on account of the numerous lakes in the vicinity. Battle Creek stands third among the cities of the State in the amount

of post-office business, exceeded only by Detroit and Grand Rapids. Pop. (1904 census) 22,213.

CHAS. E. BARNES,
City Editor 'Journal.'

Battle Creek Sanitarium, The, is a philanthropic and humanitarian institution operating under a perpetual charter which compels the use of all the profits gained to foster the spread of humanitarian work. More than 60 branches of the parent institution have been established in or near large cities in different parts of the world, under the title of The American Medical Missionary Association, and each of these branches conducts a life-saving business on Good Samaritan principles. The organization began its work in the year 1866, with almost no capital and only one patient, in a small two-story frame house, in the then small village of Battle Creek, Mich. The incorporators believed that Christianity should be expressed in works as much as in faith, in curing the sick and healing the wounded, and thus preparing the unfortunate for the reception of moral and spiritual inspiration.

The Golden Rule is the foundation principle of the institution. It has grown from a small beginning to the immense proportions of the present time, with one of its buildings nearly a thousand feet in length and six stories in height and numerous other buildings radiating from the main one and scattered about it in a finely wooded park. Fire destroyed the old building and all its contents, but it was soon rebuilt larger and better than before, and has grown to its present proportions.

Battle Cry of Freedom, The, a patriotic song of the American Civil War by the well-known composer, George Frederick Root (1861).

Battle of Dorking, The, a realistic, matter-of-fact description of an imaginary invasion of England by a foreign power, by Charles Cornwallis Chesney. It appeared first in 'Blackwood's Magazine' in 1871, and has since been reprinted under the title 'The Fall of England.' After the ignominious defeat of the French at Sedan, Col. Chesney, professor of military history at Sandhurst, foresaw a similar fate for his own country unless it should reorganize its army. He urged vigorous measures of reform; and as the necessity for these was not perceived by the country at large, he contributed to the press various articles, both technical and popular, among them 'The Battle of Dorking.' The fleet and army are scattered when war is declared, but the government has a sublime confidence that British luck and pluck will save the country now as hitherto. To universal surprise and consternation, the hostile fleet annihilates the available British squadron, and the enemy lands on the south coast. Volunteers are called out, and respond readily; but ammunition is lacking, the commissariat is unorganized, and the men, though brave, have neither discipline nor endurance. The decisive battle is fought at Dorking, and the British are routed and England, without other alternative, is compelled to submit to the humiliating terms of the conqueror.

Battle of the Bloody Angle. See SPOTTSYLVANIA COURT HOUSE, BATTLES OF.

Battle of the Frogs and Mice, The, an ancient Greek mock epic, written in hexameters. Formerly attributed to Homer. Modern critics are of the opinion that the credit of authorship should be given to Pigres (q.v.). Only 316 lines are now extant.

Battle-Ground, Ind., a town in Tippecanoe County, where the famous battle of Tippecanoe was fought between the United States troops under Gen. Harrison and the Indians under Tecumseh and his brother, "The Prophet," 7 Nov. 1811.

Battle Hymn of the Republic, The, a celebrated poem by Mrs. Julia Ward Howe, published in the 'Atlantic Monthly' in 1862, and sung to the air, "John Brown's Body."

Battle of the Kegs, The. See HOPKINSON, FRANCIS.

Battle, Law of, the contest between male animals for possession of the females, among barbarous nations. Among certain tribes of the North American Indians the men wrestled for any women to whom they were attached. With the Australians the women were the constant cause of war, both between the individuals of the same tribe and between distinct tribes. In mammals the male, says Darwin, appears to win the female much more through the law of battle than through the display of his charms. The most timid animals, even the hare, will fight desperately, the duel only ending by the death of one of the parties. Male moles, squirrels, and beavers have been seen fighting for their mate.

Battle Monument, a monument in Baltimore, Md., erected in memory of those who fell in defense of the city when it was attacked by the English forces in September 1814.

Battle of the Spurs, a battle of Guinegate, 16 Aug. 1513, in which the French cavalry were defeated by the forces of Henry VIII. of England and the Emperor Maximilian. It was thus named on account of the numberless gilt spurs gathered by the victors.

Battle, Trial by, or **Wager of,** an obsolete method of deciding cases, whether civil or criminal, by personal combat between the parties or their champions in presence of the court. A woman, a priest, a peer, or a person physically incapable of fighting could refuse such a trial. This mode of trial ended in Scotland with the close of the 16th century. See Stephen, 'History of the Criminal Law of England' (1883); Neilson, 'Trial by Combat' (1890).

Battledore and Shuttlecock, a popular game invented in the 14th century. The implements are a bat shaped like a tennis racket and strung with gut or covered with parchment, and a shuttlecock consisting of a cork stuck with feathers, which is batted to and fro between the players.

Battleford, the chief town of the Saskatchewan district of the Northwest Territories of Canada, on the river Battle near its junction with the North Saskatchewan, about 100 miles from Prince Albert. The Riel insurrection began near Battleford. It was the capital of the Northwest Territory, 1876–83. Pop. (1901) 797.

Battle-ship. See NAVAL ARCHITECTURE; WARSHIPS, MODERN.

Batwa, bät'wą, a tribe of pygmies living in the Wissmann Falls district of southern-central Africa. They are sometimes less than four feet high, but well shaped and well developed. They live in villages and are under the protection of the Bakuba. Their food consists of meat, wild roots, and a few vegetables which they cultivate. Their weapons are knives, bows and arrows, poisoned with the juice of the root of a species of Euphorbia. Their household furniture is very simple, and they do not make pottery, weave, or work in metals.

Bauan, bow'an, or **Bauang,** Philippines, a town of Luzon in the province of Babangas, 4 miles northeast of the town of Babangas, Pop. 39,659.

Baucher, bō-shā, **François,** French hippologist: b. Versailles, 1796; d. Paris, 14 March 1873. He is remembered because of his method of training saddle horses and his book 'Methode d' Equitation basée sur des nouveaux principes' (1842).

Baucis, in mythology, a Phrygian woman, the wife of Philemon. They received Jupiter and Mercury hospitably, after these gods had been denied hospitality in the whole country while traveling in disguise. A deluge destroyed the remainder of the people, but Philemon and Baucis, with their cottage, were saved. They begged the gods to make their cottage a temple, in which they could officiate as priest and priestess, and that they might die together; which was granted. Philemon and Baucis are, therefore, names often used to indicate faithful and attached married people. See PHILEMON.

Baudelaire, bōd-lār, **Charles Pierre,** French poet: b. Paris, 9 April 1821; d. 30 Aug. 1867. In early life he resided for some time in the East Indies, and on his return devoted himself to literature. He first gained some reputation by translations from the works of Edgar Allan Poe, four volumes of which appeared in 1856–65, regarded as masterpieces in their way. A production, however, that caused greater sensation was a collection of poems designated 'Les Fleurs du Mal' (1857), which had to be expurgated as the result of proceedings on the part of the police authorities. This work gave Baudelaire a high position as a writer of the romantic school, and evidenced at the same time his curious inclination for repulsive subjects. A work of higher tone was his 'Petits Poëmes en Prose'; others being 'Les Paradis Artificiels'; 'Opium et Haschich'; a monograph on Théophile Gautier; and 'R. Wagner et Tannhäuser à Paris.' Apart from his verse, however, Baudelaire's finest work is contained in his 'Little Poems in Prose.' All of these are exquisitely written, and in many of them the beauty of the thought is equal to the beauty of the language. He united a remarkably keen analytic faculty with a powerful, sombre imagination. Brooding melancholy, curiously tinctured with irony, inspires the solemn music and dream-like imagery of his best verses. The writer whom, in many respects he resembles most strongly is Edgar Allan Poe. See James, 'French Poets and Novelists' (1884); Asselineau, 'Charles Baudelaire et vie et son oeuvre' (1889).

Baudens, bō-dăn, **Jean Baptiste Lucien,** French surgeon: b. Aire, 3 April 1804; d. 3 Dec. 1857. He was a surgeon in the French army in Algeria 1830–41 and founded a hospital there in which he taught surgery for nine years. He published 'Nouvelle Méthode des Amputations' (1842); 'La Guerre du Crimée'; 'Clinique des Plaies d'Armes a Feu.'

Baudin, bō-dăn, **Nicolas,** French sea-captain and botanist: b. on the island of Ré, 1750; d. 16 Sept. 1803. He entered the merchant navy at an early age, and in 1786, went on a botanical expedition to the Indies, sailing from Leghorn under the Austrian flag, with a vessel under his own command. His collections in this expedition, and in a second which he made to the West Indies, were presented by him, on his return to France, to the government, which promoted him to the rank of captain, and sent him, in 1800, on a scientific mission to Australia. He failed to penetrate the interior of that country, but made many interesting observations on the coast. Half of his men died of fatigue and exposure, and he himself soon breathed his last at the Isle of France, on his return. Péron accompanied him and wrote an account of the voyage.

Baudin des Ardennes, bō-dăn-dāz-ăr-dĕn, **Charles,** French vice-admiral: b. Sedan, 21 July 1784; d. Paris, 7 June 1854. In 1812 he conducted a small fleet safely into the harbor of St. Tropez, though continually pursued by English cruisers. In 1816, he resigned, and entered the merchant service, but after the July revolution re-entered the navy. In 1838, he was promoted to the rank of rear-admiral, and received the command of the expedition against Mexico. His efforts to effect an amicable settlement with the Mexican government proving fruitless, he bombarded, 27 Nov. 1838, the fortress of San Juan de Ulloa, which surrendered on the following day. Baudin treated the inhabitants with great consideration, and permitted 1,000 Mexican soldiers to remain in the city to maintain order, but on the Mexican government sending re-enforcements, he was compelled to resort again to hostilities, which, on 5 December of the same year, resulted in the disarming of Vera Cruz, in the complete defeat of the Mexican army, and in the restoration of peace between the two countries. On his return to France, he was for a short time minister of marine under Louis Philippe. In March 1848 he was appointed commander of the French fleet in the Mediterranean, and remained stationed for some time during the Italian outbreak off the Neapolitan and Sicilian coast. In the following year he retired from active service.

Baudissin, bow'dĭs-sĭn, **Wolf Friedrich Karl, Count von,** German littèrateur: b. Rantzau, 30 Jan. 1789; d. Dresden, 4 April 1878. After 1827 he resided at Dresden, where he collaborated with Tieck and Schligel in a noted translation of Shakespeare. The translations contributed by Baudissin are those of 'Henry VIII.'; 'Much Ado About Nothing'; 'Taming of the Shrew'; 'Comedy of Errors'; 'Measure for Measure'; 'All's Well that Ends Well'; 'Antony and Cleopatra'; 'Troilus and Cressida'; 'Merry Wives of Windsor'; 'Love's Labor's Lost'; 'Titus Andronicus'; 'Othello'; 'King Lear.' He published 'Ben

Jonson und Seine Schule' (1836); and translations from Molière (1865–7).

Baudissin, Wolf Wilhelm, German theologian: b. Sophienhof, Holstein, 26 Sept. 1847. He was professor at Strassburg, 1876–81, at Marburg, 1881–1900, and at Berlin from 1900. His publications comprise 'Translations Antiquæ Arabicæ Libri Jobiquæ Supersunt' (1870); 'Studien Zur Semitischen Religionsgeschichte' (1870–8); 'Die Geschichte des Alttestamentlichen Priesterthums untersucht' (1889); 'August Dillmann' (1895).

Baudrillart, bō-drę-yär', **Henri Joseph Léon,** French political economist: b. Paris, 28 Nov. 1821; d. there, 24 Jan. 1892. He edited the *Constitutionnel* and subsequently the *Journal des Economistes,* and in 1881 was professor in the Ecole des Ponts et Chausées. He published 'Des rapports de la Morale et de l'Economie Politique' (1860); 'Manuel d'Économie Politique' (1857); 'Publicistes Modernes' (1862); 'Histoire du Luxe' (1878–80); 'Les Populations Agricoles de la France' (1880–8).

Baudry, bō-drę, **Paul,** French painter: b. La Roche-sur-Yon, 7 Nov. 1828; d. 17 Jan. 1886. He studied in Paris and Rome. Among his best known works are 'Punishment of a Vestal Virgin' (1857), and the 'Assassination of Marat' (1867). He was for 10 years employed in decorating the foyer of the Grand Opéra in Paris. His famous 'Glorification of the Law' on the ceiling of the Palace of Justice gained him the medal of honor in 1881 and is generally ranked as his masterpiece. He was elected a member of the Académie des Beaux-Arts in 1870.

Bauer, bow'ĕr, **Bruno,** German philosopher, historian, and Biblical critic of the rational school: b. Eisenberg, 6 Sept. 1809; d. Berlin, 15 April, 1882. Among his works are: 'Critique of the Gospel of John' (1840); 'Critique of the Synoptic Gospels' (1840); 'History of the French Revolution to the Founding of the Republic' (1847); 'History of Germany during the French Revolution and the Rule of Napoleon' (1846); 'Critique of the Gospels' (1850–1); 'Critique of the Pauline Epistles' (1850); 'Philo, Strauss, Renan, and Primitive Christianity' (1874); 'Christus und die Cäsaren' (1877). His work displays equal learning and industry but his conclusions are far from harmonizing with evangelical thought.

Bauer, Caroline, German actress: b. Heidelberg, 29 March 1807; d. Zürich, 18 Oct. 1878. She made her debut in 1822, and had achieved a brilliant success, in comedy and tragedy alike, when in 1829 she married Prince Leopold, afterward king of the Belgians. Their morganatic union was as brief as it was unhappy; in 1831 she returned to the stage, which she quitted only in 1844, on her marriage to a Polish count. An English translation of her 'Posthumous Memoirs' appeared in 1884.

Bauer, Edgar, German publicist, brother of Bruno Bauer: b. Charlottenburg, 7 Oct. 1820; d. Hanover, 18 Aug. 1886. He published various works of an historical and polemical nature strongly tinctured with radicalism, and spent five years in prison on account of his 'Streit der Kritik mit Kirche und Staat.' Other books by him are 'Die Rechte des Herzogtums Holstein' (1863); 'Die Deutschen und ihre Nachbarn' (1870).

Bauer, Louis A., American mathematician: b. Cincinnati, O., 28 Jan. 1865. He was astronomical and magnetic computer for the United States Coast and Geodetic Survey,' 1887–92; docent in mathematical physics in the University of Chicago, 1895–6; chief of division of terrestrial magnetism of Maryland Geological Survey since 1896. He became assistant professor of Mathematics in the University of Cincinnati in 1897. He is an honorary member of the Sociedad Cientifica Antonio Alzate of Mexico, and a member of the Permanent Committee on Terrestrial Magnetism and Atmospheric Electricity of the International Meteorological Conference. He edits and publishes the 'Terrestrial Magnetism.'

Bauer, Wilhelm, German inventor: b. Dillingen, 1822; d. Munich, 18 June 1875. He served as an artilleryman during the Schleswig-Holstein war (1848), and, meanwhile, conceived the plan of a submarine vessel for coast defense. From 1851 to 1855 he vainly sought means from Austria, France, and England to complete his experiment, but Russia finally adopted his scheme. He afterward made improvements in torpedoes and in submarine guns.

Bauerle, boi'ĕr-lĕ, **Adolf,** Austrian dramatist and novelist: b. Vienna, 9 April 1786; d. Basel, 20 Sept. 1859. He cultivated with much success the field of popular comedy and local farce in Vienna, where, in 1804, he founded the *Vienna Theatre-Gazette,* until 1847 the most widely read paper in the Austrian monarchy, and now a valuable source for the history of the stage in Vienna. Of his numerous plays the following became known also outside of Austria: 'Leopold's Day' (1814); 'The Enchanted Prince' (1818); 'The Counterfeit Prima Donna' (1818); 'A Deuce of a Fellow' (1820); 'The Friend in Need.' Under the pseudonym Otto Horn he wrote the novels 'Therese Krones' (1855) and 'Ferdinand Raimund' (1855), full of the personal element and local anecdote.

Bauernfeind, bow'ĕrn-fīnt, **Karl Maximilian von,** German engineer and geodesist: b. Arzberg, 18 Nov. 1818; d. 1894. He was professor of geodesy and engineering in the engineering school at Munich, and long a director of the Technical School there organized according to his plans. He invented the prismatic cross employed in surveying, and named for him, and wrote 'Elemente der Vermessungskunde' (1856–8); 'Zur Brückenbaukunde' (1854); 'Zur Wasserbaukunde' (1866).

Bauernfeld, bow'ĕrn-fĕlt, **Eduard von,** Austrian dramatist: b. Vienna, 13 Jan. 1802; d. Vienna, 9 Aug. 1890. He studied law and entered the government service in 1826, but resigned, after the revolutionary events of 1848, to devote himself exclusively to his literary pursuits. A brilliant conversationalist, he soon became a universal favorite in Vienna society. Intimate from childhood with the genial painter, Moritz von Schwind, and the composer, Franz Schubert, he also kept up a lifelong intercourse with Grillparzer. Among his comedies, distinguished for their subtle dialogue and sprightly humor, particularly the descriptions of

fashionable society have made his great reputation. The best known and most successful were 'Reckless from Love' (1831); 'Love's Protocol' (1831); 'Confessions' (1834); 'Domestic and Romantic' (1835); 'Of Age' (1846); 'Krisen' (1851); 'Aus der Gesellschaft' (1866). His serious dramas were less popular. His collected works were issued (1871–3).

Bauhin, bō-ăñ, **Gaspard,** Swiss botanist and anatomist: b. Basel, 1560; d. 1624. He was at first intended for the Protestant ministry, but having manifested a decided inclination for medicine and botany, was allowed to follow it, and studied first at Basel and then at Padua. After finishing his studies he traveled over many parts of Europe, and in 1580 returned to Basel, bringing with him a reputation which immediately secured him the chair of Greek, and in 1589 that of anatomy and botany. His fame rests chiefly on his two works, 'Pinax Theatri Botanici' and 'Theatrum Anatomicum, Botanicum.' Gaspard and his brother, Jean Bauhin, have been happily commemorated by Linnæus, who gave the name *Bauhinia* to a genus of plants.

Bauhin, Jean John, an eminent Swiss botanist: b. Basel, 1541; d. 1613. He was a brother of Gaspard Bauhin, and distinguished himself by his ardor in natural history pursuits, in prosecuting which he traveled over the greater part of the Alps, Italy, and the south of France, preparing materials for a 'Historia Universalis Plantarum Nova et Absolutissima,' which occupied the larger portion of his life, but was not published till 1650, 37 years after his death. This work, in which he describes 5,000 plants, divided into 40 classes or books, is considered the first in which an attempt was made to give a regular form to systematic botany.

Bauhinia, a genus of more than 200 species of tropical trees, shrubs or climbers of the natural order *Leguminosæ* with beautiful, showy, white to purple blossoms, unlike the usual northern type of legume flower; named in honor of the brothers John and Gaspar Bauhin (q.v.). *B. porrecta,* a West Indian tree, is called mountain ebony from its dark-colored wood; *B. racemosa,* the maloo climber, and several other East Indian climbing species are used for making ropes; *B. variegata,* a Malabar species is used in tanning, dyeing, and medicine, and its flower buds for pickles. In southern Florida and southern California several species are very popular as ornamental plants, but in greenhouses few succeed because of the difficulty of securing a dry enough atmosphere without injury to the plants. *B. natalensis, B. variegata,* and *B. corymbosa,* probably the most satisfactory greenhouse species, may be treated like oleanders during the winter and planted out of doors in spring.

Baum, bowm, **Friedrich,** German military officer in the British service in the Revolutionary war. He arrived in Canada in 1776, and in Burgoyne's expedition acted as lieutenant-colonel of the Brunswick dragoons. He was sent out with 800 men and two pieces of artillery on a foraging expedition. Near Bennington, Vt., he was attacked by the New Hampshire militia under Stark, and utterly defeated. He himself was killed 16 Aug. 1777.

Baum, L. Frank, American writer of popular juvenile books: b. Chittenango, N. Y., 15 May 1856. Among his publications are 'American Fairy Tales'; 'Father Goose: his Book'; 'Songs of Father Goose'; 'The Wonderful City of Oz'; 'Navy Alphabet'; 'Army Alphabet.'

Baumann's bow'mans, **Cavern** (German, *Baumanns Höhle*), an interesting natural cavern in the Harz, about five miles from Blankenburg, in a limestone mountain. It consists of six principal apartments, besides many smaller ones, everywhere covered with stalactites. The earthy ingredients of these petrifactions are held in solution by the water which penetrates the rock, and deposits a calcareous stone. The name of this cavern is derived from a miner, who entered it in 1672, with the view of finding ore, but lost his way, and wandered about for two days before he could find the entrance.

Baumbach, bowm'baн, **Rudolf,** German poet: b. Kranichfeld, Saxe-Meiningen, 28 Sept. 1840; d. 22 Sept. 1905. After studying natural science in Würzberg, Leipsic, Freiburg, and Heidelberg, he lived in Austria and then at Trieste, where he devoted himself exclusively to writing. In 1885 he removed to Meiningen. He most successfully cultivated the poetical tale, based upon ancient popular legends. His epics include 'Zlatorg,' a Slovenic Alpine legend (1875, 37th ed. 1892); 'Horand and Hilda' (1879); 'Lady Fair' (1881); 'The Godfather of Death' (1884); 'Emperor Max and His Huntsmen' (1888). His lyric collections are 'Songs of a Traveling Journeyman' (1878); 'Minstrel's Songs' (1882); 'From the Highway' (1882); 'Traveling Songs from the Alps' (1883); 'Adventures and Pranks Imitated from Old Masters' (1883); 'Jug and Inkstand' (1887); 'Thuringian Songs' (1891). He has also published some excellent prose: 'False Gold' (1878), a historical romance of the 17th century; 'Summer Legends' (1881), a book of fairy tales; and 'Once upon a Time' (1889).

Baumé, bō-mā', **Antoine,** distinguished French chemist and pharmaceutist: b. Senlis, 26 Feb. 1728; d. 15 Oct. 1804. He obtained the professorship of chemistry in the College of Pharmacy at Paris about 1752, was admitted a member of the Academy of Sciences, chiefly in return for some excellent memorials communicated to that body; wrote 'Elements of Theoretical and Practical Pharmacy,' which went through nine editions in France, and was translated into most European languages, and contributed by his discoveries to numerous important improvements in the arts, particularly in the manufactures of sal ammoniac, soap, and porcelain, in gilding, and the bleaching of silk. His name is familiar from the areometer which he invented, and which is still in use.

Baumeister, bow'mīs-tĕr, **Johann Wilhelm,** German veterinarian: b. Augsburg, 1804; d. 1846. In 1839 he was appointed a professor in the Stuttgart School of Veterinary Medicine. His 'Handbuch der Landwirtschaftlichen Tierkunde und Tierzucht,' condensed as 'Anleitung zur Kenntnis des Aussern des Pferdes,' attained a seventh edition in 1891.

Baumgarten, bowm'gär-tĕn, **Alexander Gottlieb,** German philosopher of the school of Wolff: b. Berlin, 1714; d. Frankfort-on-the-Oder, 1762. He studied at Halle, and was for a time professor extraordinary there. In 1740 he

was made professor of philosophy at Frankfort-on-the-Oder. He is the founder of æsthetics as a science, and the inventor of this name. He derived the rules of art from the works of art and their effects. Hereby he distinguished himself advantageously from the theorists of his time. (See ÆSTHETICS.) His ideas of this science he first developed in his academical discussion, 'De Nonnullis ad Poema Pertinentibus' (1735). George Fr. Meier's 'Principles of all Liberal Sciences' (1748–50) originated from his suggestions. Eight years later, Baumgarten published his 'Æsthetica' (1750–8), a work which death prevented him from completing. See 'Schmidt, Leibnitz und Baumgarten' (1875).

Baumgarten-Crusius, bowm'gär-tĕn-kroo'zē-ûs, **Ludwig Friedrich Otto,** German theologian: b. Merseburg, 31 July 1788; d. Jena, 31 May 1843. He studied theology in Leipsic; became the university preacher in 1810; was appointed professor of theology at Jena, in 1817; and became widely known as a foremost champion of religious liberty. He was a learned and original thinker, but his writing is often obscure. His publications include 'Introduction to the Study of Dogmatics' (1820); 'Manual of Christian Ethics' (1827); 'Outlines of Biblical Theology' (1828); 'Outlines of Protestant Dogmatics' (1830); 'Text-book of the History of Doctrines' (1832); 'Schleiermacher, His Method of Thought, and his Value' (1834); 'Considerations on Certain Writings of Lamennais' (1834), etc.

Baumgartner, Alexander, Swiss writer: b. Saint Gall, 1841. He became a member of the Society of Jesus in 1860, and after completing his theological studies in England, made a study of Scandinavian literature in Stockholm and Copenhagen. He has published 'Goethe's Jugend' (1879); 'Longfellow's Dichtungen' (1878) 'Calderon,' a festival play (1881); 'Goethe und Schiller' (1886); 'Der Alte von Weimar' (1886); a translation from the old Icelandic of Eystein Asgninsson; and a history in eight volumes of the world's literature (1897).

Baumgartner, bowm'gärt-nĕr, **Andreas von,** Austrian statesman: b. 23 Nov. 1793, at Friedberg in Bohemia; d. 1865. He was connected for many years with the teaching of mathematics and physics, especially after 1823, at the University of Vienna, until illness forced him to relinquish his academical pursuits. Subsequently he became connected with the direction of the imperial porcelain, tobacco, and other manufactures in 1841, with the establishment of electric telegraphs, and at the end of 1847 with the chief management of the construction of railways. After the revolution of March 1848, he occupied for a third time a seat in the Austrian cabinet as minister of the mining department and of public works. In May 1851, he became minister of finance and commerce, and in 1855 was made president of the Austrian academy of sciences. In 1861 he entered the House of Peers of the Reichsrath. His principal works are on mechanical science applied to art and industry. His most popular work is the 'Naturlehre,' which has passed through many editions, and was a text-book in all the schools of Austria.

Baumgartner, Herman, German historian: b. 28 April 1825; d. 19 June 1893. He was a professor of history in the University of Strassburg, 1872–89, and published 'Geschichte Spaniens zur Zeit der Französischen Revolution' (1861); 'Geschichte Spaniens vom Ausbruch der Französischen Revolution bis auf unsere Tag' (1865–71); 'Karl V. und die Deutsche Reformation' (1889).

Baur, bowr, **Ferdinand Christian,** one of the most celebrated theologians of modern Germany, founder of the "New Tübingen School of Theology": b. Blaubeuren, where his father was pastor, 21 June 1792; d. 2 Dec. 1860. At the University of Tübingen, which he entered in 1809, he devoted five years to theological studies, and in 1817 became professor in the seminary at Blaubeuren. While holding this position he published his first work, 'Symbolism and Mythology, or the Natural Religion of Antiquity' (1824–5), by which his eminent theological abilities were so clearly manifested that in 1826 he received a call to Tübingen as ordinary professor in the evangelical faculty of that university. This position he continued to occupy till his death. His chief works belong to the two departments of the history of the Christian dogmas and New Testament criticism, in both of which his views have had the most powerful effect upon the theology of the present day. His most important works belonging to the first class are: 'The Christian Gnosis, or the Christian Philosophy of Religion' (1835); 'The Christian Doctrine of the Atonement' (1838); 'The Christian Doctrine of the Trinity and the Incarnation' (1841–3); 'Compendium of the History of Christian Dogmas' (1847). To the second class belong 'The So-called Pastoral Epistles of the Apostle Paul' (1835); 'Paul the Apostle of Jesus Christ, His Life and Labors, His Epistles and His Teaching' (1845); 'Critical Inquiries Concerning the Canonic Gospels, their Relation to One Another, their Origin and Character' (1847). He also wrote the 'History of Christian Doctrine from the Origin of Christianity Down to the End of the 18th Century,' a series of volumes between 1853–63.

Baur, Frederick Wilhelm von, Russian military engineer: b. Hanau, Germany, 1735; d. St. Petersburg, 1783. He early adopted a military life, entered the British service in 1755 and in 1757 he obtained the rank of general, and engineer-in-chief. Frederick II. of Prussia ennobled him. In 1769 he entered into the service of Catherine II., empress of Russia, and was employed against the Turks. The empress had a high notion of his talents, and employed him in making the aqueduct of Tsarskoe-Selo, for supplying Moscow with water, and in deepening the canal near St. Petersburg, at the end of which he constructed a large harbor, and completed other important undertakings. Baur had for his secretary the celebrated Kotzebue, who directed in his name the German theatre at St. Petersburg.

Baur, Gustav Adolf Ludwig, German theologian: b. Hammelbach, 1816; d. 1889. He was appointed a professor at Giessen in 1847, and in 1870 at Leipsic. He belonged to the Schleiermacher school and was the author of 'Grundzüge der Homiletik' (1848); 'Boëtius und Dante' (1874); 'Die Vorchristliche Erziehung' (1884).

Bause, bow'zĕ, **Johann Friedrich,** distinguished German engraver: b. Halle, 1738; d. Weimar, 1814. He resided chiefly at Leipsic, where he executed many highly esteemed engravings. He was a member of several academies of fine arts.

Bausman, Benjamin, American Reformed (German) clergyman: b. Lancaster, Pa., 28 Jan. 1824. He founded St. Paul's Reformed Church, Reading, Pa., 1863, and has been its pastor ever since. He has published 'Sinai and Zion' (1860; 7th ed. 1885); 'Wayside Gleanings in Europe' (1876); 'Bible Characters' (1893); 'Catechetics and Catechetical Instruction' (1863); and edited *The Guardian* (1867–82), and *Reformirte Hausfreund* (1882).

Bausset, bō-sā, **Louis François** (Cardinal), French ecclesiastic: b. Pondicherry, India, 14 Dec. 1748; d. Paris, 21 June 1824. His father, who held an important position in the French Indies, sent young Bausset to France when he was but 12 years of age. He was educated by the Jesuits, and became bishop of Alais in 1784. Having signed the protest of the French bishops against the civil constitution of the clergy, he emigrated in 1791, but in the following year returned to France, was soon arrested, and imprisoned in the old Convent of Port Royal, where he remained until after the fall of Robespierre. After the restoration of Louis XVIII., in 1815, he entered the Chamber of Peers; the following year he became a member of the French Academy; and, in 1817, he received the appointment of cardinal. He wrote the 'History of Fénelon' (1808–9), at the request of the Abbot Emery, who had in his possession the MSS. of the illustrious Archbishop of Cambray. The work had great success, and its author was awarded, in 1810, the second decennial prize of the Institute, for the best biography. His 'History of Bossuet' (1814) was less favorably received.

Bautain, bō-tăn, **Louis Eugene Marie,** French philosopher: b. Paris, 17 Feb. 1796; d. 18 Oct. 1867. He entered the Church, and became a priest in 1828; resigned his professorship in 1830; and later was suspended as a priest because of his work, 'La Morale de l'Evangile comparee a la Morale des Philosophes'; but was reinstated in 1841. He was made dean of the Faculty of Letters at Strassburg in 1838, and subsequently director of the College of Juilly. At a still later period he was transferred to Paris, and made vicar-general of the Metropolitan Diocese. He was also appointed a member of the theological faculty of Paris. His writings include 'Philosophie-psychologie Experimentale' (1839); 'Philosophie Morale' (1842); 'Philosophie du Christianisme' (1835); 'La Religion et la Liberte considerees dans leurs Rapports' (1848); 'La Morale de l'Evangile comparee aux divers Systemes de Morale' (1855), etc.

Bautzen, bowt'sĕn, or **Baudissin,** bow'desen, a manufacturing town in Saxony, noted for its production of textile fabrics, leather, paper, etc. It overlooks the River Spree, 30 miles northeast of Dresden, and is encircled by a wall and moat. The cathedral church of St. Peter is used by both Protestants and Roman Catholics, it being divided into two portions for the purpose. The town contains many schools, a museum, art gallery, and three libraries. At Bautzen Napoleon, with 130,000 men, defeated the allied armies of Russia and Prussia, 20–21 May 1813. Pop. (1900) 26,000.

Bauxite, or **Beauxite,** bo'zīt (from Baux, or Beaux, near Arles, France, where it occurs), a native, hydrated oxide of aluminum, having the formula $Al_2O_3.2H_2O$. It has a specific gravity of about 2.5, and its hardness ranges from 1 to 3. It occurs massive, in concretionary grains showing a concentric structure, and in clay-like deposits. Sesquioxide of iron is usually present in considerable quantity,— sometimes to the extent of 50 per cent,— part of it replacing aluminum, and part occurring merely as an impurity. Bauxite is found in many parts of the world. One of the most important deposits is at Irish Hill, near Larne, County Antrim, Ireland, where it occurs in the iron measures together with lignite. At this place three layers of it are known, having an aggregate thickness of about 50 feet. The finest grade from Irish Hill is almost free from iron, containing as little of that metal as good china clay. Analyses have shown that the color of bauxite is no criterion of the freedom of the mineral from iron, since a white variety containing 3.67 per cent of Fe_2O_3 is known, while a certain strongly red variety showed, upon analysis, but 3.75 per cent, and a yellow specimen contained 14.39 per cent. In the United States bauxite occurs in considerable quantities in Saline and Pulaski counties, Arkansas, and in a deposit extending from Calhoun County, Alabama, eastward into Georgia. Bauxite forms the principal ore of the metal aluminum, which is obtained from it by the electrolysis of a solution of bauxite in melted cryolite (see Aluminum). The American deposits of bauxite are well suited to the production of aluminum, as ore can be had in quantity that contains as little as 1 per cent of iron oxide, and 3 per cent of silica. Bauxite, in some localities, is undoubtedly an alteration product of basaltic rocks, while in other localities (especially in the United States) it has very likely been deposited by hot springs. In addition to its use as an ore of aluminum, bauxite forms an important source of alum. Its clay-like form is known as wocheinite, on account of its occurrence at Wochein, in Styria. (C. Willard Hayes, 'Bauxite,' 'Sixteenth Annual Report of the United States Geological Survey,' Part 3 (Washington, 1896); Branner, 'The Bauxite Deposits of Arkansas,' 'Journal of Geology,' Vol. V., 1897, p. 263).

Bava'ria (German, *Bayern;* French, *Bavière*), a kingdom in the south of Germany, the second largest state of the empire, composed of two isolated portions, the larger comprising about eleven twelfths of the monarchy, bounded on the east by Bohemia and Upper Austria; on the south by Salzburg and the Tyrol; on the west by Würtemberg, Baden, Hesse-Darmstadt, and Hesse-Nassau; and on the north by Hesse-Nassau, Weimar, Meiningen, Reuss, Coburg, and the kingdom of Saxony. It lies between lat. 47° 19′ and 50° 41′ N., and lon. 8° 53′ and 13° 50′ E. The smaller portion, the Pfalz or Palatinate, lies west of the Rhine, which forms its eastern boundary, and is separated from the main body by Würtemberg, Baden, and Hesse-Darmstadt. It is included between lat. 48° 57′ and 49° 50′ N.; and lon. 7° 6′ and 8° 31′ E.; and is bounded south by Alsace-Lorraine,

west by the Prussian Rhine provinces, and north by Hesse-Darmstadt. Bavaria is estimated to contain an area of 29,286 English square miles, and is divided into eight circles (*kreise*), which were formerly named after the rivers that watered them; but an edict of 29 Nov. 1837, gave the circles new names and new boundaries. The following table shows their names, areas, and populations:

Circles	Area, Sq. M.	Pop. 1900
Oberbaiern (Upper Bavaria)....	6,456	1,323,447
Niederbaiern (Lower Bavaria)..	4,152	678,584
Pfalz (Palatinate).....	2,288	831,533
Oberpfalz (Upper Palatinate) and Regensburg (Ratisbon)...	3,728	553,857
Oberfranken (Upper Franconia)	2,702	607,903
Mittelfranken (Middle Franconia)	2,925	815,556
Unterfranken (Lower Franconia) and Aschaffenburg.....	3,243	650,758
Schwaben (Swabia) and Neuburg	3,792	713,515
Total.....	29,286	6,175,153

The capital is Munich (q.v.), and the other principal cities are Nuremberg, Augsburg, Würzburg, and Regensburg or Ratisbon (qq.v.).

Mountains.— Bavaria is a hilly rather than a mountainous country. A large portion, more especially south of the Danube, is a plateau country of considerable elevation, and indeed, the whole of the main portion of the kingdom may be described as an upland valley, averaging about 1,600 feet above the sea-level, intersected by numerous large streams and ridges of low hills. On all sides it is surrounded by hills of a greater or less altitude, either quite upon the frontier or only at small distances from it. The whole southern frontier is formed by a branch of the Noric Alps, offsets from which project far into the southern plateau of Bavaria. Besides numerous peaks which this range contains, varying from 4,000 to 8,000 feet high, the following may be named as being above the latter number: The Zugspitze, 10,394 feet; the Watzmann, 9,470 feet; the Hochvogel 8,460 feet; the Madeler Gabel, 8,650 feet. Passing along the valley of the Inn and across the Danube, we come to the Bohemian frontier, formed by the Böhmerwald mountains running south-east to northwest and lowering down at the valley of the Eger. The highest peaks in this range are the Rachel, 5,102 feet, and the Arber, 5,185 feet. Crossing the Eger we meet with the Fichtelgebirge, presenting the Schneeberg, 3,750 feet high, and the Ochsenkopf, 3,633 feet. West from this range, and along the frontier of the Saxon ducal territories and Hesse-Cassel, run hills of moderate elevation, under various names, Frankenwald, Rhöngebirge, etc., no peaks of which attain an elevation of more than 3,327 feet. The western mountain boundary of the Bavarian valley is formed north of the Main by the Spessartwald range, and in the kingdom of Würtemberg by the Alb or Alp. The only noteworthy interior ranges are, in the northwest the Steigerwald; and in the northeast, running in a southwesterly direction from the Fichtelgebirge, the Franconian Jura; a low limestone range, containing numerous remarkable stalactitic caves. The Pfalz or Palatinate is traversed by the northern extremity of the Vosges, the highest peak in this locality being the Königstuhl, 2,162 feet.

Lakes.— The lakes of Bavaria are neither very numerous nor of very great extent, though many of them present exceedingly picturesque scenery. The larger are all situated on the upper part of the southern plateau; the smaller within the range of the Noric Alps. The most remarkable of the former are, Lake Ammer, about 10 miles long by 2½ broad, 1,736 feet above the sea; Lake Würm or Starnberg, about 12 miles long by 3 broad, 1,899 feet; and Lake Chiem, 9 miles long by 9 to 4 broad, 1,651 feet above the sea. Of the smaller, the more remarkable are Lake Tegner, about 3 miles long, 2,586 feet; Lake Walchen, 2,597; and various others upward of 2,000 feet above the sea-level. Most of the lakes are well supplied with fish.

Rivers.— Bavaria belongs wholly to the basins of the Danube and the Rhine, with the exception of a very small portion in the north-east corner, which through the Eger appertains to the basin of the Elbe. The river Danube intersects the main portion of the kingdom west to east nearly in the centre, and before it enters the Austrian dominions at Passau, where it is still 925 feet above the sea, it receives on its right bank the rivers Iller, Lech, and Isar, which have their sources in the Noric Alps, besides numerous smaller streams; and on its left bank, the Wörnitz, Altmühl, Nab, and Regen, besides other lesser streams. The Main traverses nearly the whole of the northern part of this portion of the kingdom from east to west, and is navigable for steam vessels from Bamberg to the Rhine. Its principal affluents are the Regnitz and the Saale. In the Palatinate there are no streams of any importance, the Rhine being merely a boundary river.

Climate.— If we except the valley of the Rhine, and the valley of the Main in lower Franconia, Bavaria, even including the Palatinate, is, in comparison with other German states, a cold country. The average temperature of the year is about 47° F.; winter, 30°; spring, 47°; summer, 63°; and autumn, 47°.

Soil, Vegetation, etc.— Bavaria is one of the most favored countries in Germany in respect of the fruitfulness of its soil, due, no doubt, in a considerable degree, to the undulating nature of the country, to the numerous streams by which it is watered, and to being nearly wholly composed of Jura limestone. In the plains and valleys the soil is capable of producing all kinds of crops, but not till lately were the natural advantages of the country turned to good account. Ignorance and idleness opposed a barrier to improvement, which it took the utmost efforts of an enlightened government, aided by the general spread of education, to remove. Now a spirit of agricultural enterprise pervades the kingdom, improved methods of cultivation have been introduced, and large tracts of waste land have been reclaimed and brought under the plow. The principal crops are wheat, rye, barley, and oats; but in some districts rice, spelt, maize, and buckwheat are also raised. To these productions of the soil may be added potatoes (the cultivation of which is yearly increasing), tobacco, and fruit, of which large quantities are grown in the valleys of the Main and the Rhine. In the circles of Mittelfranken and Schwaben-Neuburg, the hop plant is cultivated to a considerable extent, the quantity varying from 30,000 to 40,000 hundredweight per annum; and the

vine in the circles of Pfalz and Unterfranken. The latter produces the Franconian wines; the best wines of the former are produced near Deidesheim and Wachenheim. The celebrated Steinwein and Leistenwein are the produce of the southern slope of the Marienburg, near the town of Würzburg. The forests of Bavaria, composed chiefly of fir and pine trees, cover nearly a third of its entire surface and yield a large revenue to the state; much timber being annually exported, together with potashes, tar, turpentine, and other products peculiar to these wooded regions. The principal mineral products are salt, coal, and iron. Some of the mining works belong to the state, and contribute something to the public revenue; but the minerals are not wrought to the extent they might be. Coal mining gives employment to between 4,500 and 5,000 hands. Plumbago is found in several places and is principally manufactured into pencils. Porcelain clay of the finest quality likewise abounds in some localities, the best being obtained in the districts of Wunsiedel in the Upper Main. Lithographic stones are another important production. In the rearing of cattle and sheep the Bavarians are somewhat backward. Swine are reared in great numbers in all parts of the country, and poultry and wildfowl are abundant. The wolves and bears with which the forests of Bavaria were at one time infested are nearly extinct.

Manufactures.— The manufactures of Bavaria are singly not very important, being mostly on a small scale and conducted by individuals of limited capital. The principal articles manufactured are linens, woolens, cottons, silks, leather, paper, glass, earthen, iron, and steel ware, jewelry, etc., but the supply of some of these articles is inadequate to the home consumption. Of leather, paper, glass, and ironware rather large quantities are exported. The optical and mathematical instruments made at Munich are the best on the Continent, and are prized accordingly. But the most important branch of manufacture in Bavaria is the brewing of beer — the universal and favorite beverage of the country. There are upward of 5,000 brewing establishments in the kingdom, which have been calculated to supply on an average about 20 gallons a year to every individual of the population. The beer, however, is not consumed only in the country of its production, but is sent to all parts of Germany, and even as far as America and India. Spirits are also largely distilled. A large portion of the industrial population maintain themselves by weaving linen, and by the manufacture of articles in wood (some of which are of beautiful workmanship), and by the felling and hewing of timber. Notwithstanding its favorable geographical position and other natural advantages the trade of Bavaria is comparatively limited. Among the exports are corn, timber, wine, cattle, leather, glass, hops, fruit, beer, iron, and steel wares, machinery, fancy articles, colors, lucifer matches, stoneware, etc. Among the imports are coffee, cacao, tea, cotton, tobacco, drugs, copper, oil, spices, dyestuffs, silk and silk goods, lead, etc.

Transportation.— From its position Bavaria enjoys a considerable portion of transit trade, much facilitated by the good roads that traverse the country in all directions. The means of communication are now very complete. The Danube, the Rhine, the Main, the Regnitz, etc., afford ample scope for inland navigation, besides the König Ludwig Canal, which connects the Main at Bamberg with the Altmühl a short distance above its embouchure in the Danube, thus establishing direct water communication through the Rhine between the German Ocean and the Black Sea. The railway system (now managed as a part of the imperial system of railways) has been carried out on an extensive scale. The lines are partly state property, partly private. The number of miles in operation amounted in 1899 to 4,062, about 3,000 of this total being state railways, the remainder being private enterprises. The amount of debt contracted for railways by Bavaria is $250,000,000, forming over four fifths of the total debt of the country. The receipts from the railways are now generally sufficient to pay the interest and charges on account of this debt. The state also possesses two canals.

Education and Art.— The Department of Education is under the superintendence of the Superior Board of Education and Ecclesiastical Affairs. A complete system of inspection is established throughout the country; the reports of the inspectors including not only the number and proficiency of the scholars, but also the conduct of the teachers, the state of the buildings, and the nature and extent of the funds available. It is necessary in Bavaria, before admission can be obtained into any higher school, to have passed a satisfactory examination in the lower school. Not only must all candidates for offices under the state pass examinations, but examinations are held of apprentices in trade who wish to become masters, and even of officers in the army on promotion. There are over 8,000 schools in Bavaria, attended by more than 600,000 pupils. Attendance on school is compulsory up to 14 years of age. There are three universities in Bavaria — two of which (Munich and Würzburg) are Roman Catholic, and one (Erlangen) Protestant. The University of Munich is attended by about 3,500 students, and has about 170 professors and instructors; that of Würzburg has 80 professors and instructors, and about 1,350 students; and that of Erlangen 67 professors and instructors, and about 1,100 students. There are also several lycea, a number of gymnasia, numerous Latin, normal, and polytechnic schools, besides academies of arts and sciences, fine arts, horticulture, etc. The capital, Munich, contains a library of 800,000 volumes, including 25,000 MSS.; several scientific and literary institutions, academies, and national societies, and extensive collections of works of art.

Bavaria enjoys the honor of having originated a school of painting of a high order of merit, known as the Nuremburg school, founded about the middle of the 16th century by Albert Dürer, a native of that town, whose works are little, if at all, inferior to those of his great Italian contemporaries. Hans Holbein, who excelled Dürer in portrait, though far behind him in historical painting, is claimed by Bavaria, but neither the precise locality nor the date of his birth is known with certainty — Augsburg, Basel, and Grünstadt being severally named as the one, and the dates 1495 and 1498 as the other. To these celebrated names have been added those of the eminent sculptors Kraft and Vischer, both also Bavarians; the former

born about 1435 and the latter about the middle of the same century. The masterpiece of the latter distinguished artist is the bronze shrine of St. Sebaldus in Nuremberg, esteemed a marvel of art for beauty of design and delicacy of workmanship. The most celebrated of Kraft's works is the remarkable tabernacle in stone, affixed against one of the columns of the choir of the Church of St. Lawrence, also in Nuremberg. The restoration of Bavarian pre-eminency in modern times, in connection with the fine arts, is, in a great measure, if not entirely, owing to Louis I., whose love of art and liberal patronage have rendered the capital one of the most celebrated seats of the fine arts in Europe.

Religion.—The religion of the state is Roman Catholicism, which embraces more than seven tenths of the population. The remainder are principally Protestants and Jews. The proportion between Catholics and Protestants has scarcely varied during the last three quarters of a century. All citizens, whatever their creed, are equally admissible to the same public functions and employments, and possess the same civil and political rights. The articles of the concordat concluded with the Pope are subordinate in their application to the fundamental law of the state. By an ordinance of Louis I. females are prohibitied from pronouncing any monastic vow until after having passed their 33d year. The dioceses of Bavaria comprise two archbishoprics, Munich and Bamberg; and six bishoprics, Augsburg, Ratisbon, Eichstädt, Passau, Würzburg, and Spires. The salaries are paid by the government. In Bavaria marriage between individuals having no capital cannot take place without the consent of the principal persons appointed to superintend the poor institutions, who, if they grant such liberty where there are no means of supporting the children that may spring from such marriage, render themselves liable for their maintenance. The law is intended to prevent improvident marriages.

People.—In personal appearance the Bavarians are stout and vigorous, well adapted to bear the fatigues of war, and are generally considered good soldiers. They are accused of being indolent and somewhat addicted to drinking, but are brave, patriotic, and faithful to their word. Their manners and customs toward the close of the 18th century were described as very coarse, and they were said to be deeply imbued with superstitious bigotry; but since the more general diffusion of knowledge a great change for the better has taken place. Many of the peasantry wear long, loose, snuff-colored coats, lined or edged with pink, and studded in front with silver or white metal buttons, thrown open to display a smart waistcoat of various and brilliant colors; their hats are often ornamented with artificial flowers. Many of the Bavarian women are handsome, lively and graceful. They dress smartly and display much taste in their attire. Some of them wear black-silk handkerchiefs, decorated with flowers or ribbons, tied tightly round their heads, some caps of silver or gold tissue, and all have their hair neatly braided. German is the language spoken, with local peculiarities; but they have never been conspicuous for the cultivation of their native tongue.

Constitution.—Bavaria was formerly a member of the Germanic Confederation and now forms part of the German empire. The executive is in the hands of the king. The legislature consists of two chambers—one of senators and one of deputies; the former composed of princes of the royal family, the great officers of state, the two archbishops, the heads of certain noble families, a bishop named by the king, the president of the Protestant General Consistory, and any other members whom the king may create hereditary peers; the latter, of members chosen indirectly, one to every 31,500 persons of the total population. The qualifications are that the candidate shall have completed his 30th year, shall be a free and independent citizen, and shall be a member of the Catholic or the Reformed Church and pay direct state taxes. The members are chosen every six years unless the house is dissolved by the king, and are generally convened once a year, but are bound to assemble at least once every three years. Each of the eight circles or provinces has a provincial government consisting of two boards, one for the management of the police, schools, etc., and the other for the management of financial affairs. The revenue for the financial year 1900–1 was estimated at about $105,000,000, and the public debt, including railway debt, etc., was $350,000,000. The army is raised by conscription,—every man being liable to serve from 1 January of the year in which he completes his 20th year,—and it forms an independent part of the army of the German empire. In time of peace it is under the command of the king of Bavaria, but in time of war it is placed under that of the emperor of Germany as commander-in-chief of the whole German army. The period of service is three years in the active force, four in the reserve, and five in the landwehr; and no Bavarian can settle or marry, or accept of any definite appointment, till he has fulfilled his military liabilities. On a peace footing the Bavarian army consists in all of fully 63,000 men and 2,600 officers; on a war footing, about twice this number.

History.—The Bavarians take their name from the Boii, a Celtic tribe who inhabited the districts which, when conquered by the Romans, became the Roman provinces of Vindelicia and Noricum. After the fall of the Western Empire this territory was overrun by various Germanic tribes who formed themselves into a confederation like that of the Franks and Marcomanni and called themselves Boiarii. The confederacy of the Boiarii was made tributary first to the Ostrogoths and then to the Franks. Finally the sovereignty over them was assumed by Charlemagne, and on the death of that monarch the kings of the Franks and Germans governed it by their lieutenants, who bore the title of margrave, afterward converted into that of duke, and latterly (1623) into that of elector. In 1070 Bavaria passed into the possession of the family of the Guelphs, and in 1180 it was transferred by imperial grant to Otho, count of Wittelsbach. On the extinction of the direct line of that family in 1777, the elector palatine, Charles Theodore, added the Palatinate and the duchies of Juliers and Berg to the Bavarian dominions. In 1799 the Duke Maximilian Joseph of Deux-Ponts came into possession of all the Bavarian territories. The Peace of Lunéville (9 Feb. 1801) essentially affected Bavaria.

While it lost all its possessions on the left bank of the Rhine, and also the lands of the Palatinate on the right bank, it obtained, on the other hand, by an imperial edict, an indemnification by which it gained, in addition to the amount lost, a surplus of 2,109 square miles and 216,000 inhabitants.

In 1805 Bavaria was raised, by the Treaty of Presburg, to the rank of a kingdom, with some further accessions of territory, all of which were confined by the treaties of 1814 and 1815, by which also a great part of the lands of the Palatinate was restored. In 1848 the conduct of the king of Bavaria, in maintaining an open liaison with Lola Montez, had thoroughly alienated the hearts of his subjects, and quickened that desire of political change which had previously existed. The people, early in March 1848, demanded immediate convocation of the chambers, liberty of the press, public judicial trials; also that electoral reform should be granted, and that the army should take an oath to observe the constitution. The king having refused to grant these demands, tumults occurred, and King Louis announced his resignation of the sceptre to his son, Maximilian II., under whom the reforms and modifications of the constitution were carried out. Maximilian died in 1864 and was succeeded by Louis II. In the war of 1866 Bavaria sided with Austria, in consequence of which it was obliged, by the treaty of 22 August in the same year, to cede a small portion of its territory to Prussia, and to pay a war indemnity of $12,150,000. Soon after Bavaria entered into an alliance with Prussia, and in 1867 joined the Zollverein under Prussian regulations. In the Franco-German war of 1870–1 Bavaria took a prominent part, and since 1871 it has been one of the constituent states of the German empire, represented in the Bundesrath by 6, in the Reichstag by 48 members. In 1886 King Louis II. committed suicide through alienation of mind. His brother Otto succeeded, but he being also insane, his uncle, Leopold, became regent.

Ba'viad and Mæviad, The, two satires, by William Gifford. It was through these that the author, who later was the first editor of the 'Quarterly Review,' became known. 'The Baviad' (1792) is an attack on a band of English writers, who had formed themselves into a kind of mutual admiration society. It is an imitation of the first satire of Perseus, and in it the author not only attacks the "Della Cruscans," but all who sympathize with them. The 'Mæviad' (1795) is an imitation of the 10th satire of Horace, and was called forth, the author says, "by the reappearance of some of the scattered enemy."

Bavieca, bą-wyā'ką, the favorite horse of the Cid.

Bavius, Marcus and **Mævius,** still notorious as two miserable poets and presumptuous critics, satirized by Vergil. The words are often used to signify bad or malevolent poets.

Bawbee, bôr-bē' (French, *bas billon,* "low" or "debased billon"), a coin originally minted in Scotland from an alloy of copper with a very small amount of silver, called billon, and having at different times a value varying from 1½ to 3 cents. The coin is no longer issued, but the term is used in Scotland to mean a halfpenny (a cent) or a very small value.

Bax, Ernest Belfort, English socialist: b. Leamington, 23 July 1854. He was educated in London and Germany; followed journalism in Germany as foreign correspondent in 1880–1; and returning to England, became one of the founders of the English socialist movement. In 1885 he aided in starting the Socialist League. He wrote a large number of works on socialistic and historical subjects.

Bax'ter, Andrew, Scotch philosopher and metaphysician: b. Aberdeen, 1686; d. 1750. He was educated at King's College, Aberdeen, and found occupation as a private tutor. About 1733 he published an 'Inquiry into the Nature of the Human Soul; Wherein the Immateriality of the Soul is Evinced from the Principles of Reason and Philosophy.' In 1741 he went abroad with two of his pupils, and remained for some years at Utrecht, where he contracted an acquaintance with some of the Dutch *literati.* He returned to Scotland in 1747, and resided at Whittingham, East Lothian, where he died. He was the author of a Latin treatise on the principles of astronomy, entitled 'Matho sive Cosmotheoria, Puerilis Dialogus,' which he afterward translated into English and published in two volumes, 12mo. He was a staunch friend and correspondent of John Wilkes, then quite a young man.

Baxter, James Phinney, American author: b. Gorham, Me., 23 March 1831. A successful merchant and manufacturer; he has been six times mayor of Portland, Me., to which he presented the land and building for a public library. A devoted student of the history of his native State, he has published: 'George Cleeve of Casco Bay' (1885); 'Journal of Lieut. W. Digby' (1888); 'Sir Ferdinando Gorges and His Province of Maine' (1890); 'The Pioneers of New France in New England' (1894). He edited Vols. III., IV., V. and VI of the 'Documentary History of Maine' (1889).

Baxter, Jere, American lawyer: b. Nashville, Tenn., 11 Feb. 1852. He traveled in Europe, studied law, and reported the decisions of the supreme court of Tennessee, 9 volumes He was prominent in railroad enterprises, particularly in schemes devoted to the opening up of the mineral and timber resources of his State. He was president of the Memphis & Charleston R.R. before reaching the age of 30, and he organized and built the Tennessee Central R.R., of which corporation he was president He was instrumental in the founding and extension of industrial towns, and was a member of the Tennessee Senate..

Baxter, Lucy E. (BARNES), English art writer: b. Mere, Wiltshire, about 1835; d. Florence, Italy, 10 Nov. 1902. She was the daughter of William Barnes, the Dorset poet, and wrote over the pen name of LEADER SCOTT. After her marriage to Mr. S. T. Baxter in 1867, she resided in Italy, where she was made an honorary member of the Accademia delle Belle Arti. She was the author of 'The Painter's Ordeal'; 'A Nook in the Apennines' (1879); lives of Fra Bartolommeo, Andrea del Sarto, Fra Angelico, and Lucadella Robbia; 'The Renaissance of Art in Italy' (1882); 'Messer Agnolo's Household, a Unique Cento Florentine Story' (1882); 'Ghiberbi and Donatello' (1882); 'A Bunch of Berries' (1883); 'Sculpture, Renaissance and Modern' (1886);

'Tuscan Studies and Sketches' (1887); 'Life of William Barnes' (1888); 'Vincigliata and Mariano' (1891); 'The Orti Orcellari' (1893); 'Echoes of Old Florence' (1894); 'The Castle of Vincigliata' (1897); 'The Cathedral Builders,' her most important work (1899); 'Filippo di Ser Brunellesco' (1901).

Baxter, Richard, English divine: b. near Shrewsbury, 1615; d. 8 Dec. 1691. After receiving a somewhat desultory and defective education he was sent to London under the patronage of Sir Henry Herbert, master of the revels; but he soon returned to the country to study divinity, and in 1638 received ordination in the Church of England. In 1640 he refused to take the oath of universal approbation of the doctrine and discipline of the Church of England, usually known as the *et cætera* oath, and in the following year he became minister at Kidderminster, with the best results to the morality of the town. When the civil war broke out he sided with the Parliament, and after the battle of Naseby accepted the appointment of chaplain to Col. Whalley's regiment. He is said to have been, the whole of this time, a friend to the establishment, according to his own notions. In 1647 he retired, in consequence of ill health, from his military chaplainship, and when he recovered preached against the Covenant. He even endeavored to persuade the soldiery not to encounter the Scottish troops who came into the kingdom with Charles II., and did not hesitate to express an open dislike to the usurpation of Cromwell. The fact is that Baxter held civil liberty to be of secondary consequence to what he esteemed true religion, and appears, from a sermon preached before Cromwell, to have deemed the toleration of separatists and sectaries the grand evil of his government. After the Restoration he was made one of the king's chaplains and a commissioner of the Savoy Conference to draw up the reformed liturgy. The active persecution of the Nonconformists soon followed; and upon the passing of the act against conventicles he retired, and preached more or less openly as the act was more or less rigidly enforced. After the accession of James II., in 1685, he was arrested for some passages in his 'Commentary on the New Testament' supposed to be hostile to Episcopacy, and was tried for sedition. The violence of Jeffreys, who would hear neither the accused nor his counsel, produced a verdict of guilty on the most frivolous grounds. He was sentenced to two years' imprisonment and a heavy penalty, which, after a short confinement, the king remitted. Henceforward Baxter lived in a retired manner till his death. His wife cheerfully shared all his sufferings on the score of conscience, both in and out of prison. The character of Baxter was formed by his age; his failing was subtle and controversial theology; his excellence, practical piety. In divinity he sought to establish a resting place between strict Calvinism and high-church Arminianism, by the admission of election and the rejection of reprobation. Christ, he considered, died for some especially and for all generally; that is to say, all possess the means of salvation. A body called Baxterians long acknowledged these distinctions; and the Nonconformist clergy, after the Revolution, were divided between this body, the pure Calvinists, and the high-church passive-obedient Arminians. Baxter was a voluminous writer; his 'Saints' Everlasting Rest,' and the 'Call to the Unconverted,' have been extraordinarily popular. In 1830 an edition of his 'Practical Works' appeared in 23 octavo volumes. The chief authority for the facts of his life is the 'Reliquiæ Baxterianæ' of Sylvester, consisting of autobiographical matter.

Baxter, Robert Dudley, English political economist: b. Doncaster, Yorkshire, 1827; d. May 1875. He was educated at Trinity College, Cambridge, and in 1866 became a member of the Statistical Society of London. He wrote and published 'Railway Extension and Its Results' (1866); 'National Income of the United Kingdom' (1868); 'Taxation of the United Kingdom' (1869); 'English Parties and Conservatism' (1870); 'National Debts of the World' (1871), etc.

Baxter, Sylvester, American journalist: b. West Yarmouth, Mass., 6 Feb. 1850. While on the staff of the Boston *Herald* he was prominent in pushing the metropolitan park system and advocating a "Greater Boston." He has written: 'The Cruise of a Land Yacht, a Boy's Book of Mexican Travel'; 'Berlin: a Study in Municipal Government' (1890); 'The Boston Park Guide.'

Baxter, William, American clergyman and author: b. Leeds, England, 1820. He was president of Arkansas College, Fayetteville; when it was burned in the Civil War, he removed to Cincinnati. He has written 'The Loyal West in the Time of the Rebellion' and 'Pea Ridge and Prairie Grove, or Scenes and Incidents of the War in Arkansas' (1864). His 'War Lyrics,' originally published in 'Harper's Weekly' were very popular at the time of their publication.

Baxterians. See BAXTER, RICHARD.

Bay, in *architecture,* a term used to signify the magnitude of a building. Thus, if a barn consists of a floor and two heads, where they lay corn, they call it a barn of two bays. These bays are from 14 to 20 feet long, and floors from 10 to 12 broad, and usually 20 feet long, which is the breadth of the barn. It is also used to denote the divisions of a church or cathedral from floor to roof, as indicated by the pillars or arches; as, a church of eight bays.

In *botany,* the name of several trees and shrubs, as sweet bay (*Laurus nobilis*) the laurel (q.v.) of the poets, used for crowning heroes in ancient times and for church decoration at the present. It has stiff, dull-green leaves sometimes used to flavor culinary dishes. Its sweet, fragrant, aromatic, cherry-like, purple fruits are edible. This tree is widely cultivated for ornament in Europe and America, and is probably the most popular tub-plant used in open-air restaurants, esplanades, etc., on account of its ability to withstand neglect, abuse, and shearing. Several hundred thousand specimens are used annually on the two continents. The bay laurel is better known as the cherry laurel (*Prunus laurocerasus*). Its leaves yield prussic acid, and were at one time extensively used as a poison. The loblolly bay (*Gordonia lisianthus*), white bay (*Magnolia glauca*), and red bay (*Persea carolinensis*), are well-known natives of the southeastern United States. The name rose bay is given to divers evergreen rhododendrons, to oleander, and sometimes to *Epilobium angustifolium.* The California bay-

tree is *Umbellularia californica.* The bay-tree from which bay rum (q.v.) is distilled is *Myrcia acris.* See LAUREL; MAGNOLIA.

In *geography,* an arm of the sea, extending into the land. It is generally applied to smaller bodies of water than gulfs, of the same general geographical character, though the terms "gulf" and "bay" are used sometimes interchangeably and much to the confusion of geographical science. The word is of Saxon origin and signifies an angle. It should properly be applied only to arms of the sea which are widest at their departure from the main line of sea coast, or mouth, while "gulf" should be applied to such bodies of water as the Gulf of California, whose width is nearly the same throughout a great part of their extent.

Bay-birds, or **Beach-birds,** a sportsmen's name, in particular use along the south shore of Long Island, N. Y., for snipe, curlews, sandpipers, avocets, and other limicoline birds that frequent the shores and bays of estuaries. Compare SHORE-BIRDS.

Bay City, Mich., county-seat of Bay County, is located on the south bank of the Saginaw River, four miles from its mouth on Saginaw Bay, from which it takes its name, and at the head of deep water navigation. It is connected with the Michigan Central, Pere Marquette, Grand Trunk, and Detroit & Mackinac Railway systems, and 108 miles northwest of Detroit. It is the principal market town of a large area of the Saginaw Valley and "Thumb" region of the lower peninsula, the garden of the State in an agricultural sense. The Saginaw River is navigable to this point for the largest lake vessels. West Bay City lies on the north bank of the Saginaw River and directly opposite Bay City. These cities will become one municipality April 1, 1905, an act of the legislature having made this provision.

Manufactures.— Bay City is a large manufacturing town, the principal industries being coal, salt, lumber, sugar, alcohol, beer, machinery, and chemicals. It has the only alcohol plant in the State which produces proof alcohol from the refuse molasses, a by-product of the manufacture of beet sugar, and one of the largest chemical plants in the world, manufacturing alkalis, soda ash, salt, etc. Three large beet sugar factories are located in Bay City and two in West Bay City. The development of coal mining in the Saginaw Valley is of comparatively recent origin, dating back only ten years, but it has attained large proportions in Bay County, a dozen mines, being in operation and others being established. It is the port of entry of 150,000,000 feet of rough lumber imported annually from Canada and Upper Michigan and Lake Superior district. This product is worked up in the planing mills, box factories and other wood working plants of which there are more than a score. A dozen saw mills are in operation and manufacture more than 100,000,000 feet of lumber annually, the logs coming in by rail. The Michigan Central Railroad alone brings to Bay City nearly 100,000,000 feet of saw-logs annually. Large quantities of forest products are distributed by rail, fully 300,000,000 feet of lumber besides vast quantities of shingles, cedar poles, posts, railroad ties and hemlock bark being handled in and out of the city annually. The city has a large shade roller factory, wind mill factory, one of the largest industrial works in the country, turning out machinery, another large machinery plant, maple flooring plants, the largest woodenware factory in the world, a number of breweries, a large flour mill and elevator, two feed mills, and a large marine engine plant, yacht building plant, and a large chicory plant, considerable attention being paid to this industry. The city has 87 incorporated manufacturing and business concerns with a capitalization of nearly $20,000,000.

Trade and Commerce.— The growth of the commerce of Bay City has been steady. It has also changed. Up to 20 years ago the manufacture of pine lumber was the chief industry on the Saginaw River and there was produced in a narrow strip of territory 18 miles long since 1851 an aggregate of 24,000,000,000 feet of manufactured lumber. Of late years the pine industry declined owing to the exhaustion of the pine timber tributary to the mills, and mixed timber is now chiefly manufactured. The lake shipments of lumber which have exceeded 850,000,000 feet in a single season have declined and lumber is now brought in instead of being shipped out by water, the product being worked up in factories and shipped to consuming points by rail and water, these consisting of lumber products, fish, salt, coal, sugar and alcohol. The city also does an extensive business in wholesale groceries, supplies for mills and machinery generally. The total business aggregates $50,000,000 annually.

Railroads and Water Communication.—Bay City is the division headquarters of the Michigan Central Railroad, the Mackinaw, Bay City & Detroit, and Bay City and Jackson divisions centering here. It is also the northern terminal of the C. H. D. & Pere Marquette system, the northern terminal of the Grand Trunk, and the southern terminal of the Detroit & Mackinac Railroad. It has a street railway system of 35 miles and an interurban road extending 14 miles south to Saginaw. Two interurban routes are projected, one to Lapeer, Pontiac and Detroit, the other to Caro, Cass City, Bad Axe and Harbor Beach. It is at the head of deep water navigation on the Saginaw River, and is reached by the largest lake vessels. Opposite Bay City are two large ship-building plants and it has also an extensive dry dock. The chief water exports are lumber products, salt and coal, and the imports are lumber products and merchandise. It is reached by navigation from all ports on the great lakes.

City and County Government.— Bay City is the seat of the county government and contains the county court-house and all county offices. It has a fine city-hall building, erected at a cost of $200,000. The charter election is held on the first Monday in April of each year, the mayor holding office two years, the comptroller four years, and the treasurer and recorder two years. The total expenses of the city government in 1903 were $177,576.18, and the valuation as assessed for taxation purposes in 1904 is $11,797,875. The bonded debt of the city is $600,000, of which $342,000 are waterworks bonds. The rate of taxation on $1,000 valuation in 1904 was $18.19, which includes the school tax of $3.93.

Banks and Loan Companies.—Bay City has five banking institutions with an aggregate capital of $600,000; profits $367,651, and deposits

amounting to $4,784,014, according to the statement of 6 Sept. 1904. There are two building and loan associations, the Mutual Building and Loan Association of Bay County, capital $2,000,000; and the Savings Building and Loan Association of Bay County, capital $1,000,000.

Churches and Charities.—Bay City is well represented in its religious and charitable institutions. It has 36 churches and missions and 12 private and parochial schools. There are three charitable institutions, the Children's Home, Lutheran Children's Home, and Woman's Home; three hospitals — the Mercy Hospital, under the auspices of the Sisters of Mercy; the Lewis Hospital, and the Bishop Hospital. The city also has 66 aid, benevolent, social, and other societies, and 87 secret societies and lodges.

Newspapers.—Bay City has two daily newspapers and several weekly publications.

Education.—Bay City has a fine high school and nine other school buildings, employing in all 127 teachers, including the superintendent and principals of the several schools. The school census of 1904 shows 9,506 children of school age in the city. A county normal training school and kindergarten schools are maintained in connection with the public school system. The city maintains the Bay City Business College, Holy Rosary Academy, conducted by the Dominican Sisters; Mercy Hospital Training School for Nurses; Oral School for the Deaf, and Lutheran and Catholic parochial schools. There are two libraries — the Bay City Public Library, located in the city-hall building, and having 24,000 volumes; the Bay County Bar Library.

Buildings, Parks, Suburbs, etc.—Bay City is noted for its substantial business buildings, its suburban attractions, and the beauty of its homes. The city-hall, Masonic temple, and Federal building are imposing structures. The Bay City Club erected in 1904 a fine club house, the Masonic Club meets in Masonic Temple, the Elks Club owns its own building, as does the Bay City Boat Club, and there are a number of private clubs. Bay City has a board of trade with a membership of over 200. The city has six public parks, and has an abundant supply of good water, obtained from Saginaw Bay.

History.—The Saginaw Valley, in the lower portion of which Bay City is situated, derived its name from the Indian appellation «O-sauge-nong,» meaning «land of the Sauks,» a tribe of red men who inhabited this locality more than 350 years ago. Subsequently the Sauks were nearly exterminated by the Chippewas, and the latter ceded the territory to the United States in 1819. The first settler located here in 1831, he being employed by the government as an Indian farmer, in conformity to the provisions of the treaty. There were two reservations, one of 2,000 and one of 1,000 acres, embraced within what are now the corporate limits of the city, the reservations being to Stephen V. R. Riley, of Schenectady, N. Y., who had resided with the Indians many years, married an Indian woman, by whom he had three sons, the eldest, John Riley, being located on the reservations referred to. In 1836 he sold his land to a number of Detroit business men, who organized the Saginaw Bay Company, which began to lay out the future city. A large hotel was framed and a dock and warehouse built, but, the panic coming on soon, the company suspended and progress ceased for some time. In 1840 three gentlemen purchased the stock of the Saginaw Bay Company and became the proprietors of what was known as Lower Saginaw. There was a steady growth after 1844, due to the development of the white pine lumber industry, the Saginaw River being the outlet for streams that traversed the richest pine forests then known in the United States. The village of Bay City was incorporated in 1859, and retained its village organization until 1865, when it was given a city charter.

Population.—The Federal census taken in 1900 gave the city a population of 27,628, and the State census taken in 1904 gave the city a population of only 27,644, figures which are not accepted as accurate. The population of West Bay City slightly exceeds 13,000, so that when the consolidation becomes effective, 1 April 1905, the greater Bay City will have a population in excess of 40,000.

E. D. Cowles,
Editor 'Bay City Tribune.'

Bay Islands, Honduras, a group of six islands in the Bay of Honduras, 150 miles southeast of Belize, known as Ruatan, Guanaja (or Bonacca), Utilla, Barbareta, Elena, and Morat. They were discovered by Columbus, 30 July 1502, and it was from Guanja that he first sighted the mainland of America. Their ownership was long a matter of dispute between Spain and England, and later between England and the republic of Honduras. In 1852 the group was declared a colony of Great Britain by royal warrant, and this action involved the United States in the dispute, that government claiming that the seizure was a violation of the Clayton-Bulwer treaty (q.v.). Negotiations dragged along slowly for several years, but finally Great Britain recognized the claim of Honduras to the islands. A practical protectorate was, however, maintained by Great Britain over the group, and the inhabitants (who number nearly 6,000) avowed British allegiance. In 1903 Great Britain formally renounced all jurisdiction, and title to the Bay Islands is now clearly vested in Honduras.

Bay Lagoon, Philippines, a freshwater lake in the northern part of Luzon. This lake is connected with Manila Bay by the Pasig River, and from its centre rises a high volcanic island. It is about 20 miles in extent from north to south, and about 47 miles from east to west. In 1899 it was made a naval headquarters for the United States.

Bay Psalm Book, the title of the first book published in the American colonies. It was printed by Stephen Daye at Cambridge, 1640, and was the product of the joint labors of Revs. Richard Mather, Thomas Wilde, and John Eliot. It was revised in 1650 and was long in use in New England.

Bay Salt, the coarse-grained salt found in salt-marshes and along ocean shores, where it is formed by the spontaneous evaporation of sea-water. The name is supposed to refer to the Bay of Biscay, on whose shores extensive deposits of «bay salt» occur.

Bay State, the popular name of Massachusetts, which prior to the adoption of the United States' Constitution had been known as the Massachusetts Bay Colony.

Baya, or **Baya Sparrow,** a sparrow-like weaver-bird (*Ploceus phillippinus*), which the people of India and the Malay countries often keep about their houses, not only in cages, but as a free pet trained to do a variety of clever tricks, even to find small articles, to carry notes to certain places, and to steal ornaments from the hair of visitors. See WEAVER BIRD.

Bayad, a cat fish, *Bagus bayad,* a large edible fish found in abundance in the river Nile; distinguished, however, from the electric catfish of the same waters.

Bayaderes, bä-yạ-dārz, in the East Indies, young girls, from 10 to 17 years of age, who are instructed in dancing, singing, and acting little plays. They are trained under the care of women, who are experienced in all female arts, and particularly in that of pleasing. These procure from the lowest classes of the people the most beautiful girls, of seven or eight years of age, and instruct them in all the arts of their profession (especially dancing and singing), the object of which is to amuse the rich and minister to their passions. Their presence is considered necessary even at the smallest public entertainments, though they are known to be mere prostitutes. After their 17th year, when their first charms have faded, they retire to a pagoda under the protection of the Brahmins, who scruple not to pocket the gains of their prostitution. This word is from the Portuguese word *bailadeira,* from *bailar,* to dance.

Bayamo, bä-yä'mō, Cuba, a town whose name is indissolubly connected with the Ten Years' war and the revolution of 1895. Thus the Cuban national air received the name 'Bayamese Hymn.' The republican movement of 1868 originated here and in the neighboring town of Yara; and here Gen. Garcia received the message that Lieut. Rowan delivered to him before the war of 1898 between the United States and Spain. Bayamo was founded in the early years of the Spanish conquest. It is situated on an affluent of the Canto, Cuba's largest river, in the province of Santiago.

Bayard, bī'ạrd, **George Dashiell,** American soldier: b. Seneca Falls, N. Y., 18 Dec. 1835; d. 14 Dec. 1862. Passing his boyhood in Iowa, he entered West Point, 1852, and became a cavalry lieutenant; then captain in August 1861, colonel of volunteers in September, brigadier-general the following April; and after serving in the Shenandoah and northern Virginia campaigns, was mortally wounded at Fredericksburg.

Bayard, James Asheton (1st), American statesman: b. Philadelphia, 28 July 1767; d. 6 Aug. 1815. He was the son of Dr. James A. (see BAYARD FAMILY); was adopted by his uncle, Col. John (q.v.), graduated at Princeton, 1784; studied law, and settled in Wilmington, Del., permanently. In 1796 he was elected (Federalist) Representative in Congress and became the leader of the party in the House, noted as a constitutional lawyer; and when the peculiar system of presidential elections at that time had tied Jefferson and Burr for the presidency, though Jefferson was the only one really voted for, Bayard threw his vote for Jefferson and elected him as the less obnoxious of the two. John Adams appointed him minister to France, but he declined. He served in the House till 1803; in 1804 he was elected to the Senate, and held the seat till 1813, voting against the War of 1812. He was made peace commissioner in 1813 by Madison, and, declining the ministry to Russia, was one of those who concluded the Treaty of Ghent, December 1814, but died shortly after his return.

Bayard, James Asheton (2d), American statesman, son of the foregoing: b. Wilmington, Del., 15 Nov. 1799; d. there, 13 June 1880. He became a lawyer of high rank in Wilmington, United States attorney for Delaware under Van Buren, and was elected United States senator, 1851, 1857, and 1863, as a Democrat; but on the last occasion the «iron-clad» oath of allegiance being required of public officers at that time, Mr. Bayard entered a protest against it as a violation of State rights, and resigned his seat at once on taking it. His successor, George R. Riddle (q.v.), dying four years later after the war, he accepted an election to fill out his own unexpired term, to March 1869; during most of the time was chairman of the Judiciary Committee, and gained an honorable celebrity for his punctilious sense of public honor in the matter of the Credit Mobilier (q.v.). His son, Thomas F. (q.v.), was chosen to succeed him by the same legislature which had elected himself, the only instance of the kind in American history. He lived quietly at Wilmington during the remainder of his life.

Bayard, John, American patriot: b. Bohemia Manor, Md., 11 Aug., 1738; d. 7 Jan. 1807. (For his descent, see BAYARD FAMILY.) He was a prominent Philadelphia merchant, member of the Sons of Liberty, and later of the Provincial Congress, 1774–5, and of the Council of Safety; colonel of infantry at the battles of Brandywine, Germantown, and Princeton; member of the State board of war, and speaker of its House. He furnished arms to Congress and fitted one of the earliest efficient privateers. In 1785 he was elected to Congress. Somwhat impoverished by his sacrifices in the Revolution, he removed permanently to New Brunswick, N. J., where he was mayor, county judge, and leading magnate. He was a firm Federalist, of high character.

Bayard, Nicholas, American colonial official: b. Alphen, Holland, about 1644; d. New York, 1707. (See BAYARD FAMILY.) He was double nephew of Peter Stuyvesant, by blood and marriage; became his private secretary and surveyor of the province, secretary of it after the English conquest, and mayor in 1685. He was commander-in-chief of the militia of the province, and one of the three resident councilors; and had to flee to Albany for his life on Leisler's usurpation after Andros' overthrow, but was made councilor anew on Leisler's downfall. On Kidd's arrest for piracy in 1699, Bayard, like all Gov. Bellomont's officials, was accused of complicity, and visited London to clear himself; but the old hates of the Leisler time pursued him, and on charge of attempting to introduce popery, piracy, and slavery into New York he was condemned to death for high treason. William's death intervening, however, he was released and restored to his possessions by an order in council.

Bayard, bă-yär, **Pierre du Terrail** (CHEVALIER DE), French soldier: b. Château Bayard, near Grenoble, 1475; d. 30 April 1524. He was descended from one of the most noble families

in Dauphiny, and at the age of 13 became page to the Duke of Savoy, at that time an ally of France. Charles VIII., struck by his skill and grace in riding, asked that he be transferred to his service, and accordingly, as a preparation to being attached to the royal suite, young Bayard was placed in the household of Paul of Luxembourg, Count de Ligny, where he was taught all the feats of arms and niceties of chivalry which were then held necessary to constitute a gentleman and a soldier.

His first experience in war was in the wild and daring march of Charles VIII., with a small unsupported army, through the whole length of Italy, to invade the kingdom of Naples, which was won and lost in a few days with equal ease; and in that campaign, he greatly distinguished himself, taking, with his own hand, a stand of colors in the battle of Verona. After this, while serving in an invading army in Italy, after a battle fought near Milan, in the heat of pursuit he entered that city pell-mell with the fugitives, and was made prisoner, but, in consideration of his astonishing valor, was sent back without ransom by Ludovico Sforza, together with his horse and arms. In Apulia he defeated a Spanish corps commanded by Alonzo de Soto-Mayor, who broke his parole and slandered Bayard, in return for which the latter challenged and slew him in single combat, and afterward covered the retreat of the whole French army, and defended the bridge over the Liris, now the Garigliano, single-handed against half an army. For this feat he received an augmentation of his armorial bearings, a porcupine bristling with spears, with the motto *Vires agminis unus habet.*

A real type of the ideal knight-errant of romance, wherever honor was to be won or danger incurred, Bayard was there. Desperately wounded in the assault of Brescia, he was carried to the house of a nobleman who had fled, abandoning his wife and daughters to the fate which befalls women in a sacked city, and from which the wounded enemy alone preserved them. Half-recovered from his wounds, he joined Gaston de Foix before Ravenna, where with his own hand he took two Spanish standards and converted a retreat of the enemy into a rout. In the subsequent wars with Ferdinand the Catholic of Spain he displayed the same chivalric valor and the same generalship among the Pyrénées which he had displayed in his boyhood among the passes of the Alps and Apennines. In the dark days which clouded the latter years of Louis XII., when Henry VIII. brought his English archers to back the German Maximilian in Flanders, and Térouanne and Tournay went down, with but feeble resistance, before the allies, Bayard was the same in adverse as he had been in prosperous fortunes. Made prisoner at the disgraceful battle of the Spurs, it was again his glory to be taken under circumstances of such honor that, once more, he was dismissed, with his horse and arms, unransomed. It was, however, in his noon of manhood that his glory shone the brightest. When Francis I. invaded Italy after his accession to the throne of France, it was Bayard who was the precursor of his march; who made Prosper Colonna, at the very moment of his belief that he had ambushed and surprised him, his prisoner; who, in a word, paved the king's way to the magnificent battle of Marignano. In that tremendous conflict, he did prodigies, and more than any or all beside to change what once seemed a lost fight into a victory. At its close his sword conferred the accolade on the shoulder of his king, Francis I., who deemed it honor enough to take knighthood at the hand of such a paladin as Bayard. The fortunes of war, proverbially fickle and changeful, were never more so than at this epoch; and when, a short time later, Charles V. invaded Champagne, his wonderful defense of the open town of Mézières alone prevented his penetrating to the heart of France, of which, by this exploit, he deserved, as he obtained, the name of savior. His next war was his last. Genoa, ever an unwilling conquest of the French arms, revolted; and, under the command of Bonnivet, Bayard was sent to reduce the city to obedience and chastise the rebels. In the first instance success attended their advance; but, after the surrender of Lodi fortune again changed, and, foot by foot, the French were beaten out of their conquests. In retreating through the Val d'Aosta the French rear was beaten, Bonnivet was severely wounded, and the safety of the army was committed to Bayard, if he perchance might save it. In passing the river Sesia in the presence of a superior enemy, as Bayard was covering the rear and pressing hard upon the Spaniards, who were fast giving way before his impetuous charge, he was shot through the right side by a stone from an arquebus, which shattered his spine. «Jesu, my God!» he cried, «I am a dead man.» And then commanding that he should be placed erect, in a sitting posture, with his back against a tree, with his face to the Spaniards, and the cross-hilt of his sword held up as a crucifix before him, he confessed his sins to his esquire, sent his adieux to his king and country, and died in the midst of weeping friends and admiring enemies. With his fall the battle was ended. The French lost everything,— standards, drums, baggage, ordnance,— and their retreat to France became a flight. But there was most grief that they had lost Bayard. His body remained in the hands of the Spaniards; but they embalmed and returned it to France unsolicited. A simple bust, with a brief and modest Latin inscription, in the church of the Minorites, in Grenoble, erected in 1823, is the only monument to one of the purest and most beautiful characters in mediæval history, the *chevalier sans peur et sans reproche.*

Bayard's life was written by Symphorien Champier in 1525, and two years later by his secretary, Jacques Joffrey, known as the «loyal servitor.» Other accounts have been translated by E. Walford (London, 1867).

Bayard, Richard Henry, American senator, elder brother of James A. (2d): b. Wilmington, Del., 1796; d. 4 March 1868. He graduated at Princeton, 1814, and became a lawyer in Wilmington. He was United States Senator 1836–45, resigning for a few weeks in 1839 to be chief justice of Delaware, but accepting an immediate re-election; then chargé d'affaires at Brussels 1850–3. Returning, he lived in Philadelphia till his death.

Bayard, Samuel, American jurist, son of Col. John: b. Philadelphia, 11 Jan. 1767; d. 12 May 1840. He was valedictorian at Princeton, 1784, and practised law in Philadelphia till 1791, when he was made clerk of the United States

supreme court. From 1794 to 1798 he was in London as agent to prosecute American claims before the British admiralty court; after his return was presiding judge of Westchester County till 1803, lawyer in New York 1803–6, then removed permanently to Princeton, N. J. He was one of the founders of Princeton Theological Seminary, the American and New Jersey Bible societies, and the New York Historical Society.

Bayard, Thomas Francis, American statesman, son of James A. (2d): b. Wilmington, Del., 29 Oct. 1828; d. 26 Sept. 1898. He was intended for a business career, and was placed in a New York house, his elder brother being designed to carry on the family succession for public life; but, the latter dying in 1848, Thomas returned to Wilmington, studied law with his father, and was admitted to the bar in 1851. He was appointed United States district-attorney, but resigned the next year; removed to Philadelphia 1855 and practised law two years, then returned permanently to Wilmington. He and his father were peace Democrats, unalterably opposed to the war, publicly denounced it, and gave no help to its prosecution. Elected to the Senate to succeed his father, he took his seat 4 March 1869, and served by successive re-elections till 1885. He was one of the leading Democratic figures, member of the Finance, Judiciary, and other important committees, and its president *pro tem.* in 1881; was on the Electoral Commission of 1876; continued to champion the party doctrines, and was one of the most prominent candidates for the presidency before both Democratic national conventions of 1880 and 1884. On 4 March 1885 he was appointed secretary of state in the Cabinet of President Cleveland; and in this position had his share of important and vexatious questions, such as the Bering Sea seal-fishery matter, and treaties with Great Britain and Russia. He was United States ambassador to Great Britain 1893–7, in Cleveland's second term, the first British minister to hold the title of ambassador.

Bayard Family, a remarkable succession of American public leaders, statesmen, and jurists, identified for two and a half centuries with the Middle States from New York to Maryland, and for a century and a quarter almost continuously in public service. They descended from a family of French Huguenot refugees, whose ancestor was a Paris theological professor driven to Holland to escape persecution about 1580. His son Samuel became a wealthy Amsterdam merchant and married the accomplished, energetic, and capable sister (Anna) of Peter Stuyvesant, the last governor of the Dutch New Netherlands, who himself married Bayard's equally accomplished sister Judith, a great lady of her time. Samuel died in Holland; and his widow with her three sons accompanied her brother to Manhattan Island, where she took up an estate of 200 acres, including the site of the Astor Library. Of these sons, Nicholas became secretary of New Netherlands and later of English New York, mayor, commander-in-chief of the colony's militia, and practically the head of the colony — a perilous honor which twice brought him to the verge of destruction. His brother Peter, however, though not personally conspicuous, became the ancestor of the distinguished Bayards of the 18th and 19th centuries. Peter's son Samuel joined the Labadists (see LABADIE, JEAN), a sect of communists otherwise much like the Quakers, and removed to Maryland. Of his grandsons, Col. John was a leading Philadelphia merchant, patriot, and soldier, representative in Congress, a county magnate in Maryland till after the Revolution, later judge and Federalist pillar; his son Samuel, lawyer, clerk of the supreme court, United States claim agent, and judge, was one of the founders of the New York Historical Society and the American Bible Society. Col. John's twin brother, Dr. James A., was father of James A., the noted Federalist statesman of Jefferson's and Madison's time, leader of the Federalists in the House of Representatives, and the one whose vote gave the presidency to Jefferson instead of Burr, senator, and peace commissioner. The two sons of the latter James A., Richard H. and James A. (2d), were both United States senators of distinction from the State of Delaware, the one a Whig and the other a Democrat — the only instance of the kind in United States history; the former also chosen chief justice of Delaware. The son of James A. (2d), Thomas F., was also senator to succeed his father; so that father, two sons, and grandson represented Delaware in the Senate 47 years between 1805 and 1885. Thomas F. was further a member of the Electoral Commission of 1876, and secretary of state under Cleveland. This unique record of distinguished public position is the more notable that it has been on the highest plane of public character as well as capacity — conspicuous for dignity, probity, and scrupulous sense of those official proprieties which shun the appearance of evil and therefore bar out its reality.

Bayazid, or **Bayezeed,** Turkey in Asia, a town in the pashalic of, and 140 miles southeast from Erzeroom, southwest of Mount Ararat, from the base of which it is separated by a lava-covered plain 10 miles wide. It is situated on the declivity of a rugged eminence, the summit of which is fortified and surrounded by a wall and ramparts. The town is in a ruinous state; most of the houses are small and ill built, and the streets are extremely filthy. Besides the extensive palace of the pasha, the town contains two Christian churches, three mosques, and the famous monastery of Kara-Keleeseh, celebrated for its beautiful architecture and antiquity. The inhabitants consist chiefly of Kurds and Armenians. Kurdish is the common language of the place. Some trade is carried on with Persia, on the frontiers of which the town is situated. It was occupied and held by the Russians for a time in 1877. Pop. 5,000.

Bayazid, bä-yä-zēd', **I.** and **II.** See BAJAZET.

Baybay, bāī'bāī, Philippines, a town of the province of Leyte, situated on the west coast, 40 miles southwest of Tanaban. Pop. 17,367.

Bayberry. See CANDLE BERRY.

Bayer, bī'ĕr, Gottlieb Siegfried, German philologist, grandson of Johann Bayer: b. Königsberg, 1694; d. St. Petersburg, 21 Feb. 1738. He displayed from his earliest childhood a singular passion for Chinese and other Eastern languages. He studied the Coptic at Berlin, under La Crosse, Arabic at Halle, under Solomon Negri, and at the same time opened a correspondence with the missionaries in India,

in order to obtain more information about the Sanskrit and Hindustanee. On the foundation of the academy of sciences in St. Petersburg in 1726, he became professor of Greek and Roman antiquities. Besides his extraordinary knowledge of languages, Bayer was an eminent historical and archæological scholar. His monument is his work published in 1730, 'Museum Sinicum, in quo Sinicæ linguæ et literaturæ ratio explicatur,' containing a Chinese grammar, a grammar of the dialect of Shin-Shu, and many interesting notices on Chinese literature.

Bayer, Johann, German astronomer: b. Augsburg, 1572; d. 1660. He is celebrated for a large work published in 1603, under the title of 'Uranometria,' and republished in 1627 under the title of 'Cœlum Stellatum Christianum,' which contains a minute description and a catalogue of the constellations. He changed the name because he had withdrawn the heathen names of the constellations, and supplied their names by others taken from the Bible, taking those of the northern constellations from the New, and those of the southern constellations from the Old Testament, and giving the names of the 12 apostles to the signs of the zodiac. His letters were adopted by Flamsteed and others, and are now universally used, but the heathen names have kept their ground. He contributed much to the simplification of astronomical science, by avoiding the old unintelligible nomenclature and by denoting the stars in every constellation by the letters of the Greek alphabet in their order. Bayer was also a good student of law and an able theologian. He was settled as minister over different parishes, and so zealous in his advocacy of Protestantism that he was called "Os Protestantium." The Emperor Leopold ennobled him.

Bayer, Karl Robert Emerich von, German novelist, who wrote under the pseudonym of Robert Byr: b. Bregenz, 15 April 1835. He is a very popular and exceedingly prolific story-teller, and his voluminous fictions have had a wide circulation. Among his best-known novels are 'The Struggle for Life'; 'Masks'; 'A Secret Dispatch'; 'The Road to Fortune'; 'Meadow Maidenhair'; 'The Ironworm.'

Bayeux, bā-yė, an ancient town of France, department Calvados, about 16 miles northwest of Caen. It possesses many antique houses of singular appearance, and has a beautiful cathedral dating from the 12th to the 15th century, and having a crypt under the choir several centuries earlier. Its noble portal and three towers render it especially noteworthy. The local industries include the manufacture of porcelain and lace, bonnet-making and cotton spinning. There is a public library and museum, in which one of the most interesting relics of the Middle Ages is preserved. See Bayeux Tapestry. Pop (1896) 7,900.

Bayeux Tapestry, a celebrated piece of mediæval embroidery of sewed work originally found in the cathedral of Bayeux, in the library of which town it is still preserved. The fact that such a tapestry existed was brought to light by M. Lancelot, who communicated a description of an illuminated drawing of a portion of it to the Academy of Inscriptions and Belles-lettres in 1724. This led to the discovery of the tapestry itself in 1728, whereupon various speculations arose as to its date, its origin, and its purport. According to tradition it is a contemporary representation of the invasion and conquest of England by the Normans, and the discussions upon it have proved that tradition is right. It is thus not only valuable as a relic of the art of the Middle Ages, but it has also great historical value, inasmuch as it supplies several details of the great event which it portrays which are not found in the chroniclers, and also gives us an exact picture of Norman costumes and manners. It contains 1,512 figures with inscriptions in Latin giving the names and subjects. It is supposed to have been worked by the needle of Matilda, queen of William the Conqueror, assisted by her attendants, and to have been presented by Odo, bishop of Bayeux, the half-brother of William, to the church in which it was found. Whether this be so or not, it is regarded as certain that the tapestry is not later than the 11th century. During the French Revolution the tapestry was in great danger of being destroyed. In 1803 it was removed to Paris by order of Napoleon, and when he was meditating the invasion of Britain he caused it to be carried from town to town and exhibited between the acts in the theatres. It was brought back to Bayeux in 1804, when it was placed in the hôtel de ville, instead of the cathedral, its former resting-place. The length of the tapestry is 230 feet, and its height 20 inches. It is in an excellent state of preservation. There are good representations of it produced photograpically. Consult J. C. Bruce's 'Bayeux Tapestry' (1885). See Tapestry.

Bayfield, Matthew Albert, English clergyman: b. Edgbaston, 17 June 1852. He was educated at the King Edward's School, in Birmingham, and at Clare College, Cambridge; was assistant master in the Blackheath School, 1875–9, and in Marlborough College, 1879–81; headmaster's assistant in Malvern College, 1881–90; headmaster of Christ College, Brecon, 1890–5, and headmaster of Eastbourne College, 1900. He published editions of 'Ion, Alcestis, and Medea,' and also 'Septem contra Thebas' (with Dr. Verrall); 'Iliad' (with Dr. Leaf); 'Latin Prose for Lower Forms,' etc.

Bayle, bāl, **Pierre,** French critic and philosopher: b. Carlat, near Foix (Languedoc), 1647; d. Rotterdam, 28 Dec. 1706. At the age of 19 he entered the College of Puy-Laurens, to finish his studies. All books were eagerly devoured by him; his taste for logic led him particularly to study religious controversies, but Amyot's 'Plutarch' and 'Montaigne' were his favorite works. In Toulouse he studied philosophy with the Jesuits. The arguments of his professors, and still more his friendly discussions with a Catholic priest who dwelt near him, confirmed his doubts of the orthodoxy of Protestantism, so that he resolved to change his religion. His family, however, tried all means to regain him, and after 17 months he returned to his old faith. To escape from the punishment of perpetual excommunication which the Roman Catholic Church then pronounced against apostates, he went to Geneva, and thence to Copet, where Count Dohna intrusted him with the education of his sons, where he studied the philosophy of Des Cartes. But after some years he returned to France and settled in Rouen, where he was employed in teaching. In 1675 he obtained the philosophical chair at

Sedan, where he taught with distinction until the suppression of this academy in 1681. He was afterward invited to discharge the same duties at Rotterdam. The appearance of a comet in 1680 induced him to publish, in 1682, his 'Pensées Diverses sur la Comète,' in which he discussed various subjects of metaphysics, morals, theology, history, and politics. It was followed by his 'Critique Générale de l'Histoire du Calvinisme de Maimbourg.' This work, received with equal approbation by the Catholics and Protestants, and esteemed by Maimbourg himself, excited the jealousy of his colleague, the theologian Jerieu, whose 'Refutation du P. Maimbourg' had not succeeded, and involved Bayle in many disputes. He afterward undertook a periodical work, 'Nouvelles de la République des Lettres,' in 1684.

The death of his father and of his two brothers, together with the religious persecutions in France, induced him to write his 'Commentaire Philosophique' on the words of the Gospel: «Compel them to come in»; which is not equal in merit to his other works. Bayle himself was unwilling to acknowledge it; but Jurieu, who probably recognized its author by the zeal with which toleration is defended in this work, attacked it with violence, and his influence was sufficient to lead the magistrates of Rotterdam to remove Bayle from the office in 1693.

He now devoted all his attention to the composition of his 'Dictionnaire Historique et Critique,' which he published in 1696. This was the first work which appeared under his name. Jurieu opposed him anew, and caused the consistory, in which he had the greatest influence, to make a severe attack upon him. Bayle promised to remove everything which the consistory deemed offensive; but finding the public had other views, and preferring the satisfaction of his readers to that of his judges, he left the work, with the exception of a few trifles, unaltered. He found two new enemies in Jacquelot and Le Clerc, who both attacked his religion: others persecuted him as the enemy of his sect and his new country.

The best editions of his 'Dictionnaire Historique' are that of 1740, in 4 volumes folio (Amsterdam and Leyden), and that in 16 volumes, published 1820–4 at Paris.

Baylen, bī-lān', or **Bailen,** a town of Spain, province of Jaen, at the foot of the Sierra Morena, 22 miles north of Jaen. It commands the road leading from Castile into Andalusia, and derives its celebrity from the events which took place in its vicinity leading to the «Capitulation of Baylen,» signed 20 July 1808, when Gen. Dupont, and about 20,000 French troops under his command, surrendered to the Spaniards on condition of their being conveyed to France by the Spanish government; but the latter stipulation was not carried into effect. The incapacity of Dupont was mainly instrumental in bringing about this result, which inspired the Spaniards with confidence, and was always regarded by Napoleon as the principal source of the French disasters in the Peninsula. Pop. (1887) 8,580.

Bayley, James Roosevelt, American theologian: b. New York, 23 Aug. 1814; d. Newark, N. J., 3 Oct. 1877. He studied at Trinity College, Hartford, and became a minister of the Protestant Episcopal Church; but, in 1842, was converted to the Roman Catholic faith; and, after studying at Paris and Rome, was ordained a priest in 1844. He accepted the chair of belles-lettres at St. John's College, Fordham, and was its acting president in 1846. After serving as secretary to Archbishop Hughes, he was consecrated the first Bishop of Newark, N. J., in 1853. In 1872 he became Archbishop of Baltimore, Md. He was the founder of Seton Hall College and several other institutions. His 'Pastorals for the People,' and 'History of the Catholic Church on the Island of New York,' are his chief writings.

Bayley, Richard, American physician: b. Fairfield, Conn., 1745; d. Staten Island, N. Y., 17 Aug. 1801. After studying medicine in England, chiefly in the London hospitals and under Dr. Hunter, he returned to America in 1776 as a surgeon in Gen. Howe's army, but settled in New York the following year. He was the first professor of anatomy in Columbia College (1792), and for a time health officer of the port of New York, where his vigorous advocacy of proper quarantine laws was finally successful. A careful student of his profession, he suggested a new method of treatment for croup, and maintained (1797) that in its origin, yellow fever was due to local causes and was not contagious. He published: 'Cases of the Angina Tracheatis, with the Mode of Cure' (1781); 'Essay on the Yellow Fever' (1797); 'Letters on Yellow Fever' (1798).

Bayley, William Shirley, American geologist: b. Baltimore, Md., 10 Nov. 1861. He graduated at Johns Hopkins in 1883, and since 1887 has been assistant geologist of the Lake Superior division of the United States Geological Survey, and since 1886 associate editor of the 'American Naturalist.' He is the author (with Prof. C. R. Van Hise) of the 'Report on the Geology of the Marquette Iron District of Michigan' and has been a frequent contributor to scientific journals.

Baylies, bā'lĭz, **Francis,** American statesman, member of Congress from Massachusetts for several sessions: b. 1784; d. Taunton, Mass., 28 Oct. 1852. In the presidential contest which finally resulted in the election of John Q. Adams, he threw the only electoral vote for Jackson that was given from New England. He was for a short time minister to Brazil. He published in 1828 a history of the old colony of Plymouth.

Bayliss, Clara Kern, American author: b. near Kalamazoo, Mich., 5 March 1848. She was married to Alfred Bayliss in 1871, and has published 'In Brook and Bayou' (1897); 'Lolami, the Little Cliff Dweller' (1901).

Bayliss, Jeremiah Henry, American Methodist Episcopal clergyman: b. Wednesbury, England, 20 Dec. 1835; d. Bay View, Mich., 14 Aug. 1889. He was educated at Genesee College, N. Y., and was prominent as pastor of Park Avenue and Trinity churches, Chicago; Roberti Park and Trinity churches, Indianapolis; Central Church, Detroit; and Walnut Hills Church, Cincinnati. He edited the *Western Christian Advocate* in 1884 and 1888.

Bayliss, Sir Wyke, English artist: b. Madeley, 21 Oct. 1835; d. London 6 April 1906. He was educated at the Royal Academy, and was

president of the Royal Society of British Artists from 1888. His paintings include 'La Sainte Chapelle' (1865); 'St. Mark's, Venice' (1880); 'St. Peter's, Rome' (1888); 'The Cathedral, Amiens' (1900); 'The Golden Duomo, Pisa' (1892), etc. His publications include 'The Witness of Art' (1876); 'The Enchanted Island' (1888); 'The Likeness of Christ Rex Regum' (1898); 'Five Great Painters of the Victorian Era' (1902).

Baylor, Frances Courtenay. See BARNUM, F. C. B.

Baylor, Robert Emmett Bledsoe, American lawyer: b. Lincoln County, Ky., 10 May 1793; d. Gay Hill, Tex., 6 Jan. 1874. In the War of 1812 he served under Col. Boswell and took part in the engagement near Fort Meigs. Admitted to the bar in Kentucky, he later removed to Alabama (1820), acquired a large practice, and became prominent in politics, being a representative in Congress, 1829–31. Later he emigrated to Texas, then a republic, and was a district judge for 25 years. A loyal member of the Baptist denomination, he gave largely in money and land to establishing one of its colleges at Independence (1845), and in recognition of his munificence it was named Baylor University (q.v.).

Baylor University, a co-educational institution in Waco, Tex., controlled by the Baptist Church. It was founded in 1845 on a charter granted by the republic of Texas, and named for Robert E. Baylor (q.v.). Its first location was in Independence, Tex.; it was provided with a university course in 1851; in 1861 President Burleson (who had been its head for 10 years) and the entire faculty resigned and organized a university in Waco, Tex., giving it the name of that city. The two institutions were consolidated in 1882, the earlier one being removed to Waco, and President Burleson continuing at the head of the institution. At the close of 1901 the university reported: Professors and instructors, 47; students, 436; volumes in the library, 11,000; grounds and buildings valued at $200,000; benefactions, $82,100; income, $125,000; number of graduates, 660.

Bayly, Ada Ellen, a popular English novelist, best known as EDNA LYALL: b. Brighton, about 1859; d. Eastbourne, 9 February 1903. She has written 'Won by Waiting' (1879); 'Donovan' (1882); 'We Two' (1884); 'In the Golden Days' (1885); 'Knight Errant' (1887); 'Autobiography of a Slander' (1887); 'Derrick Vaughan, Novelist' (1889); 'A Hardy Norseman' (1889); 'Doreen' (1894); 'How the Children Raised the Wind' (1895); 'Autobiography of a Truth' (1896); 'Wayfaring Men' (1897); 'Hope the Hermit' (1898); 'In Spite of All' (1901); 'The Hinderers' (1902), etc. Although her novels are decidedly romantic, their aim is to depict the development of character.

Bayly, Lewis, Welsh prelate: d. 26 Oct. 1631. He was the author of 'The Practice of Piety,' a very popular religious book which had great influence on Bunyan. It not only passed through many English editions, but was also translated into the Indian language by John Eliot, and was used by him in his work among the Indians.

Bayly, Thomas Haynes, English songwriter and author: b. Bath, England, 13 Oct. 1797; d. London, 22 April 1839. He began the study of law under his father, and later went to St. Mary Hall, Oxford, in order to prepare for the Church; but abandoned both and devoted himself to literature. He gained great popularity with some songs, and several dramas and novels by him also hit the public taste. With Henry Bishop he published 'Melodies of Various Nations.' Among his songs some of the best-known are: 'I'd Be a Butterfly'; 'The Soldier's Tear'; 'We Met—'twas in a Crowd'; and 'She Wore a Wreath of Roses.' His best play is 'Perfection'; among his novels are 'The Aylmers'; and 'A Legend of Killarney.' 'Loves of the Butterflies'; and 'Songs of the Old Château,' are volumes of songs and ballads; and his other works include 'Kindness in Women,' a collection of tales; 'Parliamentary Letters and other Poems,' and 'Rough Sketches of Bath.'

Bayly, Thomas Henry, American statesman: b. Accomac County, Va., 1810; d. 22 June 1856. He was admitted to the bar in 1830, and was for several years a member of the General Assembly of his State. In 1842 he was elected judge of the circuit superior court of law, an office which he resigned in 1844, when elected a representative in the national Congress; and by successive re-elections he held the latter position till his death. As chairman of the Committee on Ways and Means, he was the leader of the house during many sessions, and was highly respected by men of all parties, as well for his urbanity and dignity, as for his ability. The family home in which he died was established by his ancestors from England in 1666, and it is remarkable that he held just the same public offices that had been filled by his father.

Baynam, William, American surgeon: b. Caroline County, Va., 1749; d. 8 Dec. 1814. He completed his medical education in London, where he resided for 16 years, and was long assistant demonstrator to the professor of anatomy and surgery in St. Thomas' Hospital. He was probably unsurpassed in his time as an anatomist, and performed many remarkable operations. He furnished some excellent preparations in the museum of Cline and Cooper in London, and wrote various papers for medical journals.

Bayne, Peter, Scottish writer: b. Fodderty, Scotland, 19 Oct. 1830; d. London, 10 Feb. 1896. He studied theology at Edinburgh and philosophy under Sir William Hamilton, and was editor successively of the Glasgow *Commonwealth;* Edinburgh *Witness;* London *Dial;* and *Weekly Review;* and associate editor of the *Christian World.* He was author of 'The Christian Life: Social and Individual' (1855); 'Essays Biographical, Critical, etc.' (1859); 'Life and Letters of Hugh Miller' (1871); 'Testimony of Christ to Christianity' (1862); 'The Days of Jezebel,' a drama (1872); 'The Chief Actors in the Puritan Revolution' (1878); 'Life of Martin Luther' (1887).

Baynes, Thomas Spencer, English philosopher: b. Wellington, Somersetshire, March 1823; d. 29 May 1887. He was educated at Bath, Bristol College, and the University of Edinburgh, where he became (1851–5) assistant to Sir William Hamilton, then professor of logic.

In 1857 he was appointed examiner in logic and mental philosophy in the University of London; became (1857–64) assistant editor of the *Daily News*, to which he contributed many noteworthy articles on the American Civil War, and at this time wrote for several literary journals, such as the 'Athenæum' and the 'Literary Gazette.' In 1864 he was elected professor of logic, rhetoric, and metaphysics in the University of St. Andrews. Besides his contributions to reviews he published a translation of the 'Port Royal Logic,' with notes (1851); and an 'Essay on the New Analytic of Logical Forms' (1852). He was appointed editor of the ninth edition of the 'Encyclopædia Britannica' (being subsequently assisted by Prof. Robertson Smith).

Bayombong, bī-yŏm-bŏng', Philippines, the capital of the province of Nueva Vizcaya, Luzon, situated on the Magat River. It is the centre of a fertile rice and tobacco region. Pop. 3,691.

Bayonet, a straight, sharp-pointed weapon, generally triangular, intended to be fixed upon the muzzle of a rifle or musket, which is thus transformed into a thrusting weapon. It was probably invented about 1640, in Bayonne, though this is doubtful, but was not universally introduced until after the pike was wholly laid aside, in the beginning of the 18th century. About 1690 the bayonet began to be fastened by means of a socket to the outside of the barrel, instead of being inserted as formerly in the inside. A variety of the bayonet, called the sword bayonet, is now quite widely used, especially for the short rifles of the light infantry, the carbines of the artillery, etc. It is a compound of the sword and the bayonet, as its name indicates, having a sword-like blade with only one edge, and being capable of being fastened to the muzzle of the gun like the bayonet. The battle of Spire, in 1703, was the first in which charges of infantry were made with fixed bayonets. Opinions as to the present utility of bayonets differ widely, many authorities considering them of little importance, while others assert just the contrary. While the result of a battle is often determined by the employment of smokeless powder and long-range and rapid-firing rifles in surprises and night attacks the bayonet may be used to advantage as was frequently proved in the Boer war (1889–1902). See also TACTICS.

Bayonne, bā-yōn, a cathedral town in the department of the Basses-Pyrénées, France. It is situated at the confluence of the Nive and the Adour, about four miles from the Bay of Biscay. These rivers form a harbor capable of admitting vessels of considerable size. They divide the town into three parts, namely, Great Bayonne on the left bank of the Nive, Little Bayonne between the rivers, and St. Esprit on the right bank of the Adour. A citadel, built by Vauban, on the summit of an eminence in the suburb, commands the harbor and the city. The cathedral is a beautiful building dating from 1213, restored in the 19th century and furnished with two towers. The arsenal, one of the finest in France, and the mint are among the other buildings of Bayonne. The city has a considerable trade with Spain, Portugal, and South America, and masts and other timber for ship-building, from the Pyrenees, are exported to Brest and other ports of France. The hams of Bayonne are famous. Ships are built, and woolens, chocolate, soap, etc., are manufactured. Among the lower class the ancient Biscayan or Basque language is spoken. Catherine de Medici had an important interview with the Duke of Alva in Bayonne, June 1565, at which it is said the massacre of St. Bartholomew was arranged. The meeting of Napoleon with the king of Spain, Charles IV., and the prince of the Asturias, took place here in May 1808, when the latter transferred their rights to the Spanish territories in Europe and India to the French emperor. Pop. (1896) 22,278.

Bayonne, bā-yŏn', N. J., a city in Hudson County on New York harbor, the Kill von Kull, and Newark Bay, and the Central R.R. of N. J.; seven miles southwest of New York. It was formed by the union of a number of former villages (Pamrapo, Bayonne, Centerville, and Bergen Point), and is principally engaged in coal-shipping and the exporting and refining of petroleum, the works for the latter being connected by pipe lines with New York, Philadelphia, Baltimore, and other cities. Other industries are the manufacture of chemicals, ammonia and colors. The residential part of the city is very attractive, containing fine homes of New York business men. Its public library contains 11,000 volumes. Pop. (1900) 32,722.

Bayonne Conference, a conference held at Bayonne, June 1565, between Charles IX. of France, the queen mother, Catherine de Medici, Elizabeth, queen of Spain, and the Duke of Alva, envoy of Philip II., to arrange plans for the repression of the Huguenots.

Bayonne Decree. On 17 April, 1808, Napoleon directed the capture and sale of all vessels entering the ports of Spain, France, Italy, and the Hanse towns, under the American flag, and by the provisions of this declaration, known as the Bayonne Decree, France is supposed to have confiscated more than 300 American vessels. The decree was issued ostensibly with the view of helping the United States to enforce the embargo of 1807 and on the presumption that all such vessels must be sailing under false colors and thus indirectly benefiting the English cause.

Bayonne, Treaty of, a treaty of peace agreed to 4 May 1808, and signed on the next day, between Napoleon I. and Charles IV., king of Spain. The latter resigned his kingdom, and Napoleon I. engaged to maintain its integrity, and to preserve the Roman Catholic religion. His son, Ferdinand VII., confirmed the cession 10 May.

Bayou, bī'oo, probably a corruption of the French word *boyau,* a «gut» or «channel.» Its strict signification is a stream which is not fed by springs, but flows from some other stream or from a lake; but it is not unfrequently used in America as synonymous with «creek.» The term is very little employed except in the States of Louisiana, Texas, and Arkansas.

Bayou State, the name often given to the State of Mississippi.

Bayreuth, bī'roit. See BAIREUTH.

Bayrhoffer, bīr'hōf-fĕr, **Karl Theodor,** German Hegelian philosopher and radical politician: b. Marburg, 1812; d. Jordan, Wis., 3 Feb. 1888. He was professor of philosophy at Marburg,

taking the chair in 1845, but in 1846 his radical views caused his expulsion. During the brief rule of liberalism in Hesse, he was chosen president of the chamber; but, in 1853, was forced to flee to the United States. Among other works he wrote 'On Catholicism in Germany'; 'Idea and History of Philosophy'; 'Fundamental Problems of Metaphysics,' etc.

Baza, bä'thạ (ancient Basti), a city of Spain, in the province of and 53 miles east-northeast from Granada, in a valley north of the Sierra Baza. The environs yield wine and hemp; sheep, cattle, and mules are reared; and there are some manufactures. Baza is famed in early Spanish history, more especially in that of Granada. In 1489 it was taken from the Moors by the Spaniards, after a siege of nearly seven months. In 1810 the French, under Marshal Soult, here defeated the Spaniards under Generals Blake and Freire. Pop. (1897) 11,992.

Bazaine, bạ-zān, **François Achille,** French military officer: b. Versailles, 13 Feb. 1811; d. 28 Sept. 1888. He entered the army in 1831, served in Algeria, in Spain against the Carlists, and in the Crimean war. He joined the Mexican expedition under Gen. Forey, was present at the siege of Puebla, and shortly afterward was the first to enter the city of Mexico. In 1863 he obtained the chief command, was made a marshal of France in 1864, and remained in Mexico with the Emperor Maximilian. When Napoleon III. abandoned the emperor, Bazaine tried vainly to persuade him to abdicate the throne voluntarily. In 1870, at the outbreak of the Franco-Prussian war, he commanded the 3d army corps, and capitulated at Metz, after a seven weeks' siege, with an army of 170,000 men. For this act he was tried by court-martial in 1871, found guilty of treason and condemned to death. This sentence was commuted to 20 years' seclusion in the Isle of St. Marguerite, off the south coast of France, from which he escaped and retired to Spain. His widow, who had clung faithfully to him in his adversity and had plotted successfully for his escape, died in the city of Mexico, 8 Jan. 1900. She was a woman of aristocratic birth and much beauty. See La Brugère, 'L'affaire Bazaine' (1874); L'Hérisson, 'La légende de Metz' (1888).

Bazalgette, băz-ăl-jet', **Sir Joseph William,** English civil engineer: b. Enfield, England, 1819; d. London, 1 March 1891. As chief engineer of the London board of works he built many miles of sewers and embankments, three of the Thames bridges, and the well-known Thames embankments. He was an expert authority on questions of municipal engineering.

Bazan, bạ-zäñ, **Don Cæsar de.** See Don Cæsar de Bazan.

Bazan, bạ-thäñ', **Emilia Pardo.** See Pardo Bazan, Emilia.

Bazancourt, bạ-zäñ-koor, **Ce'sar** (Baron de), French military historian: b. Paris, 1810; d. there, 25 Jan. 1865. He was official historiographer to Napoleon III., whom he accompanied in several campaigns. He published 'L'expédition de Crimée jusqu'à la prise de Sebastopol' (1856); 'La campagne d' Italie de 1859'; 'Les expéditions de Chine et Cochinchine' (1861–2); 'Histoire de Sicile sous la domination des Normands' (1846); and the novels: 'Georges la Montagnard (1851); 'Noblesse Oblige' (1851); 'La Princess Pallianci' (1852).

Bazancourt, Jean Baptiste Marin Antoine Lecat de, French general: b. Val-de-Molle (Oise), 19 March 1767; d. 17 Jan. 1830. He took an active part in the Italian campaigns; distinguished himself and was wounded at the siege of St. Jean d'Acre; fought in the battle of Austerlitz, and was a member of the court-martial which, on 21 March 1804, pronounced the sentence of death upon the Duke d'Enghien. In 1806 he was appointed commander of the legion of honor, and in 1808 promoted to the rank of brigadier-general, while in the same year he was created baron of the empire, and went as commander to Hamburg with a mission connected with the continental blockade. He withdrew from service in 1815.

Bazar, or **Bazaar,** a market-place in the East, the word being Arabic in origin. Some bazars are open, some covered over. As the Orientals live almost entirely out of doors, the bazars of populous cities, besides their mercantile importance, are of consequence as places of social intercourse. In the Oriental tales,—for instance, in the 'Arabian Nights,'—the bazars occupy a very conspicuous place. The word bazar has also been imported into Europe, where it is used in much the same sense as in the East. Among English-speaking people it is frequently applied to a temporary sale of fancy goods contributed gratuitously, and sold to raise a special fund.

Bazard, bạ-zär, **Saint Amand,** French socialist: b. Paris, 1791; d. 29 July 1832. After the Restoration, he helped to found the Revolutionary Society of the "Amis de la Vérité," and in 1820 an association of French Carbonari. In 1825, impressed with the necessity of a total reconstruction of society, he attached himself to the school of Saint-Simon, and became one of the editors of a journal termed 'Le Producteur.' In 1828 he delivered at Paris a series of lectures, the substance of which was published in the 'Exposition de la Doctrine de Saint-Simon' (1828–30), of which the first part was by Bazard, the second being chiefly the composition of Enfantin. He and Enfantin became the acknowledged leaders of the school. After the July Revolution (1830), a larger scope was afforded to the Saint-Simonians. The masses were attracted by the doctrine that all social institutions ought to have for their end the moral, intellectual, and physical amelioration of the poor. In a short time, Bazard and his friends had created a new society, living in the midst of the old, with peculiar laws, manners, and doctrines. But Bazard's connection with it was of short duration. He differed from Enfantin on the doctrine of the emancipation of women, and in 1831 seceded in disgust. His efforts to found a school of his own proved unsuccessful, and, during a heated discussion with his former friend, Enfantin, he was struck with apoplexy, from the effects of which he died.

Bazarjik, bä-zär-jēk', a town in eastern Bulgaria, situated north of Varna. An important fair is held here annually. It was twice captured by the Russians, in 1774 and 1810. Pop. (1888) 10,717.

Bazigars, bä-ze-gärz', a tribe of nomadic Indians dispersed throughout the whole of Hindustan. They are divided into seven castes;

their chief occupation is that of jugglers, acrobats, and tumblers, in which both males and females are equally skilful. They present many features analogous to the gypsies of Europe.

Bazoche, bą-zōsch, or **Basoche** (a corruption of Basilica), a brotherhood formed by the clerks of the Parliament of Paris at the time it ceased to be the Grand Council of the French king. They had a king, chancellor, and other dignitaries; and certain privileges were granted them by Philip the Fair early in the 14th century, as also by subsequent monarchs. They had an annual festival, having as a principal feature dramatic performances in which satirical allusions were freely made to passing events. The representation of these farces or satires was frequently interdicted, but their development had a considerable effect on the dramatic literature of France. The order was suppressed 13 Feb. 1793.

Baztan, bäz-tän′, or **Bastan,** a Pyrenean valley in the extreme north of Spain; having a length of nine miles, and an average breadth of four miles. It is inhabited by about 8,000 people, who form, under Spanish supervision, a diminutive republic, at the head of which is the mayor of Elizondo. The citizens of this republic rank with the Spanish nobility and hold special privileges, which were granted them for former services to the Spanish crown.

Bdellium, dĕl′lĭ-ŭm, an aromatic gum found in different countries, but brought chiefly from Arabia and India. It resembles myrrh in its appearance, and is hence often fraudulently substituted for it. It is obtained from *Balsamodendron mokul* and *B. roxburgii.* It has a sweet smell but bitter taste, softens readily between the fingers before the fire, and dissolves partially in alcohol and still more in water. A better variety of bdellium is that produced by the west African *B. africanum;* it is used in plasters.

The bdellium mentioned in Scripture, in Hebrew *bedholachh,* is rendered in the Septuagint of Gen. ii. 12, anthrax (literally, "burning coal") = the carbuncle, ruby, and garnet (Liddell and Scott), the red sapphire (Dana); while in Num. xi. 7 it is translated *krystallos* = rock crystal. Some modern writers, following the Septuagint translation, make it a mineral, as are the gold and onyx stone with which it is associated in Gen. ii. 12, while the Rabbins Bochart and Gesenius consider that it was a pearl or pearls.

Beach, Alfred Ely: b. Springfield, Mass., 1 Sept. 1826; d. 1 Jan. 1896. He was a son of Moses Yale Beach, and after receiving an education in the Monson Academy at Monson, Mass., he was associated with his father in the publishing business of the New York *Sun.* In 1846 he formed a partnership with his life-long friend and schoolmate, Mr. Orson D. Munn, of Monson, Mass., and purchased the 'Scientific American' from Rufus Porter, combining with the business of publishing that of soliciting patents. In 1853 he invented the first typewriter which printed raised letters on a strip of paper, intended for the blind, and was awarded a gold medal at the Crystal Palace Exposition. In 1867 he constructed a suspended tube 8 feet in diameter by 100 feet long, through which passengers were carried back and forth in a tightly fitting car, as the air was exhausted from or forced into the tube by a rotating fan. He also devised means for transporting letters through a tube under the street, by which they could be conveyed directly to the post-office when dropped into a street letter-box.

His most important invention,—a shield for tunneling under streets or rivers without disturbing the surface,—was made in 1868, and became known as the Beach shield. It resembled a gigantic hogshead with the heads removed, the front circular edge being sharp, and the rear end having a thin iron hood. This cylinder is propelled slowly forward through the earth by several hydraulic rams forced out from the rear of the shield, by the operation of a single hydraulic pump, against the completed tunnel in the rear. By this method only the amount of earth to be occupied by the tunnel is excavated. After the shield is forced forward the hydraulic rams are pushed back, and in the thin hood at the rear a new section of the tunnel is constructed. In 1869, by means of such a shield, Mr. Beach constructed a tunnel nine feet in diameter under Broadway, New York, from the corner of Warren Street south to a point opposite the lower side of Murray Street, and in 1870 a car was sent to and fro on tracks through this tunnel by pneumatic power — the first underground transit in New York. From 1872 to 1876 Mr. Beach edited an annual publication entitled "Science Record," published by the 'Scientific American.' In 1876 he originated the 'Scientific American Supplement,' devoted to the publication of scientific matters *in extenso,* taken largely from exchanges and foreign publications. He was also instrumental in beginning the publication of the 'Scientific American Builders' Monthly.'

Beach, Charles Fisk, American clergyman and lawyer: b. Hunter, N. Y., 5 Sept. 1827. He studied theology at Auburn Theological Seminary, N. Y., was pastor of Presbyterian churches 1854–73, editor and publisher *National Presbyterian* 1873–95, and was admitted to the bar 1896. He has published 'The Muzzled Ox' (1866); 'The Christian Worker' (1869); 'Commentaries on the Law of Trusts and Trustees' (1897); 'Monopolies and Industrial Trusts' (1898).

Beach, Charles Fisk, Jr., American legal writer: b. Kentucky, 4 Feb. 1854. He was called to the bar in New York 1881, and practised in that city till 1896, but since the last named date has practised in London and Paris. His especial field is railway and corporation law, and he has published treatises on 'Receivers' (1887); 'Wills' (1888); 'Railways' (1890); 'Private Corporations' (1891); 'Modern Equity Jurisprudence' (1892); 'Public Corporations' (1893); 'Modern Equity Practice' (1894); 'Injunctions' (1895); 'Insurance' (1895); 'Contracts' (1897); 'Contributory Negligence' (3d ed. 1899).

Beach, David Nelson, American clergyman: b. Orange, N. J., 30 Nov. 1848. Entering the Congregational ministry he was successively pastor of Congregational churches in Westerly, R. I., 1876–9; Wakefield, Mass., 1879–84; Cambridge, Mass., 1884–96; Minneapolis (1896–8), Denver from 1899. He was active in banishing the saloon from Cambridge and has been prominent in advocating a modified Norwegian liquor system in Massachusetts. He has

written 'Plain Words on Our Lord's Work'; 'The Newer Religious Thinking'; 'How We Rose'; 'The Intent of Jesus.'

Beach, Frederick Converse, American editor: b. New York, 27 March 1848. In 1855 he removed to Stratford, Conn., where he received an education at public and private schools. In 1864, as a pastime, he began the practice of photography with his father, Alfred Ely Beach (q.v.), and has continued his interest in the art ever since. In 1866 he suggested to the commissioner of patents the utility and practicability of photo-lithographing the United States patents, a plan which was subsequently adopted. In 1868 he graduated from the Sheffield Scientific School of Yale University with the degree of Ph.B. In 1869, after engaging in the business of patent solicitor at Washington, D. C., he returned to New York and was appointed assistant superintendent of the construction of the Beach pneumatic tunnel under Broadway, New York. (See Beach, Alfred Ely.) Subsequently he took up the manufacture of electrical instruments. In 1877 he entered the office of the 'Scientific American,' assisting his father, and after the latter's demise he became one of the editors.

He has made extensive experiments in photography and written much relating to the art. In 1884 he founded the Society of Amateur Photographers of New York, the name of which was afterward changed to the Camera Club of New York. In 1885 he assisted in organizing the American Lantern Slide Interchange. In 1889 he was instrumental in establishing a monthly magazine entitled 'The American Amateur Photographer.' In 1902 he was appointed editor-in-chief of the 'Encyclopedia Americana,' the policy of which it was determined should give full credit to all matters pertaining to America and Americans.

Beach, Mrs. H. H. A. (Amy Marcy Cheney), American composer: b. Henniker, N. H., 5 Sept. 1867. She studied music from childhood, and made her first appearance in public as a pianist at the Boston Music Hall when 16 years old. She has composed a mass in E flat; 'The Rose of Avontown,' a cantata for female voices; a Gaelic symphony; a symphony, anthems, songs, and compositions for various musical instruments and full orchestras.

Beach, Harlan Page, American missionary: b. South Orange, N. J., 4 April 1854. He was graduated at Yale in 1878 and at Andover Theological Seminary in 1883. During 1878–80 he taught at Phillips Andover Academy; in 1883 he went to China as a missionary, remaining there seven years. Soon after his return he became head of the School for Christian Workers, Springfield, Mass., and in 1895, educational secretary of the Student Volunteer Movement for Foreign Missions. His publications include: 'Dawn on the Hills of T'ang' (1898); 'Knights of the Labarum; or Four Typical Missionaries' (1898); 'New Testament Studies in Missions' (1899); 'Protestant Missions in South Africa' (1900); 'Geography and Atlas of Protestant Missions' (1902).

Beach, Miles, American jurist: b. 1840; d. 1902. He graduated at Union College, Schenectady, studied law, and practiced in Troy. When 27 years of age he removed to New York and in 1879 was elected judge of the court of common pleas, holding that office till 1894, when he passed to the bench of the supreme court of the State.

Beach, Moses Sperry, American inventor and editor: b. Springfield, Mass., 5 Oct. 1822; d. 25 July 1892. He was the son of Moses Yale Beach (q.v.), and in 1845 he married Chloe Buckingham, of Waterbury, Conn., and in the same year became joint proprietor, with George Roberts, of the Boston *Daily Times*. Soon after this he became associated with his father and brother in the publication of the New York *Sun*, and acquired the sole ownership of it in 1851, transferring it in 1868 to Charles A. Dana. It was while he was conducting the publication of the *Sun* that he invented and made several important improvements in printing-presses, which were patented, a few now being in use. Among them were the feeding of roll paper to the press instead of flat sheets, apparatus for wetting the paper prior to printing, and another improvement for cutting off sheets after printing; also a method of adapting newspaper presses to print both sides of the sheet at the same time, as is now customary. In 1867 he visited the Holy Land, on the steamer Quaker City, in company with the distinguished party of which "Mark Twain" was a member, and whose experiences formed the basis of Twain's book, 'The Innocents Abroad.' Mr. Beach brought back an olive-tree from the Mount of Olives, from which was made a pulpit stand that is at present in Plymouth Church, Brooklyn.

Beach, Moses Yale, American inventor and publisher: b. Wallingford, Conn., 15 Jan. 1800; d. 17 July 1868. He received a common-school education and before he was 21 married, and with a partner opened a cabinet factory at Northampton, Mass. In 1822 he established himself at Springfield, Mass., where he was very successful. He expended considerable money on a stern-wheel steamboat, the first to ply on the Connecticut River above Hartford. A powder engine intended for its propulsion proved ineffective. In 1829 he obtained an interest in a paper-mill and removed to Saugerties, N. Y., where his inventive faculty produced a rag-cutting machine, which he patented and which is still used in all paper-mills. In 1835 he purchased from his brother-in-law, Benjamin Day, the New York *Sun*, the first penny paper (then a comparatively new sheet), and to Mr. Beach was due the subsequent growth and popularity of that newspaper. In 1846 President Polk sent Mr. Beach on a secret mission to Mexico. In 1857 Mr. Beach retired from active business and settled in his native town, where he died.

Beach. See Coast; Dune; Ocean; Lake; Shore.

Beach-flea, one of a group of small amphipod Crustaceans (*Orchestia agilis*) which abound under sea wrack near high-water mark. When the dry weed is lifted they will be seen leaping like fleas, by means of the last three pairs of abdominal legs. They are brown, of the same color as the weed and wet sand beneath, about a quarter of an inch in length or about one half as large as the larger and more southern kind of beach-flea (*Talorchestia longicornis*), which is nearly an inch long. Consult: Arnold, 'Sea Beach at Low Tide.'

Beach-grass. See AMMOPHILA.

Beach-pea, a leguminous plant growing on beaches. See also LATHYRUS.

Beach Plants, the usually sparse vegetation of sea and lake shores above the water-line and below the cliffs or dunes, notable for its resemblance to the vegetation of deserts. The plants of sea beaches are closely similar to those of fresh-water shores, and not, as might be inferred, different on account of the salt content of the soil as an influencing factor. (See HALOPHYTES). Bordering the water is a strip of sand or gravel where, on account of summer wave action, land plants cannot gain a foothold, and where, because of exposure to sun and air, water plants are unable to live. Contiguous to this border is a zone of vegetation almost wholly restricted by winter wave action to annuals. Still farther back from the water is the region of perennials especially characterized by rosette plants and plants with underground storage organs. This region is safe from wave action at all times. Beach plants, like desert plants (see XEROPHYTES) are capable of withstanding more intense heat, cold, and light, and more violent winds than any other plants of ordinary climates. Other common terms for this vegetation are littoral, shore, and strand plants. See DISTRIBUTION OF PLANTS.

Beach-plum. See PLUM.

Beach-robin. See BRANT-BIRD.

Beaches, Raised, terraced, level stretches of land, consisting of sand and gravel, and lying at a considerable distance above and away from the sea, but bearing sufficient evidences of having been at one time sea beaches. They are quite common along the coasts of continents in the higher latitudes. In California such terraces occur as high as 1,500 feet above the present sea-level, while the coasts of Scotland are marked by a series of terraces succeeding each other at distances of from 10 to 25 feet. That the materials composing the beaches were deposited beneath the sea is proven by the marine character of the fossils which are often found in abundance. The existence of raised beaches is of importance to the geologist, as it affords direct evidence of changes of level between the sea and the land in comparatively recent times, and explains the widespread occurrence of sedimentary rocks over continental areas. Many large lakes are also fringed by terraces, but in this case they have resulted from a lowering of the water level and not from coastal movements. See also LAKE; SHORE; etc.

Beachy Head, England, a promontory on the coast of Sussex, about three miles southwest of Eastbourne; height 564 feet. Here a combined Dutch and English fleet, under Lord Torrington was defeated by a French fleet, under Tourville, in 1690. In 1828 a revolving light was erected here, 285 feet above the level of the sea, visible in clear weather from a distance of 28 miles.

Beacon, a conspicuous mark or signal either used to alarm the country in case of invasion, or as a guide to mariners. The alarm beacon was usually fire placed on the tops of high hills, the flames of which could be seen at a great distance by night, and the smoke by day. They were in great use for rousing the Border on an invasion either by Scotch or English. A beacon to mariners is either a landmark erected on an eminence near the shore, or a floating signal moored in shoal water.

Beacon Hill, one of the original three hills of the peninsula of Boston. It is north of Boston Common, and received its name from the fact that the public beacon was fixed upon its summit in the earliest colonial period. It has been much reduced in height, and the State House now occupies its highest position. Beacon Street extends in a westerly direction over the hill, skirting the Common and Public Garden. See BOSTON.

Beaconsfield, bĕk'ŏns-fēld or bē'kŏns-fēld, **Benjamin Disraeli,** (EARL OF), English statesman: b. 21 Dec. 1804; d. 19 April 1881. He was the eldest son of Isaac D'Israeli (see D'ISRAELI, ISAAC), the well-known author of the 'Curiosities of Literature'; his mother also being of Jewish race. Little is known of his early education, though it is certain he never attended a public school or a university. In 1817 he was baptized into the Church of England. He was apprenticed to a firm of attorneys, but did not remain long in this uncongenial occupation. His father's position gained him an easy entrance into society, and before he was 20 he was a frequenter of such salons as those of Lady Blessington.

In 1826 he published 'Vivian Grey,' his first novel, a work which became very popular, and, considering the youth of its author, displays remarkable cleverness and knowledge of the world. He now traveled for some time, visiting Italy, Greece, Turkey, and Syria, and gaining experiences which were afterward reproduced in his books. In 1831 another novel, 'The Young Duke,' came from his pen. It was followed at short intervals by 'Contarini Fleming,' 'Alroy,' 'Henrietta Temple,' 'Venetia,' 'The Revolutionary Epic' (a poem), etc.

His father having acquired a residence near High Wycombe, Buckinghamshire, young Disraeli attempted to get elected for this borough in 1832. He came forward as a Radical or «people's» candidate as against the Whigs, and he was supported by the Tories, as well as by Hume and O'Connell, but was defeated. At the general election after the passing of the Reform Bill he again unsuccessfully contested High Wycombe, and the like ill-fortune attended him on another attempt in 1835, as also at Taunton the same year. On the latter occasion he appeared in the character of a decided Tory, and his change of political opinions naturally occasioned a good deal of comment. To this period belongs the noted passage of arms between him and O'Connell, which was signalized by a strength of language happily rare between public men in these days.

At last, however, he gained an entrance to the House of Commons, being elected for Maidstone in 1837. His first speech was treated with ridicule; he had to stop abruptly and sit down but he finished with the prophetic declaration that the time would come when the House would hear him. In 1839 he married the widow of his colleague in the representation of Maidstone, a lady 15 years older than himself. At the general election of 1841 he was sent to Parliament by Shrewsbury. He had now gained some reputation, and for some years he was an enthusiastic supporter of Sir Robert Peel. About this

time he became a leader of what was known as the "Young England" party, the most prominent characteristic of which was a sort of sentimental advocacy of feudalism. This spirit showed itself in his two novels of 'Coningsby; or, The New Generation,' and 'Sybil; or, The New Nation,' published respectively in 1844 and 1845.

For some years previous to the downfall of Sir Robert Peel in 1846 he was most persistent and bitter in his hostility to this statesman, whom he had so recently supported, being the advocate of protection against the free-trade policy of Sir Robert. His clever speeches of this period greatly increased his reputation, and by 1847 he was recognized as one of the leaders of the Tory party. Having acquired the manor of Hughenden in Buckinghamshire, he was in the above year elected for this county, and he retained his seat till raised to the peerage nearly 30 years later. In 1847 he published his novel of 'Tancred; or, The New Crusade,' a somewhat extravagant production containing enigmatic allusions to the great "Asian mystery."

His first appointment to office was in 1852, when he became chancellor of the exchequer under Lord Derby. The following year, however, the ministry was defeated, and Mr. Disraeli again became leader of a Conservative Opposition. He remained out of office till 1858, when he again became chancellor of the exchequer with Lord Derby as his chief. As on the former occasion his tenure of office was but short; a reform bill which he had introduced causing the defeat of the government and their resignation after an appeal to the country. During the next six years, while the Palmerston government was in office, Mr. Disraeli led the opposition in the lower House with conspicuous ability and courage. He spoke vigorously against the Reform Bill brought forward in 1866 by the Russell-Gladstone ministry; but when, soon after, he came into power along with his chief, Lord Derby, the demand for reform was so urgent that he had to bring in a reform bill himself. Accordingly, in August 1867, a measure by which the parliamentary representation was reformed became law, being piloted through Parliament by Mr. Disraeli with remarkable tact and dexterity.

In February 1868 he reached the summit of his ambition, becoming premier on the resignation of Lord Derby, but being in a minority after the general election he had to give up office the following December. In 1874 he again became prime minister with a strong Conservative majority, and he remained in power for six years. This period was marked by his elevation to the peerage in 1876 as Earl of Beaconsfield, and by the prominent part he took in regard to the Eastern question and the conclusion of the Treaty of Berlin in 1878, when he visited the German capital. In the spring of 1880 Parliament was rather suddenly dissolved, and, the new Parliament showing an overwhelming Liberal majority, he resigned office, though he still retained the leadership of his party. Not long after this, the publication of a novel called 'Endymion' (his previous one, 'Lothair,' had been published 10 years before) showed that his intellect was still vigorous. His physical powers, however, were now giving way, and he died, after an illness of some weeks' duration. His wife had died in 1872 after having been created Viscountess Beaconsfield.

Among others of his writings, besides those already mentioned, are: 'A Vindication of the English Constitution' (1834); 'Alarcos, a Tragedy' (1839); and 'Lord George Bentinck, a Political Biography' (1852). Lord Beaconsfield was one of the most remarkable men of the 19th century. If not possessed of actual genius he was endowed with great intellectual power, and he had astonishing tenacity of purpose and showed remarkable tact and ability in managing men. As a parliamentary speaker and debater he had few rivals, and in wit, sarcasm, epigram, and other rhetorical devices he was a master. His novels are fatally open to criticism on many grounds, and it is doubtful if they will long maintain the place they at present hold. Their popularity has been largely owing to their author having so frequently introduced real persons into them under a more or less penetrable disguise, and presented them in a more or less favorable light.

Beaconsfield, Africa, a town of Cape Colony, in Griqualand West, formerly known as Du Toit's Pan. It lies a little to the east of Kimberley, with which it is connected by tramway, and is, like it, an upgrowth of the diamond fields. It is well supplied with churches, schools, and hotels. Pop. (1891) 10,478.

Beaconsfield, England, a market-town in Buckinghamshire, 24 miles west by north of London. It is situated on high ground, and its name is supposed to have originated from a beacon once set up there. The remains of Edmund Burke, who resided at Gregories in this parish, are deposited in the parish church; and the churchyard contains a monument in honor of the poet Waller, to whom the manor belonged, as it still does to his descendant.

Beadle. (1) An officer in an English university, whose chief business is to walk with a mace in a public procession. The universities of Oxford and Cambridge have each three esquire beadles (or bedels), one being attached to each of the faculties of law, medicine and arts, and divinity. The former university has also three yeomen beadles, and the latter one. (2) An inferior parish officer, whose business is generally to execute the orders of the vestry, by whom he is appointed. These parochial beadles were originally officers given to the rural deans to cite the clergy and church-officers to visitations, and for other purposes.

Beads, small perforated ornaments, generally of a round shape and made of glass, but also of gold, silver, and other metals, paste, coral, gems, etc. The use of them as ornaments belongs to very early times, and this use, still continued, has made them an important article of trade with savage tribes. Glass beads are supposed to have been manufactured by the Phœnicians more than 3,000 years before Christ. Beads have been found in the ruins of Assyrian temples, also as decorations of Egyptian mummies, and in the graves of the ancient Greeks, Romans, and Britons. The manufacture of glass beads was introduced into modern Europe by the Italians, and in the neighborhood of Venice it is still an important branch of industry. On the island of Murano alone several thousand workmen are employed in this manufacture. Birmingham is the chief seat of the manufacture of beads in Great Britain. For their use in religion, see ROSARY.

Beagle, a small hunting dog; in general appearance a diminutive fox hound, solidly built, well set upon straight fore legs, with plenty of bone in proportion to its size, good hard feet, and a broad, deep chest with ample lung capacity. It is of good disposition, and clever and industrious in the field. In color and marking it much resembles the fox hound, black, white, and tan being the more common colors, and these in more or less solid or pied masses. In its original home, Great Britain, there are both rough and smooth varieties, but the typical American beagle is smooth-haired. Beagles vary in height from 12 to 15 inches, and while excellent trackers are not so fast but that they can be followed on foot, a very common sport in Great Britain. Their voices are exceedingly musical and justify the name sometimes given them of «buglers.» They are principally used for rabbit-hunting. In former times a very diminutive breed was in favor; according to one authority, no larger than well-grown kittens — so small, in fact, that it is said a whole pack could be carried afield in a pair of panniers slung across a pony's back.

Beagle, The, a small ship of the British navy which in 1828–34 was employed, under the command of Capt. (afterward Admiral) Fitzroy, in making surveys of the coast of Patagonia and other South American shores and waters, and later making a voyage around the world. The expedition had for its naturalist the famous Charles Darwin.

Beagle Island, an island discovered by Admiral Fitzroy during a voyage in H. M. S. Beagle (q.v.). The channel of the same name is on the south side of the island of Tierra del Fuego.

Beak, or **Bill,** the projecting jaws or snout of a bird or other animal, when prolonged into an instrument for seizing or penetrating objects, and formed of hard materials, as bone, or covered with a rigid envelope, as of horn or chitin. It is most characteristic of birds, where it is called «bill» or «neb,» and forms the principal means for obtaining, as well as devouring food (except in most birds of prey), and where it takes on a great variety of shapes and characteristics adapted to special habits and purposes. (See Birds.) A more or less similar prolongation of mouth-parts occurs in many other animals, however, and receives a similar name. Among mammals, the duckbill (q.v.) is a conspicuous example of a true mammal with the lips formed into a horny bill much like that of a duck, and similarly used. The turtles have horny, projecting, parrot-like jaws of the same sort; and a curious imitation of this occurs among cephalopod mollusks. The prolonged jaws of various fishes, as of gars («billfish»), sturgeons, etc., receive the term (technically *rostrum*), and these are often bird-like, as in the case of the spoon-billed catfish (q.v.). The term is also borrowed by entomologists to describe the elongated mouth-parts of many insects, such as blood-sucking flies; juice-sucking plant-bugs, weevils, and other forms. The prolonged tubular or trough-like parts (canals) of many gastropod shells protecting the siphon, and the prominent umbos of such bivalve shells as the cockles, clams, and fresh-water mussels, are also termed «beaks.»

Beal, bēl, **George Lafayette,** American military officer: b. Norway, Me., 21 May 1825; d. 11 Dec. 1896. When the Civil War broke out he was captain of the Norway light infantry, and with this company was mustered into the 1st Maine regiment for the three months' campaign. At the end of this service he was commissioned colonel of the 19th Maine infantry, which took part in the battles of Cedar Mountain and Antietam and covered the retreat of Gen. Banks from Winchester to Williamsport, Va. He was mustered out with his regiment in May 1863; volunteered again; was made colonel of the 29th Maine, and promoted to brigadier-general of volunteers 30 Nov. 1864, for his services in the Red River campaign. On 15 Jan. 1866 he was mustered out of service with the brevet of major-general of volunteers. In 1880–5 he was adjutant-general of Maine, and in 1888–94, State treasurer.

Beal, Samuel, English Orientalist. He was educated at Trinity College, Cambridge, graduating therefrom in 1847. Some time after, he entered the royal navy as chaplain, and in that capacity saw active service in China and Japan. He made a close study of the Chinese and Japanese languages, and on his retirement from the navy in 1877 was elected professor of Chinese at University College, London. His principal work was tracing the early history of Buddhism in original Chinese records, and the results of his work were given to the world in several volumes, notably: 'The Catena of Buddhist Scriptures' (1872); 'The Legend of Buddha' (1876); 'Buddhist Records of the Western World' (1884); 'Life of Hienen-Fsiang' (1888); etc. He also catalogued a large series of Japanese Buddhist works.

Beal, William James, American botanist: b. Adrian, Mich., 11 March 1833. He graduated at the University of Michigan in 1859; taught in various institutions 1859–70, since which time he has been professor of botany in the Michigan Agricultural College. He is a Fellow of the American Society for the Advancement of Science, and was president of the natural history section of this society in 1883; first president of the Association of Botanists of the United States Experimental Stations in 1888, etc. His works include 'Grasses of North America' (2 vols.); 'The New Botany'; 'Plant Dispersal'; etc.

Beale, Dorothea, English teacher: b. London, 1831. She became mathematical tutor in Queen's College in 1850, and later, Latin tutor in the school; head teacher in the Clergy School, in Casterton, in 1857; and principal of Cheltenham Ladies' College in 1858. Her publications include 'Text-Book of English and General History'; 'Chronological Maps'; 'Report on Girls' Education Commission of 1864'; 'Work and Play in Girls' Schools.' In 1880 she became editor of the 'Ladies' College Magazine.'

Beale, Edward Fitzgerald, American diplomatist: b. Washington, D. C., 4 Feb. 1822; d. 22 April 1893; graduated at the United States Naval Academy 1842, and at the beginning of the Mexican war was assigned to duty in California under Commodore Stockton. After the war he resigned his naval commission and was appointed superintendent of Indian affairs for California and New Mexico. He was commissioned brigadier-general in the army by Presi-

dent Pierce. He served in the Union army in the Civil War, and at its close engaged in stock-raising in Los Angeles, Cal., till 1876, when President Grant appointed him United States minister to Austria.

Beale, Lionel Smith, English physician and biologist: b. London, 5 Feb. 1828; d. 28 March 1906. He was the son of Lionel John Beale, M.R.C.S. He was educated at King's College School and King's College, London, later becoming an honorary Fellow. In 1852 he established a laboratory for chemical and microscopical studies, and in the following year became professor of physiology and general and morbid anatomy in King's College, London. In the same college he held in succession the professorships of pathology and of the principles and practice of medicine, but in 1896 he retired from the latter post. He was a Fellow of the Royal Society, and for some years acted as treasurer of the Royal Microscopical Society. His published works deal with medical, anatomical, physiological, and biological subjects, the microscope, etc. Among the most important are 'How to Work with the Microscope'; 'Protoplasm; or, Life, Matter, and Mind'; 'Life and Vital Action in Health and Disease'; 'The Physiological Anatomy and Physiology of Man' (in collaboration with Dr. Todd and Sir W. Bowman); 'Disease Germs'; 'Life Theories and Religious Thought'; 'The Mystery of Life'; etc.

Beall, John Young, Confederate guerrilla: b. Virginia, 1 Jan. 1835; d. 24 Feb. 1865. He was appointed acting master in the Confederate naval service in 1863. On 19 Sept. 1864 he and a number of followers took passage on the Lake Erie steamer Philo Parsons and at a given signal took possession of the vessel, making prisoners of the crew. They also scuttled another boat, the Island Queen, and tried to wreck a railroad train near Buffalo, N. Y. In spite of a proclamation of Jefferson Davis assuming responsibility for this expedition, Beall was hanged on Governor's Island, N. Y., on the ground that, if acting under orders, he should have shown some badge of authority.

Beam, in architecture, a long, straight and strong piece of wood, iron, or steel, especially one holding an important place in some structure, and serving for support or consolidation; often equivalent to girder (q.v.). In a balance it is the part from the ends of which the scales are suspended. In a loom it is a cylindrical piece of wood on which weavers wind the warp before weaving; also the cylinder on which the cloth is rolled as it is woven. In shipbuilding, one of several strong transverse pieces of timber stretching across the ship from one side to the other, to support the decks and retain the sides at their proper distance, with which they are firmly connected by means of strong knees, and sometimes of standards. They are sustained at each end by thick stringers on the ship's side called shelf-pieces. The main-beam is next abaft the main-mast. The greatest beam of all is called the midship beam. A ship is said to be "on her beam-ends" when she lies entirely on her side, so that the beams are almost at right angles to the surface of the water. An object is said to be "a-beam" when it is in a line with the beams of the ship, and accordingly at right angles to its length.

Beam Engine. See STEAM ENGINE.

Beam-tree, White (*Pyrus aria*), a European and Asiatic tree of the natural order *Rosaceæ,* rarely exceeding 50 feet in height, often cultivated in dry and exposed situations for its ornamental leaves, which are bright dark-green above and light beneath; and for its large terminal corymbs of flowers which appear in late spring followed by showy orange-red or scarlet, acid and astringent fruits which resemble those of the service-berry (q.v.), and which are used to make a kind of beer. Its hard, fine-grained wood is made into cog-wheels. It is closely related to the mountain-ash (q.v.).

Bean, Nehemiah S., American inventor: b. Gilmanton, N. H., 1818; d. 20 July 1896. He learned the machinist's trade, and in the winter of 1857–8 built his first steam fire engine, which he named the Lawrence, and sold it to the city of Boston. In 1859 he took the management of the Amoskeag Locomotive Works in Manchester, where he had been employed in 1847–50. During 1859 he built the "Amoskeag Steam Fire Engine No. 1," the first of a class of engines which now is used everywhere.

Bean, Tarleton Hoffman, American ichthyologist: b. Bainbridge, Pa., 8 Oct. 1846. He graduated at Columbian University, Washington, D. C., 1876. He was editor of the 'Proceedings and Bulletins' of the United States National Museum, Washington, 1878–86, and of the 'Report and Bulletin of the United States Fish Commission,' Washington, 1889–92; was assistant in charge of the division of fish culture in the United States Fish Commission, 1892–5, and curator of the department of fishes in the United States National Museum, 1880–95. In 1893 he represented the United States Fish Commission at the World's Columbian Exposition, and in 1895 at the Atlanta Exposition. In 1895 he became director of the New York Aquarium, and in 1899 was appointed director of forestry and fisheries of the United States Commission to the Paris Exposition of 1900. His works include 'The Fishes of Pennsylvania'; 'The Salmon and Salmon Fisheries'; 'Oceanic Ichthyology' (with George Brown Goode); etc. He has also contributed articles to 'Forest and Stream.'

Bean (M. E. bene, ben; A. S. bean, a "bean"), a plant of the natural order *Leguminoseæ,* or legumes. Originally the smooth kidney-shaped, flat-sided seed of the broad bean, *Vicia faba,* it is now applied to various genera, usually with a specific epithet, as Lima bean, etc.

The broad bean (*Vicia faba*) is the bean of history. Its origin is doubtful, but it is probably a native of southwestern Asia and northern Africa. It is much grown in Europe, especially in England, but the hot dry summers prevent its cultivation in most parts of the United States. It is grown successfully in the maritime provinces of Canada, and in other parts, with corn and sunflowers, to make ensilage. It is an annual plant, growing from two to four feet high, erect, with thick angular stems; flowers usually white with black on the wings. The pods, which contain the thick flattened seeds, vary from two to four inches up to 18 inches long. The common varieties are the Broad Windsor and Mazayan; they are quite hardy and should be sown early. The soils best suited are heavy loams and clays. The green seeds are eaten as a vegetable, or, if allowed to mature, are ground

and used as feed for horses and cattle. The straw is fed to cattle.

The kidney-bean of Europe is known in the United States as the bean *Phaseolus vulgaris;* it embraces all the common field, garden, snap, and string beans, both bush and climbing. The French know it as the haricot. It is probably a native of South America, and was introduced into Europe during the 16th century. Over 150 varieties are in cultivation; the growers usually group them into bush- and pole-beans. The bush-beans embrace the "field beans" grown for dry shelled seeds, also the green-podded and yellow-podded garden, string, or snap beans. The pole-beans are usually grown for use while green. Bush-beans do well on a good warm loam. The yellow-podded varieties and pole-beans require a richer soil. They should not be planted until danger from frost is over, and require constant cultivation while growing. Leading field varieties are white marrowfat, navy or pea bean, medium, and the kidneys: in string-beans, early Valentine, stringless green-pod, refugee, etc.: in yellow-podded beans, black wax, golden wax, kidney, and white: in pole-beans, Limas, large Lima, dreer Lima, etc. See Bulletins 87 and 115, Cornell Experiment Station. For forcing pole-beans under glass, see Bailey's 'Forcing Book'; Bulletin 62, New Hampshire Experiment Station, Durham.

The Lima bean (*P. lunatus*) is the most popular pole-bean. It is of South American origin, but is now grown in various parts of this country, most of the seed being raised in California. The short, flat, slightly kidney-shaped seeds are enveloped in flat, broad pods. The soy-bean (q.v.) (*Soja hispida* or *Glycine hispida*) is a bushy, erect, hairy plant which bears pea-like seeds in small pods. It is a native of China and Japan, where it is largely grown. It is used for forage and soiling. The cowpea (q.v.) (*Vigna catjang*) is generally used for forage, soiling, hay, and green manuring. The scarlet runner (*P. multiflorus*) is a perennial. It is grown largely for ornament, but in England the seeds and pods are eaten as a vegetable. The Adzuki bean (*P. radiatus*) is a native of Japan, and a recent introduction in America. (See Bulletin 32, Agricultural Experiment Station, Kansas). The frijole (*P. spp*) is grown in the southwestern States and in Mexico, where it is a staple food.

Other important Oriental beans, but not very common here, are: Mungo-beans (*P. mungo*); various species of Dolichos, as the asparagus-bean (*D. sesquipedalis*); and the locust or carob bean (*Ceratonia siliqua*), the pods of which are sold by confectioners as St. John's bread. The sweet pulp which surrounds the seed is eaten, especially in the Mediterranean. The pods and seeds are ground and used extensively as feed for cattle and other animals. The velvet-bean (*Mucuna utilis*) is often grown for ornament; also for forage and soil renovation in the southern States. It only ripens seed in the Gulf States and Florida. The beans and pods, when ground, are fed to cattle. The cooked green beans have caused illness in those who have eaten them. The sea-beans of the Florida coast are transported by ocean currents from the tropics. In 1899, 15,004 acres of green beans were grown, yielding 1,512,642 bushels, or an average of 100.8 bushels per acre. The four leading States in bean cultivation are New York, New Jersey, Florida, and Virginia. These furnish about half the supply.

Uses and Feeding Values.— The seeds and sometimes the pods are used, either green or dry, as food for man and animals. Some species are grown for forage, hay, or green manuring. Owing to their nitrogen-gathering propensities they all aid in soil-renovation.

The average percentage composition of:

	Water	Protein	Nitrogen-free extract	Ether extract	Ash	Fuel value of one pound
Dry shelled beans...	12.6	22.5	29.6	1.8	3.5	1605 calories
Fresh shelled beans..	58.9	9.4	29.1	0.6	2.0	740 "
Fresh string beans..	89.2	2.3	7.4	0.3	0.8	195 "

With man, on an average, 90 per cent of the dry matter is digestible; 80 per cent of the protein; 96 per cent of the nitrogen-free extract; and 80 per cent of the ether extract. String-beans or green-shell beans are usually boiled and served in various ways. In composition they compare favorably with other vegetables. Dry beans are baked with salt pork or beef and used for soups and other dishes. They are a cheap, nutritious food, rich in starch and in the proteid, legumin; hence they may be used to replace meat in the diet. If the skins are removed they are easier of digestion and are not so liable to cause flatulence; the latter is due to the production of methane by fermentation in the intestines. Shell- and string-beans are preserved by evaporation or canning. String-beans are also preserved with salt. Cooked dry beans are canned. Bean flour consists of beans ground. Bean meal is used in Europe as feed for horses, cattle, and hogs. Bean cake is the residue after the oil has been extracted; it is fed to cattle in northern China. Bean curd is eaten by the natives of northern China.

Bean Diseases.— Pod-rust; anthracnose (*Colletotrichum lindemuthianum*), a fungus which attacks the stems, leaves, and fruit. The disease may be carried over in the seed, the affected ones may be recognized by the yellow or brown discoloration. A black discoloration with ensuing brittleness marks the progress of the disease on the leaves. The selection of sound seed, immediate removal of infected plants, and spraying with Bordeaux mixture, are recommended. The bean-rust (*Uromyces phaseoli*) appears as small brown, nearly circular, and slightly elevated dots on the leaves. These discharge a brown powder, the spores of the disease. Spraying with Bordeaux mixture is recommended. Blight (*Phytophthora phaseoli*) attacks the Lima bean. Spraying with copper compound is recommended. The bean-weevil (*Bruchus obtectus*) may injure the beans when stored. After harvesting, treat the seed two or three times, at intervals of three or four weeks, with carbon bisulphide.

Consult: De Candolle, 'Nativity of the Bean'; Gray and Trumbull, "Origin of Cultivated Plants," 'American Journal of Science,' XXVI., 130; Sturtevant, 'American Naturalist,' (1887, p. 332; Wittmack, 'Ber. der Deutschen Bot. Gesellschaft,' VI. 374 (1888).

S. Fraser.

Bean-goose (*Anser segetum*), a species of European wild goose, distinguished from the true wild goose (*A. ferus*) by its comparatively small and short bill, which, as far as the nostril, is black, and above it of a reddish flesh color, whereas that of the gray lag, or true wild goose, is orange-red, with a touch of grayish-white. They feed generally on high grounds, considerably inland, selecting particularly young wheat, stubbles sown down for grass, and, in spring, fields sown with beans, their fondness for which is supposed to have given them their name. They breed chiefly within the Arctic Circle, but their nests are often found in large numbers in the Hebrides. The bean-goose being rather less than the common wild goose, but having the same color, is sometimes provincially called the small gray goose.

Bean, St. Ignatius, a seed which yields strychnin.

Bean Weevil, a beetle, *Brunchus obtectus,* which is smaller than the pea-weevil, measuring .15 of an inch in length. Compared with that insect it is lighter and more uniform in color, being of a tawny gray, without the white spots so conspicuous in *B. pisi.* The uniform tawny gray elytra are spotted with a few oblong dark spots, situated between the striæ; tye antennæ also differ in having the four basil joints more reddish than in *B. pisi,* while the terminal joint is red. The legs also are much redder. The eggs are laid on the outside of the bean; the young hatch and bore in, and there may be 8 or 10 grubs in a single bean. The chrysalis lies in a cavity in the bean just large enough to receive its body. The best remedy is to carefully examine the beans in the autumn and before sowing time, when the presence of the weevil can be easily detected by the transparent spots made by the larva. These should be burned and such beans as are apparently uninjured should be soaked for a minute in boiling-hot water, so that no beetles be overlooked.

Bear, or **Bere,** a species of barley (q.v.).

Bear Flag War, a rising against the Mexican government in 1846, by a small body of emigrants from the United States who had settled in California, thought to have been incited by Capt. John C. Fremont. He was then commanding a small detachment of American troops in California and a few Americans having proclaimed a republic in Sonoma and raised a flag on which was a figure of a bear, Frémont joined the insurgents with his troops. The Mexican war began in the following July and the Bear Flag war then became a part of the American scheme for the conquest of California.

Bear Lake, Great, a body of water in Canada, so named on account of its situation directly under the Arctic Circle, and therefore under the constellation Ursa Major. It is of very irregular shape, having five arms projecting out of the main body, and its greatest diameter is 150 miles. The principal supply of the lake is Dease River, which enters it from the northeast. Its outlet is on its southwestern extremity, at the bottom of Keith Bay, through Bear Lake River, which empties into Mackenzie River. The surface of Bear Lake is not more than 200 feet above the Arctic Ocean; consequently, its bottom must, like many of the northwestern lakes, lie considerably below the level of the sea. Great Bear Lake abounds in fish of many varieties, among which the herring-salmon is noted. The second land expedition, under Franklin, in 1825, wintered on the western shore of this lake, near its outlet, where they built Fort Franklin. Dr. Richardson, a member of the expedition, mentions a curious circumstance concerning the singing of birds of this lake, that when they first appeared after the long Arctic winter they serenaded their mates at midnight, and were silent during the day. The waters of the lake are so clear that a white substance can be distinctly discerned at the depth of 90 feet. This lake is situated about 250 miles east of the Rocky Mountains, about the same distance south of the Arctic Sea, and 400 miles northwest of Slave Lake. It is the basin of a water-shed of about 400 miles diameter.

Bear Mountain, the designation of a hill some 750 feet in height, situated in the northeastern part of Dauphin County, Pa. In its vicinity are valuable deposits of anthracite coal.

Bear River, a river in Utah about 400 miles long, which rises in a spur of the Rocky Mountains, about 75 miles east of Great Salt Lake, takes first a northwesterly and then a southeasterly direction, forming nearly a letter V, of which more than half the entire length is in Oregon territory, and finally empties into the Great Salt Lake. Its valley is about 6,000 feet above the sea-level. At the bend of the river in Oregon, and about 45 miles from Lewis River, are found the famous Beer and Steamboat springs, which are highly impregnated with magnesia and other mineral substances.

Bear State, a popular nickname for Arkansas.

Bearberry, the name of the *Arctostaphylos,* a genus of plants belonging to the order *Ericaceæ* (heathworts). It includes the two species, *A. uva ursi* and *A. alpina,* both of which are American. They are sometimes ranked under the genus *Arbutus.* The flowers are rose-colored, the berry of the *Uva ursi* is red, while that of the other is black. The Manzanita of California is *A. manzanita* or *A. pungens.* It reaches a height of 30 feet, and forms dense thickets, impenetrable by man or cattle. By reason of an active glycoside, arbutin, bearberry is a very efficient urinary antiseptic, useful in cystitis, pyelitis, and urethritis. The arbutin is decomposed in the urine into hydrochinon and other bodies. Its antiseptic properties are due to the phenal hydrochinon. The extract of the plant is used for dyeing and tanning leather.

Beard, Charles, English Unitarian clergyman: b. Manchester, England, 27 July 1827; d. Liverpool, 9 April 1888. He was pastor of Renshaw Street Chapel, Liverpool, editor of the *Theological Review,* 1864–79, and author of 'Outlines of Christian Doctrine' (1859); 'The Soul's Way to God' (1875); 'The Hilbert Lectures,' his most important work and one much esteemed (1883); 'The Universal Christ' (1888); 'Martin Luther' (1889).

Beard, Daniel Carter, American artist and author: b. Cincinnati, Ohio, 21 June 1850. He first engaged in civil engineering and surveying; went to New York in 1878 and studied art, and

has since become widely known as a book and magazine illustrator. He founded and became teacher of the department of animal drawing in the Woman's School of Applied Design, believed to be the first class of this character in the world. Besides his illustrative work he has published 'Moonlight'; 'Six Feet of Romance'; 'American Boys' Handy Book'; 'American Boys' Book of Sport,' etc.

Beard, George Miller, American physician and hygienic writer: b. Montville, Conn., 8 May 1839; d. New York, 23 Jan. 1883. He made a specialty of the study of stimulants and narcotics, hypnotism, spiritualism, etc. Among his works were: 'Our Home Physician' (1869); 'Eating and Drinking' (1871); 'Stimulants and Narcotics' (1871); 'American Nervousness' (1881); 'Sea-Sickness' (1882).

Beard, Henry, American painter: b. Ohio, 1841; d. New York, 19 Nov. 1889. He was a son of James Henry Beard, and nephew of William Holbrook Beard; served in the Union army during the Civil War; at its close applied himself to painting, particularly animal life; and, after his removal to New York, in 1877, was chiefly engaged in illustrating books and periodicals.

Beard, James Henry, American painter: b. Buffalo, N. Y., 1814; d. 4 April 1893. He became a portrait painter in Cincinnati, and painted the portraits of Henry Clay and other distinguished men. In 1846 he exhibited his 'Carolina Emigrants' at the National Academy in New York, of which he was elected an honorary member in 1848. In 1870 he removed to New York, and in 1872 was elected a full member of the National Academy. Subsequently he devoted himself to animal painting. Among his better known works are: 'Mutual Friend' (1875); 'Consultation' (1877); 'Blood Will Tell' (1877); 'Don Quixote and Sancho Panza' (1878); 'Heirs at Law' (1880); 'Which Has Pre-emption?' (1881); 'Detected Poacher' (1884); 'Don't You Come Here' and 'The Mississippi Flood' (1885); 'A Barnyard' and ''Ll Yer Gimme Some? Say!' (1886).

Beard, Richard, American theologian: b. Sumner County, Tenn., 27 Nov. 1799; d. Lebanon, Tenn., 2 Dec. 1880. He was graduated from Cumberland College, Princeton, Ky., in 1832; was professor of languages there, 1832-8; president 1843–53. In 1854 he was called to the chair of systematic theology in Cumberland University, Lebanon, Tenn., a position held until his death. He was one of the ablest scholars and most conspicuous figures in the Cumberland Presbyterian Church. He published 'Why I Am a Cumberland Presbyterian' (1874); 'Systematic Theology,' a standard work regarded as the crystallization of the Cumberland Presbyterian form of thought and faith.

Beard, Thomas Francis, commonly known as FRANK BEARD, American artist: b. Cincinnati, 6 Feb. 1842; d. 1905. During the Civil War he served in the 7th Ohio regiment, and acted as a special artist for the Harper publications. As an artist he devoted himself especially to character sketches. From the age of 12 he contributed pictures to the leading American magazines. As a lecturer he had great success before Chautauqua and other audiences. He accompanied his talks by crayon sketches on a blackboard. The title of his first lecture was "Chalk-Talk," whence the word originated. In 1881 he occupied the chair of æsthetics at Syracuse University. He has published: 'The Blackboard in the Sunday-school' (1880); and a number of short stories.

Beard, William Holbrook, American painter: b. Painesville, Ohio, 13 April 1825; d. New York, 20 Feb. 1900; brother of James H. Beard. He was a traveling portrait painter from 1846 till 1851, when he settled in Buffalo, N. Y. After several years of foreign study and travel he settled in New York in 1860. In 1862 he was elected a member of the National Academy. His works include genre and allegorical pictures, but he was most popular in painting animals, especially bears, whose actions he humanized in a satirical and pleasing manner. He made many studies of decorative architecture. Among his most popular works are: 'Power of Death' (1859); 'Bears on a Bender' (1862); 'Bear Dance' (1865); 'March of Silenus' (1866); 'Flaw in the Title' (1867); 'Darwin Expounding his Theories' and 'Runaway Match' (1876); 'Divorce Court' (1877); 'Bulls and Bears in Wall Street' (1879); 'Voices of the Night' (1880); 'Spreading the Alarm' (1881); 'In the Glen' (1882); 'Cattle Upon a Thousand Hills' (1883); 'Who's Afraid?' (1884); 'His Majesty Receives' and 'Office Seekers' (1886), etc. He published 'Humor in Animals,' a collection of his sketches (1885).

Beard, the hair on the chin, cheeks, and upper lip of men. It differs from the hair on the head by its greater hardness and its form. The beard begins to grow at the time of puberty. The connection between the beard and puberty is evident from this, among other circumstances, that it never grows in the case of eunuchs who have been such from childhood; but the castration of adults does not cause the loss of the beard. According to Cæsar, the Germans thought, and perhaps justly, the late growth of the beard favorable to the development of all the powers. But there are cases in which this circumstance is an indication of feebleness. It frequently takes place in men of tender constitution, whose pale color indicates little power. The beards of different nations afford an interesting study. Some have hardly any, others a great profusion. The latter generally consider it as a great ornament; the former pluck it out; as, for instance, the American Indians. The character of the beard differs with that of the individual, and, in the case of nations, varies with the climate, food, etc. Thus the beard is generally dark, dry, hard, and thin in irritable persons of full age; the same is the case with the inhabitants of hot and dry countries, as the Arabians, Ethiopians, East Indians, Italians, Spaniards. But persons of very mild disposition have a light-colored, thick, and slightly curling beard; the same is the case with inhabitants of cold and humid countries, as Holland, Britain, Sweden. The difference of circumstances causes all shades of variety. The nature of the nourishment likewise causes a great variety in the beard. Wholesome, nutritious, and digestible food makes the beard soft; but poor, dry, and indigestible food renders it hard and bristly.

In general the beard has been considered with all nations as an ornament, and often as a mark of the sage and the priest. Moses forbade the Jews to shave their beards. With the ancient Germans the cutting off another's beard was a high offense: with the East Indians it is severely punished. Even now the beard is regarded as a mark of great dignity among many nations in the East, as the Turks. The custom of shaving is said to have come into use in modern times during the reigns of Louis XIII. and XIV. of France, both of whom ascended the throne without a beard. Courtiers and inhabitants of cities then began to shave, in order to look like the king, and, as France soon took the lead in all matters of fashion on the continent of Europe, shaving became general; but it was only from the beginning of the 18th century that shaving off the whole beard became common.

The English clergy by and by, probably in imitation of those of western Europe, began to shave the beard, and until the time of William the Norman, the whole of whose army shaved the beard, there prevailed a bearded class and a shaven class, in short, a laity and a clergy, in England. In forbidding the clergy to wear beards Gregory VII. (1084) appealed to the custom of antiquity. The higher classes indulged in the moustache, or the entire beard, from the reign of Edward III. down to the 17th century. The beard then gradually declined, and the court of Charles I. was the last in which even a small one was cherished. Shaving, among many ancient nations, was the mark of mourning; with others it was the contrary. Plutarch says that Alexander introduced shaving among the Greeks by ordering his soldiers to cut off their beards; but it appears that this custom had prevailed before among the Macedonians. The Romans began to shave about 296 B.C., when a certain Ticinius Mena, a barber from Sicily, introduced this fashion. Scipio Africanus was the first who shaved every day. The day that a young man first shaved was celebrated, and the first hair cut off was sacrificed to a deity. Hadrian, in order to cover some large warts on his chin, renewed the fashion of long beards; but it did not last long. In mourning the Romans wore a long beard, sometimes for years. They used scissors, razors, tweezers, etc., to remove the beard. The public barbers' shops (*tonstrinæ*), where the lower classes went, were much resorted to; rich people kept a shaver (*tonsor*) among their slaves. Army regulations generally prohibit the wearing of beards, while in the navy beards are permitted. Physicians suggest that the beard should be suffered to grow on the chin and throat where tendencies to throat diseases exist.

Beard Moss (*usnea barbata*), a lichen of gray color. See also USNEA.

Beardslee, Lester Anthony, American naval officer: b. Little Falls, N. Y., 1 Feb. 1838; d. near Augusta, Ga., 11 Nov. 1903. Appointed acting-midshipman 5 March 1850, he served in the East Indies in 1851-5, participating in one battle and several skirmishes with the Chinese army at Shanghai. Graduating from the Naval Academy 1856, he passed through all grades of the service to rear-admiral 1895, and was retired 1 Feb. 1898. During the Civil War he commanded the monitor Nantucket in the attack of the ironclad fleet on the defenses of Charlestown Harbor, 7 April 1863, and captured the Confederate steamer Florida at Bahia, Brazil. In 1870 he took the steam-tug Palos to the East Indies, carrying on her the first United States flag through the Suez Canal. In 1879–80 he discovered, surveyed, and named Glacier Bay, Alaska. He is the author of a number of valuable official reports, especially those on 'The Strength of Metals,' 'Resources of Alaska,' and 'Present Condition of Affairs in Hawaii' (1897), published as Senate executive documents; 'The Strength of Wrought Iron and Chain Cables' (1880).

Beardsley, Aubrey, English author and illustrator: b. Brighton, 1874; d. Mentone, France, 16 March 1898. After receiving a grammar school education, he began working for London periodicals and publishers in 1892; and soon became widely known by his striking designs for posters and book covers. In 1894 he became art editor of 'The Yellow Book,' and while supplying it with illustrations, contributed drawings also to the 'Savoy' and 'Le Courrier Française.' He illustrated 'Bons Mots' (1892); Malory's 'La Morte d'Arthur' (1893); Oscar Wilde's 'Salome' (1894); 'The Rape of the Lock' and 'An Album of Fifty Drawings' 1896); and wrote and illustrated 'The Story of Venus and Tannhauser' (1895); and a novel, 'Under the Hill' (1896).

Beardsley, Eben Edwards, American Episcopal clergyman and writer: b. Stepney, Conn., 1808; d. 22 Dec. 1891. He was for many years rector of St. Thomas's Church at New Haven. He wrote 'History of the Episcopal Church in Connecticut' (4th ed. 1883), and lives of 'Samuel Johnson, First President of King's College, New York' (1874); 'William Samuel Johnson, President of Columbia College' (1876); and 'Samuel Seabury, First Bishop of Connecticut' (1881).

Beardsley, Samuel, American jurist: b. Hoosic, N. Y., 9 Feb. 1790; d. Utica, N. Y., 6 May 1860. On leaving the common school he took up the study of medicine, but abandoned it for law. In 1813 he was a member of the militia that defended Sackett's Harbor. Two years later he was admitted to the bar, and became judge-advocate of the militia. In 1823 he was State senator from the Fifth District of New York. He was appointed attorney for the Northern District of New York by President Jackson, and was a member of Congress in 1831–6 and 1843–5. From 1836 to 1838 he was attorney-general of the State of New York. He became associate judge of the supreme court of New York in 1844, and three years later succeeded Judge Bronson as chief justice. On his retirement he devoted himself to the practice of his profession.

Beardstown, Ill., a city in Cass County, 45 miles northwest of Springfield, on the Illinois River. The St. Louis division of the Burlington Route has its repair and other shops at Beardstown. There are manufactures of flour, lumber, and window screens as well as important cooperage works. The city has a fine park and two great bridges across the river. It was settled in 1832 and received a city charter in 1896. Pop. (1900) 4,827.

Bearing, in navigation and surveying, signifies the angle made by any given line with a north and south line. The bearing of an object is the direction of a line from the observer to that object.

In architecture, the space between the two fixed extremities of a piece of timber, or between one of the extremities and a post or wall placed so as to diminish the unsupported length. Also and commonly used for the distance or length which the ends of a piece of timber lie upon or are inserted into the walls or piers.

In mechanics, (a) The portion of an axle or shaft in contact with the collar or boxing. (b) The portion of the support on which a gudgeon rests and revolves. (c) One of the pieces resting on the axle and supporting the framework of a carriage. (d) One of the chairs supporting the framework of a railway carriage or truck.

In heraldry, a charge; anything included within the escutcheon. Generally in the plural, as armorial bearings.)

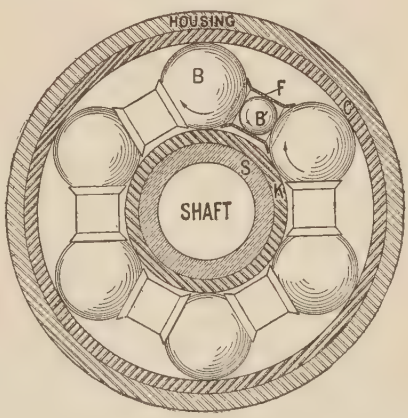
Bearer Company, a British organization for removing wounded soldiers from the field of battle to the dressing station or temporary hospital, which is part of the equipment of the bearer company, and where first aid can be given to them. The bearer company, first introduced into the British army in 1873, comprises the medical and other officers for discipline and supply duties, over 30 non-commissioned officers and men, trained as sick bearers of the medical staff corps, about 100 attendant untrained bearers from the Militia Reserve, six "bâtmen" and drivers of the Army Service Corps. Tents for the personnel and for the dressing stations are carried, and a bearer company also has ambulances, surgery wagons, equipment, supply, and water carts, requiring over 100 horses. A modified organization for mountain warfare comprises muleteers, mules, and a special kind of cacolets or litters. Half a bearer company is attached to each army corps on active service, forming the link between the battalion stretcher bearers and the field hospitals.

Bearings, Anti-friction. Anti-friction bearings are bearings involving the principle of rolling friction, as distinguished from sliding friction. An ordinary shaft turning in a plain journal slides around on a layer of some lubricating substance. If the lubricant is good and properly applied, little energy or power is lost in the heat produced by rubbing friction. If not, then much heat is produced, often to such an extent that the oil or grease is set on fire, dried up, thereby causing a so-called "hot box" or journal. The starting friction of a plain journal differs very greatly from the friction of motion. The reason is that while at rest under a heavy load, the film of the lubricant is penetrated, and contact of metal to metal is established. To overcome this contact, until the bearing has moved far enough to drag the film of oil between the points of contact again, requires much more power. Careful tests show the coefficient of rest to be from .09 to .13, as compared with .05 to .08 for the coefficient of motion. Bearings involving rolling friction are entirely different in this respect. No lubricant other than enough to prevent rusting is needed. Between the shaft and the wheel or other bearing is interposed some shape, made of hardened metal that rolls between the two surfaces. Rollers and balls are the two forms adopted to accomplish this purpose. During the last decade rapid evolution has taken place in the design and range of use to which such bearings are applied. Improved manufacturing methods in the way of production of large balls are bringing this type rapidly to the front for large work, such as trolley and steam car bearings, shafting, and many other uses not formerly possible commercially, because of cost.

The latest improvements have also very greatly advanced the possibilities of the bearing of the ball type. It is the invention of C. H. Chapman, interposing smaller balls between the working, or load carrying balls, in such a way as to prevent all rubbing, sliding or wedging tendencies, thus eliminating all wear, and indefinitely prolonging the life of a bearing. Advanced designers of this bearing have learned also to skilfully combine the materials, dimensions and design of same in such a way as to successfully perform what has hitherto been thought too heavy work for ball or roller bearings. The saving of such a bearing as made by the American Compound Bearing Company over the plain journal is very remarkable. Tests give the following comparative results:

Bearing	Starting Friction	Running Friction
Plain	.100	.05
Ball	.009	.005

It is seen that the starting friction for this ball bearing is not appreciably greater than the running friction, and that under all conditions the running friction of this compound bearing (the highest refinement of anti-friction bearing), is less than one tenth of the friction of the best lubricated plain journal.



By referring to the cut it will be noted that *B* is the load-carrying ball, *B'* the idler, *F* the retaining tube or float for *B'*, *C* the cup, *K* the cone, and *S* the journal sleeve.

The idler *B'* is so placed that its centre is coincident with a line connecting the centres of each of the adjacent load-carrying balls *B*, and is positively and automatically held in position by a loose free tube *F* that floats with the load-carrying balls, but not in frictional contact with any of the balls when the same are under load, during which time the idler balls are maintained

in the same relative position by rolling contact with the load-carrying balls.

An important and unique function of the compound features of the bearing is the differential compensating movement of the journal between the shaft and the balls, insuring a positive revolution of the load-carrying balls under all conditions.

For the class of journals that are called upon to start frequently, the saving in power is exceedingly great, and the necessity of saving power is bringing about the very general use of anti-friction bearings. Incidentally, there are other very important advantages in the decrease of annoyance and expense of lubrication, hot boxes and dirt attending the use of all plain journals. The use of anti-friction bearings as a means of saving power in all transmission problems is attracting increased attention among all mechanical engineers.

HENRY SOUTHER,
Engineer of the American Compound Bearing Company.

Béarn, bā-ārn, a former province of France, at the foot of the Pyrenees, with the title of a principality; about 42 miles long and 36 broad. It now forms part of the department of the Basses-Pyrénées. It belonged, with Navarre, to Henry IV., when he obtained the crown. The plain country is very fertile, and the mountains are covered with fir-trees, while within are mines of copper, lead, and iron; and the little hills are planted with vines, which yield good wine. Pau is the chief town. There is a peculiar and well-marked dialect,— the Béarnese,— spoken in this district, which has much more affinity with the Spanish than with the French. It contains a certain number of Greek elements, which some believe to have been derived from the ancient Greek colonists established in Gaul. The people have retained many Old-World manners, customs, and superstitions, as well as their old costume. See Bordenare, 'Histoire de Béarn et Navarre' (1873).

Bears, a family (*Ursidæ*) of large, heavy, long-haired, plantigrade, carnivorous mammals, scattered throughout all the northern hemisphere, and some parts of the tropics. They are absent from Africa (except the Atlas Mountains, which zoologically belong to Europe), and from Australasia. In their structure and dentition they are allied to the dogs on one hand, and to the badgers, weasels, skunks, etc., (*Mustelidæ*), on the other. The head is broad, and the jaws extended and rather narrow, but not so powerful as those of dogs or hyenas; while the teeth are complete and large, the molars especially being broad and tuberculous, fitting them well for crushing the vegetable fare so largely eaten by this group. The skeleton is massive, the limbs of great strength and furnished with long and powerful claws for digging, and for use in fighting. The whole sole of the foot rests upon the ground, leaving a footprint much resembling that of a man. Ordinarily they move about rather slowly and clumsily, yet all except the heaviest bears climb trees, and the largest scramble over rocks or ice with surprising agility; and all, when urged by rage or fear, can get over the ground at great speed, their gait being a lumbering but effective gallop. Their ears, though small, are highly developed, and their hearing is perhaps of more service to them than is their eye-sight; but neither equals in keenness the nose, which seems to be extremely sensitive. In respect to food, bears are truly omnivorous, taking flesh, fish, or vegetable materials as circumstances favor. They seize such small animals of the woods as cannot avoid them, and near settlements raid the herds of swine and flocks of sheep and cattle, especially in search of the young ones. All bears eat fish, and some, like the Polar and the Kadiak bear, live almost wholly upon this diet, catching the fishes cleverly from the shore by a stroke of the paw, or going into the water after them. Reptiles, crabs, crayfish, etc., are eaten also; and insects form a large part of their fare, especially ants and honey-making bees and wasps. They dig up ant hills and overturn rotting logs and stumps for the former, and search out and tear to pieces the combs of the latter, well protected against stings by their long hair. They also eat succulent leaves and herbage, certain roots, fruit, and especially sweet acorns and berries, of which they are exceedingly fond. The Rocky Mountain Indians used to burn over certain tracts of mountain-side annually in order to keep the oaks low and promote the growth of certain berry-bearing bushes in order to attract the bears. They drink a great deal of water, enjoy going into it, and will swim long distances.

Bears are nowhere very numerous, each pair or family occupying a district and keeping it fairly well to itself. When, as frequently happens, three or four are seen together, they are likely to be old and young of the same family. Their home is usually some cave or crevice among rocks, a hollow tree, a tangle of wind-thrown logs, or a dense thicket. There, in the early spring, are born the young, usually two, sometimes four; and in the case of the Arctic species, this often happens under the snow, before the female is released from her hibernation. The young remain with the mother until fully grown; and when they are little she guards and controls them with great solicitude, and will rush at an intruder. At other times bears are rather shy and will usually endeavor to retreat, yet when brought to bay, fight with great courage, and are among the most dangerous animals men can encounter. Their attack is made with both teeth and claw, striking down or clasping the foe in a crushing embrace, and then tearing him with the teeth. They can easily be tamed, however, remain friendly and prove intelligent and docile to a limited extent. They submit well to confinement, endure change of climate, and breed readily in captivity. The close family likeness throughout the group has made their distinction into natural species a matter of much dispute and uncertainty. Everyone recognizes the great white «Polar» or «ice» bear of the Arctic region (*Ursus maritimus*) as distinct. Its elongated body, long, pointed head, slender limbs, large, hairy-soled feet, and cream-white coat, are quite unlike the features of any other. Large specimens are nine feet or more in length, and have enormous strength. These bears are numerous throughout the icy circumpolar regions, and wander a vast distance away from the coast on the ice, sometimes swimming many miles. They often winter and their young are born on the floes. They live mainly upon seals, young walruses, and fish, which they scoop out of the

1. Polar Bear (Ursus maritimus).

2. Grizzly Bear (Ursus horribilis).

surf and from the coast rivers where they come to spawn, but in summer obtain various other kinds of food, including marine grass and shore herbage. The writings of Arctic explorers abound in accounts of this wide-spread species, and should be read by those who wish to know more of their habits. Another sub-Arctic bear that seems undoubtedly distinct is the glacier or "blue" bear of the Mount St. Elias Alps on the coast of Alaska (q.v.) first described by Dall in 1895, and named *Ursus emmonsi*. It is the smallest of all bears — not larger that a half-grown grizzly, and bluish black, with a dorsal stripe, the ears and the outer surfaces of the limbs jet black; black and silver is the prevalent color of the sides, neck, and rump; the belly and inside of the legs are white; sides of the nose bright tan color. Very little is known of its habits, or of the extent of its limited range.

The other American bears, called black, grizzly, cinnamon, Barren-Ground, brown, Kadiak, and so on, are so confusingly alike that some conservative naturalists regard them all as merely varieties of one species, altered by climate and food, and a tendency to individual variation; and it has even been said that there was no real specific distinction between them and the Old World bears, which also present differences that blend confusingly together when many specimens are compared. Others regard the differences not only of specific value, but even place some of the forms in separate genera. The latest monographer of the American *Ursidæ* recognizes no less than eight species on this continent, besides the Polar bear, and the spectacled bear of the Andes (*Ursus ornatus*), which is thought by others to be merely an isolated variety of the black bear, that somehow has acquired whitish rings around its eyes. The black bear (*Ursus Americanus*) is the most wide-spread of these, being found in all the forested regions of the continent north of Mexico, and still remaining wherever a large patch of forest, or a range of mountains or rough hills give it a harbor, whence it may raid the pasture-lots and pig sties of frontier farmers, especially in early spring, when wild food is scarce. Black bears climb trees easily, travel about a great deal, and are often captured and tamed. They are timid and secretive, and rarely are dangerous unless wounded or cornered and enraged. The color of this bear is properly black, but brown, reddish ("cinnamon"), or even yellowish examples are frequently seen. The nose is always tan-colored. In size they average about five feet, and never reach the dimensions of a large grizzly. The bears of Florida and of Texas are each regarded by some as separate species, but most naturalists consider them to be merely geographical races. The Barren-Ground bear (*Ursus richardsoni*) is a large whitish-brown species dwelling on the brushy plains northwest of Hudson Bay, which there is good reason to believe is an isolated American race of the European brown bear.

The grizzly bear (*Ursus horribilis*) of the mountains of western North America is one of the largest, and perhaps the most to be feared, of any of the family. It is found from the Black Hills and the Badlands of Dakota westward to the Pacific coast, and from Mexico to northern Alaska. A large specimen is nine feet in length, and will weigh 1,000 pounds, but the size varies greatly. So does the color, which ranges from reddish-brown to hoary gray. Hence several varieties are recognized by hunters, such as "cinnamons," "silvertips" (in which the tips of the hairs are white), and "grizzlies." The typical form may be described as yellowish-brown, with a reddish mane, black dorsal stripe, and dark-colored legs. In form they are massive, with broad, squarish heads, and immensely muscular bodies. They cannot, or at any rate, do not, climb trees, but they scramble about the roughest mountains or through a dense forest with surprising agility, and can run very rapidly on occasions. They seem rarely if ever to hibernate, and go about alone or in pairs, eating all sorts of food, but seizing and pulling down large prey when an opportunity offers. In former days even a bull buffalo was unable always to resist their strength, and they constantly attacked them and the deer. At present the cattle and horses upon the ranges in some parts of the west suffer from their ravages. Though so mighty, and when at bay or enraged probably not less dangerous to encounter than a lion or tiger, they will usually avoid and flee from man, and do not seem quarrelsome, the tradition of a constant enmity between them and the black bears not finding support in facts. The grizzly is easily the most terrible of the game animals of North America, and one of the most formidable in the world; but different bears vary greatly in temperament and according to circumstances. The Indians and experienced hunters of the west, however, have learned to hold all of the race in the highest respect. Much the same statement will apply to the Barren-Ground bear, already mentioned, and to the Alaskan bears to be spoken of presently. The grizzly is still to be found throughout most of its range, though no longer numerous except in the wilder parts of the Rocky Mountains, in the northern parts of the Sierra Nevada, and in the high mountains northward from Oregon to Alaska, where the largest ones are now to be obtained. The Kadiak bear is a brownish species or variety (*Ursus middendorffi*) dwelling on Kadiak Island, Alaska, and the neighboring mainland. Specimens of it exceeding in size any other bear have been obtained, and weighing 1,200 pounds. Whether it will prove to be a distinct species remains to be seen. The same may be said of Dalli or the Sitka bear (*Ursus dalli*). Both are dark-brown or grizzled, and difficult to distinguish externally from other bears of the north.

The bears of the Old World have been divided into many species by earlier naturalists, but are now regarded as more nearly connected. The best known is the common brown bear of Europe and Asia (*Ursus arctos*). It is of large size, reaching about eight feet in length in the bigger European specimens, and is usually of some shade of yellowish-brown, reddish-brown, or black, but varies greatly. It is exceedingly difficult to distinguish from the American bears, and passes by indeterminate variation into the so-called species of Siberia, Japan, and the Himalayan region, the differences being such as might come from varying climate and habitat; thus those of the high Himalaya are smaller and lighter in color, etc. Although long ago extinct in Great Britain, it still lingers in the

wilder, more mountainous parts of Europe, and is numerous in the forests of Russia, the Caucasus, on the Lebanon range of Asia Minor (where it is called the Syrian bear), in the Atlas Mountains of Morocco, and throughout Asia north of the Himalayas. The largest are those of Kamchatka, where they are numerous and bold, and live in summer almost wholly on salmon, as do the Kadiak and other Alaskan bears east of Bering Sea. This is the bear most often seen in menageries, where it breeds readily; and which is led about by "bear-tamers," and taught certain clumsy "dancing" tricks. The Thibetan or "blue" bear (*Ursus pruinosus*), is a little known species regarded as distinct. Two other quite distinct species of bear belong to the Indo-Malayan region. One is the sloth-bear or honey-bear of India, a large animal which in its jungle home is one of the most dangerous carnivores of the Indian forests, yet is often tamed and led about the country by Hindu jugglers, who called it "aswail," etc. It is black, unusually shaggy, and has a prolonged mobile snout, a very long tongue and no teeth in the front of the mouth (after the milk teeth drop out), making its facial grimaces very comical. Another very distinctive feature is the large yellowish crescent on its breast. It is an agile climber, and exceedingly fond of robbing the nests of honey-making bees. These facts are recorded in its name (*Ursus* or *Melursus*), *labiatus*.

The Malayan sun bear, or "bruang" (*Ursus,* or *Helarctos, Maylayanus*), is a smaller species inhabiting the forests of the Malayan Peninsula, and islands eastward to Borneo. Its coat is short and fine, black in color, marked on the breast with a white or orange crescent, and the lips and tongue are remarkably long and flexible. It feeds mainly on ants, which it gathers with its glutinous tongue after digging up their hills, to which its long claws are well fitted.

Fossil bears, commonly called "cave bears," have been found in the Quaternary bone-breccia of many caves of Europe, North and South America. Some are closely allied to or identical with living species; others, as the California and South American cave bears, are referred to a distinct genus, *Arctotherium.* In the Tertiary strata of the Old World occur remains of a series of animals (*Amphicyon, Hyaenarctos,* etc.) which appear to connect the bears with primitive *Canidæ,* indicating that they are an offshoot of the dog family. See also Cave Bears.

For modern and contrasting ideas of classification: Lydekker, 'Proceedings of Zoological Society of London, for 1897,' page 412; Merriam, 'Proceedings Biological Society of Washington,' p. 65 (1896). For habits and hunting, such general works as Brehm, 'Thierleben'; the Standard, Royal, and Allen's 'Natural Histories'; Mayne Reid, 'Bruin, or the Grand Bear Hunt' (1864); Aflalo, 'Sport in Europe' (1901); the works of Jerdon, Blanford, and Blyth on the mammals of Persia, India, and eastward; and the writings of sportsmen-naturalists, especially Baker, Hornaday, Kinloch, Pollok, Sanderson, Shakespeare, and Wallace. For American bears, consult Richardson, 'Fauna Boreali Americana' (1829); Audubon and Bachman, 'Quadrupeds of North America' (1846); Merriam, 'Mammals of the Adirondacks' (1882); Marey (editor), 'Sport with Rod and Gun' (1892); Shields (editor), 'Big Game of North America' (1890); Porter, 'Wild Beasts' (1897); and the writings of sportsmen in the Rocky Mountains, especially Baillie-Grohman, 'Fifteen Years of Sport, etc.' (1900).

Beas, bē'as, or **Bias** (the ancient *Hyphasis*), one of the five great rivers of the Punjab, having its rise at the Ratanki Pass, on the south side of the Santch Mountains, a branch of the Himalaya system, in lat. 32° 21′ N.; lon. 77° 22′ E.; where the former attain an elevation of 13,300 feet. Its entire course is about 215 miles. The Beas has been considered larger than the Sutlej, which it joins 35 miles to the southeast of Amritsar, but it is greatly inferior to that river in the length of its course; and, though they have about the same breadth, the Sutlej has the greater volume of water. The united stream, below the point of junction, is called the Ghara or Gharra.

Beasts of Prey, is not a scientific term, but, as in the case of the phrase "birds of prey," represents merely the idea of an assemblage of such mammals as prey upon other creatures. The greatest number, and most prominent examples, belong to the order *Carnivora,* whose members subsist mainly upon flesh, and some of which, as the cats, bears, and wolves, are the most powerful, deadly, and dangerous animals of the world. These have acquired bodies with great strength and endurance in chasing and leaping, seizing and holding; teeth adapted to cutting and piercing; sharp muscular claws; and a high degree of intelligence in the wiles of hunting, and of courage and pertinacity in attacking their prey or defending their gains against rivals. Their digestive organs are simplified and adapted to the assimilation of flesh, of which a less quantity is required than in the case of an animal subsisting on vegetable fare, because it is already in a concentrated, partly elaborated form; but as the obtaining of it is occasional and often interrupted by long intervals, all beasts of prey are likely to kill and eat excessively when opportunity offers, in instinctive preparation for a possible fast. To provide against the loss of heat during the periods of famine, rather than as a provision against low temperature, most beasts of prey are clothed in dense, hairy coats of hair, or "fur." Not all the beasts of prey belong to the *Carnivora* for animals with similar structures and adaptations are to be found in other orders of mammals, whose basal structure is very different. The blood-sucking bats, for example, have teeth roughly similar to those of a dog; and some of the apes are savage and powerful and have carnassial teeth. The most precise parallel, however, is found in the predatory marsupials of Australia, such as the Zebra wolf, Tasmanian devil, and several others, which have the equipment and habits of true beasts of prey.

Beat, in music, the beating or pulsation resulting from the joint vibrations of two sounds of the same strength, and all but in unison. Also a short shake or transient grace-note struck immediately before the note it is intended to ornament. The Greeks employed the up beat

1 American Black Bear (Ursus Americanus).
2. Brown Bear (Ursus arctos).
3. Black Bear of the Himalayan Mountains (Ursus torquatus).
4. Malay Bear (Ursus Malayanus).

(*arsis*) to denote the accented, and the down beat (*thesis*) to signify the unaccented part of the measure, but in modern practice the down beat denotes the accented and the up beat the unaccented.

Beatifica'tion, in the Roman Catholic Church, an act by which the Pope declares a person beatified or blessed after his death. It is the first step to canonization, or the raising one to the honor and dignity of a saint. No person can be beatified till 50 years after his or her death. All certificates or attestations of virtues and miracles, the necessary qualifications for saintship, are examined by the Congregation of Rites at Rome. This examination often continues for many years, and embraces a number of different steps or stages, at one of which a functionary known popularly as the «devil's advocate» brings forward all possible objections, and points out all weak points in the evidence brought forward in favor of the reputed saint. When the question has been finally debated in successive meetings of the congregation, the Pope at last gives his decision, and the beatification may then take place in the Vatican. Beatification differs from canonization in this, that «whereas the cultus of a canonized saint belongs to the universal Church, and churches and altars can be freely erected in his or her honor, and images, pictures, or statues of him or her displayed without special permission, in the case of one of the Blessed it is otherwise. The honor and veneration which are authorized in their regard are limited and partial; and because the cultus of one of them is permitted to one country, or city, or order, or branch of an order, it does not follow that it should be practised elsewhere; and the attempt to extend it without special permission is condemned.» Compare Addis & Arnold's Catholic Dictionary. See CANONIZATION.

Beating the Bounds, a periodical survey or perambulation by which the boundaries of parishes in England are preserved. It is, or was, the custom that the clergyman of the parish, with the parochial officers and the boys of the parish school, should, on Ascension Day, march to the boundaries, which the boys struck with willow rods. A similar ceremony in Scotland is called riding the marches. In the New England colonies parallel duties were performed by «perambulators» and in Virginia by «processioners.» The custom is of Teutonic origin.

Beatitude, the Christian term meaning the highest degree of happiness of which our nature is susceptible, and applied particularly to the state of the elect in heaven. It was a favorite topic of discussion among the scholastic theologians, who divided it into subjective and objective, perfect and imperfect, and made our eternal happiness consist in the vision of God perfecting the intellect and will in possessing Supreme Truth and God. Recent theologians have generally made beatitude consist in honoring God and sharing his perfections, a sublime though indefinite conception. Though the state of beatitude be incomprehensible to us, yet the belief in it is a motive in the present life which begets heroism in the midst of misfortune, and an adherence to virtue in the midst of evils. The Beatitudes is the name given particularly to the beginning of the separate clauses in Christ's Sermon on the Mount.

Beaton, David, Scottish prelate and cardinal: b. 1494; d. St. Andrew's, 29 May 1546. He studied at St. Andrew's, Glasgow, and Paris, was for years Scottish resident in France, and in 1537 was consecrated bishop of Mirepoix in that country. Pope Paul III. raised him to the cardinalate in 1538, and next year he became primate of Scotland. He had much influence with James V., and after his death (1542) set himself to oppose the English party, to which the Reformers belonged. Upon the coronation of the young Queen Mary, he was made chancellor, and became also legate *a latere* from Rome. He now began to renew the persecution of heretics, and among the rest the famous Protestant preacher George Wishart suffered, being strangled and burnt at the stake, on the twofold charges of sedition and heresy. But a conspiracy had been formed against him, and he was assassinated at his own castle of St. Andrews. He was a man of great ability and recent historical research has cleared his character from many former calumnies.

Be'atrice, a witty, lively character in Shakespeare's 'Much Ado About Nothing,' who marries Benedick by the contrivance of the friends of each.

Beatrice Cenci, bā-ą-trē'chā chĕn'chę, a 16th century Roman girl whose picture was painted by Guido Reni, and whose career is the subject of Shelley's tragedy 'The Cenci.'

Beatrice Portinari, bā-ą-trē'chā pōr-tę-nä'-rę, the Beatrice of Dante's poems: b. about 1266; d. 1290. She was the daughter of a wealthy citizen of Florence, and wife of Simone de Bardi. She was but eight years of age, and Dante nine, when he met her first at the house of her father. He saw her only once or twice, and she probably knew little of him. The story of his love is recounted in the 'Vita Nuova,' which was mostly written after her death.

Be'atrice, Neb., a city and county-seat of Gage County, on the Big Blue River, and several railroads; 40 miles south of Lincoln, the State capital. It is the seat of the State Institution for Feeble Minded Youth; and has a handsome court-house, United States government building, Holly system of waterworks, electric light and street railway plants, public library, three national banks, excellent water power, flour and planing mills, tile and barbed wire works, creamery, iron foundry, and manufactories of gasoline engines, wind mills, and farming implements. It was incorporated as a town, 1871, and as a city, 1873. Pop. (1900) 7,875.

Beatrix (bę-ā'trĭks) **Antelope,** an Arabian oryx *Oryx beatrix*), resembling the beisa but without black markings on the haunches. See ORYX.

Beattie, bē'tĭ, **Francis Robert,** Canadian-American educator: b. near Guelph, Ontario, 1848. He was educated at Toronto University, studied theology at Knox College, Toronto, and at the Presbyterian College in Montreal. He was pastor at Baltimore and Cold Springs, Ontario, in 1878–82, and at Brantford in 1882–8. In 1888 he became professor of apologetics in the Presbyterian Theological Seminary in Columbia, S. C., where he remained till 1893, and then accepted the chair of systematic theology and apologetics in the Presbyterian Theological

Seminary, Louisville, Ky. His writings include 'An Examination of Utilitarianism' (1884); 'Methods of Theism' (1887); 'The Higher Criticism; or, Modern Critical Theories' (1888); 'Radical Criticism, an Exposition and Examination of the Radical Critical Theory of the Old Testament Scripture' (1895); 'Presbyterian Standards' (1896), etc.

Beattie, bā'tę, **James,** Scotch poet: b. Kincardineshire, 25 Oct. 1735; d. Aberdeen, 18 Aug. 1803. He obtained a scholarship at Aberdeen, and subsequently became assistant in the Aberdeen grammar school, and married the daughter of the head schoolmaster. After this event he began to be distinguished as a writer, and in 1771 commenced the publication of his work called the 'Minstrel.' This obtained for him the patronage of Lord Errol, and caused him to be appointed professor of moral philosophy and logic in Marischal College. In 1765, he published a poem, the 'Judgment of Paris,' which failed of any celebrity. The work which gained him the greatest fame was an 'Essay on the Nature and Immutability of Truth,' in opposition to sophistry and skepticism. It was designed as a reply to Hume, and was so much in demand that in four years five large editions were sold; and it was translated into several languages. He was urged by the archbishop of York and the bishop of London to take orders in the Church of England, a proposal which he declined. While in London he became intimate with Dr. Johnson, Dr. Porteus, and other distinguished literary characters. In 1783, he published 'Dissertations, Moral and Critical,' and the 'Evidences of the Christian Religion,' written at the request of the bishop of London. In 1790 he published the first volume, and in 1793 the second, of his 'Elements of Moral Science'; subjoined to the latter was a dissertation against the slave trade.

Beatty, John, American legislator: b. Bucks County, Pa., 10 Dec. 1749; d. Trenton, N. J., 30 May 1826. He was educated at Princeton, and took up the study of medicine with Dr. Rush of Philadelphia. He fought with distinction through the Revolutionary war, reaching the rank of colonel; was delegate to the Continental Congress in 1783–5; speaker of the House; served in the convention which adopted the Federal Constitution; was a member of Congress in 1793–5; and secretary of State of New Jersey in 1795–1805.

Beatty, bē'tĭ, **John,** American military officer: b. Sandusky, Ohio, 16 Sept. 1828. He fought on the Union side in the Civil War, rising from private to brigadier-general, and showing intrepid courage at Stone River, 1862–3. He was a member of Congress in 1868–74, and Republican presidential elector-at-large in 1884. He has written 'The Citizen Soldier; or, Memoirs of a Volunteer' (1876); 'The Belle o' Becket's Lane' (1882).

Beau Brummel. See BRUMMEL, GEORGE BRYAN.

Beaucaire, Monsieur, the principal figure in a story of the same name by Booth Tarkington (1900), dramatized 1901. Beaucaire is a French prince living incognito in the fashionable society of Bath, England, near the end of the 18th century.

Beaucaire, bō-kār, a small, well-built, commercial city of France, in the department of the Gard, on the Rhone opposite Tarascon, with which it communicates by a fine suspension-bridge, at the commencement of the Beaucaire and Aigues-Mortes Canal, and connected with several lines of railway. It has a commodious harbor for vessels which come up from the Mediterranean, seven leagues distant, considerable commerce and some manufactures; but is chiefly famous for its great fair (founded in 1217, by Raymond II., Count of Toulouse), held yearly from 21 to 28 July. Merchants from all parts of Europe, and even from the coast of Africa, attend with their goods; and almost every kind of article, however rare, is to be purchased here; though silks, woolens, printed cottons, leather, wool, wine, brandy, olive-oil, and fruits, are the chief objects of sale. Pop. (1890) 9,020.

Beauchamp, bō-shān, **Alphonse de,** French historian and publicist: b. Monaco, 1767; d. Paris, 1 June 1832. Under the Directory he had the surveillance of the press, a position which supplied him with materials for his 'History of La Vendée' (1806). He contributed to the 'Moniteur' and the 'Gazette de France.' Among his chief works are the 'History of the Conquest of Peru' (1807); the 'History of Brazil' (1815); and the 'Life of Louis XVIII.' (1821); 'Life of Julius Cæsar' (1821). The 'Memoirs of Fouche' is also with reason ascribed to him.

Beauchamp, bēch'ăm, **William Martin,** American clergyman and author: b. Coldenham, N. Y., 25 March 1830. Ordained to the Protestant Episcopal ministry in 1863, he filled rectorships at Northville, N. Y., 1863–5, and Baldwinsville, N. Y., 1865–1900. He has published 'The Iroquois Trail; or Foot Prints of the Six Nations' (1892); 'Indian Names in New York' (1893); and a valuable series of archæological studies published as Bulletins of the New York State Museum, namely, 'Aboriginal Chipped Stone Implements of New York' (1897); 'Polished Stone Articles used by the New York Aborigines' (1897); 'Earthenware of the New York Aborigines' (1898); 'Aboriginal Occupation of New York' (1900); 'Horn and Bone Implements of the New York Indians' (1902); 'Metallic Bone Implements of the New York Indians' (1902).

Beauclerk, bō'klärk, **Topham,** one of Dr. Johnson's favorite friends: b. December 1739; d. 11 March 1780. He was the only son of Lord Sidney Beauclerk, third son of the first Duke of St. Albans, and in general appearance much resembled his great-grandfather, Charles II. He studied at Oxford, and his conversational talents so much charmed Johnson that when «The Club» was founded, in 1763, he was one of the nine members who originally formed it. When he went to Italy, in 1762, Johnson wrote to his friend Baretti, warmly commending Beauclerk to his kindness. In 1765 he accompanied Johnson on a visit to Cambridge. A short time before his death, Johnson said of him: «He is always ready to talk, and is never exhausted»; and when communicating his death to Boswell, he said: «His wit and his folly, his acuteness and maliciousness, his merriment and reasoning, are now over. Such another will not often be found among mankind.»

Beaufort, bō-fôr, **François de Vendôme** (Duc de), French naval officer, grandson of Henry IV.: b. Paris, January 1616; d. 25 June 1669. He is peculiarly known by the conspicuous part he took in the civil war of the Fronde. On the accession of Louis XIV., the queen-regent treated him very favorably, but was soon dissatisfied with his impertinent manners. Her displeasure threw him on the side of the malcontents, and he became one of the leaders of the Frondeurs. He was extremely popular with the Parisians, and was consequently called *le roi des halles,* and he exercised a powerful influence on the common people against Cardinal Mazarin, who was twice driven out of France. In 1664 and 1665 he successfully led attacks against the corsairs of Africa; in 1666 was at the head of the fleet which was to join the Dutch to make war against England; lastly, in 1669 he went to the assistance of the Venetians, then besieged by the Turks in the island of Candia; fought bravely and was killed in a sally.

Beaufort, bū'fêrt, or bō'fêrt, **Henry,** English cardinal, natural son of John of Gaunt, and half-brother of Henry IV., king of England; d. Winchester, 11 April 1447. He became bishop of Lincoln, 1398, whence he was translated to Winchester, and in 1403 was made chancellor. In 1426 he received a cardinal's hat, and was appointed legate in Germany. In 1431 he crowned Henry VI. in Paris. Shakespeare depicts him in his 'Henry VI.,' but it is questionable whether the likeness is true to history.

Beaufort, Margaret, English countess: b. 1441; d. 1509. She was daughter of John, first Duke of Somerset, and mother of Henry VII., king of England. She was three times married, namely, to Edward Tudor, Earl of Richmond, in 1455; Henry Stafford, son of the Duke of Buckingham, and to Lord Stanley, a minister of Edward IV. In the Wars of the Roses, she and her son Henry became more or less dangerous to the Yorkists and were for a long time in retirement or exile.

Beaufort, bū'fêrt, N. C., city, port of entry and county-seat of Carteret County, at the mouth of Newport River, 167 miles east of Raleigh. The harbor here is the finest in the State. At Cape Lookout, 11 miles to the southeast, is a lighthouse 156 feet high. Pop. (1900) 2,195.

Beaufort, S. C., a town and county-seat of Beaufort County; on the Port Royal River, and the Charleston & W. C. R.R.; 15 miles from the ocean and 80 miles southwest of Charleston. It is midway between Charleston and Savannah; has an excellent harbor, and is the centre of the phosphate trade of the State. It was founded in 1711, and for many years prior to the Civil War was a noted health and pleasure resort, especially for the cotton planters interested in the plantations on the adjoining Sea Islands. It is still a popular summer and winter resort, principally engaged in phosphate mining, and with large exports of cotton, yellow pine and cypress lumber, rice, and sweet potatoes. In the fiscal year ending 30 June 1900, the imports of merchandise here aggregated in value $81,042, and the exports, $181,908. Pop. (1900) 4,110.

Beaufort Scale, an instrument for measuring the apparent force of the wind, so called from Admiral Beaufort who introduced it into the English navy about 1805. It is now in common use among navigators. Twelve numbers are embraced in the scale.

Beaugency, bō-zhŏn-sę, a town of France, in the department Loiret, 16 miles southwest of Orleans, on the side of a hill, above the Loire, here crossed by a stone bridge of 26 arches. The town was formerly surrounded by a wall flanked by towers and bastions, parts of which still remain. The square donjon tower of Beaugency, 115 feet high, is a remarkable structure of high antiquity, probably of the 10th or 11th century, though the exact date of its erection is unknown. The articles manufactured here are principally cloth and leather. There are also some distilleries and a considerable trade in wine. In the Franco-German war Gen. Chanzy was defeated here by the Grand-Duke of Mecklenburg on 7 and 8 Dec. 1870. Pop. (1896) 3,305.

Beaugrand, bō-grăn, **Honoré,** Canadian journalist: b. Lanoraie, P. Q., 24 March 1849. In 1865 he joined the French army in Mexico under Marshal Bazaine, and, after the failure to establish Maximilian as emperor, accompanied the army to France. In 1867 he went to New Orleans, where he engaged in newspaper work. He served subsequently as a journalist in Boston and St. Louis, and, returning to Canada, founded *La Patrie* in Montreal in 1879, as an organ of the French Liberal Party. He sold this paper in 1897. In 1887 he established a paper in the English language, the Montreal *Daily News.* He was mayor of Montreal 1885–7, and a delegate from Montreal to the Congress of the World's Chambers of Commerce in London in 1896. His publications include 'Melanges; Trois Conferences' (1888); 'Lettres de Voyage' (1889); and a novel, 'Jeanne la Fileuse.' He was decorated with the Cross of the Legion of Honor in 1885, and became commander of that order in 1889. He is also an officer of the Academy of France; a commander of the Order of Nicham Iftikar of Tunis, etc.

Beauharnais, bō-är-nā, **Alexandre** (Viscount de), French soldier: b. Island of Martinique, 1760; d. Paris, 23 July 1794. He served with distinction as major in the French forces under Rochambeau which aided the United States in their Revolutionary War, and married Joséphine Tascher de la Pagerie, afterward the wife of Napoleon. At the breaking out of the French Revolution he was chosen a member of the National Assembly, of which he was for some time president, and which he opened, after the king's departure, with the following words: «*Messieurs, le roi est parti cette nuit: passons à l'ordre du jour.*» In 1792 he was general of the army of the Rhine, but retired in 1793, in consequence of the decree removing men of noble birth from the army. He was falsely accused of having promoted the surrender of Mainz, was sentenced to death, and guillotined. His children, Eugène and Hortense, were adopted by Napoleon on the latter's marriage to Beauharnais's widow.

Beauharnais, Eugene de, French general: b. 3 Sept. 1781; d. Munich, 21 Feb. 1824. He was the son of Alexandre Beauharnais, who was guillotined in 1794, and Joséphine Tascher de la Pagerie, afterward wife of Napoleon and

Empress of France. During the French Revolution Eugene entered the military service, and after his father's death joined Hoche in La Vendée, and subsequently studied for a time in Paris. In 1796 Joséphine was married to Napoleon Bonaparte, then commander-in-chief of the army of Italy, and Eugene accompanied the great warrior in his campaigns in Italy and Egypt. In 1805 he was created a prince of France and viceroy of Italy, and after the peace of 13 Jan. 1806, married the Princess Augusta Amelia of Bavaria. In 1807 Napoleon made him Prince of Venice, and declared him his heir to the kingdom of Italy. He administered the government of Italy with great prudence and moderation, and was much beloved by his subjects. He conducted himself with great prudence on the occasion of the divorce of Napoleon from his mother. In the disastrous retreat from Moscow he did not desert the wrecks of his division for a moment, but shared its toils and dangers with the soldiers, and encouraged them by his example. To him and to Ney France was indebted for the preservation of the remains of her army during that fatal retreat. On the departure of Napoleon and Murat he was left in the chief command, and showed great talent at that dangerous conjuncture, and at the battle of Lützen, 2 May 1813, by surrounding the right wing of the enemy, he decided the fate of the day. Napoleon sent him from Dresden to the defense of Italy, and after the fall of Napoleon he concluded an armistice with Count Bellegarde, by which he delivered Lombardy and all upper Italy to the Austrians. Eugene then went immediately to Paris, and thence to his father-in-law at Munich. He was at the Congress of Vienna. On the return of Napoleon from Elba he was obliged to leave Vienna and retire to Baireuth. By an ordinance of the king of Bavaria, his father-in-law, he was created Duke of Leuchtenberg, November 1817. The Bavarian principality of Eichstädt was bestowed upon him, and his posterity declared capable of inheriting in case of the failure of the Bavarian line. Prince Eugene, under a simple exterior, concealed a noble character and great talents. Honor, integrity, humanity, and love of order and justice were the principal traits of his character. Wise in the council, undaunted in the field, and moderate in the exercise of power, he never appeared greater than in the midst of reverses. See Aubriet, 'Vie Politique et Militaire d'Eugène Beauharnais, Vice-roi d'Italie.'

Beauharnais, François (Marquis de), French nobleman: b. La Rochelle, 12 Aug. 1756; d. Paris, 10 Jan. 1819. He violently opposed the motion of his younger brother, the Viscount Alexandre, to take from the king the chief command of the army, and would not listen to any of the amendments proposed, saying, «*Il n'y a point d'amendement avec l'honneur.*» He was called in consequence of this, *Le féal Beauharnais sans Amendement.* In 1792 he formed the project of a new flight of the royal family; but the arrest of his companion, the Baron Chambon, prevented the execution of the plan. He was appointed major-general in the army of the Prince of Condé, and wrote, in 1792, to the president of the National Assembly, protesting against their unlawful treatment of the king, and offering to appear himself among his defenders. When Bonaparte became first consul, the marquis sent him a letter, in which he exhorted him, by the glory which he would gain by such a course, to restore the sceptre to the house of Bourbon. Having at last recognized the emperor he was sent by him as ambassador to Florence and Madrid; but having afterward fallen into disgrace he was banished.

Beauharnais, Hortense Eugenie, wife of Louis Bonaparte, and queen of Holland: b. Paris, 10 April 1783; d. Arenenberg, Switzerland, 3 Oct. 1837. She was the daughter of Alexandre Beauharnais and Joséphine, afterward wife of Napoleon. She was to have married Desaix; but on 7 Jan. 1802, in compliance with the wish of Napoleon, became the wife of Louis, who also gave up a former attachment for the marriage. The union was not happy; and Hortense returned to Paris, and lived a dissolute life there apart from her husband. Prominent among her lovers was the Comte de Flahaut, for whom she composed her popular air, «*Partant pour la Syrie,*» as he was leaving Paris for Germany, and Admiral Veruel, a Dutch naval officer. The former is believed to have been the father of M. de Morny, universally recognized as the illegitimate half-brother of Napoleon III., whom he greatly aided in becoming emperor; and to the latter is attributed the paternity of Napoleon III. himself. It is known that Louis Bonaparte had a warm dispute with his brother, the emperor, touching this child, which he averred to be none of his, and that his unwillingness to recognize it as such was only overcome by the most decided measures on the part of Napoleon. After the separation of Napoleon and Joséphine, Hortense remained on intimate terms with the former. When the Bourbons came back in 1814, she alone of all the Bonaparte family remained in Paris. After the Hundred Days, she lived in Augsburg, in Italy, and in Switzerland, devoted to her sons, and greatly beloved by the people with whom she came in contact, who found her a kind and gentle benefactress. When her sons had to flee, after participating in an unsuccessful attempt at revolution, in Italy, in 1831, she went for a time to Paris, and was kindly received by Louis Philippe. She possessed much literary, as well as social talent.

Beaulieu, bō-lyė, **Jean Pierre,** Austrian military officer: b. Namur, 26 Oct. 1725; d. near Linz, Austria, 22 Dec. 1819. He served in the Seven Years' war; was promoted a major-general for his successful operations against the Belgian insurgents in 1789; commanded at Jemappes in 1792; was defeated by Napoleon, in 1796, while commander-in-chief of the forces in Italy, in the battles of Montenotte, Millesimo, Montesano, Mondovi, and Lodi.

Beaulieu, bū'lĭ, a village in Hampshire, England, six miles southwest of Southampton. It contains the remains of an abbey founded by King John and much visited by students of mediæval architecture. Within the limits of Beaulieu Manor exemption from arrest for debt was enjoyed till very recent years.

Beaumarchais, bō-mär-sha, **Pierre Augustin Caron de,** French dramatist: b. Paris, 1732; d. May 1799. He was the son of a watchmaker, who destined him for his trade, and early gave striking proofs of his mechanical and also of his musical talents. He was afterward the teacher of the harp to the daughters of Louis XV., and was admitted into their society.

By a rich marriage he laid the foundation of the immense wealth which he afterward accumulated by his speculations, and which was also increased by a second marriage. In the meantime he occupied himself with literature and published the dramas of 'Eugénie' (1767), and 'Les Deux Amis' (1770). The first still holds its place on the stage. He showed all his talents in his lawsuit against Goezman and Lablache, when he wrote against the former (who belonged to the *parlement Maupeou*, so called, which was engaged in a dispute with the ministry) his celebrated 'Mémoires' (1774), which entertained all France. The fame of his 'Mémoires' alarmed even Voltaire, who was jealous of every kind of glory. 'The Barber of Seville' (1775) and the 'Marriage of Figaro' (1784) have given him a permanent reputation. In 1792 he wrote 'La Mère Coupable,' but never regained his former fame. His last work was 'Mes Six Epoques,' in which he relates the dangers to which he was exposed in a revolution in which a celebrated name, talent, and riches, were sufficient causes of proscription. He still possessed, at the age of more than 60, all the vigor of his youth, but was afflicted with deafness. He lost about 1,000,000 livres by his famous edition of the works of Voltaire (1785), and still more at the end of 1792 by his attempt to provide the French army with 60,000 muskets. In 1809 an edition of his works appeared in seven volumes; a later edition in one volume came out in 1835. Beaumarchais was a singular instance of versatility of talent, being at once an artist, politician, projector, merchant, and dramatist. He was passionately fond of celebrity. His 'Marriage of Figaro' excited one of those extraordinary sensations for which Paris has always been remarkable. The English modifications and versions of this comedy convey but a slight notion of the mischievous subtlety and deep spirit of intrigue in the original. See Loménie, 'Beaumarchais et son temps'; 'Beaumarchais et ses œuvres' (1887); 'Histoire de Beaumarchais' (1886); Lescure, 'Eloge de Beaumarchais' (1887); Bonnefou, 'Etude sur Beaumarchais' (1887); Hallays' 'Beaumarchais' (1897).

Beaumaris, bō-mar'is, a seaport town of North Wales, Isle of Anglesey. It is situated on the west shore of the Menai Strait, near its junction with the Irish Sea, where it expands into a good roadstead called Beaumaris Bay. It consists of several well-paved streets; houses in general, good, particularly in the principal street, terminated by the ancient castle of Beaumaris, erected by Edward I.; while many modern dwellings of very handsome appearance have lately been erected. The chief public buildings, exclusive of the churches, are the town-hall, a commodious and handsome edifice, the county-hall, the grammar-school, police office, and public library. The chief place of worship is the Church of St. Mary, a spacious and elegant structure in the later style of English architecture, with a lofty, square, embattled tower; and several chapels. The harbor is safe and commodious, and may be entered at any state of the tide. Beaumaris is now a favorite watering-place. Pop. (1901) 2,310.

Beaumont, Francis, b. 1585; d. 1616; Fletcher, John, b. 1576; d. 1615: English poets and dramatists, well known for their work in collaboration.

Francis Beaumont, third son of Sir Francis Beaumont of Grace Dieu in Leicester, one of the Justices of Common Pleas, was admitted gentleman commoner at Broadgates Hall, Oxford, in 1597, and was entered at the Inner Temple, London, 3 Nov. 1600. He married Ursula, daughter of Henry Isley of Sundridge, Kent, probably in 1613, and left two daughters, one a posthumous child. He was buried in Westminster Abbey.

John Fletcher, son of Richard Fletcher, Bishop of London, was entered as a pensioner at Bene't College, Cambridge, 1591. His father, as Dean of Peterborough, attended Mary Queen of Scots at Fotheringay, and was later rapidly promoted to the sees of Bristol, Worcester, and London. He was a successful courtier and a favorite of the queen, though he suffered a loss of favor shortly before his death in 1596. The dramatist received by bequest a share in his father's books, but apparently little other property. He was buried 29 Aug. 1625, in Saint Saviour's, Southwark.

Although the biographical details of the friendship and collaboration of the two dramatists are involved in uncertainty, it seems probable that Fletcher began writing plays for the London theatres as early as 1604–5, and that his friendship with Beaumont was established by 1607, when both prefixed commendatory verses to Jonson's 'Volpone,' and 'The Woman Hater,' probably by Beaumont alone, was published. In 1612, in the address to the reader prefixed to the 'White Devil,' Webster praises "the no less worthy composures of the both worthily excellent Master Beaumont and Master Fletcher," ranking them on equal terms with such scholars and experienced dramatists as Chapman and Jonson, and apparently above Shakespeare, Dekker, and Heywood. Before 1612, the reputation of Beaumont and Fletcher as dramatists must have been well established.

By 1612, indeed, the work of their collaboration was accomplished, for there is no direct evidence that Beaumont wrote anything for the public stage after that date. The most famous collaboration in the history of English literature, therefore, comprises only some half dozen years. During this time the dramatists, we are told, lived as brothers, sharing everything in common; and so intimate was their association as writers that it is only recently that criticism has been able to separate their shares in the authorship of the plays with any degree of probability. Fletcher's energies seem to have been devoted exclusively to the theatre; but Beaumont wrote verses to the Countess of Rutland, and elegies on the Lady Markham, Lady Penelope Clifton, and the Countess of Rutland; and also a masque for the Lady Elizabeth's marriage in 1613, performed with great splendor by the gentlemen of the Inner Temple and Gray's Inn. 'Salmacis and Hermaphroditus,' 1602, may possibly have been written by him; it is so assigned in the entry of 1639 in the *Stationer's Register*. Eight plays may be assigned to this period before 1612 with considerable certainty, each being the result of collaboration except where the contrary is indicated:

'The Woman Hater' (by Beaumont alone); 'The Knight of the Burning Pestle' (Beaumont); the 'Faithful Shepherdess' (Fletcher); 'Philaster'; 'The Coxcomb'; 'The Maid's Tragedy'; 'Cupid's Revenge'; 'A King and No King.' Eight other plays may be assigned before 1612 with more or less probability: 'The Woman's Prize' (Fletcher); 'Wit at Several Weapons' (first version); 'Love's Cure'; 'Thierry and Theodoret'; 'Monsieur Thomas'; 'Four Plays in One'; 'The Scornful Lady'; 'The Captain.'

The brief period of their collaboration came at the climax of the astonishingly rapid and varied development of the Elizabethan drama. It was during these years that Jonson and Shakespeare were at their greatest; but a growing critical consciousness among the dramatists themselves and an increasing patronage from the court seemed to promise for the drama a future even greater in achievement than its past. Gentlemen by birth and breeding, attached to the court rather than the people, Beaumont and Fletcher naturally joined with Jonson in viewing the plays of their predecessors with critical, though doubtless appreciative minds, and in seeking for a more cultivated audience and a more critical art. Their attitude toward the preceding drama is indicated by their abandonment of several species long popular but by this time falling under Jonson's attacks. Beaumont and Fletcher in their collaboration made no use of the historical matter of the chronicles or of the methods or spectacles of the chronicle play; nor did they use the story of blood vengeance, which had been popularized by Kyd in 'The Spanish Tragedy,' transformed by Shakespeare into 'Hamlet,' and was still the prevailing type of tragedy. Some of their earlier plays were experiments that further attest their reforming attitude. Beaumont's 'Woman Hater' was a comedy in Jonson's manner; and his 'Knight of the Burning Pestle,' written under the inspiration of 'Don Quixote,' was a burlesque on contemporary plays of adventure. Fletcher's 'Faithful Shepherdess' was an attempt to replace the abortive pastorals of earlier playwrights by a genuine and elaborate pastoral tragi-comedy on the model of 'Il Pastor Fido.' These plays won the praise of the critical, but even the manifest genius of the two latter was impotent to avert the disapproval of a public unused to such innovations.

Their other plays, though hardly less novel in character, and affording full opportunity for the authors' gifts of invention and language succeeded in captivating the public. These successes, the result of a constant attention to theatrical effectiveness, comprised two distinct classes of plays, the comedies and the heroic romances, both immediately popular and both of large influence on the later history of the drama.

Their comedy has its resemblances and connections with preceding drama; but it is a distinct departure from Jonson's comedy of «humours,» and it marks out a line of development that led to the plays of the Restoration. A lively plot, abounding in surprises, combines in a love story the manners of the day and the excitements of romance, an overflowing wit and no morals. Its full development belongs to Fletcher's later years; 'The Scornful Lady' is perhaps the best representative of the collaboration.

The romances, sometimes tragic and sometimes tragi-comic, also mark important innovations. The period immediately preceding them had been distinguished by Shakespeare's tragedies, the prevalence of realistic comedy, and the absence of sentimental or romantic comedy or tragi-comedy. The return to romance seems to have been established by 'Philaster,' and resulted in six plays that form the most distinctive product of the collaboration.

Other plays of the collaboration and many later written by Fletcher might be grouped with these; but the six plays, 'Four Plays in One,' 'Thierry and Theodoret,' 'Philaster,' 'The Maid's Tragedy,' 'Cupid's Revenge,' 'A King and No King,' serve to define the type, and resemble one another so closely in material, construction, characterization, and style that a single analysis will serve for all.

Their plots are usually original, and are ingenious complications of suspense and surprise. Like most preceding tragedies, they deal with royal or noble persons, foreign localities, and the plots and passions that convulse kingdoms; but there are no battles or processions, and the action is mainly confined to the rooms of the palace or an adjoining forest. A story of gross sensual passion is usually contrasted with one of idyllic sentiment; and a great variety of incidents are designed to keep the interest at fever heat. A girl disguised as a page is stabbed by the man whom she loves; a woman accused of adultery defies her accusers; the hero is saved from the tyrant by a timely insurrection — such idyllic or melodramatic material as this is skilfully constructed into a number of telling theatrical situations, leading through a series of surprises to startling climaxes or catastrophes. In the ingenuity of their structure even more than in the choice of their material, the romances marked a departure from preceding plays. Their *dramatis personæ* belong to the impossible and romantic situations, and are usually of certain types,— the sentimental or violent hero; his faithful friend, a blunt outspoken soldier; the sentimental heroine, often disguised as a page that she may save the hero; the evil woman who makes most of the trouble; and the poltroon, usually a comic personage. With the addition of a king, some persons of the court, and some from the lower ranks, the cast is complete. Even at their best such plays afford little that is valuable in the revelation of character or the criticism of life; yet the masterpieces of the class, 'Philaster' and 'The Maid's Tragedy,' take almost if not quite the highest rank after Shakespeare, because of the skill of their invention and the felicities and vigor of their poetry.

Both romances and comedies delighted their own age, and the young authors were quickly established among the poets of highest rank in both critical and popular estimation. There is evidence that their heroic plays suggested Shakespeare's change from tragedy to romance, and that 'Philaster' led somewhat directly to 'Cymbeline.' Certainly both comedies and romances were much imitated by dramatists of the next 30 years. Their freedom in versification, their emphasis on stage situation rather

than interpretation of character, their heedlessness of morality, and their fondness for the abnormal and sensational, all led to the decadence of the drama; but much of what is worthy as well as what is unworthy in the drama of the 17th century may be traced back to their initiative. They were ranked above Shakespeare and Jonson by their contemporaries, and their plays remained the favorites of the theatre during the Restoration. By the beginning of the 18th century, pseudo-classicism brought them into disrepute with the critics, and a chastened stage condemned their immorality. During the two centuries since they have never recovered their position on the stage, but numerous editions of their plays testify to their continued favor with the reading public.

After 1612 Fletcher continued for 13 years to write plays with unabated energy, displaying even greater versatility of invention and wit than when writing with Beaumont, but becoming more addicted to his mannerisms and more careless of moral decency. About 1613 he seems to have collaborated with Shakespeare on 'Henry VIII.' and 'The Two Noble Kinsmen,' and the association with the great master brought forth some of his finest passages. He was, indeed, frequently engaged in collaborating with various authors, and especially with Massinger. 'The Queen of Corinth,' 'The Double Marriage,' 'The Laws of Candy,' 'The Little French Lawyer,' 'The False One,' 'The Prophetess,' and 'The Spanish Curate' are some of the plays most certainly to be ascribed to this partnership, and most typical of the two authors. Fletcher, however, did not require collaboration for stimulus. In 'Bonduca' he produced one of the most vivid of our historical tragedies; and in a series of romances and comedies, of which 'The Little French Lawyer,' 'The Chances,' 'The Wild Goose Chase,' and 'The Loyal Subject' are among the best, he gave continued evidence of his extraordinary fertility both as a playwright and as a poet.

Most of the characteristics of these later plays may, however, be traced in the period of Fletcher's collaboration with Beaumont; and, though modern criticism has denied to the latter a share in the majority of the plays long published under his name it is difficult to separate the sentiments and opinions of the two friends or to divide their contribution to the development of the drama.

The following plays were printed separately, many of them several times before 1647, when the first collected edition appeared. The dates are for the first editions. 'The Woman Hater,' 1607; 'The Faithful Shepherdess,' 1609 (?); 'The Knight of the Burning Pestle,' 1613; 'Cupid's Revenge,' 1615; 'The Scornful Lady,' 1616; 'The Maid's Tragedy,' 1619; 'A King and No King,' 1619; 'Philaster,' 1620; 'Thierry and Theodoret,' 1621; 'The Two Noble Kinsmen,' 1634; 'The Elder Brother,' 1637; 'Rollo, or the Bloody Brother,' 1639; 'Monsieur Thomas,' 1639; 'Wit Without Money,' 1639; 'The Coronation,' 1640; 'The Night Walker,' 1640; 'Rule a Wife and Have a Wife,' 1640. In 1647 appeared the first folio entitled, «Comedies and Tragedies written by Francis Beaumont and John Fletcher,» and containing the following plays «never before printed»: 'The Mad Lover,' 'The Spanish Curate,' 'The Little French Lawyer,' 'The Custom of the Country,' 'The Noble Gentleman,' 'The Captain,' 'The Beggar's Bush,' 'The Coxcomb,' 'The False One,' 'The Chances,' 'The Loyal Subject,' 'The Laws of Candy,' 'The Lovers' Progress,' 'The Island Princess,' 'The Humorous Lieutenant,' 'The Nice Valour,' 'The Maid in the Mill,' 'The Prophetess,' 'The Tragedy of Bonduca,' 'The Sea Voyage,' 'The Double Marriage,' 'The Pilgrim,' 'The Knight of Malta,' 'The Woman's Prize,' 'Love's Cure,' 'The Honest Man's Fortune,' 'The Queen of Corinth,' 'Woman Pleased,' 'A Wife for a Month,' 'Wit at Several Weapons,' 'The Tragedy of Valentinian,' 'The Fair Maid of the Inn,' 'Love's Pilgrimage,' 'Four Plays in One,' 'The Mask of the Inner Temple and Gray's Inn.' In 1679 appeared the second folio, containing all the plays of the 1647 folio and the 17 previously published and also 'The Wild Goose Chase' (4to 1652). 'The Faithful Friends' and 'Sir John Van Olden Barnavelt' remained in manuscript and were not printed until the 19th century. With the exception of a few plays already noted as by Beaumont alone, Fletcher seems to have had at least a share in all of these plays and in 'Henry VIII.' See DRAMA; ELIZABETHAN LITERATURE — THE DRAMA.

Bibliography.— Collective editions of Beaumont and Fletcher were published in 1711; 1750, edited by Theobald, Seward, and Symson, 10 vols.; 1778, 10 vols.; 1812, ed. Henry Weber, 14 vols.; 1843–6, ed. Alexander Dyce, 11 vols.; and there have been various reprints of these editions. Dyce's edition has long remained the standard, but there are now in course of publication two editions of the complete works; one of which, vol. 1, appeared in 1904 under the general editorship of A. H. Bullen; vol. 1 of the other in 1905, under the editorship of A. R. Waller.

The most important of recent critical discussions are: 'Francis Beaumont, a Critical Study,' by G. C. Macaulay (1883); 'The Influence of Beaumont and Fletcher on Shakespeare' by A. H. Thorndike (1901); 'The Chronicle of the English Drama,' by F. G. Fleay (vol. 1, pp. 164–229); and articles by Robert Boyle in *Englische Studien* (1881–1887), and by E. F. Oliphant, *Englische Studien* (1890–92). Separate plays with critical introductions and notes are published in 'Belles Lettres Series' (Boston).

ASHLEY H. THORNDIKE,
Professor of English, Columbia University.

Beaumont, Sir George Howland, English art patron: b. Dunmow, Essex, 6 Nov. 1735; d. 7 Feb. 1827. He possessed considerable skill as a landscape painter, but was noted more especially as a munificent patron of the arts. The establishment of the National Gallery was mainly owing to his exertions, and 16 of its fine paintings, chiefly landscapes, including one by N. Poussin, three by Claude, and the 'Blind Fiddler' of Wilkie, were his gifts. Wordsworth dedicated to him his 'Elegiac Musings' (1830).

Beaumont, bō-môn, **Gustav Auguste de la Bonniere de,** French publicist: b. 16 Feb.

1802; d. Tours, 6 Feb. 1866. He early entered upon the legal profession, and, in 1831, was sent with De Toqueville to study the penitentiary system of the United States. He was elected deputy in 1839, and, in 1848, vice-president of the Constituent Assembly. He was subsequently ambassador to London and Vienna. Beaumont first became known as a writer by his publishing, in conjunction with M. de Tocqueville, 'Traité du Système Pénitentiaire aux Etats-Unis et de son application à la France' (1832). Among his other works may be named, 'Marie, ou l'Esclavage aux Etats-Unis' (1835)—a work somewhat resembling 'Uncle Tom's Cabin'; and 'L'Irlande sociale, politique, et religieuse' (1839).

Beaumont, bō'mŏnt, Sir **John,** English poet: b. Leicestershire, 1582; d. about 1627. He was an elder brother of Francis Beaumont, the dramatist, and studied at Broadgate Hall (now Pembroke College), Oxford. In 1605 he succeeded to his father's estates on the death of his elder brother. He began writing poetry at a comparatively early age, and in 1602 published anonymously a mock-heroic piece entitled 'The Metamorphosis of Tobacco.' He was created a baronet in 1626. In 1629 his son, Sir John, published a collection of his poems under the title 'Bosworth Field, with a Taste of the Variety of other Poems left by Sir John Beaumont.'

Beaumont, Joseph, English poet: b. Hadleigh, Suffolk, 13 March 1616; d. 23 Nov. 1699. He was educated at Peterhouse College, Cambridge, where he gained great distinction. Elected a Fellow in 1636, he was ejected with others in 1644 owing to royalist sympathies, and while living in retirement wrote 'Psyche,' an epic poem (1648). On the restoration of the monarchy he became a royal chaplain, and after a brief term as master of Jesus College he was appointed in 1663 master of Peterhouse. He received the regius professorship of divinity at Cambridge in 1674.

Beaumont, William, American surgeon: b. Lebanon, Conn., 1785; d. St. Louis, 25 April 1853. He is principally noted for his discoveries regarding the laws of digestion and for his experiments upon the body of Alexis St. Martin. In 1822 Beaumont was stationed at Michillimackinac, Michigan. On 6 June, St. Martin, a young man 18 years of age, in the service of the American fur company, was accidentally shot, receiving the whole charge of a musket in his left side, from a distance of about one yard, carrying with it portions of his clothing, and fracturing two ribs, lacerating the lungs, and entering the stomach. Notwithstanding the severity of the wound, Beaumont undertook his cure, and by careful and constant treatment and attention, the following year found him enjoying good health with his former strength and spirits. In 1825 Beaumont began a series of experiments upon the stomach of St. Martin, showing its operations, secretions, the action of the gastric juices, etc.; these experiments he was obliged to discontinue after a few months, but renewed them at various intervals until his death; his patient during so many years presenting the remarkable spectacle of a man enjoying good health, appetite, and spirits, with an aperture opening into his stomach two and a half inches in circumference, through which the whole action of the stomach might be observed.

Beaumont, Texas, city and county-seat of Jefferson county: situated on the west bank of the Neches River; on the So. Pacific, Sabine, and East Texas, Gulf, Colorado and Santa Fé, Gulf and Interstate, Kansas City So., and Beaumont, Sour Lake and W. R.R.'s; 80 miles northeast of Houston and 22 miles distant from the Gulf of Mexico.

Industries.—Beaumont is an important shipping point; is at the head of tidewater navigation and has a number of important industries, among which are oil refineries, rice mills, stove and iron works and lumber. Oil was discovered in the Beaumont fields in 1901, when there was opened up a series of gushers, the most remarkable in the history of the oil industry. That oil was there had long been known and several men had lost fortunes trying to get at it, but it was not until the wells were sunk on Spindle Top that success came. The structure of Spindle Top appears to be that of a dome with steep sides and rather flat summit. The equipment of the refineries, the pipe lines, and transportation and storage facilities for this industry alone, represent an investment of over $45,000,000. The lumber industry has assumed great proportions, the city being the natural headquarters for this business and the annual output now exceeds 360,000,000 feet of yellow pine. The cultivation of rice was begun some years ago; the belt extending along the coast of Louisiana and Texas produces more rice than is consumed in this country; and the largest rice mill in Texas is located at Beaumont.

Public Buildings, Banks, Churches, etc.—Among the most notable public buildings are the new Federal Court-house and Post-office, costing over $200,000, the Jefferson County Court-house, city hall, Y. M. C. A. building, and the Sisters Hospital. Religious services are held in churches representing nearly all denominations. A theatre has been erected at a cost of about $100,000. There are four banks with a combined capital of $600,000 and doing an annual business of $25,000,000.

Educational Institutions and Public Works.—For the public education there are a fine new high school with manual training department and several ward schools. Bell Austin Institute is located there. About 20 miles of street are paved with brick and shell; a complete sewerage system has been installed; a new waterworks system has been completed at a cost of over $300,000; and there are well appointed fire and police departments.

History, Government, and Population.—Beaumont was first settled in 1836, being plotted by John Grisby, Joseph Pulsifer, Henry Millard, and Thomas B. Huling. It was incorporated under the general law in 1881 and granted a special charter in 1889, the affairs of the community now being administered by a mayor and council of six members, elected biennially. About 80 per cent of the population are white, the remainder negroes. Pop. (1900) 9,427; (1905) about 25,000. Death rate 13.4.

H. G. Spaulding.
Secretary Chamber of Commerce.

GENERAL P. G. T. BEAUREGARD.

Beaune, bōn, **Florimond de,** French mathematician: b. Blois, 1601; d. there, 1652. He materially developed the Descartes method in geometry and was the first to treat systematically the question of superior roots of numerical equations. What is styled "Beaune's Problem," solved only by Jean Bernouilli, depends on the determination of a curved line from the property of its tangent. He was the first to treat in a systematic way superior and inferior roots of numerical equations.

Beaune, a town of France, in the department Côte d'Or, 23 miles south-southwest of Dijon. As early as the 7th century it was a fortress under the name of Belna. It is surrounded with planted ramparts, which furnish a pleasant promenade; is well built, and has a notable Church of Notre Dame, dating from the 12th century, and a large hospital, founded in 1443 by Nicholas Rollin, chancellor of Philip the Good, Duke of Burgundy. Beaune has also a public library containing about 50,000 volumes with 500 manuscripts, a very fine public garden, a theatre, etc. The trade is chiefly in Burgundy wines, to one of which the town gives its name, and in agricultural produce. The manufactures include woolen cloth, cutlery and leather. There is a statue erected in 1849, to the celebrated mathematician Monge, who was born there. Pop. (1896) 11,808.

Beauregard, bō'rę-gärd, **Pierre Gustave Toutant,** American Confederate general: b. New Orleans, 28 May 1818; d. there, 20 Feb. 1893. After studying military science at West Point he joined the artillery, but was afterward transferred to the engineers. In the Mexican war of 1846–7 he distinguished himself, and was promoted major. On the outbreak of the Civil War he resigned in order to enter the Confederate army, and was placed in command of the city of Charleston, South Carolina. On 12 April 1861 he reduced Fort Sumter, and later in the same year led the Confederates to victory in the battle of Bull Run. At the battle of Shiloh in the following year he assumed the command on the death of Gen. A. S. Johnston, but though very successful on the first day he was ultimately compelled to retreat to Corinth, Miss., which he had to evacuate shortly afterward. From September 1862, till April 1864, he defended Charleston against the siege operations of Gen. Gillmore and Admirals Dupont and Dahlgren. In October 1864, became commander of the military division of the West, in which capacity he strove without success to resist Sherman's victorious advance, and in April 1865 he and J. E. Johnston surrendered. He was afterward a railroad director, adjutant-general of Louisiana, and manager of the Louisiana State Lottery. In 1866 the chief command of the Rumanian army was tendered him, and in 1869 that of the army of the khedive of Egypt, both of which he declined. He published 'The Principles and Maxims of the Art of War' (1863), and 'Report of the Defense of Charleston' (1864).

Beaurepaire-Rohan, bō-r'-pãr-rō-äṅ, **Henriques de,** Brazilian geographer of French extraction: b. province of Piauhy, about 1818; d. 1894. He traveled extensively in the region south of Rio de Janeiro, publishing the results of his tour in a volume called 'Descripçâo de uma viagem de Cuyaba' âo Rio de Janeiro' (1846). The Brazilian government subsequently employed him to gather statistics relating to the interior provinces, and he was at one time lieutenant-general in the Brazilian army. His Etudios acerca da organizçâo da Carta geographica e da historia physica e politica do Brazil' (1877) is a work of great importance.

Beausobre, bō-sōbr, **Isaac de,** French Protestant historian: b. Niort in France, 1659; d. Berlin, 1738. He was at first intended for the law, but his own inclinations were decidedly in favor of the Church; and in 1683 he became Protestant minister of Chatillon-sur-Indre. In the persecuting spirit of the time the Church had been closed by fixing the royal seal upon the gate. Beausobre held special services in his own house, and being for this reason obliged to flee, sought an asylum at Rotterdam. Shortly after he became chaplain to the Princess of Anhalt at Dessau, which he quitted in 1694, when he became minister to French Protestants at Berlin. He enjoyed much of the favor both of Frederick William I. and of the crown-prince, afterward Frederick the Great. His most remarkable work is the 'Histoire Critique de Manichée et du Manichéisme' (1734); and he also wrote 'Histoire de la Réformation' (1785–6).

Beautiful Snow, a popular poem first published in 'Harper's Weekly' in 1858. Its authorship has had various claimants but has been definitely assigned to John W. Watson.

Beauty and the Beast, an ancient story very evidently a myth of the Sun and the Dawn. In all the variants the hero and the heroine cannot behold each other without misfortune. One of the earliest forms of the story is the Vedic myth of 'Urvasî and Purûravas.' Another is the Sanskrit Bhekî, who marries on condition she shall never see water; thus typifying the dawn, vanishing in the clouds of sunset. In Greek myths we find a resemblance in some features of 'Orpheus and Eurydice'; and the name of Orpheus in its Sanskrit form of Arbhu, meaning the sun, hints quite plainly at a solar origin of this cycle of tales. A more marked likeness exists in the myth of Eros and Psyche by Apuleius, and in the Scandinavian tale of the 'Land East of the Sun and West of the Moon,' related by Morris in 'The Earthly Paradise.' More or less striking parallels are seen in the Celtic 'Battle of the Birds'; in the 'Soaring Lark,' by Grimm; in the Kaffir 'Story of Five Heads'; in Gaelic, Sicilian, and Bengal folk-lore; and even in as remote a quarter as Chile. The tale is told in Straparola's 'Piacevoli notti' (1550); in Madame Villeneuve's 'Contes Marines' (1740), and is the basis of Gretry's opera, 'Zémise et Azor.'

Beauty. See ÆSTHETICS; ART.

Beauvais, bō-vā (ancient BRATUSPANTIUM, BELLOVACUM), a town of France, capital of the department of Oise, 54 miles north of Paris. It stands in a rich valley enclosed by wooded hills, at the confluence of the Avelon with the Thérain; and though poorly built, derives great interest from its antiquity. It existed in the time of the Romans, and in 1472 resisted an army of 80,000 Burgundians under Charles the Bold. The principal edifice is the unfinished cathedral of Saint Pierre, consisting of choir and transept. It has the loftiest stone vault in the world, and beautifully painted glass, exe-

cuted by the most celebrated masters of the art. The choir was built in 1225–72. The town-house is the finest modern structure. The principal manufacturing establishment is the Gobelins branch tapestry and carpet manufactory, famed for the beauty of its products, and employing about 400 hands; and there are also manufactures of woolens, buttons, brushes, gold and silver lace, etc. It has also large bleachfields, tanneries, and dyeworks. Beauvais is the seat of a bishop, and had a population in 1896 of 16,371.

Beauvois, bō-vwä, **Ambrose Joseph Palisot de,** French naturalist: b. Arras, 1752; d. 1820. He visited Africa, the West Indies, and America, in connection with his favorite pursuits in natural history, and was rewarded by the discovery of the jaws and molar teeth of the great mastodon, on the banks of the Ohio. He afterward returned to France, and devoted the remainder of his life to the arrangement and publication of his collections. Comparatively few of them had arrived in safety, but out of the wreck he managed to procure materials for the important publications on which his fame chiefly rests. The most valuable is his 'Flore d'Oware et de Benin.' One of the most curious plants contained in it has been named after him Belvisia.

Beaux, bō, **Cecilia,** American artist: b. in Philadelphia. She studied under William Sartain, and at Paris. She has four times gained the Mary Smith Prize of the Pennsylvania Academy of Fine Arts, and has been awarded the same academy's gold medal and Temple gold medal. She has received similar honors from the National Academy of Design, the Philadelphia Art Club, Carnegie Institute, and the Paris Exposition of 1900.

Beaux-arts, bō-zär, **Academie des.** See Academy of Fine Arts, The.

Beaux' Stratagem, a well known comedy by the English dramatist, George Farquhar (q.v.).

Beaven, Thomas, American Roman Catholic prelate: b. Springfield, Mass., 1849. He was educated at the Jesuit colleges of Holy Cross, Worcester, Mass., and Georgetown, D. C. After holding pastorates at Spencer and Holyoke, Mass., was consecrated Bishop of Springfield in 1892.

Beaver, James Addams, American military officer and statesman: b. Millerstown, Pa., 21 Oct. 1837. He was graduated at Jefferson College, Canonsburg, Pa., in 1856; and for a time practised law. He served in the Federal army, 1861–4; and was retired with the rank of brigadier-general of volunteers (22 Dec. 1864). He then resumed the practice of law; became major-general of the Pennsylvania State militia; was defeated as Republican candidate for governor in 1882; elected in 1887; president of the board of trustees of the Pennsylvania State College; vice-moderator of the Presbyterian General Assembly in 1888 and 1895; and member of the President's commission on investigation of the War Department in 1898.

Beaver, Philip, English naval officer: b. in Lewknor, Oxfordshire, England, 28 Feb. 1766; d. Table Bay, South Africa, 5 April 1813. He served during the American Revolutionary War in the royal navy. After the war he undertook to establish an agricultural colony on Bulama Island, on the west coast of Africa, and in April 1792 left England with three ships and 275 white colonists, expecting that the latter would not only cultivate the soil, but would do much toward civilizing the negroes. The enterprise proved a failure and he returned to England in 1794. Subsequently he distinguished himself in the naval service.

Beaver, Pa., a borough and county-seat of Beaver County, on the Ohio River, and the Pennsylvania and the Pittsburg & L. E. RR.'s; 28 miles northwest of Pittsburg. It has natural gas, abundant water power, large coal and oil shipping interests, a public park, national bank, and daily and weekly newspapers, and is the seat of Beaver College (Methodist Episcopal). Pop. (1900) 2,348.

Beaver, a large aquatic rodent animal of the northern part of the world, named by Linnæus, *Castor fiber,* and representing the family *Castoridæ.* It is distinguished from its nearest relatives, the marmots, not only by adaptation to an aquatic life, and the possession of large, fully webbed hind feet, which form the principal instrument for swimming, but especially by its extraordinary tail, which is exceedingly broad and covered with a horny integument resembling scales. A large beaver is about two feet in length from the root of the tail to the nose, and the tail will be nearly a foot long. Such a one will weigh about 35 pounds. Its flesh is edible, but not particularly good. The fur is exceedingly close and fine, and when freed from the long hairs that are scattered through it and overlie the under coat, forms one of the most valuable furs of commerce and one which figured largely in the early history of North America. It is owing, indeed, to the eagerness with which men have sought for this valuable commodity, going farther and farther into the wilderness in search of the animal, that the beaver has almost disappeared from large regions where it was once numerous. Originally it was widespread throughout Europe and northern Asia, but became extinct in the British Islands in the 12th century, and it remains elsewhere in Europe only in a few of the wilder streams of Norway and some of the tributaries of the Rhone and the Danube, where it is under royal protection. In some cases colonies of captives have re-established themselves in parks, notably that of Lord Bute, in England. It still exists, however, in eastern Siberia, whence a large number of its skins are annually sent to market.

When America was first entered by Europeans, the beaver was found inhabiting almost all of the woodland streams of the whole northern continent, from the Arctic Circle down to Central Mexico. Its temperament and manner of life made it an easy prey, and prevented it from adapting itself to changed conditions as did its neighbor, the muskrat. It rapidly disappeared, therefore, wherever civilization progressed or trapping was systematically carried on, and now no beavers are to be found south of the rivers that flow into Hudson Bay, except in the northern parts of the Rocky Mountains and in a few remote and scattered places like the forests of Maine and the Lake Superior region, where they are more or less protected by law. A few survive, nevertheless, in the wild ranges

of the southern Alleghenies and along the borders of Mexico. The principal use to which beaver fur was put was for the making of hats; and it is probable that had not the method of making hat-coverings from silk been discovered, the animal would long ago have become extinct, and also its South American substitute, the coypu or nutria.

The life of the beaver is remarkably interesting on account of the skilful structures by which it keeps itself surrounded with a sufficient depth of water, and so maintains access to a continuous supply of food. The food of the beaver consists mainly of the bark of hardwood trees, such as the maple, linden, birch, poplar, and the like. It never eats the bark of the coniferous trees, and beavers are not found living in forests composed entirely of coniferous trees, nor are beavers able to live in a treeless country. They are gregarious and dwell in colonies, which in favorable circumstances, may persist for centuries. From time to time a pair of young beavers will wander away from such a colony and seek a new place in which to start afresh. They will choose a sluggish stream in the woods, preferably where the ground is low and level, and there will dig for themselves a burrow in the bank, the entrance of which is below the surface of the water. The tunnel will lead upward into the earth above the level of high water, and there be enlarged into a chamber in which will be placed a bedding of grass, etc. They are likely to make an opening from this chamber into the air, and, as if for defense or concealment, will pile over this opening a little heap of brush, in which perhaps may be seen the germ of the architectural ability which the species have so highly developed. It is necessary to their scheme of life that the water in the stream should never fall so low in summer as to expose the entrance of the burrow; moreover, it is necessary that this water should be so deep that in winter the ice will not freeze to the bottom, but that, on the contrary, there shall remain room enough between the ice and the bed of the creek for them to store there a supply of winter food. In order to maintain this requisite level of water the beavers throw a dam across the stream below their settlement, holding the water back to a sufficient height. For this purpose they choose a place where the water is not more than 2½ feet deep and the bottom is firm, and beginning in the centre of the channel they place there, lengthwise of the current, a number of long sticks which they hold down by piling upon them mud and stones, moved into place with their dexterous fore feet. They procure these poles by cutting off small trees with their front teeth, which are exceedingly large and strong and are faced with a hard yellow enamel. As the back part of the tooth consists of softer material, it wears away more rapidly, leaving the front with a chisel-like edge, which is always sharp. Standing on their hind feet, they gnaw round and round the stem of a tree until it falls; and are able to cut down trees 18 inches in diameter, but this is only done in procuring their winter supplies. From its foundation in the centre the dam is carried each way to the shore. As the beavers increase in number and the young ones grow up, they settle in the immediate neighborhood until after a few years a considerable colony will have arisen. During all this time work progresses upon the dam, each beaver gathering drift-wood, branches, and logs from the shore, stones, mud, pieces of sod, and everything available for the purpose, and working it into the structure of the dam. The work is carried on only at night and especially on pleasant moonlight nights, when they seem to be extremely busy from sunset till sunrise. There is no superintendence, but each one possessed with an instinct for industry, does whatever seems to it best. The result is a mere tangled heap, having a long slope and comparatively tight surface on the upper side, which sometimes in a low, swampy region, will stretch for several hundred feet and hold back a large pond or morass, largely grown up to grass, but having many channels running through it. Meanwhile each family of beavers has erected for itself upon the bank of the pond or upon some islet adjacent to one of the channels, a conical house or lodge, the interior of which may be a room six or seven feet in breadth, which has no opening into the air, but is entered from beneath the water by two channels, one of which is commonly used, while the other forms a means of escape in case of invasion by a mink or some other aquatic enemy. These houses are more solidly constructed than even the dam; and when frozen in winter are so thick and strong that nothing less than a bear is able to break into them. These houses are largest and strongest in the cold northern regions. During the summer beavers go ashore and obtain from time to time such bark as they want for food, and also feed largely upon the roots and stems of the flags, lilies, and other water plants. In winter, however, when the pond is covered with ice and the banks with snow, the beavers would be unable to obtain such food, and to escape starvation are obliged to store in the autumn a sufficient supply to last them through the winter. They do this by felling large trees near the water's edge and cutting them up into such portions as they can manage to roll or drag into the water. These are floated away and sunk at the doors of their houses, where they are weighted or stuck into the mud to prevent their floating away, until a sufficient pile has been procured. Piece by piece this store is taken into the house during the winter, and, the bark having been eaten off, the sticks are thrown out to be used in the spring as material for repairing and extending the dam.

It will be apparent that a colony of beavers would soon exhaust the supply of trees bearing edible bark within reach of the shore of their stream, unless they had some means of reaching new and more distant supplies. In truth, where the banks are steep, this soon happens, and the beavers must then seek a new place. Where the forest is low and level, however, they will excavate canals which are gradually extended farther and farther into the woods on each side of the pond, and so enable themselves to reach more and more fresh trees. In some of the swampy forests about the headwaters of the Mississippi which was perhaps the headquarters of beaver life in this country, these canals have been known to extend several hundred feet, and in such places colonies of beavers have maintained an existence of more than 200 years. These channels are kept free from weeds and of a proper depth; and the most important service which the dam renders is to maintain

the right level of water in these canals, so that they may always be used as the avenues of the industrious community.

The American beaver seems to have carried its architectural work to a higher degree of perfection than the European beaver was ever known to do, although in Siberia, where similar climatic conditions prevail, and it is necessary for them to erect houses impervious to the great cold and to the attacks of marauding animals, they come near to equaling their American cousins. There is little record of such structures being made primitively in central Europe, and the beavers now living in the streams of Germany and Austria make few attempts at either dams or houses, but are content to dwell in their bank-burrows.

The substance called *castoreum* is obtained from two glandular pouches in the beaver, closely connected with the organs of reproduction, and probably of service in attracting the sexes to one another in the rutting season. It is a secretion having a powerful, peculiar, pungent odor, and was formerly in demand for medicinal purposes. At present its only use is as a scent-bait for traps. Fossil remains of beavers have been found as far back as the middle of the Tertiary period. Fossils of small-sized species, with some distinctive peculiarities, occur in the Miocene rocks of the western United States; and a huge beaver (*Trogontherium*) existed in Europe in the Pliocene age.

Beaver Dam, Wis., a city of Dodge County, situated on Beaver Dam Creek, and on the Chicago, M. & St. P. R.R. It is the seat of Wayland Academy, has a library of 10,000 volumes and several parks. It is in an agricultural district and has a considerable trade; it is also well provided with water-power and has numerous manufacturing interests, including flour mills, iron works, machinery manufactures, etc. Beaver Dam was settled in 1841 and incorporated in 1856. The revised charter of 1889 provides for a mayor and a city council, to be elected biennially. Pop. (1900) 5,128.

Beaver Falls, Pa., a borough in Beaver County, situated on the west bank of the Beaver River, about four miles from its confluence with the Ohio River, and seven miles north of Beaver, the county-seat, and on branches of the Lake Shore and Pennsylvania R.R.'s. The water-power furnishes excellent facilities for manufactories; there is an abundant supply of coal and natural gas, and the manufactures consist of iron bridges, axes, saws, glassware, gas engines, and steel products. There are four banks, a Carnegie library, and a commodious post-office building. Beaver Falls is also the seat of Geneva College (Reformed Presbyterian). Religious services are held in 17 church edifices. Beaver Falls was settled about 1800 by a few families of pioneers, and was called Brighton until 1868, when it was incorporated as a borough. The affairs of the community are administered by a burgess and council of 12 members elected irregularly every three years. Until 1868 the town was only a small village, but in that year the Harmony Society bought up nearly the entire tract of land and laid it out into lots, thus starting the growth in population, until it now is the largest town in Beaver County. Pop. (1900) 10,054.

Beaver Islands, a group of islands situated in the north part of Lake Michigan in Charlevoix County, and interesting as the scene of a short-lived Mormon colony. The largest town, Saint James, on Big Beaver Island, was settled in 1847 by James J. Strang, a Mormon elder, driven away from the parent Mormon community because his claims conflicted with those of Brigham Young. In the little colony which he called Saint James, after himself, Strang exercised the authority of king and high priest, and was implicitly obeyed. In 1849 he introduced polygamy, which did not spread rapidly and led to withdrawals and troubles with the "gentiles." Strang was assassinated in 1856 and the colony dispersed. There are several lighthouses on the island. Pop. of Saint James (1900) 420; of Peaine township, 372.

Beaver State, a popular designation of Oregon.

Beaverwood. See MAGNOLIA.

Bebber, Wilhelm Jakob van, Prussian meteorologist and writer: b. Grietham-Niederrhein, 10 July 1841. He was educated at Bonn University and for several years was a teacher. He became rector of the high school at Weissenburg-am-Sand in 1875. Since 1879 he has been chief of the weather telegraphing department of the German Seewarte at Hamburg. Among his works are a 'Hand-book of Practical Meteorology' (1885–6), and a 'Manual of Meteorology' (1890).

Bebee'rine, an uncrystallizable basic substance, $C_{19}H_{21}NO_3$, extracted from the bark of the bebeeru or greenheart-tree (*Nectandra rodiæi*), of Guiana. In pharmacy, the sulphate of bebeerine is a valuable medicine, being used, like quinine, as a tonic and febrifuge. Unfortunately, owing to the supplies of the bark being uncertain, the drug is sometimes scarce and difficult to obtain. Bebeerine is thought, by some chemists, to be identical with buxine.

Bebee'ru, a tree (*Nectandra rodiæi*) of the laurel family. See GREENHEART.

Bebel, bā'bĕl, **Ferdinand August,** German socialist: b. Cologne, 1840. He was apprenticed to the turner's trade, and acquired a practical knowledge of the difficulties and disabilities of workingmen. He settled in Leipsic in 1860, joined various labor organizations, and became one of the editors of the *Volkstaat* and of the better known *Vorwärts*. Membership in the North German Reichstag was followed by his election to the German Reichstag, of which he was a member from 1871 to 1881, and which he entered again in 1883, being the acknowledged leader of his party therein. Bebel's earnestness, large sympathy, and wide range of knowledge impress his hearers, although his appearance and manner in the Reichstag did not at first win them. These qualities are also characteristic of his books, among which are: 'Our Aims' (1874); 'The German Peasant War' (1876); 'The Life and Theories of Charles Fourier' (1888); 'Women in Socialism, the Christian Point of View in the Woman Question' (1893).

Bebel, Heinrich, German humanist: b. 1472; d. 1518. He was an alumnus of Cracow and Basel universities, and from 1497 professor

of poetry and rhetoric at Tübingen. His fame rests principally on his 'Facetiæ' (1506), a curious collection of bits of homely and rather coarse-grained humor and anecdote, directed mainly against the clergy; and on his 'Triumph of Venus,' a keen satire on the depravity of his time.

Bec, a celebrated abbey of France, in Normandy, near Brionne, now represented only by some ruins. Lanfranc and Anselm were both connected with this abbey.

Beccafico, bĕk-ä-fē'kō, the Italian name of the small olive-brown garden-warbler (*Sylvia hortensis*), called in England "pettychaps," which has the habit of pecking holes in the rind of ripening figs and other fruits, in search of small insects. The damage done is very slight. These birds were eaten with much delight by the ancient Romans, and are still in high favor on Grecian, French, and Italian tables, especially in Venice. An annual feast made on beccaficos is called Beccaficata. The term is also applied in continental Europe, rather indiscriminately, to different kinds of sylvan warblers when fat and in condition for the table.

Beccafumi, Domenico, bĕk-kä-foo'mē, dō'mā-nē'kō, surnamed MECHERINO, Italian painter: b. near Sienna, 1486; d. Sienna, 1551. As a shepherd boy amusing himself with drawing figures on the sand, he attracted the attention of a wealthy man, from whom he takes the name of Beccafumi, who, discerning his genius, sent him to Sienna to study drawing. He there saw, admired, and tried to imitate the paintings of Perugino, but having heard much of Raphael and Michael Angelo, obtained means from his patron to travel to Rome. After much study of the masterpieces of the Vatican he returned to Sienna and enriched its churches and its city with many noble frescoes, and painted an altar-piece in the museum there. He drew and colored well, possessed strong inventive powers, was thoroughly acquainted with perspective, and excelled particularly in foreshortening, but he was not free from mannerism, and his heads are in general deficient in both dignity and beauty. He was buried with pomp in Sienna cathedral, among some of the finest monuments of his genius. His paintings include: 'St. Catherine receiving the Stigmata' (Sienna), 'Madonna and Child' (Berlin), 'Marriage of St. Catherine' (Rome), etc. He also gained distinction as a sculptor and engraver.

Beccaria, Cesare Bonesana, Marchese di, bĕk-kä-rē'a, chä'sä'rĕ bō-nä-sä'na, mär-kā'sĕ dē, Italian author: b. Milan, 1735 (or 1738); d. November 1794. He was early excited by Montesquieu's 'Persian Letters,' to the cultivation of his philosophical talents, and was afterward favorably known as a philosophical writer by his noble philanthropic 'Crimes and Punishments' (1764), and several other works. With the eloquence of true feeling and a lively imagination he opposes capital punishments and torture. This work led to the establishment of more correct principles of penal law, and contributed to excite a general horror against inhuman punishments. He is also known in Italy as the author of a philosophical grammar and theory of style, 'Ricerche intorno alla Natura dello Stilo' (Milan 1770), and of several good treatises on style, rhetorical ornament, etc., contained in the journal 'Il Caffé,' edited by him in conjunction with his friends, Visconti, Verri, and others. In 1768 a chair of political philosophy was created for him at Milan.

Beccaria, Giovanni Battista, jō-vä'nē bät-tēs'ta, Italian philosopher: b. Mondovi, 1716; d. 27 April 1781. He went to Rome in 1732, where he studied, and afterward taught grammar and rhetoric; at the same time applying himself with success to mathematics. He was appointed professor of philosophy at Palermo, and afterward at Rome. Charles Emanuel, king of Sardinia, invited him to Turin in 1748, to fill the professorship of natural philosophy at the university there. He paid much attention to the subject of electricity, and published 'Natural and Artificial Electricity' (Turin 1735), besides many other valuable works on this subject. In 1759 the king employed him to measure a degree of the meridian in Piedmont.

Becerra, Gasparo, bĕ-thĕr'ra, gäs-pä'rō, Spanish artist: b. Baeza, Andalusia, 1520; d. Madrid, 1570. He studied for some time in Rome under Michael Angelo and others, and on his return became sculptor and painter to Philip II. He adorned the palace of Madrid with several frescoes, and also executed works in sculpture and architecture.

Beche, bāsh, Sir Henry de la, English geologist: b. 1796; d. 1855. He founded the geological survey of Great Britain, which was soon undertaken by the government, De la Beche being appointed director-general. He also founded the Jermyn Street Museum of Economic or Practical Geology, and the School of Mines. His principal works are: 'Geology of Jamaica'; 'Classification of European Rocks'; 'Geological Manual'; 'Researches in Theoretical Geology'; 'Geology of Cornwall, Devon, and West Somerset'; etc.

Bêche-de-Mer, bāsh-dĕ-mār, the French name for the dried flesh of holothurians. It is largely cured in the South Sea Islands.

Becher, Johann Joachim, bĕH'ĕr, yō'hän yō'ä-HĭM, German chemist: b. Speyer, 1635; d. 1682. He traveled and resided in various parts of Germany, Holland, Italy, Sweden, and Great Britain, investigating Cornish and Scotch mines. He wrote a number of works on chemistry, the chief of which is entitled 'Physica Subterranea.' In it he expounds his views on the composition of inorganic bodies, the constituents of which, according to him, are three earthy principles, the vitrifiable, the combustible, and the mercurial. The metals consist of these three earths in different proportions, and whenever a metal is calcined the combustible and mercurial earths are expelled, and the vitrifiable earth forms the residual calx. When these principles are combined with water different salts are formed, and a fundamental acid, which exists in all the others. This theory was subsequently developed by Stahl, who, by means of the principle of phlogiston (q.v.) explained not only the calcination of metals, but the phenomena of combustion in general.

Bechstein, Johann Matthäus, beH'stīn, yō'hän mä-tā'oos, German naturalist: b. Waltershausen, Gotha, 1757; d. 1822. He studied theology for four years at Jena, but never felt in his element unless hunting in the fields or roam-

ing the forest. After teaching for some time he resolved to devote himself to his favorite pursuits, and in 1800 the Duke of Saxe-Meiningen made him director of the Forest Academy of Dreissigacker, in the vicinity of his capital. This academy, under Bechstein's management, became one of the most celebrated establishments of the kind in Germany. His chief work is his 'Natural History of Germany,' in four volumes. In Great Britain he is best known by a treatise on singing-birds.

Bechstein, Ludwig, lood'vĭH, German poet and novelist: b. 1801; d. 1860. He is chiefly remembered for 'The Legend Treasure and the Legendary Cycles of Thuringia' (1835–8); 'German Fairy-Tale Book' (1845, 41st ed. 1893); and others. Among his epical poems are: 'The Children of Haymon' (1830); 'The Dance of Death' (1831); 'New Natural History of Pet Birds' (1846), a humorous didactic poem; and 'Thuringia's Royal House' (1865). Of his numerous novels, chiefly historical, the best known is 'Journeys of a Musician' (1836–7).

Bechuanaland, bĕt-choo-ä'nä-lănd, Africa, an extensive British territory in the southern part of the continent, so named from its chief inhabitants, the widely spread race of people called Bechuanas. It may be said to extend from the Orange River on the south to the Zambesi on the north, having the German territory on the west and the former South African republic (Transvaal), etc., on the east. The Bechuanas belong to the great Kaffir race, and are divided into tribal sections, each of which has a chief. Many of them live in villages or towns, some of which are of considerable size. They work with skill in iron, copper, and ivory, and engage in husbandry, cattle-breeding, and hunting. Bechuanaland is a portion of an elevated plateau 4,000 to 5,000 feet above the level of the sea, and though so near the tropics, is suitable for the British race. In winter there are sharp frosts, and snow falls in some years. The rains fall in summer, and then only the rivers are full. It is an excellent country for cattle; sheep thrive in some parts, and there are extensive tracts available for corn lands; but it is not a wheat country on account of the summer rains. Though apparently subject to droughts, it is not more so than Cape Colony, and the greater portion will be available for farming operations when the necessary dams have been constructed. It can be reached from Cape Town, Port Elizabeth, Durban, Delagoa Bay, and the Zambesi, the railway from the former being extended to Kimberley, Vryburg, Mafeking, Palachwe, Tati, and Buluwayo. There are extensive forests to the northeast, and to the west lies the Kalahari desert, which only requires wells dug to make it inhabitable.

The enormous quantities of buck which roam over the land attest the productiveness of the soil. Gold has been found near Sitlagoli, and there are indications of gold-bearing quartz reefs in many directions. Diamondiferous soil is also said to exist in several localities; indeed, diamonds were discovered at Vryburg in the autumn of 1887.

The province of Stellaland is principally inhabited by Boers, and the remainder of the country by Bechuanas. The Bechuanas are a black race possessing a language in common with the Bantu races of South Africa, extending as far north as the equator. Their ancestors are said to have come from the north, and progressing southwest, met the Hottentots from the Cape of Good Hope journeying north. The Bechuanas have divided up within the last 150 years, and comprise the Bahurutse, Bamangwato, Bakwena, Bangwaketse, Barolongs, Batlapins, and Batlaros. Each tribe has an animal as an emblem, or heraldic sign, which it is said they hold in esteem. Since 1832 they have been at enmity with the Matabele, and in later years the Transvaal Boers have on one pretext or another endeavored to occupy their country. During the native risings in 1878 the Bechuanas invaded Griqualand West, and were in turn subdued by British volunteers as far as the Molopo. When the British government withdrew from Bechuanaland in 1880, the natives, being helpless, were left to the mercy of the Boers of the Transvaal, whose harsh treatment in 1882 and 1883 led to the Bechuanaland expedition in 1884. At the beginning of the 19th century the Bechuanas were further in advance in civilization than other nations of South Africa, and they are still ahead in this respect. The system of government among the Bechuanas would be termed in Europe local government. All important matters are decided in the public assembly of the freemen of the town, but matters are previously arranged between the chief and headmen. During the Boer-British war of 1899–1900, Mafeking was the scene of one of the most determined and successful defenses in history. See Baden-Powell.

Beck, James Burnie, American lawyer: b. Dumfriesshire, Scotland, 13 Feb. 1822; d. 3 May 1890. He came to the United States when a youth and settled in Kentucky, and was graduated at the law school of Transylvania University in 1846. He practised law in Lexington, Ky., for 20 years. He was elected a Democratic representative to Congress in 1866, 1868, 1870, and 1872; and United States senator in 1876, 1882, and 1888.

Beck, Karl, Austrian poet: b. Baja, Hungary, 1 May 1817; d. Vienna, 10 April 1879. His poems reflect the passionate temperament of his Hungarian countrymen in sonorous verses of consummate finish. Among his works are 'Nights' (1838); 'The Poet Errant' (1838); 'Jankó' (1842), a romance in verse; 'Songs of the Poor Man' (1847); 'Jadwiga' (1863), a tale in verse; 'Mater Dolorosa' (1854), a novel.

Beck, Lewis Caleb, American scientist: b. Schenectady, N. Y., 4 Oct. 1798; d. Albany, N. Y., 20 April 1853. A man of remarkable and wide scientific attainments, he graduated at Union College 1817, and became professor of chemistry and natural history at Rutgers College 1830–37 and 1838–53; professor of chemistry and pharmacy at Albany Medical College 1841–53; and State mineralogist of New York 1837. His publications include 'Gazetteer of Illinois and Missouri' (1823); 'Salt Springs at Salina' (1826); 'Mineralogy of New York' (1842), his most important work; and 'Botany of the United States North of Virginia' (1848). Cf. Gross, 'American Medical Biography.'

Becke, George Louis, Australian author: b. Port Macquarrie, New South Wales, 1848. He went to sea at the age of 14 and has spent his life

trading in the South Pacific. His publications are 'By Reef and Palm' (1894); 'South Sea Stories'; The Ebbing of the Tide' (1896); and with W. Jeffery, 'A First-Fleet Family' (1896); 'Pacific Tales' (1897); 'Wild Life in Southern Seas' (1897); 'Ridan the Devil'; 'Tom Wallis' (1900); 'Edward Barry'; 'Tessa, the Trader's Wife'; 'By Rock and Pool'; Breackley Black Sheep'; 'York the Adventurer' (1901); 'The Strange Adventure of James Shervinton'; 'The Jalasco Brig' (1902); 'Rodman the Boat Steerer; 'Naval Pioneers of Australia' and 'Admiral Philip' (1899); 'The Tapir of Banderah' (1901).

Beckenham, England, a town of Kent, situated southeast of London. It is one of the English municipalities which have experimented in "municipal socialism," as it owns its electric lighting plant and public baths, and has charge of the work of a technical institute. Pop. (1901) 26,300.

Becker, August, German poet and novelist: b. 1828; d. 1891. He was the author of 'Young Friedel, the Minstrel' (1854), a lyrical epic; and of the novels 'The Rabbi's Bequest' (1866); 'Proscribed' (1868); 'The Carbuncle' (1870); 'My Sister' (1876), descriptive of the doings of Lola Montez and the events of 1848 in Bavaria; 'Painter Fairbeard' (1878); and 'The Sexton of Horst' (1889).

Becker, Christiane Luise Amalie Neumann, krís-tē-än' loo-ēs' ä-mä'lē-ē noi'män, German actress: b. Krossen, 15 Dec. 1778; d. Weimar, 27 Sept. 1797. She was the daughter of Johann Christian Neumann, the actor. She performed in both tragedy and comedy, and was a friend of Goethe, who, after her death, made her the theme of his elegy, 'Euphrosine.'

Becker, George Ferdinand, American geologist: b. New York, 5 Jan. 1847. He graduated at Harvard University in 1868; was instructor of mining and metalurgy in the University of California in 1875–9; was attached to the United States geological survey since 1879, and special agent of the 10th census, 1879–83. He was appointed a special agent to examine into the mineral resources of the Philippine Islands in 1898. His publications include 'Geology of the Comstock Lode'; 'Statistics and Technology of the Precious Metals' (with S. F. Emmons); 'Geology of the Quicksilver Deposits of the Pacific Slope'; etc.

Becker, Karl Ferdinand, German philologist: b. Liser, 14 April 1775; d. Offenbach, 5 Sept. 1849. He was the author of 'Ausfuhrliche Deutsche Grammatik'; 'Handbuch der Deutschen Sprache'; etc.

Becker, Karl Ferdinand, German musician: b. Leipsic, 17 July 1804; d. Leipsic, 26 Oct. 1877. He wrote 'Systematisch-chronologische Darstellung der Musikalischen Literatur' (1836–39); 'Die Hausmusik in Deutschland' (1840); etc.

Becker, Karl Friedrich, German historical writer: b. Berlin, 1777; d. Berlin, 15 March 1806. He wrote various popular works on historical topics, the best known being 'The World's History for Children and their Teachers' (1801–5), a truly successful undertaking.

Becker, Nikolaus, German song writer: b. Bonn, 8 Jan. 1809; d. 28 Aug. 1845; known as the author of the Rhine song, 'They Never Shall Obtain It, the Free, the German Rhine,' which became immensely popular throughout Germany, and provoked Alfred de Musset's 'We Have Had it, Your German Rhine,' and Lamartine's more conciliatory 'Peace-Marseillaise' (1841).

Becker, Oskar, political fanatic: b. Odessa, Russia, 1839; d. Alexandria, Egypt, 1868. In 1861 he attempted, at Baden-Baden, to kill King Wilhelm I. of Prussia, by shooting at him with a pistol at a distance of but three paces. The king fortunately escaped with only a slight wound in the neck. Becker's motive for the act was his belief that the king was unable to unite Germany. Though sentenced to 20 years' imprisonment he was pardoned by the king on condition of living out of Germany ever after.

Becker, Rudolf Zacharias, German author: b. Erfurt, 9 April 1752; d. 28 March 1822. He first became known by an essay on the theme, "Is it useful to deceive the people?" which gained a prize from the Berlin Academy of Sciences in 1799. His theory was that happiness depended on the gratification of an innate desire for improvement. In 1782 he took charge of a school at Dessau and published a journal for youth. A work in two volumes, entitled 'A Little Book of Needful Help; or, Instructive Tales of Joy and Sorrow in the Village of Mildheim,' became such a favorite with the public that over 500,000 copies were soon disposed of. He also produced other works and journals, and the extensive transactions in them led him, in 1797, to set up a publishing and bookselling establishment at Gotha, which is still continued by his son. On 30 Nov. 1811 he was arrested by Davoust on suspicion of conspiring against Napoleon, and was imprisoned at Magdeburg till April 1813. On this imprisonment he wrote a book, which still has a historical value.

Becket, Thomas à, archbishop of Canterbury, the Saxon hero, priest, and martyr of England in the reign of Henry II.: b. London, 1119, or, according to some writers, 21 Dec. 1117; d. Canterbury, 29 Dec. 1170. He was the son of a Saxon and a Syrian lady, whose union was said to have been brought about in the following extraordinary manner: Gilbert, the father of Thomas, having gone to the Holy Land in the second crusade, was made a prisoner; but while in durance a Syrian damsel, becoming enamored of him and being converted by him to Christianity, contrived to effect his liberation, after which, with little chivalry or gratitude, the Saxon crusader returned home as best he might, leaving the lady by the seabanks of Tyre. But, with a love and faith stronger than that of the deserted Carthaginian queen, the fair Saracen followed her recreant lover, and, although she knew but two words of any European language, the names of her lover and of the city where he dwelt, by the repetition of those two words, "London" and "Gilbert," and by the display of her tears, her beauty, her jewels, and her gold, she at length made her way to the already famous metropolis, and there, with well-deserved good fortune, found her Gilbert, both free and willing to reward her undoubting trust by taking her to his home and to his heart, all of which is pure romance. Of so strange a union Thomas was said to be the offspring; but, if possible, his

own fortunes were stranger yet. He was at first educated by the canons of Merton, and continued his studies in the schools of Oxford, London, and Paris. On the death of his father he was admitted into the family of Theobald, archbishop of Canterbury, and, with his permission, went to the Continent for the purpose of studying the civil and canon law. He attended the lectures of Gratian at Bologna, and of another celebrated professor at Auxerre. Concerning his early life little more is known; but it is recorded that his first appearance at the court of Henry was made in the humblest guise, bearing his fortunes on his back in the shape of a not too sumptuous garb, riding a spavined jade with galled withers and bare ribs, which moved the insolent mirth of the Norman courtiers. He soon, however, obtained high favor with the king, who, it was alleged, was in some sort under obligation to him, as if he, acting as agent for Theobald, had obtained from the Pope letters prohibitory of the crowning of Eustace, the son of Stephen, by which that design was defeated. This service not only raised Becket in the esteem of the archbishop, but in that of King Henry II., and was the foundation of his high fortune. In 1158 he was appointed high-chancellor and preceptor to Prince Henry, and at this time was a complete courtier, conforming in every respect to the humor of the king. He was, in fact, his prime companion, had the same hours of eating and going to bed, held splendid levees, and courted popular applause. In 1159 he made a campaign with the king in Toulouse, having in his own pay 700 knights and 1,200 horsemen; and it is said he advised Henry to seize the person of Louis, king of France, shut up in Toulouse without an army. This counsel, however, so indicative of à Becket's energy, being too bold for the lay counselors of one of the boldest monarchs of the age, was declined. In the next year he visited Paris to treat of an alliance between the eldest daughter of the king of France and Prince Henry, and returned with the young princess to England. He had not enjoyed the chancellorship more than four years when his patron Theobald died, and King Henry was so far mistaken as to raise his favorite to the primacy, on the presumption that he would aid him in those political views, in respect to Church power, which all the sovereigns of the Norman line embraced, and which, in fact, caused a continual struggle till its termination by Henry VIII. It is narrated that when Henry announced his intention of having Becket promoted to the primacy left vacant by the death of Theobald, Becket prophetically remarked: «I am certain that if, by God's disposal, it were to so happen, the love and favor you now bear towards me, would speedily turn into bitterest hatred.»

Becket was consecrated archbishop in 1162, and immediately assumed an austerity of conduct which formed a very natural prelude to the course which he was to follow. Pope Alexander III. held a general council at Tours in 1163, at which Becket attended and made a formal complaint of the infringements by the laity on the rights and immunities of the Church. On his return to England he began to act in the spirit of this representation, and to prosecute several of the nobility and others holding Church possessions, whom he also proceeded to excommunicate. Henry, an able and politic monarch, was anxious to recall certain privileges of the clergy, which withdrew them from the jurisdiction of the civil courts; and it was not without a violent struggle, and in the interests of peace, that Becket finally acquiesced. The king soon after summoned a convocation or parliament at Clarendon, to the celebrated «constitutions» of which, although the archbishop swore that he would never assent, he at length yielded, but afterward refused to affix his signature, and by way of penance suspended himself from his archiepiscopal functions till the Pope's absolution could arrive. Finding himself the object of the king's displeasure, he soon after attempted to escape to France; but being intercepted, Henry, in a parliament at Northampton, charged him with a violation of his allegiance, and all his goods were confiscated. A suit was also commenced against him for money lent him during his chancellorship, and for the proceeds of the benefices which he had held vacant while in that capacity. In this desperate situation he with great diffiulty and danger made his escape to Flanders, and, proceeding to the Pope at Sens, humbly resigned his archbishopric, which was, however, restored. He then took up his abode at the abbey of Pontigny, in Normandy, whence he issued expostulatory letters to the king and bishops of England, in which he excommunicated all violators of the prerogatives of the Church, and included in the censure the principal officers of the Crown. Henry was so exasperated that he banished all his relations and obliged the Cistercians to send him away from the abbey of Pontigny; from which he removed, on the recommendation of the king of France, to the abbey of Columbe, and spent four years there in exile.

After much negotiation a sort of reconciliation took place in 1170, on the whole to the advantage of Becket, who, being restored to his see with all its former privileges, forthwith prepared to return to his long vacant see. After a triumphant entry into Canterbury the young Prince Henry, crowned during the lifetime of his father, transmitted him an order to restore the suspended and excommunicated prelates, which he refused to do, for the reason that the Pope alone could grant the favor, though the latter had authorized him to inflict the censure on them. The prelates immediately appealed to Henry in Normandy, who in a state of extreme exasperation exclaimed, «What an unhappy prince am I, who have not about me one man of spirit enough to rid me of a single insolent prelate, the perpetual trouble of my life!» These rash and too significant words induced four of the attendant barons, Reginald Fitz-Urse, William de Tracy, Hugh de Morville, and Richard Breto, to resolve to wipe out the king's reproach. Having laid their plans, they forthwith proceeded to Canterbury, and having formally required the archbishop to restore the suspended prelates, they returned in the evening of the same day (29 Dec. 1170), and, placing soldiers in the courtyard, rushed with their swords drawn into the cathedral, where the archbishop was at vespers, and, advancing toward him, threatened him with death if he still disobeyed the orders of Henry. Becket, without the least token of fear, replied that he was ready to die for the rights of the Church; and magnanimously added, «I charge you in the name of

the Almighty not to hurt any other person here, for none of them have been concerned in the late transactions.» The confederates then strove to drag him out of the church; but not being able to do so on account of his resolute deportment, they killed him on the spot with repeated wounds, all which he endured without a groan.

The perpetrators of the deed repented, one of them, de Tracy, taking a voyage to Rome, and expiating the enormity in the Holy Land. Henry II. did penance at the saint's tomb.

Thus perished Thomas Becket in his 52d year, a martyr to the cause which he espoused, and a man of unquestionable vigor of intellect. He was canonized two years after his death, and miracles abounded at his tomb. In the reign of Henry III. his body was taken up and placed in a magnificent shrine erected by Archbishop Stephen Langton; and of the popularity of the pilgrimages to his tomb the 'Canterbury Tales' of Chaucer will prove an enduring testimony. See 'Life,' by John Morris, and 'Thomas Becket,' by R. A. Thompson.

Beckett, Arthur William, à, English journalist and novelist (son of Gilbert Abbot à Beckett, q.v.): b. Fulham, 25 Oct. 1844. Beside fulfilling other journalistic engagements he was on the staff of 'Punch' 1874–1902, edited the *Sunday Times* 1891–5, and the 'Naval and Military Magazine' 1896. In addition to several comedies he has published 'Comic Guide to the Royal Academy,' with his brother Gilbert (1863–4); 'Fallen Amongst Thieves' (1869); 'Our Holiday in the Highlands' (1874); 'The Shadow Witness' and 'The Doom of St. Quirec,' with Burnand (1875–6); 'The Ghost of Grimstone Grange' (1877); 'The Mystery of Mostyn Manor' (1878); 'Traded Out'; 'Hard Luck'; 'Stone Broke'; 'Papers from Pump Handle Court, by a Briefless Barrister' (1884); 'Modern Arabian Nights' (1885); 'The Member for Wrottenborough' (1895); 'Greenroom Recollections' (1896); 'The Modern Adam' (1899); 'London at the End of the Century' (1900).

Beckford, William, English writer, famous in his time for his immense wealth, eccentricities, and literary talents: b. London, 1761; d. Bath, 2 May 1844. When only 10 years old he was in receipt of an income, through the death of his father, of more than $500,000 a year. Under the direction of Lord Chatham he received a careful education, and at an early age gave evidence of unusual abilities. His first work, a satirical essay entitled, 'Biographical Memoirs of Extraordinary Painters,' in which he ridiculed the English artists of his time, was published before he was 20 years of age. After this he spent some time in traveling on the Continent, an account of which he published half a century later with the title, 'Italy, with Sketches of Spain and Portugal' (Lond., 2 vols. 1834). On his return to England he entered the House of Commons for a short time as member for Hindon, but soon became tired of this career, and withdrew to Portugal, where he bought an estate in the neighborhood of Cintra, and lived in familiar intercourse with the royal family of Portugal. After the lapse of some years he appeared again in England, and began in 1796 to erect a splendid edifice upon his estate of Fonthill, which he furnished with more than royal luxury, and continually enlarged with new buildings. Here he resided till 1822, when, owing to the loss of two large estates, which had been successfully claimed in Chancery by other owners, he was obliged to sell Fonthill for £330,000. He then settled at Bath, where he began to occupy himself anew with building and collecting works of art. His literary fame rests upon his eastern tale 'Vathek,' which he wrote in French, and published at Lausanne in 1784, and which made a remarkable impression upon Byron.

Beckham, John Crepps Wickliffe, American statesman: b. Bardstown, Ky., 1867. In 1893 he began the practice of law; elected to the Kentucky legislature 1894–7; speaker 1898; elected lieutenant-governor 1899, and became governor upon the death of Goebel, 3 Feb. 1900; elected governor on the Democratic ticket in the fall of the same year.

Beckmann, Johann, German writer on agriculture and natural history: b. Hoya, Hanover, 4 June 1739; d. Göttingen, 4 Feb. 1811. He studied theology at Göttingen, but soon applied himself to natural philosophy and chemistry. For a short time he was professor of natural philosophy and history at a gymnasium in St. Petersburg. He resigned this, and coming back through Sweden, made the acquaintance of Linnæus and was allowed to see how the Swedish mines were worked. Having returned to Göttingen, he was made professor of philosophy there in 1766, and in 1770 ordinary professor of economy, which office he held for over 40 years. He published several scientific works, which once were popular, but the best known of his productions is called 'Contributions to the History of Discovery and Inventions,' of which several translations have been published in England, where (with corrections and additions extending it to the present time) it continues to be a favorite work.

Beckwith, Sir George, English military officer: b. 1753; d. London, 20 March 1823. His scene of action was largely in America — in the United States and the West Indies. He fought with the English in the American Revolution in 1776–82, and was entrusted with important diplomatic commissions in 1782–91, as there was then no British minister to the United States. In 1804 he was made governor of St. Vincent, and four years later governor of Barbados. As England was then at war with France he organized an expedition and conquered Martinique, for which he obtained the thanks of the House of Commons. Later (1810) he conquered Guadeloupe, the last possession of the French in that part of the world. When he returned to England, after nine years' service in the West Indies, a set of silver plate was given to him by the legislature of Barbados, and the king conferred upon him armorial distinction.

Beckwith, James Carroll, American genre painter: b. Hannibal, Mo., 23 Sept. 1852. He was a pupil of Carolus Duran, in Paris, and became a member of the National Academy in 1894. Among his paintings are 'Under the Lilacs' and 'The Falconer.'

Beckwith, John Watrus, American Episcopal bishop: b. Raleigh, N. C., 9 Feb. 1831; d. 24 Nov. 1890. He was graduated at Trinity College, Hartford, in 1852; ordained priest in 1855; labored in Mississippi and Alabama till

after the close of the Civil War; was then called to the rectorship of Trinity Church, New Orleans; and while there was elected bishop of Georgia, being consecrated in Savannah, 2 April 1868. He was an eloquent preacher, and published several sermons and addresses.

Beckx, Pierre Jean, běks, pē-ār zhŏń, French general of the order of Jesuits: b. near Louvain, Belgium, 8 Feb. 1795; d. Rome, 4 March 1887. The success of the Jesuits, especially in non-Catholic countries, was greatly due to his tact and energy.

Becky Sharp, the heroine in Thackeray's 'Vanity Fair.' She has been accepted as the type of the shrewd, conscienceless adventuress whose sole purpose is to rise in the world and who allows nothing to interfere with it.

Becque, Henri François, běk, ŏń-rē fräń-swä, French dramatist: b. Paris, 9 April 1837. He was the pioneer of realism on the Parisian stage, producing 'The Prodigal Son' (1868); 'The Abduction' (1871); 'The Ravens' (1882); 'The Parisian' (1885); etc.

Becquer, Gustavo Adolfo, běk-kăr′, goos-tä′vō ä-dōl′fō, Spanish poet and novelist: b. Seville, 17 Feb. 1836; d. Madrid, 22 Dec. 1870. His lyrics, chiefly elegiac, show much feeling, and his tales and legends are among the best creations of modern Spanish prose.

Becquerel, Alexandre Edmond, běk-rĕl, ä-lĕx-ändr ād-mŏń, French physicist: b. Paris (son of Antoine César Becquerel, q.v.), 24 March 1820; d. Paris, 13 May 1891. He was decorated with the cross of the Legion of Honor in 1851, and was appointed professor of physics in the Conservatoire des Arts et Métiers in 1853. Besides his conjoint labors with his father he made important researches on the nature of light and its chemical effects, on phosphorescence, and on the conductivity and magnetic properties of many substances. He wrote 'Light, Its Causes and Effects' (1868).

Becquerel, Antoine César, än-twän sā-zär, French physician, and member of the Institute: b. Chatillon-sur-Loing, 7 March 1788; d. Paris, 18 Jan. 1878. In early life he served in the French army in Spain as an officer of engineers. In 1815 he resigned his commission as *chef de bataillon* of the engineers and devoted himself to scientific pursuits. In 1829 he became professor of physics in the Museum of Natural History. He was a voluminous writer on chemistry and electricity, and his industry in the collecting of facts was remarkable. His principal works are: 'Traité d'Electro-Chimie'; 'Traité de Physique Appliquée à la Chimie et aux Sciences Naturelles'; 'Eléments de Physique Terrestre et de Météorologie' (1847); and 'Traité de l'Electricité et du Magnétisme' (1855). He invented a new psychometer in 1866.

Becquerel, Antoine Henri, ŏń-rē, French physicist: b. Paris, 15 Dec. 1852 (son of Alexandre Edmond, and grandson of Antoine César Becquerel, qq.v.). In 1892 he became professor of physics in the Natural History Museum, and in 1895 held a similar position at the Polytechnic School. His investigations have largely dealt with such subjects as the magnetic rotation of polarized light, phosphorescence, the ultra-red rays, light-absorption, etc. He is perhaps best known in recent years by his researches concerning the invisible rays given off by uranium, radium, thorium, etc., called, in his honor, Becquerel rays — a mixture of Roentgen and cathode rays.

Becse, bĕch′ĕ, Hungary, the name of two towns situated on the river Theiss. Old Becse is on the right bank, 48 miles south of Szegedin. Pop. (1901) 18,865. New Becse is on the left bank, five miles east of Old Becse. Pop. (1901) 7,752. Both towns carry on an extensive trade in grain.

Bed, in modern domestic use, a framework (bedstead) supporting a mattress or cushion, with coverings, on which to take repose or sleep. Originally a bed consisted merely of a lair or hollowed-out place in the earth, such as is made by a wild animal; then the skins of beasts were employed to render the spot more comfortable, and such skins form the beds of many savage tribes of the present day. Rushes, leaves, husks, twigs, and straw came in time to supplement or replace the skins, and when the Romans invaded Britain they taught the natives to sew their straw within sacks. In the progress of luxury feathers came to take the place of the harder straw, and their use was made the basis of charges of effeminacy against the Roman patricians. The feather bed still persists among the older nations of Europe, but as feathers are bad conductors of caloric they do not permit that free radiation of heat from the body which is essential to comfort and health, and the hair mattress has very largely supplanted it. The feather bed was particularly unserviceable in cases of sickness, as it did not permit of the patient's easily changing his position. Modern mattresses are sometimes made of felt, of pure hair, or of layers of hair and cotton, stuffed more or less tightly into a casing of strongly woven material called ticking. Pillows are made of materials similar to those of the mattress, and the bed-coverings of almost any fabric suited to the taste and purse of the owner, from coarse cotton sheets or blankets to the finest wool or silk. In the northern countries of Europe the downy feathers of the eider duck are largely used for bed-coverings, their slow radiation of heat, mentioned above, permitting the retention of the bodily heat combined with extreme lightness.

Bedsteads have for thousands of years ranged from a mere platform, designed merely to keep the bedding off the floor, to enormous structures of solid costly woods or ivory, magnificently decorated with carvings, or inlaid with precious metals and gems. They were frequently surmounted by canopies, and surrounded with curtains to keep off drafts, or with nettings to exclude flying insects. The bedding was supported within the framework on a network of cord, which later was supplanted by cross-bars or slats of wood. Sometimes bedsteads were built with such lofty platforms that a short stepladder was necessary for ingress and egress. The four-post bedstead held its own for centuries, but within the last 50 years their close curtains, valances, and canopies have given way before the more hygienic iron or brass bedstead, almost entirely free from draperies and fitted with metallic springs or woven-wire mattresses, some of the latter being so elastic, though firm, and giving such general support to the body, as to render thick mattresses almost unnecessary. Wooden bedsteads

are still in considerable use, however; but they are mostly free from the objectionable features of the four-post bed.

Folding-beds have had considerable vogue for a long period, being designed for economy of space in small rooms. Truckle or trundle beds, were formerly used for similar economic reasons, and consisted of a low platform on wheels to admit of its being run under the larger bed by day, and was occupied at night by children or servants. Other forms of space-saving beds are folding cots, and lounges constructed over a box-body wherein the bedding may be concealed by day.

Special forms of bed have been contrived for the benefit of sick and wounded persons, notably mattresses of material impervious to air or water and filled with those fluids.

In French history, the bed of justice was the throne on which, before the Revolution of 1789, the king used to sit when he went to Parliament to look after the affairs of State, the officers of Parliament attending him in scarlet robes. As this interference of the king with the Parliament was not compatible with free government, sitting on the bed of justice came to signify the exertion of arbitrary power.

In law, a divorce from bed and board is the divorce of a husband and wife to the extent of separating them for a time, the wife receiving support, under the name of alimony, during the severance.

In mechanics, a bed is the foundation piece or portion of anything on which the body of it rests, as the bed-piece of a steam engine; the lower stone of a grinding-mill; or the box, body, or receptacle of a vehicle.

Bed-sore, an ulcer due to long-continued pressure on certain bony prominences of the body, due to protracted maintenance of the reclining position. The buttocks, shoulder-blades, and heels are the most frequently affected sites. In certain diseases, notably in myelitis, or inflammation of the spinal cord, bed-sores may develop very rapidly, within ten days to two weeks. Here the nerve-fibres governing the tone of the skin are affected. In long-continued diseases, however, necessitating the reclining posture, bed-sores develop largely from lack of careful nursing. A due amount of attention paid to absolute cleanliness, care for the skin, careful turning, and use of air-cushions or the water-bed, are often effective in preventing them. Alcohol and water, equal parts, is one of the best washes. If ulcers develop in spite of all precautions, they should be surgically treated. Oxid of zinc ointment, balsam of Peru, aristol powder, or bismuth powder, may all be used, alone or in combination.

Bed of Justice (Fr. *lit de justice*), formerly a solemn ceremony in France, in which the king, with the princes of the blood royal, the peers, and the officers of the crown, state, and court, proceeded to the Parliament, and there, sitting upon the throne (which in the old French language was called *lit,* because it consisted of an under cushion, a cushion for the back, and two under the elbows), caused those commands and orders which the Parliament did not approve to be registered in his presence. The Parliament had the right of remonstrating in behalf of the nation against the royal commands and edicts. If the king, however, did not choose to recede from his measures, he first issued a written command (*lettres de jussion*) to the Parliament, and if this was not obeyed he held the *lit de justice.* The Parliament was then, indeed, obliged to submit, but it afterward commonly made a protest against the proceeding. Louis XV. held such a *lit de justice* in 1763, in order to introduce certain imposts, but on account of the firm resistance of the parliaments was finally obliged to yield. The last *lits de justice* were held by Louis XVI. at Versailles, 6 Aug. 1787.

Bedamar, bā-da-mar', a character (a Spaniard of noble birth) in Saint Real's 'Conjuration des Espagnols contre la République de Venise,' the source of Otway's 'Venice Preserved.'

Bédarieux, bā-dä-rē-ür, France, a town in the department of Herault, on the left bank of the Orb, 18 miles north from Beziers. It is well built, and is one of the busiest and most thriving commercial and manufacturing towns of the same size in France. It has manufactures of fine and common cloth, woolen stuffs, floss silk, worsted and cotton stockings, hats, soap, olive-oil; tanneries, dye-works, paper and glass works, and a brass foundry. It has also a trade in wine and brandy. Pop. (1901) 5,802.

Bedbug, a hemipterous insect (*Cimex* or *Acanthias lectularius*). The body is broad, two and a half lines in length, flat and wingless; it is a rust red color with fine brown hairs. By its shape it is adapted for living in cracks between boards in furniture, etc., and by its long, slender beak it sucks the blood of its victim. This insect lays eggs throughout the warmer months of the year, the generations succeeding each other as long as the temperature is high enough. The eggs are oval, white, and the young bugs hatch in about eight days, escaping by pushing off a lid at one end of the shell. They are white, transparent, differing from the perfect insect in having a broad, triangular head, and short and thick antennæ. The bedbug is said to live as a parasite on domestic birds, such as the dove. A nest of swallows swarming with alleged bedbugs was once found on a courthouse in Iowa. Trestwood states that the bedbug is 11 weeks in attaining its full size; it molts about five times. De Geer has kept full-sized individuals in a sealed bottle for more than a year without food. The cockroach is the natural enemy of the bedbug and destroys large numbers, as does also the Reduvius and certain kinds of ants. In Europe a small black ant, *Monomorium,* is said to clear a house of them in a few days. Houses have been cleaned of them after being thoroughly fumigated with brimstone, or by the use of insect powder blown into the cracks and crevices where they live. They are also easily destroyed by painting the cracks with corrosive sublimate dissolved in alcohol. Temporary relief may be had by sprinkling insect powder over the sheets of the bed one is to occupy. As the bedbug was known to Aristotle, who supposed it arose spontaneously from sweat, it is probable that it originated about the Mediterranean Sea, for it was not known to have occurred in England before the 17th century.

Bibliography.— Osborn, 'Insects Affecting Domestic Animals' (Dept. of Agriculture Bulletin); Sutherland, H., 'The Book of Bugs.'

Beddoes, Thomas Lovell, English dramaauthor: b. Shiffnal, Shropshire, 1760; d. 1808. He distinguished himself both at school and at Oxford by his knowledge of ancient and modern languages and literature. The great discoveries in physics, chemistry, and physiology irresistibly attracted him. He continued his studies with success in London and Edinburgh. In his 26th year he took his doctor's degree, afterward visited Paris, and formed an acquaintance with Lavoisier. On his return he was appointed professor of chemistry at Oxford. There he published some excellent chemical treatises, and observations on the calculus, scurvy, consumption, catarrh, and fever. Dazzled by the splendid promises of the French Revolution, he offended some of his former admirers, and excited such a clamor against him by the publication of his political opinions that he resigned his professorship. He then composed his 'Observations on the Nature of Demonstrative Evidence,' in which he endeavored to prove that mathematical reasoning proceeds on the evidence of the senses, and that geometry is founded on experiment. He also published the 'History of Isaac Jenkins,' which was intended to impress useful moral lessons on the laboring classes in an attractive manner. After his marriage in 1794 he formed the plan of a pneumatic institution for curing diseases, particularly consumption, by means of factitious airs or gases. With the assistance of the celebrated Josiah Wedgewood, he succeeded in opening this institution in 1798. As superintendent of the whole, he engaged young Humphry Davy, the foundation of whose future fame was laid here. The chief purpose of the institution, however, was never realized, and Beddoes' zeal gradually relaxed, so that he relinquished it a year before his death. In the last years of his life he acquired considerable reputation by his 'Hygeia,' in three volumes.

Beddoes, Thomas Lovell, English dramatist and physiologist: b. Clifton, 20 July 1803; d. Basel, 26 Jan. 1849. He published 'The Bride's Tragedy' while an undergraduate at Oxford, and led an eccentric life, ultimately committing suicide. His work was largely fragmentary, but his posthumous 'Death's Jest-Book; or, the Fool's Tragedy' (1850) received the high praise of such judges as Landor and Browning. It was begun in 1825, and occupied him till his death, being mostly written while he was studying medicine in Germany. In 1890 Mr. Gosse edited an edition of his poetical works in two volumes, with a memoir.

Bede, Beda, or **Boeda,** known as "The Venerable Bede," English historian and scholar, was born in 673 at the double monastery of Wearmouth and Jarrow, in the county of Durham, and died in the same monastery in 735. At the age of seven he was intrusted to Benedict Biscop, abbot of Wearmouth, and one of the best equipped scholars of the age, who, together with Ceolfrith, abbot of Jarrow, directed his education. All the rest of Bede's life was spent in the monastery of Wearmouth and Jarrow. In his nineteenth year he was made deacon, and in his thirtieth year, priest. He never held positions of higher dignity, refusing the office of abbot because its duties would have interfered with his chosen work of "learning, teaching, and writing." Under Bede, Northumbria became one of the great centres of learning in Europe. Bede himself gave instruction in Latin, Greek, Hebrew, astronomy, mathematics, grammar, rhetoric, and music, in short in all the subjects which constituted the learning of the Middle Ages. His knowledge was encyclopedic in character, and though all directed towards the service of the church, seems to have been imparted with a vivacity and charm that endeared him greatly to his pupils. Besides attending to his monastic duties and his work as teacher, Bede wrote voluminously. In a brief summary of the main events of his life at the conclusion of his 'Historia Ecclesiastica,' finished in 731, he gives a list of his works amounting to nearly forty titles. His activities did not cease, however, with the completion of his great history, and at the very hour of his death, as is narrated by his pupil, St. Cuthbert, he was engaged in dictating a translation of the Gospel of St. John, now unfortunately lost. Cuthbert states that Bede was a lover of Anglo-Saxon poetry, but the only extant writings in the vernacular which can be connected with his name are two lines of a poem known as Bede's 'Death Song,' quoted by Cuthbert. The body of his writings consists of exegetical treatises on the books of the Old and New Testaments, and of treatises on scientific, rhetorical, and historical subjects, all written in Latin. His reputation as a mathematician was very great, and for five centuries following his death, his works were standard throughout Europe. For modern readers, however, Bede's most interesting and important achievements lie in the field of history. His greatest work is his 'Ecclesiastical History' (*Historia Ecclesiastica Gentis Anglorum*), a history of England from the earliest Roman occupations to the year 731. It is written in a charmingly simple and pure style, and is remarkable for a degree of critical judgment such as one would not expect in a monk of the 8th century who had never lived outside his monastery. It was translated into West Saxon by Alfred the Great, or under his direction, and it was largely used for the earlier entries of the 'Anglo-Saxon Chronicle.' It is still the main source of our information concerning England for the period which it covers.

Bibliography.—For Bede's works, consult Migne, 'Patrologiæ Cursus Completus,' (vol. 90); Giles, 'Opera Omnia' (London 1843). The separate edition of the 'Historical Works,' by Plummer (Oxford 1896), contains much valuable material, among other things the letter of Cuthbert narrating Bede's death. The West Saxon translation of the 'Historia' is printed in Wülker, 'Bibliothek der Angelsächsischen Prosa' (vol. IV., 1899). For estimates of the character and work of Bede, consult Bright, 'Chapters of Early English Church History' (3d edition 1897; Brooke, 'English Literature from the Beginning to the Norman Conquest' (1898); Hunt, 'The English Church from its Foundation to the Norman Conquest' (1899).

George P. Krapp,
Instructor in English, Columbia University.

Bede, Adam, a character in the novel of the same name, by George Eliot. He is a

carpenter with some knowledge of books. He loves Hetty Sorel, but marries Dinah Morris (q.v.).

Bedeau, bĕ-dō, **Marie Alphonse,** French general: b. Vertou, near Nantes, 1804; d. Nantes, 1863. He won his military fame in Algeria, where he was active in the operations against the Algerians and became general of brigade. He was in Paris at the outbreak of the revolution of 1848, and was subsequently vice-president of the constituent assembly. As he opposed Louis Napoleon, he went into exile after the *coup d'état* of December 1851.

Bedeguar, bĕd'e-gär, or **Sweetbriar Sponge,** a mossy roundish gall somewhat resembling a chestnut burr in size and form, but generally more or less reddish or purplish. It is caused by a poisonous fluid injected into the plant by a gall-fly (*Rhodites rosæ*), the larvæ of which may be found feeding upon the plant juices. Like many other vegetable substances, it was believed to be useful in medicine in cases of sleeplessness, diarrhœa, scurvy, stone, worms, etc.

Bedel, bĕ-dĕl', **Timothy,** American army officer: b. Salem, N. H., about 1740; d. 1787. In the Revolutionary War he was in command of the American force near Montreal, which surrendered without resistance when attacked by Brant's Indians. He was sick at the time, and the surrender was made by the officer second in command, yet Arnold placed the blame on Bedel.

Bedell, bĕ-dĕl', **Frederick,** American physicist: b. Brooklyn, N. Y., 12 April 1868. He graduated at Yale in 1890, and at Cornell in 1892, and was assistant professor of physics at the last named, 1892–1900. He has established a high reputation for his investigations in alternating currents of electricity. Publications: 'Principles of the Transformer' (1896); with A. C. Crehore, 'Alternating Currents' (4th ed. 1901); and numerous special articles in the 'Sibley Journal' and 'Physical Review.'

Bedell, Gregory Thurston, American clergyman: b. Hudson, N. Y., 27 Aug. 1817; d. 11 March 1892. In early life he was rector of the Protestant Episcopal Church of the Ascension, New York. In 1859 he was consecrated assistant bishop of Ohio, and in 1873 bishop of that State. He wrote 'The Divinity of Christ'; 'The Profit of Godliness'; 'The Age of Indifference'; 'Episcopacy — Fact and Law'; 'A Canterbury Pilgrimage'; 'A Votive Pillar'; 'Memorial of Bishop McIlvaine'; and 'Pastoral Theology.'

Bedell, William, English clergyman: b. Black Notley, Essex, 1570; d. 1642. He studied at Cambridge, became minister of St. Edmundsbury in Suffolk, and in 1604 went to Venice as chaplain to the ambassador, Sir Henry Wotton. Here he remained for eight years and became intimately acquainted with the celebrated Fra Paolo Sarpi, who taught him Italian and was taught theology in return. While here Bedell translated the English prayer-book into Italian. On his return to England he resumed the duties of his curacy, but left it in 1615 for the living of Horingsheath. Here he remained for 12 years, and quitted it to become provost of Trinity College, Dublin. He undertook several important reforms, and successfully accomplished them through the admirable manner in which he tempered firmness with prudence. In 1629 he was appointed to the united sees of Kilmore and Ardagh, but thinking the duties of one sufficient, he retained only Kilmore and insisted on resigning Ardagh. He next turned his attention to the Roman Catholics, and labored assiduously to convert them to Protestantism. He caused the prayer-book to be translated into Irish and read regularly every Sunday in the cathedral. The New Testament had already been translated, but Bedell had the honor of perfecting the boon by procuring the translation of the Old Testament. In 1641, on the breaking out of the rebellion, his house was for some time the only English one in the county of Cavan which remained uninjured; but at last he was so far involved in the common fate that he was carried off to the castle of Cloughboughter, where he was imprisoned with many others, the only exception in his favor being that he was not put in irons. His works are few and of comparatively little importance. His biography has been written by Bishop Burnet.

Beden, the Arabic name, in Palestine, of the local species of ibex (*Capra sinaitica*), which ranges throughout Palestine and along both shores of the Red Sea. It varies little from other ibexes except in having the great horns of the bucks more compressed, and the knobs on their front at less regular intervals. The general color is yellowish, with conspicuous dark markings on the front of the fore legs, chest, and back. See Ibex.

Bedesman (Saxon, *bead,* a prayer), was a common suffix to the signature at the end of English letters in the 15th and 16th centuries, and equivalent to petitioner. The Pasten letters, 1460–80, furnish many examples. Sir Thomas More, writing to Cardinal Wolsey, styles himself "Your humble orator and most bounden bedesman." Margaret Bryan, the governess of Princess Elizabeth, signs herself, in writing to a superior, "Your dayly bede-woman."

Bedford, Gunning, American patriot: b. Philadelphia, Pa., about 1730; d. Sept. 1797. He was a lieutenant in the French war; entered the Revolutionary army with the rank of major; was wounded at White Plains; became muster-master-general in 1776; was a delegate to the Continental Congress; and was elected governor of Delaware in 1796.

Bedford, Gunning, American lawyer: b. Philadelphia, Pa., 1747; d. 30 March 1812. He was graduated at Princeton in 1771; became a lawyer; acted for a time as aide-de-camp to Gen. Washington; represented Delaware in the Continental Congress in 1783–6; and became attorney-general of the State, and United States judge for the district of Delaware.

Bedford, Gunning S., American physician: b. Baltimore, Md., 1806; d. New York, 5 Sept. 1870. He was graduated at Mount St. Mary's, Emmittsburg, Md., 1825; took his medical degree in Rutgers Medical College, 1829; and spent some years in special study in Europe. In 1833 he was appointed professor in the medical college at Charleston, S. C.; subsequently was called to the Medical College, Albany, N. Y.; and in 1836 settled in New York. He made a specialty of obstetrics; was one of the projectors of the University Medical College; and introduced into the United States obstetrical

clinics for the gratuitous treatment of poor women. His principal publications, 'Diseases of Women and Children' and 'Principles and Practice of Obstetrics,' have had a large circulation in the United States and Europe.

Bedford, Jessie (ELIZABETH GODFREY), English novelist: b. Hampshire, England. Under the pen name of ELIZABETH GODFREY she has published in America several musical novels which have been popular. Her most important works are: 'The Harp of Life'; 'Poor Human Nature'; 'The Winding Road' (1902).

Bedford, John Plantagenet (DUKE OF), regent of France, third son of Henry IV. of England: b. 20 June 1389; d. 1435. Shakespeare, who calls him Prince John of Lancaster, introduces him in his plays of Henry IV. as distinguishing himself by his youthful courage in the battle of Shrewsbury in 1403, and forming a kind of moral contrast to his more dissipated brother, the Prince of Wales. During the reign of Henry V. he participated in the fame acquired by the conquest of France; but his talents were fully displayed when, after the death of that king, he became regent of France, having been appointed to this post by Henry in his will. At Verneuil, in 1424, he displayed his military talents; and the difficulties which he experienced in endeavoring to maintain possession of the conquered provinces in France afforded frequent occasion for the manifestation of his ability. The greatest blemish in his character is his cruel execution of the Maid of Orleans in 1431. He survived this event about four years, and dying at Rouen, was buried in the cathedral of that city.

Bedford, John Russell (DUKE OF), English nobleman: b. 1766; d. 1839. He was versed in literature, fond of science, and a passionate lover of agriculture, to the improvement of which he devoted years of his life and the expenditure of vast sums of money. He was the father of the celebrated statesman, Lord John Russell (q.v.).

Bedford, England, a parliamentary and municipal borough, situated on the Ouse, county town of Bedfordshire. The chief buildings are the law courts, a range of public schools, a large infirmary, county jail, etc., and several churches. The town is rich in charities and educational institutions, the most prominent being the Bedford Charity, embracing grammar and other schools, and richly endowed. There is an extensive manufactory of agricultural implements; lace is also made, and there is a good trade. John Bunyan was born at Elstow, a village near the town, and it was at Bedford that he lived, preached, and was imprisoned.

Bedford, Ind., a city and county-seat of Lawrence County, 65 miles southwest of Indianapolis on the Baltimore & O. S. W. and other R.R.'s. It has 24 large quarries of building-stone, the working of which is the chief industry, but there are also railroad shops, veneering-mills, etc. The court-house and other public buildings are fine stone edifices. Pop. (1900) 6,115.

Bedford, Nova Scotia, a village of Halifax County, situated on the Intercolonial R.R., north of the city of Halifax. Its site is very picturesque, and it is a favorite summer resort. Pop. about 1,500.

Bedford, Pa., the county-seat of Bedford County, situated on a branch of the Juniata River, and on the Pennsylvania R.R., Bedford division, 94 miles southwest of Harrisburg. It is a place of considerable historic interest, as it was for some time an important military post, was once Washington's headquarters, and in 1794 the headquarters of the troops sent to suppress the Whiskey Rebellion. Bedford Springs, a favorite summer resort, is located about a mile from Bedford. The chief industry is the mining and manufacture of iron. Pop. (1900) 2,167.

Bedford, Quebec, a town in Missisquoi County, situated near the northern end of Lake Champlain, on the Canadian P. R.R. Its chief manufactures are knitting-needles, gloves, and farming implements. Pop. (1901) 1,364.

Bedford City, Va., a town and county-seat of Bedford County, on the Norfolk & W. R.R. It has a picturesque situation at the base of the Blue Ridge Mountains, with an elevation of over 1,000 feet. It is the seat of the Randolph Macon Academy (Methodist Episcopal), of the Belmont Seminary (Presbyterian), of the St. John's Institute for Girls (Episcopal), and of the Jeter Female Institute (Baptist). It is in a tobacco-growing region, is the centre of the trade for its district, and has a number of tobacco factories, as well as several other industries, including a woolen-mill, flouring-mills, and foundry. Pop. (1900) 2,416.

Bedford Level, England, a large tract of low-lying land, comprising about 400,000 acres in Cambridge, Norfolk, Suffolk, Huntingdon, Northampton, and Lincoln counties, formerly full of fens and marshes, and in rainy seasons for the most part under water. Peterborough Fen, which is that part of the level running into Northamptonshire, and extending between Peterborough and Crowland, contains between 6,000 and 7,000 acres. One seventh part of the level is situated in Huntingdonshire. Nearly the whole of the Isle of Ely, which forms the northern division of Cambridgeshire, consists of this marshy ground. The southeastern part of Lincolnshire, usually termed Holland, extending to the river Witham on the north, is also included in the Bedford Level. About 63,000 acres are situated in Norfolk, and 30,000 in Suffolk. It derives its name from Francis, Earl of Bedford, who in the 17th century expended large sums of money in attempting to drain the district. Numerous cuts have been made, intersecting every part, some so large and deep as to serve as navigable canals. In the Isle of Ely two of these cuts, the Old and New Bedford rivers, running nearly parallel to each other, are navigable for over 20 miles. Wind-mills and steam-engines raise the water to such a height as to admit of its being carried off to its proper channel; but the expense has sometimes greatly exceeded the value of the land reclaimed; and the great cuts and embankments constructed in recent times have rendered the drainage now tolerably effective. A great part of the level is under cultivation, and produces grain and some other crops in considerable quantities; but there is still enough fen to form shelter for vast numbers of wild fowl.

Bedford Missal, a book made for John Plantagenet, Duke of Bedford (q.v.) and his duchess. This rich volume is 11 inches long,

7½ broad, and 2½ thick, bound in crimson velvet, with gold clasps, on which are engraved the arms of Harley, Cavendish, and Hollis, quarterly. It is embellished with 59 large miniature paintings, with over 1,000 of a small size; and among them are to be seen several portraits of persons of eminence. It was purchased by Edward Harley, Earl of Oxford, from Lady Worsley, great-granddaughter to W. Seymour, second Duke of Somerset, who figured in the reign of Charles I.; and descended from Lord Oxford to his daughter, the Duchess of Portland. In the year 1786, when the collection of the duchess was brought to sale, it was purchased by a Mr. Edwards for $1,100, and was sold again at the sale of the collection of that gentleman, in the year 1815, when it brought $3,350, and came into the possession of the Duke of Marlborough. On coming to the hammer once more it strongly attracted the attention of book-collectors and antiquaries, and realized the unprecedented sum of $5,350, being sold at that price (June 1833) to Sir John Tobin of Liverpool. It is now lodged in the collection of the British Museum. In a historical point of view it is interesting on account of its pictorial embellishments, some of which have been engraved by Virtue for his portraits to illustrate the 'History of England.' For the antiquarian and the student of the fine arts it is one of the most interesting monuments of that age. The antiquarian Gough published a work describing the Bedford Missal. Dibdin, in his 'Bibliomania,' gives an account of it.

Bedivere, bĕd'ĭ-vĕr, **Sir,** in Arthurian legend, one of King Arthur's most trusted knights. It was Sir Bedivere who cast the sword Excalibur into the lake and carried the dying Arthur to the vessel in which he was borne away to Avalon.

Bedlam, a corruption of Bethlehem, the name of a religious foundation granted in 1547 by Henry VIII. to the corporation of London, and by them applied to the purpose of a hospital for the insane. The place was originally within the city boundaries, but in 1814 a new building was erected in St. George's fields, on the south side of the Thames, which was called New Bethlehem, or vulgarly, Bedlam. The patients, who had been discharged partially cured, and went about begging, were called Bedlam beggars, or Tom-o'-Bedlams.

Bed'lington, a coal-mining town of England on the river Blyth in Northumberland, 11 miles north of Newcastle. Pop. (1901) 18,750.

Bedlington Terriers. See TERRIER.

Bedloe's, or **Liberty Island,** an island in New York harbor; ceded to the United States government, in 1800; the site of Fort Wood, erected in 1841 and mounted with 77 guns. It is now the location of Bartholdi's colossal statue of 'Liberty Enlightening the World,' presented by France to the United States. See LIBERTY, STATUE OF.

Bedmar', Alphonso de la Cueva (MARQUIS DE), Spanish politician and cardinal: b. 1572; d. Oviedo, 1655. He was sent in 1607 by Philip III. as ambassador to Venice, and rendered himself famous by the conspiracy against Venice which St. Real has so well described. Notwithstanding the circumstantiality with which the details are given by St. Real, the very existence of the conspiracy is still considered by many a very difficult historical problem. The probability is that the conspiracy was real, but that the Senate, satisfied with having discovered it, and not willing to break altogether with Spain, did not think it advisable to give it much publicity. It forms the subject of Otway's tragedy, 'Venice Preserved.' Bedmar was obliged to save himself by flight to avoid the fury of the populace, but he did not lose the favor either of his own sovereign or of the Pope. By the former he was appointed governor of the Low Countries, where his severity and rigor made him universally detested; and from the latter he received a cardinal's hat.

Bednur, bĕd-noor', or **Bednore,** a decayed city, now a village, of Mysore, India; in the midst of a basin in a rugged tableland of the western Ghats, at an elevation of more than 4,000 feet above the sea, 150 miles northwest of Seringapatam. It was at one time the seat of government of a rajah, and its population exceeded 100,000. In 1763, it was taken by Hyder Ali, who pillaged it of property to the estimated value of £12,000,000, and subsequently established an arsenal here.

Bedott', Widow, the literary name of Mrs. Francis Miriam Whitcher, author of the once famous 'Widow Bedott Papers.'

Bedouin, bĕd'oo-ĕn or bĕd'oo-ĭn, the name given to the nomadic Arabs, as distinguished from those settled in towns and villages and engaged in agriculture and manufactures. The Bedouin inhabit the deserts of Arabia and northern Africa, and are lean and short, but very active and capable of enduring great fatigue. They live mainly by hunting and pastoral occupations, and very little agriculture is carried on. Their food consists mostly of the produce of their herds, and they enjoy excellent health. Their temperament is cheerful, and they are honorable in their dealings with one another or with guests. Many of them, however, partly support themselves by robbery, but the statements regarding their marauding propensities seem to have been exaggerated. They live in tents, but frequently, when traveling, they sleep in the open air. Their religion is professedly Mohammedan, but is of a very simple character. The women grind corn and weave coarse cloths, and many of the tribes barter horses, camels, cattle, etc., for various necessaries, such as arms and cloth. Some tribes gain part of their subsistence by escorting travelers, pilgrims, etc., across the deserts. They are monogamous, but divorce is easily obtained and frequent. Though generally very ignorant, they are by no means unintelligent; and they possess the lively fancy of most Eastern nations. The head of a tribe is the *sheik,* and they have also judges known as *cadis.* See Burckhardt, 'Notes on Bedouins and Wahabys' (1830); Blunt, 'Bedouin Tribes of the Euphrates' (1879).

Bedreddin Hassan, bĕd-rĕd-dēn' häs'sạn, the hero of the amusing cream tart story in the 'Arabian Nights Entertainments.'

Bedstraw, Galium, a genus of about 200 annual or perennial herbs with four-angled stems, natives mostly of the colder climates, whether of latitude or altitude, in the northern hemisphere. The species, which are mostly harsh-feeling weeds, are often attractive for their regular whorls of leaves and their pani-

cles of profuse minute, white, yellow, green or purple blossoms which in some species are used by florists to add "misty delicacy and airy grace" to bouquets especially of sweet peas, and to cover rock-work in and out of doors. The two species most cultivated for this purpose are *G. mollugo* (European) sometimes called baby's breath (see GYPSOPHILA), and *G. boreale* (American). Yellow bedstraw or cheese rennet (*G. vernum*), a species with yellow flowers, is used for curdling milk. Its flower sprays yield a yellow dye when boiled in alum solutions and its roots a red one, said to rival madder as a wool dye. For this use attempts at cultivation have been made in England. This species, together with *G. trifidum* and *G. boreale*, redden the bones and milk of animals that eat them in quantity. Goose grass or cleavers (*G. Aparine*), a troublesome weed common to Europe, Asia, and America, yields a seed sometimes used as a substitute for coffee. It is noted for the hooked prickles of its stems, fruits, and leaves. In China *B. tuberosum* is cultivated for its farinaceous tubers. Some species, for instance, *G. mollugo* and *G. rigidum*, have been tried in cases of epilepsy and others in cutaneous disorders.

Bee, a name applied to those Hymenoptera which stand at the head of the order, and are represented by the bumblebee and the honeybee. They differ from the wasps in the mouth parts being longer, especially the tongue or proboscis. Each hind tibia is hollowed, broad, and so modified as to form a "honey-basket." The hairs are more or less spinulose or plumose, often of use in carrying pollen. Bees are solitary or social in their habits, and form nests consisting of either a single or many cells, and of varying materials and degrees of complexity. There are two families of bees: (1) *Andrenidæ*, comprising solitary bees, with the labian or under lip flattened and very short. They excavate nests in turf and in grassy sunny fields, making a deep pipe or hole, with short lateral galleries in which the grub feeds and grows. The species of Halictus and Andrena comprise the most common wild bees. They entertain guest bees (Nomada). See GUEST-BEES.

The family *Apidæ* includes the species of Bombus (see BUMBLEBEE), Xylocopa (see CARPENTER BEE); stingless bees (Melipona), and the honeybee (q.v.) *Apis mellifica*. In the bees the labium is usually produced into a long, slender, hairy proboscis, which is bent under the body. It is very long in Anthropora, and in Englossa longer than the body. The basal joints of the labial palpi are longer than the others. The mouth-parts are complicated and adapted for manifold purposes connected with nest- or cell-building and the collection of nectar and pollen. Indeed the bees stand at the head of the insect series, whether we take into account their structure, mode of development, habits, instincts, and differentiation of the sexes, though the flies (Diptera) are in their way more specialized, but the specialization of certain parts in flies is accompanied by the degeneration and atropy of others. The humble-bee besides its ordinary use in nest-building employs its jaws to cut holes in flowers in order to reach the nectar.

The transformations of the bee are complete. The larva is a footless maggot incapable of extended locomotion and lives in its cell where it is fed by the workers, or lives on pollen or honey stored up in the cell; the food is always derived from plants or other bees, although honeybees have been observed licking meat. The cells of the honeybee are open, the workers feeding the larvæ with a mixture of honey and pollen, the honey being specially adapted to be digested by the young. The larva transforms into the pupa within its cell, previously spinning a slight cocoon, or in the case of the honeybee simply closing the mouth of its cell with a cover of silk.

The sting of the queen bee is curved, of the worker straight; it is composed of three pairs of processes arising from the under side of the segments near the end of the abdomen, wherein is the poison-sac.

Besides male and female, there are in the social species numerous barren females or workers, in which the ovaries are small and undeveloped. Occasionally worker bees are capable of laying eggs and producing young. The difference between the workers and the fertile females or queen is now known to be due to the difference in the food given to the larvæ; that of the queen larva being richer in nitrogenous substances than that fed to the larval workers. Thus heredity has nothing to do with the matter; the larvæ of the workers and of the queen inherit the same peculiarities; the barrenness and smaller size of the worker bee is the result of being fed with different food.

Bees are essential agents in the fertilization of flowers, in setting fruit, and were it not for them it is now supposed that we should not have had the irregular flowers of the pea and other papilionaceous plants. It is a notable fact that the incoming or origin of flowers and of the bees and other insects which visit them was geologically about the same time. At any rate bees ensure the existence of flowers and the latter have modified bees.

The number of known species of bees is upward of 5,000. They abound in all parts of the world, especially the tropics; while humblebees (*Bombus*) reach the polar regions and live as alpine forms on high mountain plateaux and ranges. For the different kinds of bees, see also BEE-KEEPING; BUMBLEBEE; CARPENTER BEE; HONEYBEE; LEAF-CUTTING BEE; MASON BEE; STINGLESS BEE; also INSECT.

Bee-birds, birds that devour bees, especially the honeybee. Not many birds have this habit, the bees being protected against most birds by their stings. A few fly-catching birds, however, have learned how to avoid being stung, and catch not only bees but wasps, take them to a perch and beat them, so as to kill them, and probably get rid of the sting before swallowing them. Notable among these are the European and African bee-eaters (q.v.). The American kingbirds (q.v.), also catch bees, but not as frequently as is popularly supposed, and are known in the southern States as "bee-martins."

Bee-eater, a small, richly plumaged, and graceful bird of southern Europe and northern Africa, whose food consists almost wholly of bees and wasps, and which haunts the neighborhood of the hives of honeybees and devours these useful insects in great numbers. The bee-

eaters are related to the kingfishers, and like them dig deep nesting-holes in earthen banks, and lay pure white eggs.

Bee-keeping. Few persons who see the little boxes of honey in the market realize the importance and extent of the bee-keeping industry of this country. Careful estimates, based on United States statistics, and the output of large factories for the manufacture of bee-hives and honey-boxes, show that at least 125,000,000 pounds of honey is annually produced, making an aggregate of 5,000 carloads, or a train 35 miles long. The aggregate value of this, at a conservative figure, is $10,000,000. When it is remembered that California alone, in a good year, can produce 500 carloads of honey, and that a good many of the other States produce from 50 to 100 carloads, one can form some idea of the commercial possibilities wrapped up in so small an animal as the bee.

Bee on the wing.

Bee on Red Clover.

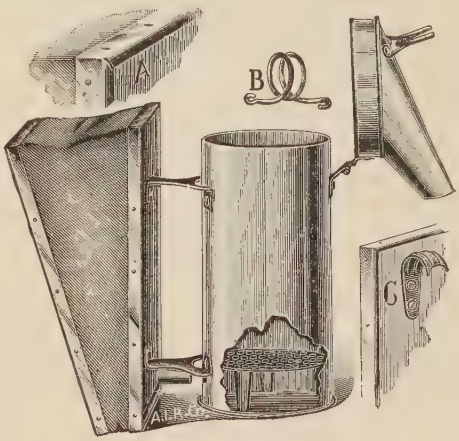
The honey resources of the great West are very largely dependent on alfalfa and mountain sage. In the north-central and eastern States, clover and basswood, in the south-central, tupelo, palmetto, catclaw, mesquite, and guajilla.

There are several races of bees — *Apis dorsata,* or the giant bee of India and of the Philippines; *A. Indica,* of India; *A. florea,* and *A. mellifica.* From a commercial standpoint, the last mentioned is by all odds the most important. It comprises the black or German bees of this country; the Italians, from the southern part of Italy; the Syrians, of Palestine; the Cyprians, from the island of Cyprus; the Carniolans, from Austria; and the Tunisians, from North Africa. But the most important of all of these varieties is the Italian. They are the most industrious and the gentlest. They, together with the black or German bees and their crosses, incorrectly termed "hybrids," are used most extensively in the United States — in fact, throughout almost all the civilized world.

Three Kinds of Hive Bees.—There are three kinds of bees in the hive; namely, the workers, or undeveloped females; the queen, a fully developed female; and the drone, or the male bee. The queen lays all the eggs of the hive, and may lay as many as 3,000 a day. Notwithstanding there may be from 10,000 to 100,000 bees in a single colony, the queen will be the mother of the whole colony. The drones are incapable of gathering honey, and serve only one purpose — that of fertilizing or fecundating the young queens, which act takes place in the air. The workers gather all the honey and pollen, fill all the combs, and rear the young or baby bees. As soon as the mating season is over, the drones are shoved out of the hives and allowed to starve.

Queen Bee.

How to Handle Bees.— There is a general impression to the effect that the ordinary honey-bees are vicious, ever in a towering rage, ready to attack any one who comes near their hives. This is a great mistake. Under certain conditions, when their habits are known, they can be handled almost like kittens; will permit one to tear their hives apart, rob them of their months and months of hard earnings — the honey and the wax — without even offering to sting. But an inexperienced or awkward person may infuriate them to fearful vengeance. To bring them into a state of subjection it is only necessary to blow smoke into the entrance and over the combs, when, if the motions about the hive are careful and deliberate, they will offer no attack. Smoke, when intelligently used, disarms opposition, puts the bees in a quiet state, and enables their owner to do with them, within reasonable limits, whatsoever he will.



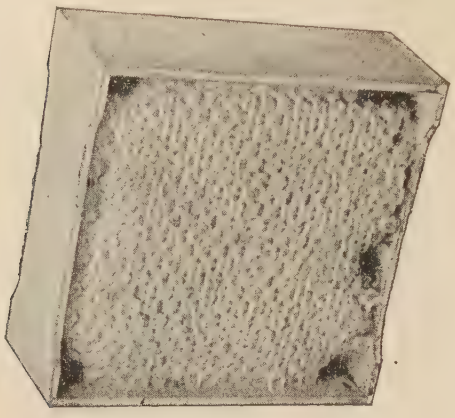
Bee-Smoker.

The bee-smoker is simply a small bellows attached to a sort of tin cup having a suitable snout from which the smoke is blown by the action of the bellows, forcing air through the cup in which there is a slow-burning fuel. Besides the bee-smoker, the bee-keeper generally uses a bee-veil made of mosquito-netting, Brussels net, or any suitable material, the same fastened to the rim of the hat, and tucked inside of the coat-collar or under the suspenders. Gloves are sometimes used by very timid persons or beginners; but as a general thing all work with the bees is performed with the bare hand. Stings are, of course, occasionally received; but beyond a sharp momentary pain no permanent effect will be felt after the first season; for the system of the bee-keeper very soon becomes

Bee-Veil.

inoculated so that no swelling takes place. There are many who receive from ten to twenty stings a day, without any ill effects; but if one will work carefully he will receive almost no stings.

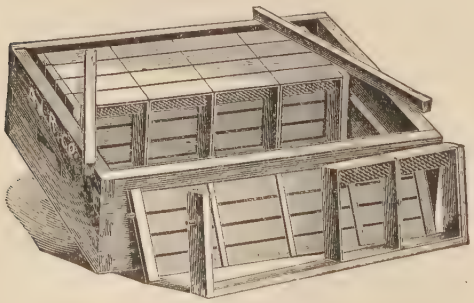
Marketable Products of the Hive.—These are beeswax, comb and extracted honey, propolis or



Section of Comb Honey.

bee-glue (sometimes used for making shoe polishes), and "apis mellifica," a homeopathic preparation taken from the poison sacs at the root of the stings of bees. While beeswax is an important product, and commands a good price in the United States, comb and extracted honey are the main sources of revenue to the bee-keeper.

Comb honey is usually put up in little square or oblong boxes, of which something like 50,000,000 are made and used in the United States annually. The honey in these boxes retails all the way from 12 to 20 cents. Extracted is honey in the liquid form, thrown from the combs by means of centrifugal force in a honey-extractor, hence the name. There are bee-keepers who make a specialty of producing honey in the comb, and others the same product free from the comb. The first mentioned can not be adulterated nor manufactured, newspaper reports to the contrary. One bee-keeper of considerable standing and prominence has had a standing offer of $1,000 for a single

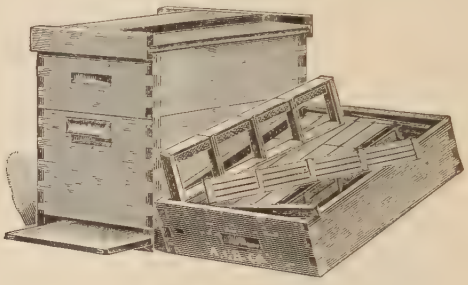


Comb Honey Super.

sample of artificial comb honey so perfect as to deceive the ordinary consumer. Notwithstanding that this offer has been broadly published over the United States for over twenty years, no one has ever claimed it.

It may be well to explain that a partial basis for these canards lies in the fact that bee-keepers use a commercial product known as "comb foundation," which is nothing more or less than sheeted wax, about an eighth of an inch thick, embossed on both sides with indentations having the exact shape and form of the bottom of the cells of honey-comb — hence the name. It is put into the hive, where the bees draw it out into comb. This is as far as the skill of man can go; hence there is no such thing as artificial comb; much less, artificial comb honey.

The business of producing comb honey re-



Bee Hive for Comb Honey.

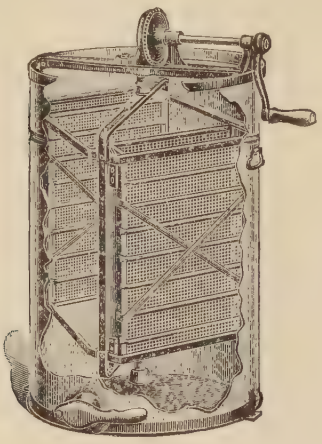
quires some knowledge of the trade. Hives and supers require to be specially constructed, and so arranged that the little boxes containing strips of comb foundation shall be accessible to the bees where they can construct the foundation into comb, fill the cells with honey, and seal them over. When their owner finds that his little servants are busily at work in the

Uncapping Can.

fields; that the combs are beginning to whiten and to be bulged with honey in what is called the brood-nest, he puts on his honey-boxes in

the part of the hive he calls the «super.» These are allowed to remain on during the height of the honey-flow until they are filled and capped over, when they are removed and others put in their place.

The business of producing extracted (or liquid) honey requires the same intelligent care and attention. Instead of section-boxes, however, an extra set of combs, or «brood-frames,» as they are called, are put in the upper story, the same being placed above the lower or brood part of the hive. When these are filled with honey, and capped over, they are removed from the hive by first shaking the bees off, taken to the extracting-house, and extracted. The thin film of wax covering the comb is shaved off with a thin-bladed knife specially designed for the purpose. After the combs are uncapped they are put in the honey-extractor, and revolved at a high rate of speed. The honey flies out of the comb by centrifugal force against the



Honey Extractor.

sides of the extractor, when the combs are reversed, exposing the other surfaces, which are emptied in a like manner. They are next returned to the hive to be filled by the bees, when the process may be repeated as long as the season lasts.

Swarming.— At the beginning of or during what is called the honey-flow, when the colony has reached a high state of prosperity, and the combs are being filled with honey, a swarm is liable to come forth between the hours of nine and three o'clock. Three-fourths of the bees, including the queen, are pretty sure to come out with a rush, filling the air with thousands and thousands of them. The bees hover about in the air for fifteen or twenty minutes, when they will in all probability cluster on some bush or tree. They will wait here for two or three hours, or perhaps as many days, at the end of which time they will take wing again and go direct into some hollow tree or cave where they will take up new quarters and start housekeeping anew. The young bees, with one or more young queens, are left to take care of the old hive.

In ordinary practice it is a custom for the bee-keeper to rehive the swarm by taking the bunch of bees, as soon as it clusters, and putting it into another hive. Or he can, if he chooses, clip the old queen's wings, preventing her flight with the swarm; and when the bees come forth she will crawl out of the entrance to be captured by her owner; and as soon as her subjects return, which they will do to find their royal mother, they are allowed to go into a new hive on the old stand, while the old hive is carried to another location in the bee-yard.

Robbing.—There are certain times during the season when no nectar is secreted by the flowers. It is during such periods as this that the bees will rob each other if they can, or help themselves at candy-stands or to the housewife's fruit-preserves during the canning season. When sweets can be obtained in considerable quantity, either from a weak colony unable to defend itself, or from man, the bees are apt to become furious, and their craze is not unlike that of gold-hunters when gold is discovered in large quantities. There is a rush; and when the sweets are suddenly cut off, the bees are inclined to be cross, and to sting. The wise and careful bee-keeper will see to it that the entrances of his weak colonies are properly contracted so that the sentinels or guards can protect themselves from intrusion from other bees.

Feeding.—The bee-keeper may, perhaps, take all the honey away from his bees, or nearly so, as his honey will bring two or three times as much as any cheap syrup costs him. Sometimes he finds it profitable to take the honey all away and give them syrup made of granulated sugar. The purpose of this, of course, is to keep them from starving during the time no honey is coming in from natural sources or during the winter.

Uniting.—After the honey-flow, and just before winter comes on, there are liable to be many weak colonies. It is a common practice to put two or more of these together so as to make one strong stock. The combs from two or three different hives are put into one hive, and the bees are confined for several days with wire cloth over the entrance, when they are allowed to fly. Some of them will return to their old stands, but the majority of them will remain.

Wintering.— Two methods are in vogue in the colder portions of the United States. One is, to put the colonies in double-walled hives, packed under chaff cushions, and contracting the entrances down to shut out as much cold as possible. The other is, to put the summer hives into a dry dark cellar as soon as cold weather comes on, leaving them there till spring.

Diseases of Bees.— Bees are subject to diseases, like all domestic animals, such as dysentery, paralysis, and foul and black brood. Dysentery, as its name signifies, is a sort of bowel trouble due to the retention of the feces for an extended time during winter. If the bees are shut up without a chance for flight (for they never void their feces inside of the hive except when confined), their intestines become distended, and this finally results in purging. The only remedy is warm weather and a flight. Paralysis is a form of palsy that seems to affect the adult bees. Their bodies become swollen and shiny, the affected individuals crawling out of the entrance, and running into the grass to die. The remedy is to sprinkle powdered sulphur over the combs. Foul brood and black brood are germ-diseases that affect bees in the

larval or imago state. The little maggots become brown or black, and die, the dead matter finally assuming a sodden, gelatinous, or ropy condition. When it attacks a colony shake the bees into a clean hive, and put them on frames of foundation. For three or four days feed them sugar syrup. The old combs, including the frames, must be burned. If the hive has been soiled by the tainted honey or dead matter, it must be scalded out or held over flames for a few seconds. Any honey taken from the hive may be rendered safe to give to the bees by boiling it for two hours.

Author of 'A B C of Bee Culture' and Editor of 'Gleanings in Bee Culture.'

Bee-killer, one of the robber-flies (q.v.), of the dipterous family *Asilidæ,* some of which are known to seize with their sharp lancet-shaped beak bumblebees and honeybees, and suck their blood. This species *Trupanea apivora,* the bee-killer, captures the honeybee while on the wing, and one such fly has been known to kill 141 bees in a single day. These flies are stout-bodied, hairy or bristly, with a long abdomen; the mouth-parts are much developed and adapted for piercing. The maggots live in the soil, preying on the grubs of beetles, or on the roots of plants.

Bee-larkspur. A well-known flowering plant, *Delphinium grandiflorum.*

Bee-line. The shortest route to any place, that which a bee is assumed to take; though, in fact, it often does differently in its flight through the air.

Bee-louse (*Braula coeca*) is a parasite on the honeybee, occurring on the thorax especially of the queen bee — rarely on the drones. Benton states that he has at one time removed as many as 75 from a queen, though the numbers do not generally exceed a dozen. It is the sole member of a family (*Braulidæ*) of flies closely allied to the horse flies (*Hippoboscidæ*) and the bat-ticks (q.v.). The bee-louse is about one twentieth of an inch in length, entirely without wings, and somewhat spider-like in appearance. On the day the maggot or larva hatches from the egg it sheds its skin and turns to an oval puparium of a dark-brown color. It has frequently been imported to this country on queens with attendant bees but has gained no foothold.

Bee Moth, or **Wax Moth,** a moth belonging to the family *Galleridæ;* specifically, *Galleria mellonella,* the larva of which feeds on wax in hives. The worm is yellowish-white with brownish dots. It constructs silken galleries running through the comb of the bee-hive on which it feeds. When about to transform it spins a thick white cocoon. Two broods of the moth appear, one in the spring, the other in August, and the caterpillars mature in about three weeks. It may become a most troublesome pest in the apiary.

Bee-orchis, the name of a species of orchis, the *Ophrys apifera* It is so called because a part of the flower resembles a bee. It is large, with the sepals purplish or greenish-white, and the lip brown variegated with yellow.

Bee-tree, a forest tree inhabited by honey-making bees, which have taken possession of some natural hollow and filled it with combs. Such a tree may be found by accident, or by deliberate hunting. Those in search take to the edge of the woods a box of diluted honey, and when they see bees near them, open the bait to which one by one the bees will be attracted. The direction of their flight is then carefully observed; the bait is moved to another point, and new observations taken, and the converging lines followed until they intersect at the tree. As most of these bee-tree colonies are escaped swarms the capture of the bees themselves is more important than merely to get such honey as may be there. The best plan is therefore to climb to the nest, if possible, and gather the combs and contents to be let down in a pail or basket, or else saw out the whole section of the tree containing the nest and lower it to the ground. Full directions for this complicated proceeding are given by Root, 'A B C of Bee Culture' (1903).

Beech, a small genus (*Fagus*) of handsome forest trees of the natural order *Fagaceæ,* divided by some botanists into two genera: Eufagus, containing five species natives of the northern hemisphere; and Nothofagus, embracing 12 species indigenous to the southern hemisphere. The American beech (*Fagus ferruginea*), and the European or common beech (*F. sylvatica*), are closely similar. They often attain heights exceeding 80 feet, and diameters greater than 3½ feet. The former has smooth, light-gray bark, a broad round head, and leaves which turn yellow before they fall in the autumn; the latter has dark-gray bark, is more ovate in general outline and has shining leaves which persist during most of the winter. The tree scarcely bears fruit before the 50th year of its age, and then not every year. After the 140th year, the wood-rings become thinner. The tree lives for about 250 years. Some stems are fluted, some even twisted. The roots stretch far away, near to the surface of the soil, partly above it. Young beeches are useful for live hedges, as they bear pruning, and as their branches coalesce by being tied together, or by rubbing each other. Amputations of limbs, and deep incisions in the tree, soon become obliterated by the bark, which contains a peculiar periderma. The dead leaves are often used by the poor of Europe for stuffing beds and pillows. Each yields pleasant, edible, three-angled nuts, usually in pairs in prickly involucres. These nuts are eaten by swine, deer, and poultry, and in France, and to some extent elsewhere, are pressed to extract a mild culinary long-keeping oil. Both species thrive in light, limy loams, upon which formations they often become the leading species of tree, covering large tracts. They do not grow in damp situations. Their reddish-brown, solid, hard but brittle wood makes excellent fuel, and is largely used

1. Young branch with male and female flowers.
2. Single male flower.
3. Single female flower.
4–5. Fruit and fruit case.
6. Twig with two buds.
7–8. Varieties of the Beech.

BEECH TREE (Fagus sylvatica).

for making tool handles where bending and twisting are not expected. The wood is not durable in contact with soil, but since it is remarkably lasting when immersed in water, it is largely used in dams, water-mills, sluices, etc. The wood of the European species is preferred to that of all other species, except walnut, for making shoes (*sabots*), in France, since it is remarkably resistant to the entrance of water. The bark is sometimes used in tanning. Both species are used in ornamental planting on account of their symmetrical forms, the colors of their bark and foliage, which latter is remarkably free from the attacks of disease and insects. The European species has produced a large number of varieties, of which the copper or purple beech is probably the best known in America. *F. Sieboldi,* a native of eastern Asia, is sometimes planted for ornament. *F. Cunninghami,* the "myrtle tree" of Tasmania, is a large tree with leathery birch-like leaves. *F. betuloides,* a Terra del Fuegian species, is a striking feature of the winter landscape on account of its evergreen foliage. Its wood is used for flooring vessels, and is exported to the Falkland Islands and elsewhere for roofing. Blue or water beech, better known as American hornbeam (*Carpinus americana*), is a common tree in damp woods and along streams. It is not a member of this genus. See HORNBEAM.

From the wood of the beech an especially pure form of creosote is obtained that is largely employed in the treatment of chronic lung disorders. See CREOSOTE.

Beech Drops, a plant parasite on beech tree roots. See CANCER ROOT.

Beecher, Catherine Esther, American educator and philanthropist, eldest daughter of Lyman Beecher: b. East Hampton, L. I., 6 Sept. 1800; d. Elmira, N. Y., 12 May 1878. Her faith and life were nearly wrecked at 22 by the loss of her betrothed, Prof. A. M. Fisher of Yale, in a shipwreck, and she lived unmarried, plunging into work as a relief; but she had the Beecher energy which could hardly have remained quiet in any case. From 1822 to 1832 she managed a girls' school in Hartford, Conn., with remarkable success and repute; she wrote some of her own class-books, one on mental and moral philosophy being afterward used in colleges. From 1832 to 1834 she kept a similar school in Cincinnati, in order to be with her father, who was at the head of Lane Seminary; but her health compelled her to abandon it. For the rest of her life she worked with heart and soul to advance the education of women and girls, physical and social, as well as intellectual and moral, for she believed in the full harmony of all inborn human qualities. She organized a "National Board of Popular Education," to train women teachers, especially for the South and West, and traveled and wrote extensively in this behalf. As with most persons of much force, she had many "fads" and eccentricities; but she was a high-minded, accomplished, and charming woman, full of wit and executive capacity. Her first work was on the 'Difficulties of Religion' (1836); among others were 'True Remedy for the Wrongs of Women' (1851); 'Physiology and Calisthenics' (1856); 'Common Sense Applied to Religion' (1857); 'Woman's Profession as Mother and Educator, with Views in Opposition to Woman Suffrage' (1871).

Beecher, Charles, American clergyman, son of Lyman Beecher: b. Litchfield, Conn., 7 Oct. 1815; d. Haverhill, Mass., 21 April 1900. He was educated successively at the Boston Latin School, the Lawrence Academy at Groton, Mass., and at Bowdoin College, graduating 1834. He then studied theology under his father at Lane Seminary, Ohio, and in 1844 was ordained pastor of a Congregational church at Fort Wayne, Ind. Leaving there in 1851, he was pastor in Newark, N. J., till 1854, and in 1857 took charge of a church in Georgetown, Mass. He lived in Florida, 1870–7, and was State superintendent of public instruction there for two years, and was stated supply at Wysox, Pa., in 1885. His best work was in the selection of the music for the famous 'Plymouth Collection' of hymns, he having fine musical taste. He wrote 'The Incarnation' (1849); 'David and His Throne' (1855); 'Pen Pictures of the Bible' (1855); 'Redeemer and Redeemed' (1864); 'Spiritual Manifestations' (1879); and 'Eden Tableau' (1880). He also edited his father's autobiography and correspondence (1863).

Beecher, Charles Emerson, American palæontologist: b. Dunkirk, N. Y., 9 Oct. 1856; d. New Haven, Conn., 14 Feb. 1904. He graduated at the University of Michigan 1878, studied under Prof. James Hall at Albany, N. Y.; in 1888 was given a position in this department at Yale; in 1892 was made professor of historical geology; and in 1892 succeeded Prof. O. C. Marsh as professor of palæontology and curator of the geological collections. He has written over 50 papers for scientific periodicals, and the proceedings of scientific societies, chiefly on evolution, especially as illustrated by the growth and structure of trilobites, and on the classification of trilobites and brachiopods; a number of these and similar studies on other organisms were collected as 'Studies in Evolution' (1901), one of the Yale bicentennial publications. He also published a memoir on the *Brachiospongidæ* in the Yale Peabody Museum Memoirs (1889).

Beecher, Edward, American clergyman, son of Lyman Beecher: b. East Hampton, L. I., 27 Aug. 1803; d. Brooklyn, N. Y., 28 July 1895. Graduating at Yale 1822, he studied theology at Andover and New Haven, and in 1826 was ordained over Park Street Church in Boston; which he left in 1830 to take the presidency of Illinois College, Jacksonville, Ill., a theological school, whence many of Dr. Beecher's pupils went to be pastors and teachers in the new West. He returned to Boston in 1844 as pastor of the Salem Street Church; in 1856 went to the Congregational church at Galesburg, Ill., remaining till 1872, also holding for some years a professorship of exegesis at Chicago Theological Seminary. He had been a regular writer for the *Christian Union* since 1870, and in 1872 retired from the ministry, removed to Brooklyn and devoted himself entirely to writing and missionary work, contributing to the *Christian Union,* and editing the *Congregationalist* for six years. Of his books, the two most discussed were 'The Conflict of Ages' (1853), and 'The Concord of Ages' (1860), a transference into terms of Christian theology of the doctrines of pre-existent and continuously existent souls and the dualism of good and evil, the struggle of the two being prolonged into a future life and good finally triumphant. Besides sermons, etc.,

he also published a 'History of the Alton Riots' (Cincinnati 1837); 'Baptism' (1850); 'Papal Conspiracy Exposed' (1855); 'History of Opinions on the Scriptural Doctrine of Future Retribution' (1878).

Beecher, Henry Ward, American clergyman, eighth son of Lyman Beecher: b. Litchfield, 24 June 1813; d. Brooklyn, N. Y., 8 March 1887. He was the offspring of a union which has produced some of the world's greatest influences, and in theory ought always to produce them — of a stern, energetic, high-principled father, with a sweet and beauty-loving mother, giving power and continuity to sensibility and sympathetic emotion. Macaulay and Victor Hugo are notable instances in this respect. He had a rather bare, hard childhood, under a father and stepmother who both considered duty and enjoyment hardly compatible. The great genial orator who shouted down and won over hostile mobs was a shy and sensitive boy; the editor, author, and book-lover had a wretched memory, disliked study, and wanted to go to sea. But the religious atmosphere was around him: "converted" in a revival, he decided to train for the ministry, entered the Boston Latin School in 1826, then the Mount Pleasant School at Amherst, graduated from Amherst College 1834, and began a theological course under his father at Lane Seminary. He revolted at his father's sulphurous theology, however, and for a short time in 1837 was editor of an anti-slavery paper in Cincinnati, fervid love for humanity holding first place with him then as always. Later in the year he took charge of a country church at Lawrenceburg, Ind., and married Eunice White Bullard, of West Sutton, Mass., to whom he had been seven years engaged. In 1839 he was called to a church in Indianapolis, then a town of 4,000 people, remaining there eight years and becoming widely known both as a revivalist of great power and a preacher of delightful humor and originality. In 1847 he was called to Brooklyn to take charge of a new church of nine members, called Plymouth Church. He held this pastorate for 40 years, lacking a few months; and for the most of the time the church was not only a Mecca to the vast class seeking to retain Christianity while forced to discard very much in the way of theology, but the fountain of a stream of influence acting powerfully on the moral and social, and sometimes the political tendencies, of the age. He preached on whatever related to the public welfare, probed every evil and championed every reform, especially of intemperance and slavery. His outspoken courage, strength of thought, and felicity of expression, his exhaustless wealth of eloquent rhetoric, humor and pathos, dramatic force, and apt analogy and illustration, not only drew to hear him one of the largest permanent congregations in the United States — his immense church with its seating capacity of nearly 3,000 being constantly crowded — but made his pulpit one of the most famed and influential of the English-speaking world; his utterances forming a basis of action for many. He was not a theologian in any sense, and his influence rested on his abstinence from credal logic: he was the spokesman of those who fear that if they compute their doctrinal latitude they may discover much more than they wish to know, and prefer to keep the fruits of faith by evading exact definition rather than lose them by a rigid self-inquiry. To the orthodox of his day he seemed an underminer; though to many at the present he seems conservative enough. He believed in the divinity of Christ, in immortality, in special providences and miracles, in the Bible as a divine revelation by fallible human instruments; he did not believe in eternal punishment (which he publicly denied in 1878), election and reprobation, the fall of Adam, the vicarious atonement, or imputed sin and righteousness; and he declared the orthodox Deity "barbaric, heinous, hideous." He gave his whole soul to the work of preaching, often delivering several discourses in a single day; but such was his physical and mental vigor that he accomplished work in several other directions sufficient in each case for an able and lusty man. He was one of the giants in oratory of the anti-slavery time; and none of the champions of the cause was more hated and reviled than "the abolitionist Beecher," whose work was excelled only by that of his great sister, and who left his pulpit in the Fremont campaign to denounce the Kansas crime, joining the Republican party on its inception and traveling great distances to speak at its meetings. Yet he was not an abolitionist like Phillips and Garrison: and like Lincoln and the mass of the Republicans, held that Congress could not interfere with slavery in the South, but only prevent its extension. The pro-slavery party drew no fine distinctions, however, and the northern Democratic papers all through this period are filled with denunciation and caricature of him. His series of speeches in England in the fall of 1863 helped to turn the tide of English opinion in favor of the North. The prime element of his success was his enormous physical vitality: he tired out the mobs which howled him down, by actual bodily endurance and power of lungs, before he began the splendid addresses which made them at least enthusiastic admirers of himself, if not perhaps converted believers in the Union. He had the "rapture of the strife" which Attila knew: he loved to be the target of a ring of opponents as well as John Quincy Adams, though without his bitterness, and was as instant and unfailing in retort; a dozen taunts hurled at him in a breath met a dozen crushing but never malicious answers. He was for many years one of the most popular lecturers and after-dinner speakers in America. Of his set orations, those at the Burns centennial of 1859, and by government request at Fort Sumter, in April 1865, on the anniversary of its capture by the Confederates are most famous. He occupied several editorial positions: editing the *Independent* 1861–3; founding the *Christian Union,* editing it 1870–81; was a fertile sketch writer, and wrote a novel and a 'Life of Christ.' Besides this, he was an enthusiastic amateur farmer, and loved outdoor nature passionately, as well as art and the drama. His open, impressible, sensitive nature responded readily to all things that stimulate the intellect, the heart, or the soul. He was essentially a man of impulses and inspirations, trusting to the spontaneous suggestion of the moment, often not even making notes for a sermon; but like all men who make any impress on the world, kept himself filled with material for inspiration to work on,

HENRY WARD BEECHER.

both from books and life. He always lamented that it had not been permitted him to lead a life of scholarship; but in fact he did not lead it because he was not willing to pay the price for it, of abstinence from leadership in the political and social life of the time. He never lacked courage to take a side, right or wrong, and often grieved and alienated large bodies of his friends by doing so when passions were hot. He was a firm adherent of the Seward-Johnson policy of reconstruction in 1866, despite the terrible results to which its prematurity led; sympathized with the Greeley movement in 1872; and braved a threatened disruption of his church in 1884 by voting and speaking for Cleveland. He believed in and advocated free trade and woman suffrage. So brave and impulsive a nature was always shocking the conventions of his order. Naturally, he was forever perpetrating indiscretions in speech, to the delight of his enemies and the discomfiture of his friends. Tact was unfortunately not a large inheritance of most of Lyman Beecher's children, and the paucity of Henry Ward's share was the cause of many an inept and unfortunate public utterance; while his fertility of comparisons and analogies often led him into pithy exaggerations and a humorous extravagance of language which his opponents could easily disprove in the letter.

In 1874 Mr. Beecher's former associate and later successor in the editorship of the *Independent,* Theodore Tilton, charged him with criminal intercourse with Mrs. Tilton. A committee of Plymouth Church examined the case and exonerated Mr. Beecher; but Tilton had brought suit for $100,000 against him, and after a six months' trial the jury disagreed, a week's confinement and 52 ballots showing three for the plaintiff and nine for the defendant. The long public scandal seriously affected Beecher's influence with the outside public, but his own congregation stood loyal to him; and while his 'Life of Christ' was unsalable, and the last two volumes not published till long after his death, his sermons and some of his essays remain popular.

Mr. Beecher's first literary work was done in his Indianapolis pastorate, where he edited an agricultural paper, and wrote for it articles afterward republished as 'Fruits, Flowers, and Farming'; and published his first book, 'Lectures to Young Men' (1844). For 20 years after coming to Brooklyn he contributed regularly to the *Independent,* signing with a (*), whence the two-volume collections of 1855 and 1858 were termed «Star Papers.» He was also for some time a regular contributor to the New York *Ledger* of «Thoughts as They Occur,» collected in 1864 as 'Eyes and Ears'; and wrote serially for it his one novel, 'Norwood' (1867). His sermons were reported in full after 1859, and the collected volumes are termed 'Plymouth Pulpit.' A two-volume selection revised by the author was issued by Lyman Abbott in 1868; other compilations from them are 'Life Thoughts' and 'Notes from Plymouth Pulpit' (1859); 'Pulpit Pungencies' and 'Royal Truths' (1866); 'Morning and Evening Devotional Exercises' (1870); and 'Comforting Truths' (1884). For some years, also, his prayers, of great charm and high quality as compositions, were taken down by stenographers and a collected volume issued in 1867. Other of his works are: 'Freedom and War' (1863); 'Aids to Prayer' (1864); 'Lecture-Room Talks' (1870); 'Yale Lectures on Preaching' 3 vols. 1872–4); 'Evolution and Religion' (1885). Individual sermons and addresses were published also, such as 'The Strike and Its Lessons' (1878); 'Doctrinal Beliefs and Unbeliefs' (1882), 'Wendell Phillips' (1884); 'A Circuit of the Continent' (1884). He also edited the famous 'Plymouth Collection' of hymns (1855); and 'Revival Hymns' (1858). His life was written before his death by Lyman Abbott (1883), and Samuel Scoville (1888); see also 'Autobiographical Reminiscences of Henry Ward Beecher,' by T. J. Ellinwood, who was his private stenographer for 30 years.

Mr. Beecher's wife, EUNICE WHITE BULLARD, was born in West Sutton, Mass., 26 Aug. 1812; d. Stamford, Conn., 8 March 1897. She wrote articles for periodicals, some of them afterward collected: also 'From Dawn to Daylight' (1859), a story of her early married life; 'Motherly Talks with Young Housekeepers' (1875); 'Letters from Florida' (1878); 'All Around the House' (1878); and 'Home' (1883).

Beecher, James Chaplin, American clergyman, son of Lyman Beecher: b. Boston, Mass., 8 Jan. 1828; d. Elmira, N. Y., 25 Aug. 1886. He graduated at Dartmouth 1848, studied theology at Andover, and in 1856 was ordained a Congregational clergyman; thence till 1861 was chaplain of the Seamen's Bethel in Canton and Hong Kong, China. Entering the Civil War as a chaplain, he rose to the rank of brevet brigadier-general and subsequently held pastorates in Owego, N. Y., 1867–70, Poughkeepsie 1871–3, and Brooklyn 1881–2. After 1864, a sufferer from mental troubles, his last three years were passed in much distress, and he finally committed suicide.

Beecher, Lyman, American theologian: b. New Haven, Conn., 12 Oct. 1775; d. Brooklyn, N. Y., 10 Jan. 1863. He was a blacksmith's son and himself a blacksmith's helper and farmer's lad in boyhood. Entering Yale College at 18, he graduated in 1797, studying also theology under President Dwight till 1798, when he became supply at East Hampton, L. I., and was ordained there 1799, remaining till 1810. His remarkable pulpit oratory gained national repute from a sermon in 1804 on Alexander Hamilton's death at Burr's hands — an occasion which made more than one reputation, all utterances being eagerly scanned from the excitement and party feeling. In 1810 he was called to Litchfield, Conn., the seat of a celebrated law school and other educational institutions, at a time when New England was the intellectual autocrat of the country, and towns were few and small; and soon became recognized not only as the foremost man in the Congregational body, but one of the greatest of American preachers. About 1814 a half-dozen sermons of his against intemperance, then a common vice among even the clergy, were not only widely read in America and England, but were translated into several foreign languages. He also took a foremost part in organizing Bible and missionary societies, etc.; and his courage, power, and energy made many look to him for guidance and succor in trouble. This came in a flood during the next decade, when the Unitarian movement, under Channing and its other great early leaders, was sweeping the Congregational churches

around Boston off their feet; and Mr. Beecher, in 1826, at the urgency of influential clergymen, accepted a call to the Hanover Street Church in Boston to stem the tide, which his polemic ardor perhaps aided in doing. In 1832 he accepted the presidency of Lane (Theological) Seminary near Cincinnati, Ohio, which had been endowed on the express condition of his taking charge of it, to strengthen Calvinism in the rapidly growing West; he remained there till 1852, holding also the chair of sacred theology, and was its titular president till death. He was also pastor of the Second Presbyterian Church in Cincinnati 1832–42. In 1833 the famous philanthropist Arthur Tappan, the chief founder of Lane, sent the students a report of the proceedings of the Philadelphia abolition convention of that year; the students, partly southern, at once fell into disputes on the subject of slavery. The trustees vainly tried to check the meetings and discussions; Kentucky slaveholders came over and urged violent suppression of these meetings and threatened the destruction of the seminary. The trustees in terror forbade all further discussion of slavery, and therefore all the students deserted in a body. The most of the anti-slavery wing refused to return, and their supporters founded Oberlin College; a few came back, and Mr. Beecher and his son-in-law Calvin E. Stowe tried for many years to build up the seminary again, but in vain. Shortly after this, in 1835, he was tried as a heretic and hypocrite, first before his own church and then before the Presbyterian Synod, for his "moderate Calvinism"; he was acquitted, but the Old School and New School controversy finally split the church in 1838, Mr. Beecher adhering to the New School party. In 1852 he resigned the presidency of Lane and returned to Boston, to prepare his works for publication; but was striken with a slow paralysis of the brain, which enfeebled his mind for many years before his death. Despite the impressions of the extreme orthodox party, he was of the firmest doctrinal faith, though his theology was of his own make, and his humorous audacities of speech often shocked dignified propriety. His boundless energy, boldness, unconquerable will, and personal magnetism, were those of a natural leader of men; while his unsurpassed logical power, his intense and compact expression, and above all his entire sincerity and spirituality of purpose, winged with his racy and picturesque wit, set him above every other American clergyman of his time in popular influence. See his 'Autobiography and Correspondence,' edited by his son Charles, 1865.

Beecher, Thomas Kinnicutt, American clergyman, son of Lyman Beecher: b. Litchfield, Conn., 10 Feb. 1824; d. Elmira, N. Y., 14 March 1900. He studied at Illinois College, of which his brother Edward was president, graduating in 1843. He was principal of a Philadelphia grammar-school 1846–8, of the Hartford (Conn.) High School till 1852. He then removed to Williamsburg (Brooklyn), N. Y., and founded a Congregational Church, which he left two years later for the pastorate of a church in Elmira, N. Y., where he spent the rest of his life, well-known as an unsectarian philanthropist and moral teacher, writer, and lecturer, editing for many years a weekly department in Elmira newspapers to discuss current questions, often with rasping originality and always with independence. He was nominated for a variety of offices by nearly every known political party, but never elected. He was a chaplain in the Army of the Potomac four months in 1863. In 1870 he published a series of lectures as a book, entitled 'Our Seven Churches' (of Elmira); and in 1901 a posthumous collection of his juvenile stories was issued, 'In Tune with the Stars.'

Beecher, Willis Judson, American clergyman and author: b. Hampden, Ohio, 29 April 1838. He was graduated from Hamilton College in 1858, and from Auburn Theological Seminary in 1864, and filled several Presbyterian pastorates. From 1865–9 he was professor of moral science and belles-lettres in Knox College, Ill., and in 1871 became professor of the Hebrew language and literature in Auburn Seminary. He has published: 'Farmer Tompkins and his Bible' (1874); 'Drill Lessons in Hebrew' (1883); 'Index of Presbyterian Ministers in the United States 1706–1881' (1883); 'Old Testament Notes' (1897); and hundreds of articles in newspapers, periodicals, cyclopædias and reference books.

Beecher Family, The, an extraordinary American family of religious and humanitarian leaders, mostly of such salient and frequently eccentric originality, combined with immense energy and independence of thought, that the human race was once said to consist of "men, women, and Beechers." They were all descendants of Lyman Beecher of New Haven, Conn., himself one of the most notable of them; a famous clergyman, orator, and controversialist, who had 13 children, so many of whom rose to national or even international distinction that he was said to be "the father of more brains than any other man in America." Eight of them were boys, seven living to maturity, and nearly all of them to extreme old age, all becoming Congregational ministers; and the greatest, Henry Ward, said of them that "only one tried to escape the ministry, and he did not succeed." But so great was the intrinsic force of the blood that the daughters were no whit inferior in persistence of energy and originality of ideas, that marriage did not in the least quench their outside work and influence, and that one of them has shown the highest creative genius and left the most enduring memorials of the entire family. The difference in work and sympathies of father and children resulted from difference of generation rather than of spirit. Lyman Beecher's problems were mainly religious. He lived at the threshold of the new material development of the country, when it seemed that the engrossing task was to prevent its relapsing to heathenism; at the beginning of the great liberalizing flood of new scientific knowledge, when there seemed a danger of all Christianity being swept away with the cosmology it rested on; and before the humanitarian questions in this prosperous country had come to the fore. He was nearly 60 when the slavery problem first showed signs of becoming acute; more than 60 when Father Mathew established his first temperance society across the water; and at no period would he ever have favored woman suffrage, which one even of his notable daugh-

ters wrote against. But his influence was intensely strong in creating the lofty spirit that fed humanitarianism. It is an encouragement to large families, as so often in history, that the greatest of his children were among the younger ones: Mrs. Stowe was the sixth and Henry Ward Beecher seventh, while the most forceful of the others, Isabella (Mrs. Hooker), was the eleventh. In their order, the ones who grew up were Catherine, William Henry, Edward, Mary, George, Harriet, Henry Ward, Charles, Isabella, Thomas, and James. Catherine, robbed of the betrothed of her youth, gave herself to work for her sex, though not with quite the aspirations of most recent women of her type, and perhaps did as much good in training cultivated wives and mothers as if they had remained unmarried teachers. William Henry was a home missionary and clergyman in Ohio, and a clergyman in the East. Edward was a clergyman, editor, and theological writer, who tried to pour antique Zoroastrianism into modern molds. Mary married in Hartford, Conn., and became the mother of Frederick Beecher Perkins and grandmother of Charlotte Perkins Stetson. George died by accident at 34, while filling a western pastorate. Harriet, author of 'Uncle Tom's Cabin,' and of a mass of other works which would give any other author one of the foremost places in American letters, has a secure immortality from her masterpiece. Henry Ward, creator of the greatness of Plymouth Church, a Moses of liberal Congregationalism, anti-slavery and temperance leader, ardent in all work for humanity and the elevation of the mass, need not be further characterized. Charles, clergyman and admirable musician, is gratefully remembered for his work in compiling the 'Plymouth Collection' of hymn-tunes. Isabella married John Hooker, a Hartford lawyer fully in sympathy with her, and has been for many years one of the stanchest champions of woman's rights and upholder of all good causes. Thomas, for some 40 years located in Elmira, N. Y., was noted as an able and independent thinker on all public questions, which he discussed with ability and high-mindedness. James C. was clergyman, soldier, and clergyman again, till shadows overclouded his mind and brought on a tragic death. Altogether, the family is one of the most useful as well as distinguished of the American intellectual aristocracy.

Beechey, Frederick William, English admiral, the son of Sir William Beechey the painter: b. London 1796; d. 28 Nov. 1856. He entered the navy at the age of 10, and in 1811 was present in an engagement off Madagascar, in which three French frigates were captured. In 1818 he accompanied Lieut. (afterward Sir John) Franklin in an expedition to discover the northwest passage, and the following year took part in a similar enterprise with Capt. Parry. In 1821 he was commissioned, with his brother H. W. Beechey, to examine by land the coasts of north Africa. During the years from 1825 to 1828 he was engaged as commander of the Blossom in another Arctic expedition, by way of the Pacific and Bering Strait. Of this he published an account: 'Narrative of a Voyage to the Pacific and Bering Strait' (1831), and subsequently a description of the botany and zoology of the regions visited. In 1854 he was raised to the rank of rear-admiral.

Beechey, Sir William, eminent English portrait painter: b. Burford, Oxfordshire, 12 Dec. 1753; d. Hampstead, 28 Jan. 1839. He entered a conveyancer's office, but soon abandoned it, and determined to make painting his profession. In 1772 he was admitted to the Royal Academy. A large equestrian picture of George III. secured his election as a Royal Academician and procured him the honor of knighthood. He was afterward constantly and lucratively employed. He died in 1839 at the advanced age of 86. His attitudes and expression are generally good, but marks of carelessness are apparent in some of his latest pictures. Two portraits by him are contained in the Metropolitan Museum of Art in New York.

Beeching, Henry Charles, English clergyman and author: b. 15 May 1859. He was educated at Balliol College, Oxford, was rector of Yabbendon, Berkshire, 1885–1900, and has been professor of theology at King's College, London, from 1900. He has published editions of Milton, Vaughan, Daniel, Drayton, and several anthologies of verse, and is author of 'Love in Idleness' (1883); 'Love's Looking Glass' (1891); 'Seven Sermons to Schoolboys' (1894); 'In a Garden and Other Poems' (1895); 'Pages from a Private Diary' (1898); 'Conferences on Books and Men' (1900); 'Inns of Court Sermons' (1901); 'Religio Laici' (1902); 'Jane Austen' (1902); 'Two Lectures on Poetry.'

Beef. See MEAT.

Beef-eater. See BUFFALO-BIRD.

Beef-eaters, a popular name for the yeomen of the guard of the sovereign of Great Britain, a body instituted in 1485. There are now one hundred in service, and seventy supernumeraries. They are dressed after the fashion of the time of Henry VII. The warders of the Tower of London, who wear a similar uniform, are also so called.

Beef-tea, a preparation made from raw beef and often employed in nursing. It is serviceable for stimulation or for nourishment largely according to the method of its preparation. As usually made, or as prepared from ready-made beef extracts, it has very little food value, but is a strong heart stimulant. When fresh beef is finely chopped and its juice squeezed from it and flavored, to take away the raw taste, the extract obtained is rich in the muscle juices and is highly nutritious. It is often thus prepared for infants and invalids. If, however, the juice thus obtained is mixed with water and the compound is boiled, as is the usual manner, all of the muscle proteids are coagulated, as a scum, and the muscle salts, or extractives remain in solution. The nutritious portions, the scum, is thrown away and the extractives retained in the tea. In this form the nutritive value is slight unless the coagulated proteid is retained. Ordinary meat extracts are mixtures of the meat extractives, xanthin, hypoxanthin, creatin, creatinin, etc. These are heart tonics but not nourishing. Their use is contraindicated in irritable hearts, in gout, and in any condition in which it is thought that the patient is not breaking down the normal amount of proteid matter. Broths are made of other meats. See also DIETETICS; FOODS FOR THE SICK.

Beef-wood, a popular name for the wood of several Australian trees of the genus *Casuarina* (q.v.), which forms the type of a family *Casuarinaceæ*. The trees have been compared to gigantic horse-tails. They have pendent leafless branches, and apetalous monœcious flowers, the male ones being in spikes, and the female in heads. The wood is of a reddish color (whence the name), hard, and close-grained, and used chiefly for fine ornamental work.

Beehive Houses, the archæological designation given to ancient dwellings of small size and somewhat conical shape, found in Ireland and Scotland. They are formed of long stones without cement, each course overlapping that on which it rests. Sometimes they occur singly, at other times in clusters, and occasionally have more than one apartment. Some of them are found near ancient oratories, and were therefore probably priests' dwellings, and certain groups are encircled by a stone wall for defense. They are assigned to various dates between the 7th and the 12th century.

Beelzebub, bē-ĕl'zĕ-bŭb (Hebrew, "the god of flies"), a deity of the Moabites or Syrians. This term is applied in the Scriptures to the chief of the evil spirits (Matt. xii. 24; Mark iii. 22, etc.). The correct form is probably Beelzebul, but in the Syriac and Vulgate the final letter is *b*. The alteration in that letter from *b* to *l* may have been due to euphonic reasons, or, as has also been maintained, *zebul* may have signified "dwelling" or "dung." In order to conceive how this name came to be given to one of the greatest of the imaginary spirits of evil it must be remembered what a terrible torment insects often are in the East. We find that almost all nations who believe in evil spirits represent them as the rulers of disgusting, tormenting, or poisonous animals — flies, rats, mice, reptiles, etc. The Greeks worshipped several of their chief deities under the character of protectors against these animals; for instance, Apollo Smintheus, the destroyer of rats. Christ was charged by the Jews with driving out demons by the power of Beelzebub (Matt. xii. 24). Compare 2 Kings i. 2.

Beer, bār, Adolf, Austrian historian: b. Prossnitz, Moravia, 27 Feb. 1831. His publications include: 'History of International Commerce' (1860–64; 'Holland and the Austrian War of Succession' (1871); 'The First Partition of Poland' (1873–4); 'The Austrian Commercial Policy in the Nineteenth Century' (1891).

Beer, Michael, German dramatist, brother of the composer Meyerbeer: b. Berlin, 1800; d. Munich, 22 March 1833. He became known to the literary world by five tragedies, of which his 'Struensee' is the best. His complete works were published at Leipsic in 1835, and his 'Correspondence' in 1837.

Beer, Wilhelm, German astronomer: brother of the preceding: b. 4 Feb. 1797; d. 27 March 1850. He was a Berlin banker, and in 1849 became a member of the Prussian Diet. His astronomical labors were associated with those of the astronomer, Mädler. He built an observatory, chiefly devoted to the observation of the planet Mars and the moon. The crowning labor of the two astronomers was a map of the moon, published in 1836, upon which the Lalande prize was conferred by the French Academy.

Beer, bē'ĕr. See Ale and Beer; Brewing.

Beer-money, in the British army, a payment of one penny a day, formerly given to non-commissioned officers and soldiers when on home service, instead of a daily portion of beer and spirits. The custom was established in 1800, and abolished in 1873, when the stoppages for rations were also abolished.

Beere, bē'ĕr, Mrs. Bernard (Fanny Mary Whitehead), English actress: b. Norwich, England, 1859. She was the daughter of Wilby Whitehead and began her stage career in 1878 at the London Opera Comique. On her marriage she retired a short time from the stage, presently returning to it as Mrs. Bernard Beere, and her acting in 'Fedora' and 'Diplomacy' attracted much favorable comment. In 1892 she visited the United States professionally. In 1900 she married H. C. S. Olivier.

Beers, bē'ĕrz, Ethel Lynn, American poet: b. Goshen, N. Y., 13 Jan. 1827; d. 10 Oct. 1879. She was the author of 'All Quiet Along the Potomac, and Other Poems' (1879), and was a descendant of John Eliot, the apostle to the Indians.

Beers, Henry Augustin, American author: b. Buffalo, N. Y., 2 July 1847. He graduated from Yale in 1859; became tutor there in 1871, and professor of English literature in 1880. He has published, among other works, 'A Century of American Literature' (1878); 'The Thankless Muse,' poems (1886); 'From Chaucer to Tennyson' (1890); 'Initial Studies in American Letters' (1892); 'A Suburban Pastoral, and Other Tales' (1894); 'The Ways of Yale' (1895); 'History of English Romanticism in the Eighteenth Century' (1899); 'History of English Romanticism in the Nineteenth Century' (1901).

Beers, Jan van, bārz, yän vän, Flemish poet: b. 22 Feb. 1821; d. 14 Nov. 1888. From 1860 he was professor at the Athenæum in Antwerp. His principal works, full of sentiment and melodious quality, are 'Youth's Dreams' (1853); 'Pictures of Life' (1858), and 'Sentiment and Life' (1869).

Beers, bē'ĕrz, Nathan, American soldier: b. Stratford, Conn., 1753; d. New Haven, 10 Feb. 1849. While still quite young he went with his father to New Haven and was a member of a military company formed there in 1774, which was commanded by Benedict Arnold. Immediately on the receipt of the news of the battle of Lexington the company was called together by their captain, and Beers with 39 others volunteered to accompany him to the seat of war. They immediately set out, and, as they passed through Pomfret, were joined by Gen. Putnam. Beers received a lieutenant's commission in the army in 1777, and served until 1783. He afterward engaged in mercantile affairs, and in 1798 was chosen steward of Yale College, a position which he resigned in 1819.

Beers, William George, Canadian dentist: b. Montreal, 5 May 1843. He was educated in his native city, and having entered the dental profession, he founded the first dental journal in Canada, and remained its editor for several years. In 1900 he was editor of 'The Dominion Dental Journal' (Toronto), and dean of the

Provincial Dental College, as well as professor of dental pathology, therapeutics, and materia medica in McGill University. He wrote the first book on the game of lacrosse, and is regarded as its originator. He organized and captained the first lacrosse team that visited England in 1876, and also the second one in 1883. He is noted as a lecturer and public speaker, and since 1862 has been a constant contributor to the principal American magazines.

Beersheba, bē-ėr-shē'ba (now Bir-es-Seba, "the well of the oath"), the place where Abraham made a covenant with Abimelech, and in common speech representative of the southernmost limit of Palestine, near which it is situated. It is now a mere heap of ruins near several wells, though it was a place of some importance down to the period of the Crusades.

Beeswax, a solid fatty substance secreted by bees, and containing in its purified state three chemical principles — myricin, cerin, and cerolein. It is not collected from plants, but elaborated from saccharine food in the body of the bee. It is used for the manufacture of candles, for modeling, and in many minor processes.

Beet (AS. bete; Lat. *beta*), a plant of the genus *Beta,* natural order *Chenopodiacæ.* There are several species, mostly biennials, with stalked, smooth, ovate leaves, with flowers borne on tall leafy stems. *B. vulgaris* is generally recognized as the only species of economic importance; the slender-rooted variety, or sea-beet, is found growing wild in sandy soil, near the sea, in Europe and western Asia. De Candolle regarded it as the original type. It has been in cultivation since 200–300 B.C., and to-day the numerous varieties may be classified under one of five sections, although the divisions are arbitrary and of no great importance.

Garden Beets.— These usually have small tops, with turnip-shaped to tapering roots of medium size, fine-grained, smooth, regular, generally red but sometimes yellowish or whitish in color. Among popular varieties are Early Blood, Eclipse, Bassano, and Egyptian turnip. The soil best suited is a loose, rich, deep, clean, well-tilled loam. Well-rotted barnyard manure with some potassic fertilizer is often applied. Seed is sown as soon as possible in the spring, for the early crop, with other sowings until June to ensure a succession; in rows, varying from one foot apart, where intensive gardening is practised, to three feet where horse labor is used. The plants are thinned from four to six inches asunder in the rows, care being taken to leave only one plant in a place. Thinning is often done when the young plants are large enough to sell as "greens." The late crop, if required for winter use, must be stored before frost. Beets are sometimes forced under glass.

Mangold Wurzels or *Mangels* are a large, coarse form raised for cattle-feeding. Standard varieties include Mammoth long red, Golden tankard, and Globe. Seed is sown as early as possible in the spring, in rows two to three feet apart, and the plants allowed to stand 12 to 16 inches asunder in the row. To ensure a good crop the land must be in a high state of cultivation and well supplied with plant-food. They may be grown on alkali soils.

Sugar-Beets.— The varieties are rather small-growing, and nearly always yellowish or whitish in color. They contain a high percentage of sugar, which has been increased by selection and cultivation. They are extensively grown in Europe and in the northern and western States.

Chard or *Swiss Beets* have comparatively large leaves with succulant leaf-stems, which are cooked and eaten like asparagus. See Chard.

Foliage Beets are grown for ornamental purposes. The luxuriant foliage is of many colors and varied in markings. Brazilian, Chilean, Victoria, and Dracena-leaved are well-known varieties. They may be raised from seed, like other beets, and the roots lifted in fall and kept over winter.

Uses and Feeding Value.— As a vegetable the root of the garden beet is boiled, pickled, and used as a salad; and the tops are boiled as "greens." The contain on an average 88.5 per cent water; 1.5 per cent protein; 8 per cent nitrogen-free extract; 1 per cent ash; 0.1 per cent ether extract, and 0.9 per cent crude fibre. Mangels are fed to cattle; they contain from 7 per cent to 15 per cent dry matter, of which about 88 per cent is digestible; an average percentage composition may be taken as: water, 90.9; protein, 1.4; nitrogen-free extract, 5.5; ether extract, 0.2; ash, 1.1; crude fibre, 0.9. About 77 per cent of the protein or 96 per cent of the nitrogen-free extract is digestible. The dry matter of mangels and corn silage are of about equal value for feeding, but as the cost of production in mangels is double that in corn, stockmen in the United States have not paid much attention to them.

Enemies.— Beets are sometimes injured by the beet-fly, otherwise they have few insect enemies. They are sometimes attacked by rust, rot, leaf-spot, and scab. Spraying with Bordeaux mixture will prevent the leaf diseases. Scab attacks the root, and as it also attacks the potato these crops should not be grown in succession.

Beet pulp is a by-product of sugar-beet factories, consisting of sliced sugar-beets after the sugar is removed. It contains about 10 per cent dry matter, the remainder being water, and in the wet condition must be fed at once or held in silos. It may be fed to milch cows, fattening steers, and sheep, and ranges in value from half to two thirds the value of corn silage. Some of the factories have erected sheds and feed large quantities of it to stock with the addition of hay and grain.

Samuel Fraser,
Instructor in Agronomy, Cornell University.

Beet Sugar, the sugar obtained from the beet, similar to cane sugar; but inferior in sweetening power. The discovery of sugar in the beet was made by a German chemist, Margraff, as early as 1747. No practical results followed his discovery, however, as the cost of obtaining sugar from the beet by laboratory methods was too high as compared with that of cane sugar. Little progress was accomplished until about 50 years later, when another German chemist, Achard, succeeded in extracting sugar from the beet root on a comparatively large scale. In 1812 a manufactory was in operation in Silesia, in which, under Achard's direction, about 20 quintals of beets were worked up daily, and about five pounds of raw sugar extracted from every quintal. The high price of sugar prevailing at that time all over the European continent by reason of the blockade, and the great interest and favorable attitude taken by the different continental governments toward the new experiment, caused

it to be a success for a short time. Napoleon issued an imperial decree in the early part of his reign, establishing this industry in France, and in 1812 he ordered the building of 10 factories and placed Delessert in charge of their construction. In 1830 attempts were made in the United States to introduce the cultivation of the sugar-beet. It was not, however, till 1876 that the first successful beet-sugar factory was built, being erected in Alvarado, Cal., since when the production of beet sugar in the United States has increased by leaps and bounds.

Beet-sugar Industry, The. The production of sugar-beets and of beet sugar in the United States is now assuming such proportions that, with the increase of factories and the marked popular interest, it has become one of the leading subjects demanding consideration from agriculturists. There is probably no other industry in this country that has developed so rapidly and now absorbs so large a share of public attention as that of beet sugar.

Attempts were made to establish the industry in Massachusetts in 1841. There were also efforts in this direction in Illinois, Wisconsin, and California between 1863 and 1876, and much was claimed for the industry at this time by newspaper writers, capitalists, and leading farmers. In California, after a long period of unprofitable production, it achieved its first success. The failure of these early attempts seems now very natural as we look back over the history of agricultural progress in the United States. The beet-sugar industry belongs to the domain of agriculture, and the problems it presents are agricultural. These early efforts were simply ahead of their time in the course of agricultural development, and they failed in the establishment of the beet-sugar industry for want of the proper methods of farming and the proper conditions underlying the farming industry.

At the time of the first attempts at sugar-beet production, agriculture comprehended simply the primary features. Its products were confined mainly to cereals, forage crops, and live stock, and the production and marketing of raw materials was its main object. The farmer in those early days did not concern himself with enterprises dependent on the concentration of efforts in the production of finished products. Land could be purchased for a few dollars per acre. If the prospective farmer did not have the money to buy the land he could enter a claim on Government land. His whole ambition was to produce something quickly and pay for the lands and primary improvements. This was accomplished by raising corn, wheat, oats, cattle, and hogs. The open public domain offered a free pasture. Gradually the eastern sections became more densely settled, and farm lands became more expensive. Crude production was accomplished more cheaply by the Western farmer. Later, owing to development of transportation facilities, the agriculture of this country had to compete with the cheap labor of Europe. The colonial extension of European countries brought areas into competition with American farms in turning out crude products, and with labor much cheaper even than that of Europe. The problem became, how to turn crude material into something that would represent not merely the labor but the skill and ingenuity of the American people, thus supplying our own markets and those of the world with finished products. The American farmers found, as the manufacturers had found before them, that their success depended upon the superior skill and artisan ability of Americans as compared with Europeans and their colonists. «Necessity is the mother of invention,» and demand and necessity united in the evolution of a new system. This began in the East, working westward, in the production of butter, cheese, prepared meats, flour, eggs, poultry, etc. Later came the establishment of other industries, working up crude products of the farm into finished articles. We became producers of syrups, canned vegetables, canned fruits, etc., until manufacturing reinforced farming from ocean to ocean. When all this was accomplished, the time was ripe for the success of the beet-sugar industry.

Industrial Features.— It is one of the marked features of American industrial life that the people as a mass have always shown a readiness to forego immediate benefits, and, even at considerable expense to themselves, to encourage industrial development. As a result this country has made a record among the nations of the earth unparalleled in rapid development, accumulation of wealth, and hold on the trade of the world.

One of the chief items of cost in the production of anything is labor. In this country it is contended that the laborer is not only entitled to earn a living, but to live comfortably, to be able to educate his family, and to acquire a comfortable home. There is no position in life, social, financial, or political, to which the laboring man may not aspire. While this means much for the citizen, it adds materially to the cost of production. This country to-day is the concern of the nations of the earth in being able to maintain a balance of trade in its favor through its agricultural and industrial productions, and this balance is constantly increasing. The sugar industry is supported by American enterprise and spirit, and under this American policy it is rapidly assuming a prominent position in the long list of successful industries.

There are two sides to the proposition of establishing a sugar factory in any particular community: (1) That of the farmer, involving agricultural conditions; and (2) that of the manufacturer or those financially interested in the enterprise.

Problems for the Farmer.— The leading difficulties of the farmer may first be noticed. To begin with, he is unacquainted with the methods of cultivating the sugar-beet plant, and his first experience usually proves unsatisfactory. He is accustomed to certain methods in farming. As a rule he is conservative, and thinks, from his long experience in farming, that he knows how to farm. He undertakes to apply methods successful in the cultivation and production of other crops. He is not inclined to listen to those who are posted in methods applicable to the new crop. Eventually he finds out his mistake. He finds that in growing sugar-beets he must apply principles, in many case, the reverse of those necessary to other crops. For instance, he has been accustomed to growing large ears of corn, large hogs, and large steers; but in the case of sugar-beets he finds that the first question is not one of size, but of quality. He must grow beets of a certain size, purity, and sugar content. In order to accomplish this he must give careful attention to the work of preparing the land,

planting the seed, bunching, thinning, and cultivating. He finds that attention to details counts in results at the harvest in the profits on the crop. He learns that the whole process is a very laborious and expensive one, entirely unlike anything he has attempted before. To be successful he must apply the methods of the gardener to a field crop. He must have a rich soil, and the proper rain conditions at the proper time. These facts can only be learned through experience.

The Question of Labor.— The labor problem is important in the cultivation of sugar-beets. At certain stages of their growth they require a considerable amount of labor. This labor is very tiresome. As a rule, the farmer, if he grows beets to any extent, does not have on his farm sufficient labor to do the work of thinning and bunching, hoeing, and harvesting the sugar-beets; nor does any farming community possess to any considerable extent the labor necessary to grow the beets that a factory will require in a campaign. It will cost about $30 an acre in sections where sugar-beets are grown under rainy conditions, and about $40 to $45 an acre in sections where beets are grown by irrigation, to cover the cost of seed, preparation of seed-bed, bunching and thinning, hoeing, cultivating, harvesting, and delivering to the factory. These estimates apply to growing sugar-beets when it is properly done. In the farming communities of foreign countries, as a rule, a large amount of suitable labor can be secured in the neighborhood, because these neighborhoods are more thickly settled; the whole population is willing to do the laborious, tedious work required, and whole families work at it, including the father, mother, and children. In this country, as a rule, the farmer, his older sons, and hired hands must attend to the outdoor work. It has been found necessary for sugar-beet growers to resort to the cities and towns for the extra labor required. Most of this work comes about the time the public schools are closed, and boys from 12 years up are employed for bunching and thinning the beets, for hoeing them during the season, and to aid in the harvesting by pulling, cleaving the tops, and loading the beets into wagons. In the cities also live many foreigners from Holland, Russia, Sweden, and other places, who are thoroughly familiar with this kind of work. These people are willing to move out into the fields and live in tents; they make contracts at so much per acre for bunching and thinning, hoeing, weeding, and harvesting. Since the agitation and starting of the beet-sugar industry in this country, foreigners are coming here with a view to securing employment of this kind. While the labor question is a serious one, it is one capable of solution by careful and detailed attention.

Problems for the Manufacturer.— The manufacturer or the capitalist who builds a factory finds that he has even more problems to work out than the farmer, and, like the farmer, he usually discovers that he is entering a field that is entirely new to him. Before establishing his plant the prospective manufacturer must thoroughly investigate certain conditions: (1) The water supply, for he must have an abundant supply of pure water for the use of the factory. (2) The fuel supply, as the factory must be located in a section where cheap fuel can be secured (the fuel usually used is coal, but on the Pacific coast petroleum is used to a large extent, and in some of the mountain States it is found that wood is the cheapest fuel). (3) A market for the product (this factor should be thoroughly canvassed and settled prior to establishing a factory; the fact that the manufacturer is proposing to establish a factory on a particular line of railroad can generally be used to secure by contract low freight rates for the future in shipping both beets and the finished product — sugar). (4) The supply of lime (the local quarries of lime rock must be investigated to see if the quality is suitable and the supply sufficient, as a large amount will be required).

The general conditions having been found satisfactory, and the factory being built, other problems arise. In the beginning only a limited amount of skilled labor is employed. Eventually every employee of the factory will become skilled in his particular part. After two or three campaigns have passed the factory will have worked out the details of producing the best product at the least cost with the machinery which it has. When this point shall have been reached those interested will be prepared to estimate the cost of production of beet sugar. The difference in cost of production at a new factory and at one operated for a considerable time is much greater than one unacquainted with the subject would suppose.

Statistics of the Industry.— The recent census shows the rapid growth of the beet-sugar industry in this country. Thirty-one factories had been established before the end of the century. Since that time 11 other factories have been put in operation, located at the following places, and having the daily capacities named: Lyons, N. Y., 600 tons; Rockyford, Col., 1,000 tons; Sugar City, Col., 500 tons; Bingham Junction, Utah, 350 tons; Provo, Utah, 350 tons; Lansing, Mich., 600 tons; Saginaw, Mich., 600 tons; Salzburg, Mich., 400 tons; Loveland, Col., 1,000 tons; Menomonee Falls, Wis., 500 tons; and Logan, Utah, 400 tons.

At the following places factories are either in process of erection or preparations have been made for building in 1902: Sebewaing, Mich., 600 tons; Carrollton, Mich., 600 tons; Mount Clemens, Mich., 600 tons; Crosswell, Mich., 600 tons; Greeley, Col., 800 tons; Eaton, Col., 500 tons; Fort Collins, Col., 500 tons.

At the following places companies have been organized and capitalized, and there is every indication that they will mature their plans and erect factories in time to engage in the beet-sugar campaign of 1902 or 1903: Saginaw, Mich., two factories, 500 tons each; Chesaning, Badaxe, Grand Rapids, and Lapeer, Mich.; Sioux City, Iowa; Longmont, and Lamar, Col.; Bear River Valley, Utah; Phœnix, Ariz.; Cheyenne, Wyo.; Los Angeles, Cal.

At many other places preliminary organizations have been formed which are only awaiting developments assuring more settled conditions affecting the sugar industry.

Methods of Growing Sugar-Beets.— It would be quite difficult to give general directions and rules for growing sugar-beets applicable to all localities and conditions. Often expert sugar-beet growers, at public meetings and in the agricultural press, give minute directions covering all the details of this intricate process. Others, each well versed in the process of growing sugar-beets, get into arguments and disputes as to the right method. In such cases each

may be correct in a measure. The occasion for such disagreements lies in the fact that each person has in mind the right method for a particular locality or set of conditions. A careful study of the different sections of the United States where sugar-beets are grown will lead to the conclusion that there is no single road to success in growing sugar-beets. Every locality has settled conditions which will materially modify any set of methods that might apply to some other one. There are some settled rules, of course, but it is an actual fact that the various agricultural districts of this country will have to work out each for itself the right method. The person who argues that the ground must be plowed in the fall in order to receive the benefit of winter frosts is not offering any argument to the Pacific coast, for instance, where many beets are grown, and he who insists that the ground should be rolled in all instances after planting will hazard the crop if his directions are followed in many parts of Nebraska and other sections where the soil is sandy and there are strong winds. In such cases a smooth surface offers an excellent opportunity for the wind to carry along the sharp grains of sand, cutting off the plants and destroying the crop.

There can be no general fixed rules applying to the kinds and application of fertilizers. General principles are all right when accompanied with the underlying reasons, but they must always be modified to meet local conditions.

With the development of the industry in all the sections which have the necessary conditions, and the acquirement of ample experience both by the farmers in the production of beets and by manufacturers in the making of sugar, there will come many improvements, and eventually a cheapening of production, a result of great importance to all concerned in the success of the industry, because eventually the beet-sugar industry in the United States will have to meet a sharper competition with foreign sugar producers.

There are some things settled, however, about growing sugar-beets. It will generally be conceded that the ground should be plowed deep, and in most instances subsoiled. Before the seed is planted, the ground must be thoroughly pulverized by harrowing and by rolling, even if the surface has to be afterward roughened. Advantage must be taken of the general and prevalent rain conditions. The ground must be moist enough to germinate the seed, either by rainfall or irrigation. Rainfall is best when it can be obtained. In some localities either is used, according to circumstances. Seeds are planted at depths of from half an inch to two inches, according to the prevailing conditions in the particular locality. The beets must be planted near enough together to produce a beet of a certain size. This spacing depends, again, upon the locality and the nature and fertility of the soil. The size and quality of the beet depend materially on the right kind of spacing. The beets must be thoroughly cultivated, hoed, and hand-weeded, because cultivation tends to conserve the moisture of the soil, and clean fields permit favorable action of sun and air. This close cultivation should be kept up until the beet tops thoroughly shade the ground and reach a size when it would be injurious to operate among them further with a plow and hoe. The beets should be harvested as soon as possible after they are ripe, because then they contain the most sugar and the highest purity. It is evident that the entire crop of beets in the neighborhood of a factory cannot be harvested at once. In many localities some will have to be siloed. Harvesting-time will depend a great deal upon circumstances connected with the operation of the factory. The sooner the beet is harvested after it is ripe the better, because further rainfall may start a new growth, producing new lateral roots and new leaves, thus greatly reducing the sugar content and purity of the beets.

Benefits to the Farmer.— No statement of facts with reference to any new crop would be complete or would indicate the advisability of its introduction unless it showed the benefits to be derived. Of course, profit and loss in any enterprise is the first consideration.

It has already been stated that it costs about $30 per acre to produce sugar-beets and to market the crop where rain conditions prevail. This is without taking into consideration the rent of the land, but it includes the farmer's time and everything else that enters into the cost of production. The average yield is about 12 tons per acre. Probably this cost of production will be gradually reduced because of improvements in implements and methods. The beets grown have a gross value at the factories of $4 to $4.50 per ton (in States paying no bounty). This gives a gross return per acre of $48 to $54, and a net profit of $18 to $24. It must be kept in mind that these are averages of gross and net proceeds. It is never very encouraging to consult the average of agricultural crop statistics; indeed, it is often said that "the average crop does not pay." If one should take the figures of the average crop of corn in Iowa, for instance, or the average crop of wheat in Minnesota or Kansas, and compute the proceeds at the average market price, and deduct therefrom the cost of production, the results would show a very small remuneration or an actual loss, quite discouraging to one who has not investigated this subject.

Taking what seem to be the most authentic figures, the cost of producing sugar-beets in sections where they are grown by irrigation is about $40 per acre. An average of 13 tons per acre can be produced, having a higher sugar content, and worth $4.50 to $5 per ton, making the gross proceeds $58.50 to $65, and the net profit $18.50 to $25 per acre. These figures give to the farmer in each case a profit greatly more satisfactory than in the case of other crops. But the successful farmer will never be satisfied with the average proceeds of any crop, and it is to him we must look for the results that give the more encouraging inducements to beet culture. Many growers receive as high as $75 and some as high as $100 per acre for their beets, these high results depending upon the superior quality of the land and the superior skill of the one producing the beets. If a farmer has poor land or is a poor farmer, he is not in a position to expect much in planting any kind of crop. These statements are sufficient to give a farmer who is experienced in all other kinds of crops a fair insight into the situation.

There are indirect benefits in sugar-beet growing that the farmer must take into consideration, along with the direct, as follows: He

learns that sugar-beets are a very valuable crop to grow for his stock. It is estimated that they are worth two thirds as much for feeding as for production of sugar. They may enter into a food ration for any kind of stock. The farmer growing beets for a sugar factory retains for feeding the beets that have been «docked,» or that are liable to be. He constructs root-cellars and stores them away, and they enter largely into all animal food rations for winter feeding. For stock-feeding sugar-beets have both a nutritive and a sanitary value.

The high cultivation that must be given to the land through deep plowing, thorough harrowing, and constant weeding and cultivating finally makes the land of superior quality for any purpose. It will grow better corn or wheat, and at a less expense, on account of the absence of weeds and grass. Finally, through rotation, other fields are brought under this high state of cultivation, until the whole farm is at its best condition of soil fertility and productiveness.

The method that has brought this about serves as an object-lesson to the farmer and the farming neighborhood. A better cultivation will prevail, and the science of farming will become several degrees higher on account of experience in sugar-beet cultivation.

After the beets are delivered to the factory, and the sugar has been extracted, it is found that the pulp (which will amount to 50 per cent in weight of the beets worked) is almost as valuable for feeding purposes as the original beets themselves. It is a very cheap feed and sells for 35 to 50 cents per ton. It enters naturally and profitably into the food rations of all kinds of stock. It is especially valuable for steers, lambs, brood mares, and brood sows, but reaches its highest use as animal food when fed to the dairy cow. The farmers in the neighborhood of a beet-sugar factory feed large quantities of it. They appreciate its nutritive and sanitary value. Pulp feeding gives an impetus to animal industry of all kinds. It offers a stimulus to the establishment of butter and cheese factories, to the erection of feeding-pens, and to the whole stock-feeding industry. Its use is one of the strong reasons for establishing the industry.

The beet-sugar industry opens up at once a large demand for labor, not only in the factory itself, but on the farm. It is one of the things in which the farmer can invest with the assurance that he has a sure market and a fixed price for his crop to begin with.

Benefits to Other Industries.— The establishment of a beet-sugar factory opens up not only a large field for the employment of labor, but also a field for the employment of capital. It becomes at once a market for considerable crude material to be used in conducting the business. First and most important it furnishes a market for the beets. Then the factory is a large consumer of coal, and as the factories are often established in communities having local coal fields they become at once local markets for a local product. The amount of coal necessary to work up a certain amount of beets is generally computed at about 17 per cent by weight, or, in case of an ordinary factory of 350 tons capacity, about 60 tons of coal per day, or 6,000 tons for a full campaign of 100 days. A factory also consumes a large amount of lime rock, which of necessity must also be a local product. It usually consumes lime rock to the extent of about 10 per cent of the crude weight of beets worked, which in the case of a 350-ton factory would be 35 tons of lime rock per day, or 3,500 tons for the campaign. It consumes about one fifth as much coke as lime, or a little less than 700 tons during a campaign.

The establishment of a factory in a community necessitates considerable transportation of crude products — beets, coal, and lime rock — to the factory, and in carrying the finished product to the market. It stimulates banking and almost all kinds of mercantile business throughout the community.

The Future of the Industry.— The following figures will give an idea of the possibilities for the expansion of the beet-sugar industry in the United States:

CONSUMPTION, PRODUCTION, AND IMPORTATION OF SUGAR.

		TONS.
For 1901 the total consumption of sugar in the United States was		2,372,000
Adding to this the average yearly increase, based on an estimate for twenty years, the consumption of sugar for 1902 will be		2,478,000
To meet annual requirements there must be imported into the United States proper this 2,478,000 tons, less what this country manufactures. The home production for 1902 should be about as follows:		
Cane sugar of the South	300,000	
Beet sugar of the North and West	185,000	
		485,000
Balance imported		1,993,000
Requirements from outside for 1902 will be in round numbers		2,000,000
Of this amount from insular possessions, free of duty, there will be received —		
From Porto Rico about	100,000	
From Hawaii about	300,000	
		400,000
There must be secured from strictly foreign sources, duty paid		1,600,000

It is the ambition of those encouraging the beet-sugar industry to establish factories enough at least to furnish this foreign importation. Making due allowance for failure of factories to reach in actual production their full capacity under ideal conditions, it would require 500 factories having a daily capacity of 500 tons of beets to produce the sugar imported, or a sufficient number of cane-sugar factories to produce an equal amount of sugar. As a matter of fact, there is likely to be a rapid increase in both beet-sugar and cane-sugar factories. But for convenience the calculations here made are based on the supposition that the increase will be in beet-sugar factories only. In order to equip and build these factories it will require an investment of capital of $250,000,000. This vast sum of money must be expended in this country for building materials and machinery and in the employment of the labor necessary to construct and equip the factories. The annual requirements of these factories will be as follows:

ANNUAL REQUIREMENTS OF 500 BEET-SUGAR FACTORIES.

They will	require of beets	tons..	18,750,000
	pay farmers for the beets		$84,375,000
	require of coal	tons..	3,187,500
	pay the coal-dealers	$	9,562,500
	require of lime rock	tons..	1,875,000
	pay to the quarries for lime rock	$	3,750,000

They will require of coke	tons..	375,000
pay to the coke-dealers for coke		$ 3,000,000
expend for labor in the factories		$19,000,000

In addition to the foregoing list large amounts of money will be paid for mill supplies, transportation, etc. As working capital to operate these factories $135,000,000 will be required. This sum being in use, however, for about four months in the year, the interest charged thereon is equal to an interest charge on $45,000,000 for one year. It should be remembered that the above estimates do not include the capital already invested in the business and the operations of the factories already built, the statement of which is as follows:

PRESENT DEVELOPMENT OF THE BEET-SUGAR INDUSTRY.

Capital invested in factories, equipment, and grounds		$30,000,000
Beets purchased annually	tons..	1,875,000
Cash paid for beets purchased annually		$ 8,437,500
Coal consumed annually	tons..	318,750
Cash paid for coal annually		$ 956,250
Lime rock purchased annually	tons..	187,500
Cash paid for lime rock annually		$ 375,000
Coke purchased annually	tons..	37,500
Cash paid for coke annually		$ 300,000
Cash paid for labor annually		$ 1,900,000
Operating capital annually employed		$ 5,000,000

Also there is a considerable amount annually expended for crude material and various other things. It hardly seems possible that an industry which affects so many people over such a wide scope of country can fail to receive anything but the most friendly, careful, and fostering consideration on the part of those who shape industrial affairs.

The immensity of future demands, it seems, answers effectually those who feel that the industry might be overdone. Attention should be called to the fact that not only are present demands great, but that the rate of increase of consumption is considerable. According to careful statistics for the last 19 years, consumption of sugar in this country has been increasing at the average rate of about 6⅓ per cent annually.

CHARLES F. SAYLOR.

Beethoven, Ludwig Van, the greatest orchestral composer of the 19th century: b. Bonn 16 Dec. 1770; d. Vienna 26 March 1827. While classed among the German masters, the Dutch Van in his name (which is not a sign of nobility) indicates his descent from a family in the Netherlands, the world's musical centre in the 15th and 16th centuries. This family moved in 1650 from Louvain to Antwerp. Beethoven's grandfather was a bass singer and a conductor; his father was a tenor, who did not lead an exemplary life; his income was only $150 a year, wherefore it is not surprising that he eagerly availed himself of his son's musical talent and exploited it. He personally taught Ludwig to play the violin and the clavier, in the hope of making of him a "wonder-child" like Mozart. While Ludwig was not remarkably precocious (he even shed tears over his music lessons), he is said to have written a funeral cantata at 11, and in the same year was taken on a concert-tour by his father, who, to make his performances seem more remarkable, represented him as being two years younger. Before he had reached his 12th year the organist Neefe spoke of him as "playing with force and finish, reading well at sight, and, to sum up all, playing the greater part of Bach's 'Well Tempered Clavier,' a feat which will be understood by the initiated. If he goes on as he began, he will certainly become a second Mozart."

Mozart himself appears to have been of this opinion, for when he heard young Beethoven improvise in Vienna he exclaimed to the by-standers, "Keep your eyes on him! He will give the world something to talk about!" This was in 1787. Beethoven had been sent to Vienna in the hope that he might be able to take lessons of Mozart; apparently he did take a few, but the illness of his mother made him hasten back to Bonn. Although Bonn was a small town, it had quite a musical atmosphere, and Beethoven had good opportunities to become acquainted with the operas and the concert pieces then in vogue. He was only 13 when he got a position as assistant court organist, and subsequently he played the pianoforte accompaniments at the rehearsals of the opera orchestra. He also played the viola. His first salaried position ($63 a year) was as assistant organist under Reicha. The most important occurrence of the Bonn period was the formation of an intimate friendship with Count von Waldstein, to whom he subsequently dedicated one of his best sonatas. The Count had promptly recognized his genius, and it was probably owing to his suggestion that the elector of Cologne, Max Franz, decided to provide the young musician with the means for going to Vienna again and there continuing his studies with Haydn, to whom Beethoven had already been introduced when Haydn stopped at Bonn, in 1790, on his way to London. It was in November, 1792, nearly a year after Mozart's death, that Beethoven entered Vienna, which was to remain his home till the end of his life. The lessons from Haydn were duly arranged for and the first was given in Haydn's house on Dec. 12, the payment being eight groschen (about 20 cents). But Haydn, like most creators, was not a good teacher and although Beethoven took lessons of him more than a year, he soon began to take his exercises for correction to Schenk before showing them to Haydn. He subsequently took lessons of the pedantic contrapuntist Albrechtsberger, who, however, complained that his pupil was unwilling to "do anything in decent style" and had too little respect for rules — this last being a peculiarity which he, fortunately, soon began to manifest in his compositions. To these compositions he was so lucky as to be able to devote nearly all his time. From his father he received no pecuniary assistance, but there were several sources of income. Prince Lichnowsky gave him an annual stipend of 600 florins, and when, in 1809, an attempt was made to entice him to Kassel, where a position as Kapellmeister was offered him, some of his princely friends gave him an additional annuity of 4,000 florins, to chain him to Vienna. This lasted only till 1811, but at this time he was already deriving a considerable income from the sale of his works. Many of his letters show that he knew how to make a good bargain. Had it not been for a spendthrift nephew, of whom he was very fond, and for whom it was found at the time of his death he had even placed 7,000 florins in the bank, he would have never suffered any financial tribulations such as Mozart and Schubert had to endure all their lives.

BEETHOVEN.

It was fortunate that the Kassel offer was refused, and that an earlier attempt (in 1796) to win him for Berlin had also led to naught; for Vienna was the proper place for Beethoven. It was at that time the world's musical centre, owing largely to the unusual interest taken in music by the aristocratic circles. To understand the significance of this fact we must bear in mind that at that time there were few public concerts; it was the nobility who maintained the orchestras and patronized the great artists, the audiences being invited guests. Beethoven brought with him from Bonn letters of introduction to leading members of the aristocracy, and thus found himself at once "in the swim." He had not yet done anything very remarkable as a composer and was at first admired chiefly for his improvisations on the pianoforte; but gradually a sense of his greatness dawned on his patrons, who bore patiently all his eccentricities. While recognizing the advantage of being intimate in the houses of the aristocracy, he never truckled to rank and refused to submit to the intricate and artificial rules of court etiquette. At the same time he expected the aristocrats to behave like ladies and gentlemen; one day when a young man talked loudly while he was playing, he suddenly stopped and exclaimed: "I play no longer for such hogs." His attitude toward wealth is illustrated by his once sending back his brother's card on which "Johann van Beethoven, land proprietor" was printed, after writing on the back: "Ludwig van Beethoven, brain proprietor."

In the homes of some of his aristocratic friends he gave lessons to the women and girls. He did this unwillingly, looking at the time thus spent as filched from his compositions. He often failed to keep his appointments and was apt to be irascible and bearish; but his fair pupils were only too glad to put up with all this for the sake of the benefit they got from his lessons. He was, at the same time, a great admirer of women and often in love, although none of his infatuations appear to have lasted more than seven months. He was never married, for although he repeatedly proposed he was each time refused. These love affairs call for mention because they had an influence on not a few of his compositions. A well-regulated household was a blessing he greatly needed. His eccentric habits were forever forcing him to change his lodgings and he seldom could keep a servant longer than a few weeks. If his cook brought him a bad egg he threw it at her. He often got angry when the servants laughed at the sight he presented while composing—tossing his hands about, beating time with his feet, and singing or rather, growling. His rooms presented scenes of great disorder. His gastronomic habits were unwise, and the dyspepsia they gave rise to was responsible for much melancholy and for many of the outbreaks of ill-temper for which he became notorious as he grew older. While naturally of an affectionate disposition (as instanced in his fondness for his nephew) and always fond of jokes, he would, on occasion, insult and abuse his best friends on slight provocation; but these outbursts of irascibility were usually followed by the most abject apologies. He was, in short, like his music, highly emotional and regardless of rules.

The chief cause of his growing moroseness and irritability was the difficulty of hearing which began in 1798 and gradually ended in complete deafness. In 1802 (25 years before his death) he wrote in his last will: "O ye, who consider or declare me to be hostile, obstinate, or misanthropic, what injustice ye do me! Ye know not the secret causes of that which to you wears such an appearance"; and he proceeds to speak of his hearing, which had been growing more and more defective for six years, and which made him shun people, as he did not wish to say constantly: "Speak louder—bawl—for I am deaf." His last appearance in public in concerted music was in 1814. Two years later he began to experiment with ear-trumpets, his collection of which is now in the Royal Library of Berlin. His attempts to conduct after this usually led to mortifying and pathetic scenes. The last was in 1824, when, although totally deaf, he insisted on conducting his ninth symphony; he could not even hear the applause which followed it. All communication with him was, in the last years of his life, carried on with the aid of pencil and paper. The autopsy showed that not only were the auditory nerves practically paralyzed, but there were other advanced troubles (the liver was tough as leather and shrunk to half its normal size), which made it remarkable that he should have retained his vitality so long. The immediate causes of death were inflammation of the lungs and dropsy. A week before his death he was still busy with letters and with plans for new compositions, including a tenth symphony, a requiem, and music to Faust. He died during a violent thunder and hail storm, about six o'clock on March 26, 1827. The Viennese, who had been neglecting him during the last few years, because of the Rossini furore (in 1823 no operas but Rossini's were sung in Vienna, and the whole musical atmosphere was affected by them), now realized their loss and a crowd of 20,000 persons attended the funeral. He was buried in the Währinger Friedhof, but in 1888 his remains were transferred, with those of Schubert, to the Central Cemetery. Statues of him were erected at Bonn in 1845, in Vienna in 1880, in Brooklyn in 1894, at Leipsic (Max Klinger) in 1902. In 1815 the freedom of the city of Vienna had been conferred upon him.

A certain wildness was given to Beethoven's appearance by his long, abundant hair, which was always in a state of disorder. He was strongly built and muscular, but below medium stature, his height being five feet five inches. His small black eyes were bright and piercing, his forehead broad and high, his complexion ruddy. His friend Schindler wrote that when a musical idea took possession of his mind, "there was an air of inspiration and dignity in his aspect; and his diminutive figure seemed to tower to the gigantic proportions of his mind." Already in Bonn his friends used to note the occasions when he was "in his *raptus*." These moments of inspiration would come to him at any time and anywhere — in his room, in the streets of Vienna, and particularly in the country. He was extremely fond of nature and country life, and spent his summers in the picturesque regions near Vienna. A sketch

book was always in his pocket, and into this he jotted his ideas as they came. Afterward he revised and re-revised these sketches. "There is hardly a bar in his music", says Grove, "of which it may not be said with confidence that it has been rewritten a dozen times. Of the air 'O Hoffnung,' in 'Fidelio,' the sketch books show 18 attempts, and of the concluding chorus 10." These sketches have been collected by Nottebohm and printed; they give an interesting and instructive insight into the workshop of genius. Another curious fact regarding his creative power is that like Wagner's, it matured slowly. Mendelssohn wrote his best piece, the 'Midsummer Night's Dream' overture at the age of 17; Schubert was 18 when he wrote his wonderful 'Erlking;' but Wagner was 28 when he wrote his first really original opera ('The Flying Dutchman'), and Beethoven 29 when he composed his first symphony, and that might have been almost as well written by Mozart or Haydn.

It is customary to divide Beethoven's compositions into three groups, following the suggestions of a Russian, W. von Lenz, who, in 1852, issued a book entitled 'Beethoven et ses trois styles.' The first group, in which the influence of his predecessors is still more or less obvious, includes, among many other things, the first two symphonies, the septet, the first six string quartets, the aria 'Ah perfido' the song 'Adelaide,' etc.; the second, which shows Beethoven in the full vigor of his manhood, originality and creative power, begins after the year 1800, and includes six symphonies, from the third (Eroica) to the eighth, the opera 'Fidelio,' the violin concerto, the Coriolan overture, the Egmont music, the Rasumovsky quartets, the Kreutzer sonata, the 'cello sonata in A, 14 sonatas for pianoforte, etc.; the third, which begins after a period of great tribulation and depression in his life, includes the last five pianoforte sonatas, the string quartets op. 127, 130, 131, 132, 135, the 'Missa solemnis,' the ninth symphony, the 'Ruins of Athens,' etc. Concerning some, at least, of the works of this third period opinion is still divided. There are critics who think that, partly in consequence of his deafness, Beethoven had become garrulous, incoherent, and vague, whereas others profess to find in the compositions of this period the highest summit of all musical creativeness.

A better way than Lenz's of considering the achievements of Beethoven's genius is to cast a glance at each class of his compositions by itself. The eminent English critic, Dr. Hueffer, wrote that "Beethoven is in music what Shakespeare is in poetry, a name before the greatness of which all other names, however great, seem to dwindle." This is an exaggeration. There is, in reality, only one department of music — the symphony — in which Beethoven is incontestably pre-eminent; in all the others he has his equals, and in some his superiors. In the Lied, or art-song, he is far inferior to Schubert and half a dozen other masters; in the grandeur of choral writing he never equalled Bach and Handel; his 'Fidelio' is not equal to the best operas of Mozart, Weber, Wagner, Gounod, Bizet, and Verdi; his pianoforte compositions are harmonically less fascinating, and less idiomatic in style, than Chopin's and Schumann's, and in the realm of chamber music there are works of Haydn, Mozart, Brahms, and particularly Schubert and Schumann, quite equal to the best of Beethoven's. His weakest works are in the department of vocal music, especially the Lied. He once said to Rochlitz: "Songs I do not like to write." He looked on them as bagatelles into which it was hardly worth while to put his best ideas. Hence, among his songs, there are only a few which show his genius to advantage. The best of them are 'Adelaide,' 'Die Ehre Gottes,' and 'In questa tomba.' (Consult Finck's, 'Songs and Song Writers,' pp. 28–34.) One of the most judicial biographers, Wasielewski, remarks: "While Beethoven wrote a good deal for the voice, he cannot be considered a vocal composer in the proper sense of the word. Full appreciation of the real nature of the human voice, the subtle knowledge of its resources which we admire in Handel and Mozart, he did not possess. His realm was instrumental music." Nevertheless, there is much that is of great beauty in his vocal works, which include the opera 'Fidelio,' the oratorio 'Christus am Oelberg,' two masses, a sonata, 66 songs with pianoforte, 18 canons, 7 books of English, Scotch, Irish, Welsh, and Italian songs with pianoforte, violin, and 'cello; etc. He himself considered his second mass — 'Missa solemnis' — his most successful work, but the musical world is much more enamored of his 'Fidelio,' which, while conventional in the first act, rises in the second to such a sublime level of dramatic expressiveness that it is to be much regretted he never found time to execute his other operatic plans, which included a Macbeth, a Faust, and an Alexander. The history of 'Fidelio' and its four overtures is of particular interest, but the limits of space forbid its insertion.

For pianoforte there are 38 sonatas, 5 concertos, 21 sets of variations, and more than 50 short pieces — bagatelles, rondos, preludes, ländlers, etc. Hans von Bülow spoke of Bach's 'Well-Tempered Clavichord' as the Old Testament of music and Beethoven's sonatas as the New, "in both of which we must believe;" and he declared that the mere technical mastery of these sonatas is "the task of half a life-time." They mark a tremendous advance over all his predecessors excepting Bach. In wealth of melodic ideas and rhythmic variety, as well as in structural finish, and especially in emotional expressiveness, they far surpass all previous works of their kind; yet it was not till several decades after the composer's death that they began to be generally appreciated and played in public. The pendulum then swung to the opposite extreme, and every Beethoven sonata was supposed to be a peerless masterwork which is far from being true. (Read the admirable comments on all these works in chap. VII of J. S. Shedlock's 'The Pianoforte Sonata'). In the matter of form Beethoven was by no means the pedant many of his admirers would have him. The orthodox sonata is supposed to consist of four movements; but of his 38 sonatas only 15 have four movements; 11 have 3, and 6 have only two; moreover, his two-movement sonatas are by no means "torsos," as some have foolishly called them; they include op. 90 and op. 111, two of his very

best works, the op. 111 being in fact, his last word on the subject.

The chamber music includes 8 trios for piano and 'cello; 5 trios, 16 quartets, and 2 quintets for strings; 10 sonatas for piano with violin, 5 with 'cello, 1 with horn, 3 sextets and 1 septet for strings and wind instruments; 2 octets for wind. The quartets have been made tolerably familiar, but among the other works here referred to there are many gems of which the public is still unaware. But it is when we come to the orchestral works — the 11 overtures, and 9 symphonies — that we see Beethoven in his real grandeur. Of these works Richard Wagner, who worshipped Beethoven, has written most eloquently; (see index to vol. I of Glasenapp's 'Wagner Encyclopädie,' or to Ellis's translation of Wagner's prose works; Grove's 'Beethoven's Nine Symphonies' gives an excellent analysis for amateurs). Concerning the symphonic works, Wagner wrote: "He developed the symphony to such a fascinating fulness of form and filled this form with such an unheard-of wealth of enchanting melody, that we stand to-day before the Beethoven Symphony as before the boundary line of an entirely new epoch in the history of art; for with them a phenomenon has appeared in the world, with which the art of no time and no nation has had anything to compare even remotely." It is not only that Beethoven's symphonies are longer than those of Haydn and Mozart, or broader and richer in melody, more varied in rhythm, and fuller in minute details of elaboration; what particularly distinguishes them is their greater emotionality and more powerful contrasts of moods. On the one side we have (as in the pianoforte sonatas) those soulful, tearful adagios which are a specialty of Beethoven; on the other the humorous scherzo, which he put in place of the dainty, graceful minuet of his predecessors. This symphonic scherzo was really a new thing in music, for while there is much fun in Haydn, it is of a much lighter quality. In Beethoven's there are elements of grimness and the grotesque; with an undercurrent of melancholy, as in the scherzos of Chopin. In the art of dyeing the music in deeper and more varied orchestral colors Beethoven's symphonies and overtures also mark a great advance over his predecessors.

While Beethoven stands at the head of composers of the classical school, an almost equal claim to distinction lies in this that in his works are to be found many of the germs which Weber, Schubert, Mendelssohn, Schumann, and others developed into the German romantic school. Among these germs are his inclination to shatter the sonata form (particularly in the last movement of the ninth symphony, which is epoch-making in its bold unconventionality); his disposition to allow his ideas to shape the form in which they are to be uttered; the subjective expressiveness of his music, which has five times as many expression marks as Mozart's; the use of characteristic (realistic) orchestral colors; his way of playing the pianoforte and conducting an orchestra, with tempo rubato, or frequent modification of pace; and above all, his sanctioning of Programme music by his 'Pastoral Symphony,' which illustrates episodes in the country — a scene at a brook, the merrymaking of peasants, the song of birds, and a thunderstorm. It is also significant of his romantic inclinations that toward the end of his life he conceived a plan of giving poetic titles to all his sonatas and even to the separate movements. The 'Moonlight sonata,' it is well to remember, did not get its inappropriate name from him. Of the books relating to Beethoven several have already been referred to. Of the biographies the best was written in English by the American A. W. Thayer and published, in a German version only, in three vols. (1866–77). An English edition, revised, with a final volume, is in preparation. Thayer also furnished a useful 'Chronologisches Verzeichniss' of Beethoven's works, of which a complete edition was printed by Breitkoff and Härtel in 1864–67. Pending the appearance of Thayer's great work, the best treatise is Grove's, in his 'Dictionary of Music and Musicians' (vol. I, pp. 162–209). Crowest's biography is a fair compilation in one volume. Other biographers are Wasielewski, Schindler, Marx, Nohl, Wilder, Wegeler, and Ries. Nohl's 'Beethoven and his Contemporaries' contains many literary "snap-shots." Analyses of his sonatas and symphonies have been written by Elterlein (English version) and Reinecke. Kullak's 'Beethoven's Piano-playing' is excellent. Other critical and analytical works are by Ulibischeff, Wagner (essay), Harding, Dürenberg, Alberti, Lorenz, Helm, Nottebohm, and Frimmel. His letters have been printed in several volumes by Nohl, Köchel, Schöne, Hadden. They are not nearly so interesting as Schumann's, Mendelssohn's, Wagner's, Liszt's, and Berlioz's.

HENRY T. FINCK,
Musical Critic, 'Evening Post,' N. Y.

Beetle, an insect of the order *Coleoptera*. Beetles are distinguished from all other insects by the elytra or thickened fore wings, which are not actively used in flight, the hind wings being especially adapted for that purpose. The elytra cover and encase, thus protecting, the posterior segments of the thorax and the abdomen. The prothoracic segment is greatly enlarged, often exarated in front, to receive the head. These characters are very persistent. There are few aberrant forms and the order is remarkably homogenous and easily limited. The head is free from the thorax; it is scarcely narrowed behind, and its position is usually horizontal. The eyes are usually quite large, and there may be one or two oceli — not more. The antennæ are usually inserted just in front of the eyes, and rarely between them. They are either filiform where the joints are cylindrical, as in the ground beetles (*Carabidæ*), not enlarging toward the end, or serrate, as in the *Elateridæ*, where the joints are triangular and compressed, giving thereby a serrate outline to the inner edge; or clavate as in the *Silphidæ*, where the enlarged terminal joints give a rounded, club-shaped termination; or lamellate, when the terminal joints are prolonged internally, forming broad, leaf-like expansions, as in the *Scarabæidæ*, while the geniculate antenna is produced when the second and succeeding joints make an angle with the first. The mandibles are always well developed as biting and chewing organs, becoming abnormally enlarged in the stag-beetles (*Lucanus*), while in certain *Scarabæidæ* they

are small and membranous. The maxillæ prepare the food to be crushed by the mandibles. The greatly enlarged prothorax is free and movable.

In the running species, as *carabidæ,* the hind wings being useless are aborted, and very rarely in some tropical *Lampyridæ* and *Scarabæidæ* both pairs of wings are wanting in both sexes, though, as in the glow-worm and some of its allies the females, are apterous. The legs are well developed, as the beetles are among the most powerful running insects; the hindermost pair of legs becoming oar-like in the swimming *Dytiscidæ* and some *Hydrophilidæ,* while in the *Gyrinidæ* both pairs of hind legs become broad and flat. The number of tarsal joints varies from the normal number five, to four and three joints, the terminal joint as usual being two-clawed. These claws are known to be wanting only in *Phanæus,* a scarabæid, and the aberrant family, *Stylopidæ.* According to the number of the tarsal joints the families of the *Coleoptera* have been grouped into the *Pentamera* (five-jointed) the *Tetramera* (four-jointed), the *Trimera* (three-jointed), and the *Heteromera,* which are four-jointed in the hind pair, while the first and second pairs are five-jointed. The abdomen, usually partially concealed by the wings, is sessile, its base broad; in form it is usually somewhat flattened.

A few genera are capable of producing sounds by rubbing the limbs or elytra over finely wrinkled surfaces, which in *Trox* are situated on the side of the basal segments of the abdomen, and in *Strategus* on the tergum of the penultimate segment of the abdomen, while such a surface is found in *Higyrus* on the surface of the elytra.

The larvæ when active and not permanently enclosed (like the curculio) in the substances that form their food, are elongated, flattened, wormlike, with a large head, well developed mouth-parts, and three pairs of thoracic feet, either horny, or fleshy and retractile, while there is often a single terminal prop-leg on the terminal segment of the body and a lateral horny spine. The wood-boring larvæ of the *Cerambycidæ* are white, soft, and more or less cylindrical, while those of the *Curculionidæ* are footless or nearly so, and resemble those of the gall-flies, both hymenopterous and dipterous.

The pupæ have free limbs, and are either enclosed in cocoons of earth, or, if wood-borers, in rude cocoons of fine chips and dust, united by threads, or a viscid matter supplied by the insect. None are known to be coarctate, though some *Coccinellæ* transform within the old larva-skin, not rejecting it, as is usual in the the group, while other pupæ are enclosed in the cases in which the larva lived. In some *Staphylinidæ* the pupa shows a tendency to become obtected, the limbs being soldered to the body, as if were enclosed in a common sheath. Generally, however, the antennæ are folded on each side of the clypeus, and the mandibles, maxillæ and labial palpi appear as elongated papillæ. The wing-pads being small are shaped like those of the adult *Meloe,* and are laid upon the posterior femora, thus exposing the meso- and meta-thorax to view. The tarsal joints lie parallel on each side of the middle line of the body, the hinder pair not reaching to the tips of the abdomen, which ends in a pair of acute, prolonged, forked, incurved horny hooks, which must aid the pupa in working its way to the surface when about to transform into the beetle.

The number of known living species is between 100,000 and 200,000, and over 10,000 species are known to inhabit the United States. About 1,000 fossil species are known.

Coleoptera have been the favorites of entomologists. They have been studied when in their perfect state, more than any other insects, but owing to the difficulty of finding their larvæ and carrying them through the successive stages of growth, the early stages of comparatively few species are known. The metamorphoses are complete, and in this respect the beetles are much in advance of the orders of net-veined insects in which the transformations are incomplete. Many beetles, as the species of *Cetonia,* etc., visit flowers to collect and eat the pollen, and in doing so bring about the fertilization of those flowers.

Classification.— The systematic arrangement of the *Coleoptera* is in an unsettled state. The tiger and ground beetles are generally considered to be the "highest" *Coleoptera,* but in reality they appeared to be allied to what were the more primtive and generalized types, while what are by some authors regarded as the "lowest" beetles, that is, the weevils, are the most specialized or most highly modified. As all our classifications begin with the more primitive or earliest forms, and end with the most specialized, we should begin with the *Carabidæ* or ground beetles, as being the nearest representatives of what are supposed to be the earliest beetles. We would, therefore, adopt provisionally Sharp's primary divisions of *Coleoptera,* with some important changes. His first division or series comprises the lamellicorns (May beetle, etc.), and his second the *Adelphaga* or ground beetles. This order should be reversed.

Series 1. *Adelphaga* (*Carabidæ* of some authors). Antennæ long, slender, filiform; tarsi five-jointed; maxillæ highly developed, three-lobed, the outer palpus shaped. (Ground and tiger beetles.)

Series 2. *Lamellicornia.* Antennæ short, the terminal joints leaf-like; tarsi five-jointed.

Series 3. *Polymorpha.* Antennæ either club-like or serrated, variable in shape, as are the number of joints of the tarsus. (*Buprestidæ,* spring-beetles, etc., including many families.)

Series 4. *Heteromera.* Front and middle tarsi five-jointed, hind tarsi four-pointed; other characters very variable. *Tenebrionidæ, Cantharidæ,* or blister-beetles (q.v.), etc.

Series 5. *Phytophaga.* Tarsi four-jointed but with a small additional joint at the base of the fourth joint; sole usually densely pubescent. (Boring or longicorn beetles; *Cerambycidæ,* leaf-beetle, potato beetle.)

Series 6. *Rhyncophora.* (*Weevils.*) Head prolonged in front to form a beak; palpi much reduced; tarsi four-jointed, but with an additional minute joint at the end of the fourth. The term *Isomera* was applied by Le Conte and Horn to a combination of series 1, 2, 3, and 5.

Phylogeny.— The *Coleoptera* are supposed by Braver and also Packard to have descended from some type allied to a *Campodea*-like ancestor. The larvæ of the ground beetles are

allied by their long legs and biting mouth-parts to the common *Campodea*-like progenitor; they appear to have undergone the least modification from the shape of the primitive coleopterous larva; the footless grubs of boring beetles, longicorns and weevils, being secondary forms. Thus the *Coratidæ* and next after them the rose-beetles (*Staphylinidæ*) have been regarded as the nearest to the earliest type of beetles.

Fossil beetles.— The earliest known remains of Coleoptera are five specimens from the carboniferous strata of Silesia, of which four are wing covers and one is a pronotum; these have been referred by Karsch to the families *Carabidæ* or *Tenebrionidæ*. In the lower Jurassic, however, comparatively well preserved remains of six families (*Carabidæ, Dytiscidæ, Elateridæ, Scarabæidæ, Ceramoycidæ,* and *Chrysomelidæ*) have been detected showing that early in the Mesozoic era, nearly all the principal types of beetles had appeared; whence we naturally suppose that their ancestors evolved during the Carboniferous period, though their remains have not yet been discovered. During the Tertiary age beetles became more abundant, and a greater number of species belonging to existing genera have been found. The Oligocene fresh-water deposits of Aix and Provence, of Florissant, Colorado, contain many kinds of beetles, as also does the Miocene amber of the Baltic coast in Prussia, and the lignite of Bohemia, as well as the fresh-water marls of Germany, Utah, and Wyoming. Of the weevils 350 Tertiary species have been described, their hard bodies accounting for their preservation.

Bibliography.— The writings of Say, Harris, and others; especially Le Conte and Horn; 'Rhynchophora of America north of Mexico' 'Classification of the Coleoptera of North America.'

Beetlehead. See BLACK-BELLIED PLOVER.

Beets, bāts, **Nicolaus,** Dutch poet and writer: b. Haarlem, 13 Sept. 1814. He studied theology at Leyden, and after serving at Heemstede, near Haarlem, he was in 1854 appointed to the pastorate of Utrecht, and in 1874 to the chair of theology there. His poetical works have been collected (4 vols., 1873–81). Through the earlier pieces runs a strong vein of misanthropic sentiment, due probably to Byron, some of whose works he translated into Dutch (2 vols., 1835–7). His prose writings include 'Camera Obscura' (13th ed., 1880), a series of tales and sketches of life and scenery in Holland, published under the pseudonym of HILDEBRAND; they display keen observation and considerable humor. Besides several critical works, he published in theology, notes on the life of St. Paul (3d ed., 1858), and 'Stichtelijke Uren' (new ed., 8 vols., 1872).

Befana, bā-fä'nä (Italian, *Befania*, "*Epiphany*"), a figure, generally representing an old woman, which is exhibited in Italy on the day of Epiphany by children, or in shops, etc., where things for children are sold. In Germany presents are given to children on Christmas Eve, and in France on New Year's evening, but in Italy on the day of Epiphany, and it is said that the *befana* brings them to good children.

Beg, or **Bey,** bā, a title of honor among the Turks, meaning "lord." The beg is, in some parts of the empire, inferior to a pasha.

Bega, bā'gą, **Cornelius,** Dutch painter: b. Haarlem, 1620; d. 16 Aug. 1664. He was a pupil of Ostade, whose manner he imitated. The subjects of his paintings are commonly the amusements of the Dutch peasantry and the interior of cottages and taverns. When the plague in 1664 visited Holland, a young lady, whom he loved, was attacked by it, and was abandoned by her friends. Bega remained by her side, rendering her every attention till her last moment, but caught the fatal infection and died.

Begarelli, bā-gä-rĕl'lē, **Antonio,** Italian designer, styled ANTONIO OF MODENA: b. Modena, about 1498; d. 1565. By his contemporaries he was considered the greatest designer of his day. He was a friend of Correggio and co-operated with him in decorating the cathedral at Parma, furnishing many of the designs and models for the artist's pictures. His groups were commonly of life size or heroic, and were greatly admired by Michael Angelo. He influenced strongly the succeeding Lombard artists in the matter of design. His 'Descent from the Cross,' the most significant of his remaining works, still adorns the Church of San Francesco at Modena.

Begas, bā'gąs, **Karl,** Prussian painter: b. Heinsberg, near Aix-la-Chapelle, 30 April 1794; d. Berlin, 23 Nov. 1854. He studied first under Philippart, and in Paris under Gros. His first work, a copy of the Madonna della Sedia, attracted the attention of the king of Prussia, who appointed him painter of the Prussian court. His productions comprise historical, genre, and portrait paintings, of which the most important are 'Henry IV. at the Castle of Canossa'; the 'Sermon on the Mount'; 'Christ on the Mount of Olives'; the 'Lorelei'; and the portraits of Humboldt, Schelling, Ritter, Rauch, Cornelius, and Meyerbeer. He was a member of the Berlin Academy of Fine Arts.

Begas, Karl, German sculptor (son of the preceding): b. 1845. He studied in the studio of his brother Reinhold and at the Berlin Academy of Art. Among his most important works are the Franco-Prussian memorial unveiled at Cassel in 1898; the groups in the Berlin "Siegasalle," of Margrave Otho IV. and Frederick William; the statue of Knobelsdorf in the Berlin Museum, and those of Columbus and Aristotle in the University of Kiel.

Begas, Oscar, German artist (eldest son of Karl Begas, 1794–1854); b. 1828. d. 1883. He painted portraits with astonishing ability at the age of 12, and in 1852 won a scholarship which gave him two years of study in Italy, where he painted his 'Hour of Gossip,' now in the Berlin National Gallery. His work is mainly portraiture.

Begas, Reinhold, German sculptor (son of Karl Begas, 1794–1854): b. Berlin, 1831. He studied in Rome, and in 1866 settled in Berlin, where he has not only executed many important works in the strict line of his profession, but painted many portraits of women, and produced important architectural designs. Among his most characteristic works are a statue of Schil-

ler (1863); 'Borussia,' a colossal statue in the Ruhmeshalle in Berlin (1885); 'The Fountain of Neptune,' in the Schlossplatz, Berlin (1882); the sarcophagus of Emperor Frederick III., in the Potsdam Mausoleum (1892); 'Germania,' a colossal equestrian statue on the new Reichstag building; and a statue of Bismarck.

Begg, Alexander, Canadian author: b. Quebec, 19 July 1840. He was educated in Aberdeen, Scotland, and in St. John's, P. Q. He was the pioneer of Canadian trade (1867) in Manitoba and in the Northwest Territories. During the rebellion of 1869 he advocated representative government for the people. In 1878–84 he was deputy treasurer of the province of Manitoba. He was commissioner for Manitoba to the Dominion Exhibition in 1879, and had charge of the Manitoba exhibits through Ontario, Quebec, and the Maritime Provinces in 1879–80. His works include 'Dot it Down'; 'The Creation of Manitoba'; 'A Story of the Saskatchewan'; 'A Practical Guide to Manitoba'; 'Ten Years in Winnipeg'; 'A History of the Northwest' (3 vols.), etc.

Begg, James, Scottish Free Church theologian: b. New Monkland, Lanarkshire, 1808; d. Edinburgh, 29 Sept. 1883. Entering the ministry in 1829 he joined the Free Church ranks in 1843, at the time of the Disruption, and was minister for the rest of his life at Newington, a suburb of Edinburgh. He was one of the most narrow of theological leaders and bitterly antagonistic to anything distantly approaching liberality. He opposed the use of hymns and church organs and did much to keep the Free Church as unprogressive as possible. Among his writings are 'A Handbook of Popery' (1852); 'Seat Rents Brought to the Test of the Scripture, Law, Reason, and Experience' (1838); 'The Use of Organs and Other Instruments of Music in Christian Worship Indefensible' (1866).

Beggar-my-neighbor, a game at cards, usually played by two persons, who share the pack, and, laying their shares face downward, turn up a card alternately until an honor appears. The honor has to be paid for by the less fortunate player at the rate of four cards for an ace, three for a king, two for a queen, and one for a knave; but if in the course of payment another honor should be turned up, the late creditor becomes himself a debtor to the amount of its value.

Beggar-Tick, a troublesome weed. See Burr Marigold.

Beggars, a term first applied to the 300 Protestant deputies under Henri de Brederode and Louis de Nassau, who protested against the establishment of the Inquisition in Holland in April 1566. The Dutch patriots assumed this designation when they rebelled against Spain in 1572.

Beggar's Lice, a coarse weed also called Dog's Tongue.

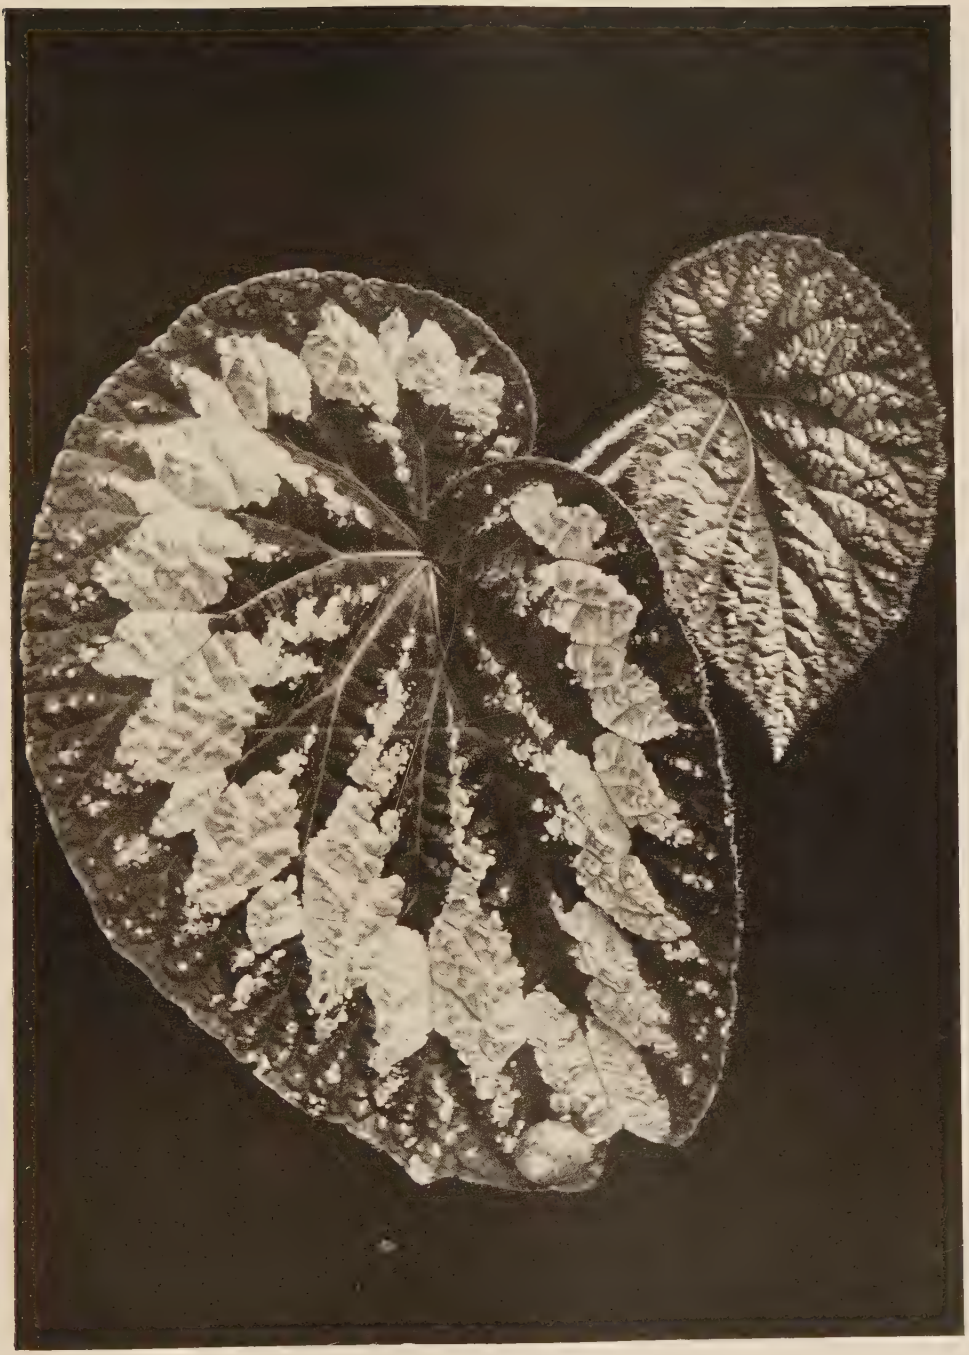
Beggar's Opera, The, a play by John Gay, was first presented in 1728, exciting a «tempest of laughter.» Its object was to satirize the predatory habits of «polite» society in thief-infested London, and to hold up to ridicule Italian opera. The chief characters are thieves and bandits. Captain Macheath, the hero, the leader of a gang of highwaymen, is loved by the ladies and feared by all but his friends — with whom he shares his booty. Peachum, the «respectable» patron of the gang, and the receiver of stolen goods, betrays his confederates from self-interest. Macheath is married to Polly Peachum, a pretty girl, who really loves her husband, and remains constant under many vicissitudes. Macheath engages to marry others, but this gets him into trouble. Being betrayed, he is lodged in Newgate. His escape, recapture, trial, condemnation to death, and reprieve, form the leading episodes in his dashing career. After his reprieve he makes tardy acknowledgment of Polly, and promises to remain constant to her for the future. Polly is an interesting dramatic character, at least three actresses having attained matrimonial peerages through artistic interpretation of the part. Gay's language often conforms to the coarse taste and low standards of his time; and the opera, still occasionally sung, now appears in expurgated form. Its best-known piece is Macheath's famous song when two of his inamoratas beset him at once:

> "How happy could I be with either
> Were t'other dear charmer away!"

Beggarweed, or **Tick Trefoil** (*Desmodium*), a genus of about 150 species, mostly herbs of the natural order *Leguminosæ,* natives of warm and temperate climates. Some of the species, notably the Florida beggarweed (*D. tortuosum* or *molle*) are used in Florida and elsewhere as fodder plants and as green manures on light soils. Like the clovers these plants can assimilate free nitrogen from the air. The species mentioned yields heavy crops of highly nutritive hay which is relished by stock. At the Louisiana Experiment Station six tons of hay per acre is reported. The plant is an annual from 3 to 10 feet tall, has pinnate leaves, small flowers in racemes and flat, jointed pods which adhere to clothing and animals by their hooked hairs. The plant has been found to do well in the West Indies and as far north as Virginia. About 10 native species worthy a place in the flower-garden have been offered for sale by dealers in native plants, but not generally by seedsmen. *D. gyrans,* the telegraph plant, a purple flowered perennial, native of southern Asia, is sometimes raised in hot-houses on account of the interesting movements of its leaflets when exposed to favorable temperature and sunshine.

Beggiatoa, one of the bacteria of the family *Beggiatoaceæ.* They are of sanitary interest as indicating the character of the water in which they grow,— it usually contains sulphur,— and their presence in large quantities in a water supply is usually held to mean that the water is contaminated and should be investigated. Their growth in natural sulphur waters is to be expected.

Begging the Question, in logic, is the assumption of a proposition which in reality involves the conclusion. Thus, to say that parallel lines will never meet because they are parallel is simply to assume as a fact the very thing you profess to prove. The phrase is a translation of the Latin term, *petitio principii,* and was first used by Aristotle.



Leaf of the Countess Pandolfini Begonia.

Bégin, bā-zhăń, **Louis Nazaire,** Canadian clergyman; educated at the College of St. Michael de Bellechasse, the Seminary of Quebec, Laval University, and the Grand Seminary of Quebec. About the time of his graduation from the last institution its trustees decided to found a theological department in connection with Laval University, and it was their wish that the faculty of this theological school should be educated in Rome. Therefore Dr. Bégin, who had been elected a member of the faculty, was sent to Rome in 1863, and remained abroad till 1868. During this time he traveled extensively and studied many branches of theology. On his return to Quebec he was appointed professor of dogmatic theology and ecclesiastical history in Laval University and held the chair till 1884. He became principal of the Laval normal school in 1885; was appointed bishop of Chicoutimi in 1888; coadjutor to Cardinal Taschereau, with the title of archbishop of Cyrene, in 1891; and in 1894 became administrator of the Province of Quebec. His works include 'La Primauté et l'Infaillibilité des Souverains Pontifes,' 'La Sainte Ecriture et la Régle de Foi' (1874); 'Le Culte Catholique' (1875).

Beglerbeg, bā-lĕr-bā', or more accurately, **Beylerbegi,** bā-lĕr-ba'ē, "prince of princes," or "lord of lords," is the title among the Turks given to the governor of certain provinces, but is not very commonly employed at the present day. The governors of Rumili, of Anatolia, and of Syria, in particular, have this title. See Beg.

Begon, Michel, bė-gŏń, mē-shĕl, French administrator: b. Blois, France, 1638; d. Rochefort, 4 March 1710. He was a naval officer, and successively intendant of the French West Indies, of Canada, of Rochefort, and La Rochelle. He is celebrated for his love of science, and the well known genus of plants, *Begonia,* was named in his honor.

Begonia, *Beefsteak Geranium,* or *Elephant's Ear.* A genus of about 350 species of succulent tropical herbs or under-shrubs of the natural order *Begoniaceæ,* most abundant in Mexico and Central and South America. Since the introduction of the first species (*B. nitida*) into England in 1777 about 150 species have been utilized by horticulturists, who have produced thousands of varieties noted for the superb coloring of either or both their flowers or foliage. In general the plants are characterized by variable, lop-sided (except in one group), alternate, entire, or lobed leaves; axillary cymes of usually large monœcious flowers, varying in all shades of red, also white and yellow; numerous stamens free or basally united; two to four styles; branched or twisted stigmas; and three-winged capsular, often colored, fruits containing numerous tiny seeds. The cultivated varieties may be grouped into: (1) Summer-flowering or tuberous-rooted, which produce large single and double flowers; (2) winter-flowering or fibrous-rooted; (3) semi-tuberous or *Socotrana,* with peltate leaves; (4) ornamental-leaved, or rex, Asiatic species and their descendants, with remarkably handsome or striking foliage. There are also hybrids between members of these groups. Each group demands somewhat different cultural treatment, but in general the tuberous sorts are started from seeds, and the tubers thereafter used from year to year; other varieties are usually increased by means of cuttings, either of the stem or of the leaf, by various methods almost confined to this group of plants. The varieties are usually easy to cultivate, but some, especially the tuberous sorts, are somewhat sensitive to dryness of atmosphere and hot sun, which usually accounts for the poor behavior of these plants in houses heated by hot air, steam, or hot water. For description of species grown in America, and for details of propagation, cultivation, etc., consult Bailey and Miller, 'Cyclopedia of American Horticulture' (N. Y. 1900–2). Consult also: Drysander, 'The Genus Begonia,' in 'Transactions of the Linnean Society,' Vol. I (1789); Klatsch, 'Begoniaceen-Cattungen und Arten,' 12 plates (1855); De Candolle, 'Prodromus,' Vol. XV. (1864); Ravenscroft, 'Begonia Culture for Amateurs' (1894); Wynne, 'Tuberous Begonias.'

Béguines, beg-ēn', **Béguins,** bĕg-ĭnz, or **Béguinæ,** bĕg-wĭ-nē, the women who live in communities, the members of which dwell not in one household, as in convents, but in a group of small cottages surrounded by a wall, with a chapel in the centre. They vow poverty and chastity so long as they remain in the béguinage as their village is called. They are the associations of praying women which arose in the Netherlands in the 13th century, the first being formed at Nivelles, Brabant, in 1226, and spread rapidly in the adjoining countries. They said they originated from a certain St. Begga, Duchess of Brabant, in the 7th century; but it is believed that they were founded by Lambert le Begue, a priest of Liége, in the 12th century. Mosheim rejects both statements. They used to weave cloth, live together under a directress, and leave on being married, or indeed whenever they pleased. They still exist in some of the Belgian towns, notably at Ghent, also in Germany, and at least in one béguinage in France, where they are renowned as makers of lace, though under different rules from those formerly observed. The corresponding communities of men were called Béghards, but these were suppressed in 1650 by Pope Innocent X.

Begum, bā'gŭm (a feminine form corresponding to beg, or bey), an Indian title of honor equivalent to princess, conferred on the mothers, sisters, or wives of native rulers. The Begum of Oudh is well known in Indian history.

Behaim, bā'hīm, **Martin,** a famous cosmographer: b. Nüremberg about 1430; d. Fayal, 29 July 1506. He is distinguished as one of the most learned mathematicians and astronomers of his age. He was engaged in commerce, and traveled for the purpose of carrying on his business, from 1455 to 1479; but also devoted himself to the study of the mathematical and nautical sciences. He went from Antwerp to Lisbon in 1480, where he was received with marks of distinction. He sailed in the fleet of Diego Cam on a voyage of discovery (1484–6), and explored the islands on the coast of Africa as far as the river Zaire. He is also said to have discovered, or at least to have colonized, the island of Fayal, where he remained for several years, and assisted in the discovery of the other Azores. He was afterward knighted, and returned to his native country, where he constructed a terrestrial globe in 1492, which bears the marks of the imperfect

acquaintance of that age with the true dimensions of the earth. Some ancient Spanish historians assert that he made many discoveries, and that he gave to his friend Columbus the idea of another hemisphere. Robertson (in his 'History of America') and others contradict this statement. It is also rejected by Irving.

Beham, bā'ham, **Bartel,** German painter and engraver: b: Nüremberg, 1496; d. Rome, 1540. He studied painting under Albert Dürer and later in Italy, and engraving under Marc Antonia Raimondi. Among his paintings are 'Christ Bearing the Cross,' 'A Woman Raised from the Dead by the True Cross,' and 'Marcus Curtius Leaping into the Gulf.' Among his prints are a portrait of William, Duke of Bavaria,' 'Adam, Eve, and Death Before a Tree,' 'The Virgin Suckling a Child,' 'Lucretia,' 'Cleopatra,' 'Apollo Causing Marsyas to be Flayed,' and 'Christ Giving His Charge to Saint Peter.'

Beham, Hans Sebald, German painter and engraver: b. Nüremberg, 1500; d. Frankfort, 22 Nov. 1550. He studied under Albert Dürer, and was one of his ablest scholars, but rendered his talents worse than useless, both to himself and society, by employing his pencil for the most profligate purposes. The disgust produced by his licentiousness drove him from his native town to Frankfort-on-the-Main, where dissipation made his downward progress very rapid.

Behar, bĕ-här', an extensive province of British India, now a part of the presidency of Bengal; pop. about 25,000,000 in 1901. It was ceded to the British by the Mogul shah Alum in 1765, on condition of an annual payment of 26 lacs of rupees. It is intersected by the Ganges, and produces much opium, indigo, sugar, cotton, and saltpetre. Gaya, the birthplace of Buddha, and the scene of one of Vishnu's incarnations, is in the province, and is visited by vast numbers of pilgrims. Other places of importance in the province are Baha, Chapra, and Patna.

Be'hemoth, the name of an animal described in Job xl. 15, to the end. It is evidently an herbivorous animal; but commentators and naturalists are not agreed as to the particular species. Bochart, Gesenius, and the generality of English commentators think the description most applicable to the hippopotamus; others think it was the elephant. Nor would it militate much against this interpretation that the elephant is not a native of the country in which the scene of the poem is laid. The author of the book of Job, whether Moses or not, may have been familiar with life in Egypt and Arabia, and if so, would naturally introduce scenery and adjuncts Egyptian or Arabian, or both combined; and that the elephant was well known in Egypt is proved not only by the use of ivory in the arts, specimens of which are preserved in abundance, but also by the representation of the animal itself on early Egyptian monuments.

Behistun, bā-hĭs-toon', a mountain near a village of the same name, not far from Kermanshah. in Persian Kurdistan, celebrated for the sculptures and cuneiform inscriptions cut upon one of its rocky sides, which rises almost perpendicularly to the height of 1,700 feet. These works are about 300 feet from the ground, and were executed by the orders of Darius I., king of Persia. The inscriptions set forth his genealogy, enumerate his 19 victories obtained against the rebels in different provinces of his empire, and proclaim the final pacification of the latter, and his gratitude to God. The sculptures consist of a large tablet, on which are represented a king with his foot upon a prostrate man, two long-speared warriors behind him, nine captives chained together by the neck before him, and above the whole a mythological figure. The inscriptions are executed with great neatness, and the whole monument is very well preserved, the rock, which had been carefully polished, having been coated with a hard silicious varnish, much harder, indeed, than the limestone beneath. The mountain was well known in ancient times, being mentioned by Diodorus under the name of Bagistanon. The same writer states also that an inscription and figures were engraved upon the rock by the orders of Semiramis, but these if they ever existed, have now disappeared. Rawlinson was the first to copy and decipher the Behistun inscriptions.

Behm, bām, **Ernst,** German geographer: b. Gotha, 4 Jan. 1830; d. there, 15 March 1884. In 1856 he became Dr. Petermann's chief assistant in editing the famous geographical periodical 'Mitteilungen,' to the editorship of which he succeeded on his chief's death in 1878. In 1872 he began, in conjunction with H. Wagner, the useful 'Population of the Earth,' intended as a statistical supplement to the 'Mitteilungen'; and from 1876 he undertook the statistical department of the 'Almanach de Gotha.' His more extended writings of this nature are marked by fullness, accuracy, and marked lucidity of arrangement.

Behn, bān, **Aphra,** or **Aphara,** English novelist and dramatist: b. Wye, Kent, 1640; d. London, 16 April 1689. She went to Surinam when she was very young, and remained there some years, during which time she became acquainted with the American prince, Oroonoko, whom she made the subject of a novel, subsequently dramatized by Sothern. On her return to England she married Mr. Behn, a London merchant, but was probably a widow when selected by Charles II. to acquire intelligence on the Continent during the Dutch war. She took up her residence at Antwerp, and it is said that, by means of one of her admirers, she obtained notice of the intention of the Dutch to sail up the Thames, and transmitted the news to England. This intelligence being discredited, she returned to England, and devoted herself to intrigue and writing for support. She published three volumes of poems, by Rochester, Etherege, Crisp, and others, with some poetry of her own; and wrote 17 plays, the heartless licentiousness of which was disgraceful both to her sex and to the age which tolerated the performance of them. She was also the author of a couple of volumes of novels, and of the celebrated love-letters between a nobleman and his sister-in-law (Lord Gray and Lady Henrietta Berkeley). Pope, in his 'Character of Women,' alludes to Mrs. Behn, under her poetical name of ASTREA.

> 'The stage how loosely does Astrea tread,
> Who fairly puts her characters to bed.'

She was buried in the cloisters of Westminster Abbey. An edition of her works was published in 1872.

Behrends, bā'rĕns, **Adolphus Julius Frederick,** American clergyman: b. Nymwegen, Holland, 18 Dec. 1839; d. Brooklyn, N. Y., 22 May 1900. He was successively pastor of a Baptist church at Yonkers, N. Y., 1868, and of the First Baptist Church in Cleveland, Ohio, 1873; of the Union Congregational Church, Providence, R. I., 1876, and of the Central Congregational Church in Brooklyn, 1883–1900. He published 'Socialism and Christianity' (1886); 'Philosophy of Preaching' (1890); 'The Old Testament Under Fire'; 'The World for Christ.' He was a forcible writer and very popular as a pulpit orator.

Behrens, bā'rĕns, **Bertha,** popular German novelist, who has written over the signature, W. Heimburg: b. Thale, 1850. She completed 'Das Eulenhaus,' a posthumous novel by E. Marlitt, whose successor as contributor to *Die Gartenlaube* she became, and among her own novels may be named 'Aus dem Leben meiner Alten Freunden' (1878, 8th ed. 1890); 'Lumpenmüllers Lieschen' (1879); 'Ihr einziger Bruder' (1882); 'Waldblumen' (1882); 'Dazumel' (1887); 'Trudchens Heirat' (1884); 'Umfreund Schuld' (1895); 'Antons Erben' (1898).

Behring, bā'rĭng, **Emil Adolf,** German physician: b. Hansdorf, 1854, and since 1895 director of the Hygienic Institute in Marburg. He has published 'Die Blutserumtherapie' (1892); 'Bekämpfung der Infektionskrankheiten' (1894) and is widely known for his discovery of diphtheria serum.

Behring, bā'rĭng or bē'rĭng. See Bering.

Beige, a light, woolen fabric, made of wool of the natural color; that is, neither dyed nor bleached.

Beijerland, bī'ĕr-lant, a fertile island in the Netherland province of South Holland at the mouth of the Maase. It produces great quantities of flax. Pop. 13,300.

Beilan, bā-län', a town and pass in the north of Syria, on the Gulf of Iscanderoon. The pass has more than once been of military importance, and was in 1832 the scene of a battle between Turks and Egyptians. The town, 1,584 feet above the Mediterranean, has 5,000 inhabitants.

Beilstein, bīl'stīn, **Freidrich Konrad,** Russian chemist: b. St. Petersburg, 1838. In 1866 he became professor of chemistry in St. Petersburg Institute of Technology. He has published 'Anleitung zur qualitaten Chemische Analyse,' which has been widely circulated (1867); 'Die Chemische Grossindustrie auf der Weltausstellung in Wien' (1873); and a celebrated 'Handbuch der Organischen Chemie' (1800–1901).

Beira, bā'ra, a province of Portugal, bounded chiefly by the River Douro on the north, by Spain on the east, and by the Tagus and Portuguese Estremadura on the south, and by the Atlantic on the west. It was formerly divided into Beira Alta (High Beira), and Beira Baixa (Low Beira). Its extent is 9,248 square miles, and the pop. (1900) 1,518,406. The capital is Coimbra. It is traversed by the Serra d'Estrella, and well watered by the Douro, Tagus, etc. Though not fertile in grain, the produce of wine and olives is considerable. The heir-apparent of the Portuguese crown is styled Prince of Beira. For purposes of administration the province is subdivided into the districts of Aveiro, Visien, Coimbra, Guarda, and Castello Branco.

Beira, a seaport on the coast of Portuguese East Africa, at the mouth of the Pungwe River, a little to the north of Sofala. It is the nearest port to the gold-fields of Mashonaland, and a railway through Fontesvilla, Chimoio, Massikesse, and New Umtali to Salisbury was completed in 1899. Beira has a good harbor protected by a sand-bank. There is a hospital, an English church, and about 1,600 inhabitants, of whom about 700 are Europeans.

Beiram, bā'räm. See Bairam.

Beirut, or **Beyrout,** bê-rut, or bā-root', (ancient Berytus), a flourishing seaport of Syria, 60 miles northwest of Damascus. It stands on a tongue of land projecting into an open bay, and spreading out toward the land into a beautiful plain, backed by the mountains of Lebanon. It consists of the old town, composed generally of narrow dirty streets, the residence of the poorer classes, and the business place of the merchants; and of the new town, which stretches around it. The latter, with its modern houses, carriage roads, and gardens,—its churches, colleges, schools, and hotels,—has little or nothing of the Oriental in its composition. Beirut has rapidly increased since 1844 when its population was only 8,000, its rise being largely due to the extension of the silk trade, of which it is the centre. The better protection afforded both to foreigners and natives by its being the residence of the consuls-general has also contributed to its prosperity. It is the seat of a consulate of the United States. Besides silk its principal exports are olive oil, cereals, sesame seed, tobacco, and wool. Shipbuilding is carried on here; an English company completed waterworks here in 1875 and gas works were built by a French company in 1886. Besides a Scottish school for Jews, there is an American-Syrian mission in Beirut, printing annually thousands of Arabic Bibles and having a school and hospital connected with it. In ancient times Beirut was a large and important Phœnician city, and under the Romans was long celebrated for its school of jurisprudence. The Byzantine Emperor Theodosius II. raised it to the rank of a metropolis. After being destroyed by an earthquake in 551, it again rose to a considerable town in the time of the Crusades. In later times it was long in the possession of the Druses. It was bombarded and taken by the British on 29 Aug. 1840. There is a railway to Damascus. Pop. estimated (1901) 120,000.

Beisa, bī'sa, a large Abyssinian antelope (*Oryx beisa*), differing from the gemsbok principally in lacking the tuft of hair on the throat and by the black patch on the front of the face being completely separated from the cheek stripe. This is probably the animal called oryx by the ancients, and may be the animal from which is derived the legend of the unicorns. Its straight horns (about 36 inches long) when seen in profile might easily appear as one. Herds of beisas are still numerous upon the plains of Somaliland. See also Gemsbok; Oryx.

Beissel, bī'sĕl, **Johann Conrad,** German mystic: b. Eberbach, 1690; d. Ephrata, Pa., 1768. He studied theology at Halle, but having been banished in 1720 for his Pietistic opinions he emigrated to Pennsylvania, settling first at Germantown and later in Lancaster County. In 1724 he returned to Germantown and adopted the Dunker faith, but his views as to celibacy and his observance of Saturday as the Sabbath were unacceptable to his neighbors, and he therefore established a sect of Seventh Day Dunkers. He attempted a hermit life, but his fellow believers gathered about him and in 1735 he founded the famous Settlement of Ephrata, Pa. (q.v.), and remained at its head till his death. He was the author of the earliest volume of German poetry published in America, 'Gottliche Liebes und Lobestöne' (1730), and published several collections of hymns, such as 'The Voice of the Lonely and Forsaken Turtle Dove — that is, of the Christian Church; by a Peaceable Pilgrim traveling to Tranquil Eternity' (1747); and 'Paradisiacal Wonder-Play' (1766). In the latter are found the 'Brother Song' of the sect with its 215 stanzas, and the 'Sister Song' with 250. He was known at Ephrata as Friedsam, and on his tomb may be read the inscription: "Here rests an outgrowth of the love of God, 'Friedsam,' a solitary Brother, afterward a leader, ruler, teacher of the Solitary and the Congregation of Christ in and around Ephrata." See 'Chronicon Ephrateuse' (1786); Sachse, 'German Sectarians of Pennsylvania' (1899–1900).

Beit, Alfred, German colonial financier: b. Hamburg, Germany, 1853; d. London, England, 16 July 1906. He was educated in the schools of his native city, emigrated to South Africa in 1873, and was a diamond merchant in Kimberley 1875–88. He became partner in the banking firm of Werner, Beit & Co. in 1888. On the discovery of gold in the Transvaal he purchased mining lands on an extensive scale, and prior to the Boer war in 1899 was chief partner in mines producing annually $90,000,000 of gold. He was a director of the Rand and Bulfontein mines, of the Rhodesia railways, of the Bechuana Railway Trust, and the Transvaal Consolidated Lands Company. His business offices were in Bishopsgate Street, London, and his wealth was estimated at over $100,000,000.

Beit-el-Fakih, bāt-ĕl-fā'kẹ, a town of Arabia, in Yemen, 32 miles south-southeast of Hodeidah, and 77 northeast of Mocha. It is celebrated for its trade in Mocha coffee, which is chiefly grown in the neighborhood. Pop. about 8,000. The word *Beit,* signifying a house or hut, is prefixed to the name of various other small towns and villages in Arabia.

Beitullah, bāt-ûl'la, the name of the building in Mecca within whose enclosure the Caaba (q.v.) is located.

Beitzke, bīts'kĕ, **Heinrich Ludwig,** German historian: b. Muttrin, 15 Feb. 1798; d. 10 May 1867. His publications include 'History of the German War for Freedom' (1855); 'History of the Russian War — Year of 1812' (1856); 'History of the Year 1815' (1865), etc.

Beja, bā'zha (anciently PAX JULIA), a town of Portugal, in the province of Alemtejo, 85 miles southeast of Lisbon. It stands on a height, surrounded by walls flanked with 40 towers, and is defended by an old fort. It was founded by the Romans, and some Roman remains are still visible. The town has two annual fairs and has an extensive trade in cattle and agricultural products. Pop. (1900) 8,895.

Bejapur, bē-ja-pōr' (anciently VIJAYAPURA, the impregnable city), a town of Hindustan in the Bombay presidency, near the borders of the Nizam's dominions, about 245 miles southeast of Bombay, and near the right bank of an affluent of the Krishna. From the great extent of the ruins here it would seem to have been formerly one of the largest cities of India. In its present state it may be described as two towns adjoining each other — the fort on the east, and the old town on the west. The former, though much less than the latter, has one entire and regular street 50 feet wide and nearly 3 miles long. Some of the mosques and mausoleums of Bejapur are elaborately elegant, but the prevailing character is solid and massive. The great dome of Mahomet Shah's tomb is visible far off. The fretwork on the ceilings and verandahs, the panels covered with passages of the Koran in bas-relief, and the stone trellises pierced with a mesh-work of Arabic characters, are all in the richest style of Oriental sculpture. Among the religious structures is a Hindu temple, built in the earliest style of Brahmanical architecture. There are here some guns of enormous size; one cast in 1549 is the largest piece of brass ordnance extant. Bejapur has become the chief town of Kaladgi district, and some of the old palaces are now used for public purposes. Pop. about 17,000. See Ferguson, 'Ancient Architecture in Hindustan' (1847); Ferguson, 'The Study of Indian Architecture' (1867).

Bejar, bā'jär, a town of Spain, in the province of Salamanca, 41 miles south of the town of that name. It is surrounded by old walls, and has considerable manufactures of cloth. Lord Hill defeated a French force here in 1813. In its vicinity are warm sulphur springs. Pop. (1895) 12,140.

Beke, Charles Tilstone, English traveler: b. Stepney, Middlesex, 10 Oct. 1800; d. Bromley, Kent, 31 July 1874. In his 20th year he entered on a business career, and was thus led to visit Italy. On his return he studied law at Lincoln's Inn, and in 1834 he followed up several archæological articles in periodicals by publishing 'Origines Biblicæ, or Researches in Primeval History.' In 1837–8 he was British consul at Leipsic, and in 1840 set out on his first journey to Abyssinia. Returning in 1843 he was awarded the gold medals of the Royal Geographical societies of London and Paris, and again engaged in business. He subsequently made several efforts to open up commercial intercourse with Abyssinia, and in 1861–2 he traveled in Syria, Palestine, and Egypt. When the news of the detention of several British subjects by the king of Abyssinia arrived in 1864, Beke went out to secure their release, and was temporarily successful, but ultimately King Theodore had to be coerced by war. In the direction of the military operations Beke's knowledge of the country proved of the utmost value, and in 1870 he received a civil list pension of $500 per annum. In 1873 he set out for Egypt in order to explore the country traversed by the Israelites, and to locate Mount Sinai. His published works com-

prise: 'The Sources of the Nile' (1860); 'The British Captives in Abyssinia' (1865); 'King Theodore and Mr. Rassam' (1869); 'The Idol in Horeb' (1871); 'Jesus the Messiah' (1872); 'Discoveries of Sinai in Arabia, and of Midian' (1878).

Bekes, bā'kāsh, a market town of Hungary, and capital of the county of the same name, at the junction of the Black and White Körös, 41 miles southwest of Grosswardein; formerly strongly fortified. Chief productions — flax, cattle, wheat, wine, and honey, in all of which the trade is considerable. Pop. (1900), 25,087.

Bekker, bĕk'kĕr, **Elizabeth,** Dutch novelist: b. Vlissingen, 24 July 1738; d. The Hague, 5 Nov. 1804. She married Adriaan Wolff, a Reformed Church minister at Beemster, who died in 1777, and lived afterward in closest friendship with Agathe Deken, who also collaborated in her most important works, 'History of Sara Burgerhart' (1782); 'History of William Leevend' (1784–5); 'Letters of Abraham Blankaart' (1787–9); 'Cornelia Wildschut' (1793–6).

Bekker, Immanuel, German scholar, distinguished by his recensions of the texts of Greek classics: b. Berlin, 21 May 1785; d. there, 7 June 1871. He studied in Halle, and, in 1811, became professor of philology in his native city. The results of his researches in the libraries of France, Italy, England, and Germany, appear in his numerous recensions of texts derived solely from MSS., and independently of printed editions. The writers included in these recensions are Plato, the Attic orators, Aristotle, Thucydides, Theognis, Aristophanes, as well as Livy and Tacitus.

Bél, bāl, **Karl Andreas,** Hungarian historian, son of Matthias Bél (q.v.): b. Presburg, 1717; d. 1782. He was professor of poetry at Leipsic and was author of 'De Vera Origine et Epocha Hunnorum, Avarum Hungaronum in Pansonia' (1757); 'De Maria Hungariæ non Rege sed Regina' (1744).

Bél, Matthius, Hungarian historian: b. Orsova, 1684; d. 1749. He was distinguished as a theologian and historian, and became rector of the Protestant schools at Neusohl. He wrote on the history of Hungary alone, and achieved much distinction. His writings are even now much valued for reference purposes.

Bel, bĕl, one of the most important gods of the Babylonian mythology; mentioned in Scripture, in Is. xlvi. 1; Jer. i. 2; li. 44; in the Septuagint, in Baruch vi. 40, and in the apocryphal additions to the Book of Daniel, as well as by classical authors. Much light has recently been thrown on Bel's characteristics and position in the heavenly hierarchy, by the examination of the cuneiform tablets and sculptures. It has been ascertained that, prior to 1600 B.C., the highly interesting Turanian people called Accadians, the inventors of the cuneiform writing, who wielded extensive authority in western Asia before the Semitic Assyrians and Babylonians had come into notice, worshipped as their first triad of gods, Anu, ruling over the heaven; Elu, Belu, or Bel, over the earth; and Ea, over the sea. Bel's three children, or three of his children, were Shamas, the sun-god; Sin, the moon-god; and Ishtar, the Accadian Venus. Sayce shows that some first-born children were vicariously offered in sacrifice by fire to the sun-god. From the Accadians the observance of human sacrifice passed to various Semitic tribes and nations. Bel's name Elu identifies him with the Phœnician El, who, in a time of trouble, offered his first-born son, "the beloved," on a high place, by fire. It is not settled whether or not Bel was the same also as the Phœnician Baal. To the wrath of Bel the deluge was attributed. In Scripture times he was known exclusively as a Babylonian divinity, being distinguished from both Nebo and Merodach. In the later Babylonian empire, however, Merodach came to be generally identified with Bel, though sometimes distinguished from him, being called "the lesser Bel."

Bel and the Dragon, certain apocryphal chapters added to the canonical Book of Daniel. The Jews do not consider them part of their Scriptures. They were penned probably by an Alexandrian Jew, the language used being not Hebrew, nor Aramæan, but Greek. The story of Bel and the Dragon tells how Daniel enlightened Cyrus, represented as having been a devout worshipper of Bel, by proving that the immense supplies of food laid before the idol were really consumed, not by it or by the inhabiting divinity, but by the priests and their families. On Cyrus urging that the dragon, also worshipped, was at least a living God, Daniel poisoned it, for which he was thrown into a lion's den, where the Prophet Habakkuk fed him. Ultimately he was released, and his persecutors put to death.

The above narrative must not be confounded with one called also 'Bel and the Dragon,' translated by Fox Talbot from the cuneiform tablets. Mr. Talbot believes that the dragon, seven-headed, like the one in Revelation, would, if the tablets were complete, prove the same being that seduced some of the heavenly "gods," or angels, from their allegiance (Rev. xii. 4; Jude vi), for which he was slain by Bel. The resemblance is not to the apocryphal book now under consideration, but to the combat between Michael and the Dragon in Rev. xii. 7–17.

Bela, bā'lŏ, the name of four Hungarian kings of the Arpad dynasty. BELA I., son of Ladislaf, competed for the crown with his brother Andrew, and was obliged to take refuge in Poland. Having there obtained assistance, he returned at the head of a powerful force, defeated his brother, who perished in the action, and mounted the throne in 1061. He immediately began a series of important reforms, and was contemplating others when he was suddenly cut off in 1063. BELA II., surnamed the Blind, because his eyes had been put out in early life by his uncle, succeeded to the throne in 1131, and at first seemed inclined to act with moderation and justice, but the vindictive spirit of his queen involved him in quarrels with his nobles, and his own intemperate habits brought on a disease which terminated his life in 1141. BELA III. succeeded his brother, Stephen III., in 1173, and held the reins of government with a strong hand, vigorously correcting the abuses and putting down the turbulent spirit which the troubles of previous reigns had engendered. He also repelled incursions of Bohemians, Poles, and Austrians, and retaking the towns of which the Venetians had possessed themselves, compelled them to accept of peace in 1189. He died

in 1196, and was succeeded by Emeric, one of two sons by his queen, a sister of Philip Augustus, king of France. Bela IV. succeeded his father, Andrew II., in 1235, and was shortly after obliged to collect an army to oppose the Tartars, who had invaded the country. In the battle which ensued he was signally defeated, and obliged to take refuge in Austria, where he was detained prisoner, and only recovered his liberty by the payment of a heavy ransom. The Tartars having retired in 1242 Bela regained his throne, and made it his object to repair the results of their invasion. He subsequently established his rule over Bosnia and northern Servia, and died in 1270.

Bela'rius, a character of prominence in Shakespeare's 'Cymbeline.' Exiled by King Cymbeline, he carries away with him the two sons of the monarch and rears them as his own.

Belas'co, David, American dramatist: b. San Francisco, 25 July 1859. He appeared on the stage in 1874, but soon forsook it for playwriting. Alone and in collaboration, he is the author of the plays 'Lord Chumley'; 'The Wife'; 'The Charity Ball'; 'The Girl I Left Behind Me'; 'The Heart of Maryland'; 'Zaza'; 'May Blossom'; 'Men and Women'; 'La Belle Russe'; 'Valérie'; Du Barry'; 'Hearts of Oak'; 'Naughty Anthony'; etc.

Belbeis, bĕl-bās', a town of Egypt, 29 miles north-northeast of Cairo, near the railway to Suez and on the border of the desert, formerly of some importance as being on the route to the East. The ruins of the ancient Bubastis are in its neighborhood. Pop. about 8,000.

Belch, Sir Toby, a roistering character in Shakespeare's comedy, 'Twelfth Night.'

Belcher, Sir Edward, English admiral and hydrographer: b. Halifax, N. S., 1799; d. 18 March 1877. Having taken part as midshipman in the defense of Gaeta and the battle of Algiers, he was in 1819 appointed to the Myrmidon sloop, destined for the African station, and in 1825 became assistant surveyor to the Bering Strait discovery expedition under Capt. Beechey. In 1829 he was promoted to the rank of commander, and served on the coast of Africa, and of Portugal, rendering on the latter occasion valuable services to the British residents by protecting their property during the political troubles in Portugal. Subsequently he was engaged for a number of years in a voyage round the world in the surveying vessel, Sulphur. In 1841 he explored the inlets of the Canton River, and materially assisted in securing the triumph of the British army. In acknowledgment of these services, he was knighted. Afterward he was employed on board of the Samarang, on surveying service in the East Indies, and was severely wounded while assisting the rajah of Sarawak, Sir James Brooke, to subdue the pirates of Borneo. From 1852 to 1854 he commanded the expedition in search of Sir John Franklin. On his return to England, he was tried before a court-martial for voluntarily abandoning the ships. The case against him, however, was not legally supported, he was acquitted, and his sword returned to him, but while some of the other officers were commended, his name was passed over in significant silence. In 1872 he became rear-admiral. He published 'The Last of the Arctic Voyages' (1855); 'Narrative of a Voyage to the East Indies.'

Belcher, Jonathan, colonial governor of Massachusetts: b. Cambridge, Mass., 8 Jan. 1681; d. Elizabethtown, N. J., 31 Aug. 1757. He was graduated at Harvard, in 1699, and spent six years in Europe before returning to Boston, as a merchant. From 1730 to 1741 he was governor of Massachusetts and New Hampshire, a dispute over his salary causing his removal. In 1747 he was made governor of New Jersey and gave it a successful administration. He enlarged the charter of the College of New Jersey (Princeton) and gave that institution, among other benefactions, his own valuable library. 'The Belcher Papers' were issued by the Massachusetts Historical Society, 1893.

Belcher, Thomas Waugh, Anglican clergyman: b. Bandon, Ireland, 1831. He was educated at Trinity College, Dublin, and in the medical schools of Paris and Vienna and subsequently took orders in the Established Church. He has published 'Our Lord's Miracles of Healing Considered in Relation to Some Modern Objections and to Medical Science' (1872); 'Hygienic Aspects of Pogonotrophy' (1864); 'Reformation for Drunkards' (1862); 'Is Christ the Head of His Church in England' (1881); 'Apostolic Contumacy'; 'Life of Robert Brett' (1889). He has been rector of Frampton-Cotterell, Bristol, from 1886.

Belching, the raising of gases from the stomach. There is always a certain amount of air in the stomach, taken in by the act of swallowing and a certain amount of carbon dioxid is thought to be formed by the mucous membrane of the stomach; but under abnormal and diseased conditions new gases may be formed, causing much discomfort. Rapid eating, bolting one's food, and drinking large quantities of water very rapidly cause an abnormal amount of air to be swallowed. This often causes extreme distress until it is belched out. In abnormal states of digestion quantities of gas are formed from the fermentation of the food; some of these are acetylene gas, carbon dioxid, marsh gas, sulphuretted hydrogen, hydrogen, oxygen, and nitrogen. Lack of free hydrochloric acid is one of the most important factors in this gas formation. The symptoms are usually excessive escape of gases just preceding or closely following a meal. The gases gradually begin to form two to three hours after the meals eaten. They increase in amount, cause distress, and may be belched occasionally, making one taste one's meal. While eating, the new food dilates the stomach, causes distress, sometimes attacks of palpitation of the heart, and when the stomach is overdilated the gases are belched forth, sometimes in large gusts. The treatment consists primarily in more careful eating, but if one deliberately chooses to eat and suffer afterward, various digestants such as pepsin, or pancreatin, sodium bicarbonate, taken before the meal; weak hydrochloric acid may be be taken with the meal, as well as sips of very hot water. These all aid somewhat in diminishing the excessive amount of fermentation. See Indigestion.

Belchite, bĕl-chē'tā, a Spanish town, 22 miles south-southeast of Saragossa, noted as the scene of a victory gained 18 June 1809, by the

French, under Suchet, over the Spanish forces under Blake. Belchite has some manufactories of woolens. Pop. (1897) 3,409.

Belden, James Jerome, American politician: b. Fabius, N. Y., 30 Sept. 1825; d. Syracuse, N. Y., 1 Jan. 1904. He received a common school education, became a contractor and amassed a fortune in building railroads. Entering politics he became a local and State Republican leader; was elected mayor of Syracuse; elected to Congress from 1887 to 1896; and was chairman of the National Republican Committee.

Belding, Mich., city in Iowa County; on the Detroit, L. &. N. R.R.; 139 miles northwest from Detroit. It has silk mills, basket, casket and furniture factories, machine shops, paper box factories and other industries. The first silk mill in the West was erected here. Pop. (1900) 3,282.

Belem, bā-lĭn′, a town of Portugal, on the right bank of the Tagus, two miles west-southwest of Lisbon, of which it may be considered a suburb. It contains a fine church and a monastery, the former containing the remains of Camoens and Vasco da Gama.

Belem'nites, a name for straight, solid, tapering, dart-shaped fossils, popularly known as arrow-heads, thunder-bolts, finger-stones, etc., but in reality the internal shell or skeleton of a molluscous animal allied to the squid or sepia, and the type of an extinct family, *Belemnitidæ*. The fossil remains of the animal are met with in the rocks of the upper secondary, both in this country and other parts of the world; and they are particularly abundant in the strata of the green sand formation in New Jersey. The part preserved, often detached from the loose strata, is a pointed cone sometimes eight inches long, of brown color and stony material, resembling in shape the head of a dart or javelin, whence their name. Belemnites are one of the earliest known fossils.

Bele'rium, or **Bolerium,** the ancient appellation of Land's End in Cornwall, England, but the origin of the name is uncertain.

Belfast, the chief commercial and manufacturing city of Ireland, the capital of the province of Ulster, on the river Lagan at the head of Belfast Lough, about 86 miles north-northeast of Dublin. The greater part of it is built on low alluvial land on the banks of the Lagan, not more than six feet above high-water mark. The country around is extremely beautiful; the position of the town renders its appearance from a distance by no means imposing, but the Lough itself presents a fine scene; and the slopes of the hills that bound it and partly encircle the town are thickly studded with the villas and country houses of the merchants. The sewerage has been improved. The streets are spacious, regular, and well lighted and macadamized; the houses, mostly of brick, are well built — many of them very handsome. Tramways and the electric light have been introduced. Four bridges cross the river, one of them an elegant structure of five arches, each of 50 feet span. The public buildings and institutions are in keeping with a city of its size and importance. Among the numerous churches all the chief religious bodies are represented, the Presbyterians possessing the greatest number of places of worship. Many of the churches are handsome buildings. Saint Anne's, the oldest of the Episcopal (Church of Ireland) churches, is about to be removed and the site occupied by a cathedral, of which the foundation stone was laid in 1899. Trinity, a fine specimen of Gothic; and St. George's, adorned with a beautiful portico, are also deserving of notice among the Episcopal churches. The more modern of the Presbyterian churches, as well as those of other denominations, display increasing taste. St. Patrick's serves as the Roman Catholic Cathedral, but is architecturally inferior to St. Malachy's. The secular buildings include the new city hall, Queen's College, a massive pile in the later Gothic style, with a façade 600 feet in length, erected at a cost of £30,000; the Presbyterian Theological College; the Methodist College, a handsome building erected in 1868 at a cost of £30,000; the municipal buildings; the county court-house; the commercial buildings and exchange; the buildings for the customs and inland revenue; the post-office; the offices of the Ulster Bank, the Bank of Ireland, the Provincial Bank, the Belfast Bank, the National Bank, the Scottish Amicable, Scottish Provident, and North British and Mercantile Assurance companies; the grand opera house; the Theatre Royal; the county jail; the Ulster Hall; the Albert memorial clock tower, 143 feet high; etc. Of the educational institutions the most prominent is Queen's College, first opened to students in 1849, with a president and over 20 professors and lecturers. Candidates for the ministry of the Presbyterian Church of Ireland receive a training in the General Assembly's Theological College. The Methodist College and the Campbell College (a secondary school) are important institutions; while the Royal Academy and the Royal Academical Institution also deserve mention. There is a free public library belonging to the city. The charitable institutions are very numerous and important. In the city there are six extensive public parks, besides the borough cemetery. Belfast is the centre of the Irish linen trade and manufacture, having within itself the great majority of the spinning-mills and power-loom factories in Ireland, some of them of immense size and of imposing appearance. The spinning of flax and weaving of linen are indeed the staple industries of the city, and have increased at a remarkable rate in modern times. The cotton manufacture, once of importance, is now of little moment. There are two large shipyards, and in their yard and engineering works Messrs. Harland and Wolff employ some 10,000 hands, and have turned out some of the finest vessels afloat, one of their triumphs being the great steamer Oceanic, built for the White Star line. There are also breweries, distilleries, flour-mills, oil-mills, saw-mills, foundries, printing and lithographic works, tan-yards, chemical works, ærated waterworks, rope works, tobacco manufactories, felt manufactories, etc. The commerce of Belfast surpasses that of any other Irish seaport, and is rapidly increasing. By its customs revenue it is the fifth port in the United Kingdom. Belfast Lough, which forms the approach by sea, is a fine sheet of water between the counties of Down and Antrim, about 14 miles in length and 6 in breadth at the entrance, narrowing toward the city. By dredging, a straight channel has been provided to accommodate large vessels. New docks have been constructed, giving a total

harbor area of over 100 acres. One of the graving docks is 825 feet long. The most important branch of traffic by sea is across the channel. A large fleet of steamers ply regularly between Belfast and London, Plymouth, Bristol, Liverpool, Fleetwood, Morecambe, Barrow, Whitehaven, Ardrossan, Glasgow, Dublin, Waterford, etc. There is also an extensive direct trade with British North America, the Mediterranean, France, Belgium, Holland, and the Baltic. In 1786 only 772 vessels (34,287 tons) entered the port; whereas in 1899, 11,263 vessels, with a burden of 2,539,199 tons, entered in the foreign, colonial, and coasting trades, while 11,172 vessels of 2,454,829 tons were cleared. Over 2,000,000 tons entered in the trade with Great Britain. Much of the inland trade is carried on by the Lagan Navigation, which connects the town with Lough Neagh; the Ulster Canal, connecting Lough Neagh with Enniskillen; and by three systems of railway, namely, the Great Northern, the Belfast, and Northern Counties, and the County Down. Belfast is comparatively modern. In 1637 it obtained the privilege of levying certain duties on goods and became a regular seaport; but its prosperity subsequently was much impeded by the Civil War. Early in the 18th century it was described as a handsome, thriving town, but its period of modern prosperity dates from about 1830. The harbor is under the management of an independent board. Belfast returns four members to Parliament. An American consul is resident here. Pop. (1901) 348,965.

Belfast, Maine, a city and county-seat of Waldo County, at the head of Penobscot Bay, and on the Maine C. R.R.; 30 miles from the ocean, and 132 miles northeast of Portland. It has a fine harbor, a large domestic trade, and important manufactures, including iron works, shoe factories, lumber mills and chemical works. The public library contains 5,000 volumes. The most notable industry is ship-building, begun here in 1793. Belfast was settled in 1770; was invested by the British in 1815, and was given a city charter in 1853. Pop. (1900) 4,615.

Belfort, bĕl-fôr, a fortified town of France, department of Haut Rhin, on the Savoureuse, 47 miles northeast of Bésançon. It is well built, and has an ancient castle situated on a lofty rock, a fine parish church, barracks, town house, court of primary resort, public library containing 20,000 volumes, and a communal college. Manufactures — hats, clocks, wax tapers, iron wire, sheet iron, etc. There are also breweries, tanneries, and iron furnaces. The principal trade is in grain, wine, brandy, and liquors. Iron is extensively worked in the neighborhood. In 1814 Belfort was besieged by the allies without success. In the Franco-German war it was invested by the Germans, 3 Nov. 1870, and after holding out with great bravery, capitulated, 16 Feb. 1871. In recognition of the bravery which the garrison had shown in its defense, it was allowed to march out with full military honors. This defense is commemorated by the huge 'Lion of Belfort' in front of the citadel, the work of Bartholdi. Belfort, with the district immediately surrounding it, is the only part of the department of Haut Rhin, which remained to France on the cession of Alsace to Germany, 26 Feb. 1871. Pop. (1896) 27,715.

Belfry, a bell-tower or bell-turret. A bell-tower may be attached to another building, or may stand apart; a bell-turret usually rises above the roof of a building, and is often placed above the top of the western gable of a church, the terms bell-cote, bell-gable, being also used. The part of a tower containing a bell or bells is also called a belfry. Strictly speaking, a belfry is a civil and not an ecclesiastical one, and in the Middle Ages, the bells in the municipal belfry became the symbols of popular freedom. The detached bell tower is of frequent occurrence on the continent of Europe, and in England the cathedral of Chichester and a few parish churches possess such an adjunct. In the United States such structures are infrequent, but in the town of Waterville, N. Y., is a detached belfry or clock-tower with quarter chimes, and Brown University at Providence is soon to have a handsome detached clock tower erected within its grounds.

Belgæ, a group of German and Celtic tribes who inhabited the country extending from the Atlantic Ocean to the Rhine, and from the Marne and Seine to the southern mouth of the Rhine, which is united with the Meuse. From time to time, until the period of Cæsar, German nations pushed forward beyond the Rhine, partly expelling the Celts from their seats, partly uniting with them; and from this union sprang a mixed nation, which, in its language as well as in its manners, resembled the Germans more than the Celts. According to the testimony of Cæsar, they were the most valiant of the Gauls. Belgic tribes seem also to have settled in early Britain.

Belgard, bĕl'gärd, a town of Prussia, in Pomerania, at the junction of the Leitnitz with the Persante, with an old castle. Iron, cloth, and wood are manufactured, and there is an important horse market. Pop. (1895) 7,386.

Belgaum, bĕl-gâm', a town of Hindustan, in the district of Belgaum, Bombay presidency, on the eastern slope of the western Ghauts, 2,500 feet above the sea. It consists of a native town, fort, and cantonments, and contains the usual courts and offices, a school for the children of natives of rank, and various other schools. In 1818 the fort and town were taken by the British after a gallant resistance by the Peishwa's forces. From the salubrity of the climate and the purity of the water, Belgaum has been selected as a permanent military station. It carries on a trade in salt, dry fish, dates, etc.; and cotton is manufactured. Pop. (1901) 26,200.

Belgic Confession, a credal statement put forth in French in 1561 by Guido de Bres of Brabant and others, and sent to Philip II. of Spain to persuade him to tolerate the Calvinistic faith. In 1562 it was published in the vernacular, and subsequently in Dutch and German, and was acknowledged by the synods of Antwerp (1566) and Dort (1619).

Belgiojoso, bĕl-jō-yō'sō, **Cristina** (Princess of), Italian patriot: b. Milan, 28 June, 1808; d. there, 5 July 1871. She took a prominent part in the revolution of 1830, and was exiled by the Austrian government. She lived in Paris for several years and then returned to Italy in 1847, and in the revolution of 1848, offered her whole fortune to the patriot cause and equipped several hundred volunteers at her own expense. After a second exile of some years she returned

under the amnesty of 1856, regained her property, and supported the policy of Cavour. She was the editor of several different periodicals in the interest of Italian liberty, and was the author of several books, among them 'Souvenirs of Exile' (1850); 'History of the House of Savoy' (1860); and 'Reflections on the Actual Condition of Italy' (1869).

Belgiojoso, a town of northern Italy, in the province and eight miles southeast of Pavia. It is situated in a beautiful and fertile plain between the Po and the Olona, and is well built, containing a parish and an auxiliary church. The old castle, in which Francis I. was temporarily lodged after being taken prisoner at the battle of Pavia, in 1525, has been converted into a magnificent château, surrounded by fine gardens. Pop. 4,000.

Belgium (French, Belgique; German, Belgien), a kingdom of Europe, bounded north by Holland, northwest by the North Sea, west and south by France, and east by the duchy of Luxemburg, Rhenish Prussia, and Dutch Limburg; greatest length, northwest to southeast, 165 miles; greatest breadth, north to south, 120 miles; area, about 11,400 square miles. Belgium, in shape, resembles a triangle, which has its vertex in the west; the base resting on Germany on the east, the shorter side facing Holland and the sea, and the larger forming the frontier of France. For administrative purposes it is divided into nine provinces — Antwerp, South Brabant, East Flanders, West Flanders, Hainaut, Liége, Limburg, Luxemburg, and Namur. These provinces do not differ much in area, and are so arranged as to form a compact and commodious division of the kingdom. South Brabant, which from containing Brussels, the capital, may be considered the metropolitan province, occupies the centre, while the others cluster round, and, with the exception of the extreme provinces of Luxemburg and West Flanders, actually touch it.

The following table shows the areas of the different provinces, with their population, on 31 Dec. 1900:

Provinces	Area in sq. miles	Population
Antwerp	1,093	819,000
Brabant	1,268	1,263,807
Flanders, East	1,158	1,029,971
Flanders, West	1,249	805,236
Hainaut	1,437	1,142,954
Liége	1,117	820,175
Limburg	931	240,796
Luxemburg	1,706	219,200
Namur	1,414	346,512
	11,373	6,687,651

Physical Features.— A general idea of the surface of the country may be obtained by regarding it as an inclined plane, somewhat rugged, and considerably elevated in the southeast, from which it slopes, more or less gradually, north and west, till it sinks into low plains, only a few feet above the level of the sea. The elevated districts are formed by ramifications of the Ardennes, which, entering Belgium from France, stretch along the south of Namur, occupy the greater part of Luxemburg, and attain their culminating point in the southeast of Liége at Stavelot, in the neighborhood of Spa, where the height exceeds 2,000 feet. The rocks appear to rest on primary formations; but those which reach the surface generally consist of slate, old red sandstone, and mountain limestone. Proceeding northwest, in the direction of the dip, these rocks take a cover, and the coal formation becomes fully developed. This coal field is a continuation of that of the north of France, and stretches through Belgium in a northeast direction, occupying the greater part of the province of Hainaut, and a considerable part of that of Liége, and skirting the provinces of Namur and Luxemburg. It contains numerous workable seams, both of coal and iron. North and west, beyond the limits of this coal field, a more recent formation is found, covered by deep beds of clay and sand, the former prevailing more in the interior, and the latter near the coast, where it has been drifted into hillocks or downs, and forms the only barrier against the encroachments of the sea. Some of the clay in this district is fit for the manufacture of fine pottery; but the greater part of it is fit only for coarse ware, or for bricks.

In accordance with the general slope of the surface already mentioned, the main streams of Belgium have a northern direction; and the whole country lies within the basin of the German Ocean. In the southeast, where the surface is elevated and broken, numerous torrents descend with rapidity; and becoming confined within rocky, precipitous, and richly wooded banks, often furnish, if not the grandest, the most picturesque and enchanting of landscapes. On reaching the lower country their speed is slackened, and their augmented volume moves along in a slow, winding course. Only two of them,— the Meuse and the Scheldt,— have a magnitude which entitles them to the name of rivers; but so important are these two in themselves, and so numerous their affluents, that no country in Europe is better supplied with water communication. Besides the Scheldt or Schelde, and Meuse or Maas, the navigable streams are the Ambleve, Demer, Dender, Darme, Dyle, Lys, Great Nethe, Little Nethe, Ourthe, Rupel, Sambre, Yperlee, and Yser. The climate of Belgium bears a considerable resemblance to that of the same latitudes in England. Though subject to sudden change, it is on the whole temperate and agreeable. Luxemburg and Namur, where the surface is high, and the numerous hills and dales which diversify it both cheer the animal spirits and freely circulate an air at once keen and pure, are most favorable to health and longevity. The only parts of the country which can be considered unhealthy are the low flats which prevail in Flanders, and the polders or rich alluvial tracts which have been gained from the rivers by embankment, chiefly in Antwerp. There agues and other diseases engendered by a humid and sluggish atmosphere are prevalent.

Woods and Forests.— Nearly one fifth of the whole surface of the kingdom is occupied by wood. The distribution of it, however, is by no means equal; and hence, while the two Flanders and Antwerp fall far below the average amount, Luxemburg and Namur rise far above it, and are very densely wooded. In these provinces extensive tracts are covered with natural woods, in which the wolf and wild boar still have their haunts. These woods are the remains of the ancient forest of Ardennes, which Cæsar describes as stretching far out into France from the banks of the Rhine. They consist of hard wood, principally oak, which is often of great

size, and furnish large quantities of the most valuable timber. By carefully dressing the stools after it is cut, a fine oak copse is raised, the cuttings of which annually produces many tons of bark, which not only supplies the tanneries of the country, but leaves a considerable surplus for exportation, chiefly to England, while the wood unfit for the carpenter is partly employed as fuel and partly converted into charcoal for the use of the iron works, where the superiority of the iron smelted and wrought by it is well known. South Brabant also possesses several fine forests, among others that of Soignies, with which the field of Waterloo has made us familiar. In the other provinces scarcely anything deserving the name of forest is seen. Wood is distributed over them in occasional patches, and more frequently in the form of hedge-row. The timber thus grown is by no means small in aggregate amount, and forms a well-known feature in the rich rural landscapes which the old Flemish masters loved to paint; but taking into account the injury which the cultivated crops sustain from it, it is very questionable whether it ought to be regarded as a source of profit either to individual proprietors or to the country at large. The timber itself, consisting principally of various kinds of poplar, is soft and of an inferior description.

Agriculture.— The greater part of the country is well adapted for agricultural operations, and the inhabitants have so happily availed themselves of their natural advantages that they early began, and in some respects still deserve, to be regarded as the model farmers of Europe. In the high lands traversed by the Ardennes the climate is ungenial, and the soil so shallow and stony as almost to forbid the labor of the plow. Here the occupants display their skill, not so much by what they do, as by what they refrain from attempting. Instead of vain endeavors to force the growth of corn where it could never yield an adequate return, they have been contented to turn the natural pastures of the district to the best account by employing themselves chiefly in the raising of stock. In particular they produce a hardy breed of horses, which, being admirably adapted for light cavalry, are largely exported to France for that purpose, while vast herds of swine are fed almost at no expense on the mast of the forests. At the same time no part of the surface is allowed to lie waste. Where arable land occurs it is carefully applied to its proper use. Even the vine has not been forgotten, and sunny slopes on which little else could have been grown have been made to yield a tolerable wine. In the Ardennes valleys an inferior quality of tobacco is raised.

In the opposite extremity of Belgium, chiefly in the province of Antwerp, and partly in that of Limburg, an extensive tract occurs which strikingly contrasts in appearance with the hilly districts of the southeast, but is perhaps still less adapted for the ordinary operations of agriculture. This tract, known by the name of Campine, is a vast expanse of moorland waste of the most dreary appearance, a dead monotonous flat composed for the most part of barren sand, in which the ordinary heaths and lichens will scarcely grow. The greater part of this tract seems destined to remain forever in its natural state, but whenever a patch of more promising appearance occurs the hand of industry has been at work, and corn fields and green pastures have become not infrequent even in the Campine. Agricultural colonies, partly free and partly compulsory, have been planted in different parts of the district. The former consist of persons generally in poor circumstances who have voluntarily engaged in reclaiming barren tracts as the means of procuring a maintenance and saving them from the degradation of pauperism. The latter consist of convicts, who, having forfeited their liberty, give compulsory labor as the penalty of their offenses. By the united exertions of both a wondrous improvement has been made, and on parts of this waste some of the finest cattle of the country are raised, and much dairy produce of excellent quality is obtained. Still, however, about 300,000 acres remain untouched.

With the exception of the two districts just described, there is no part of Belgium in which agriculture does not flourish; but the husbandry which has been so much lauded is seen in its greatest perfection in the two Flanders. Its excellence is owing not to any superior knowledge of what may be called the theory of agriculture, nor to any remarkable ingenuity in the invention of implements by which its operations are more efficiently or more cheaply performed, but chiefly to an innate spirit of economy and industry — an economy which carefully appropriates every gain, however small, and an industry which grudges no labor, however great, provided it is possible, by the application of it, to obtain an additional amount of valuable produce. In fact, the Flemish husbandry partakes more of the nature of garden than of field culture. In many of its operations, no doubt, horse labor is employed. The plow and the harrow are in frequent requisition, but the implement on which the greatest dependence is placed is the earliest and simplest of all — the spade. To give full scope for the use of it, the ground is parceled out into small fields of a square form, which have their highest point in the centre, and slope gently from it in all directions toward the sides, where ditches of sufficient size carry off the superfluous water as it filters into them. To promote this filtration the ground is trenched to a uniform depth, so that the slope of the subsoil corresponds as nearly as possible to that of the surface. In performing this trenching a considerable degree of skill and ingenuity is displayed. The performance of the whole at once would be a formidable and not a very efficient process. In a few years a new subsoil would be formed, and the trenching would require to be renewed. This is rendered unnecessary in the following manner: The land is laid out in ridges about five feet wide, and when the seed is sown it is not covered as usual by the harrow, but by earth dug from the furrows to the depth of two spits, and spread evenly over the surface. By changing the ridges and throwing the furrow of the previous year into the ridge of the next, the whole ground becomes furrow in the course of five successive crops, and is consequently trenched to the depth of about 18 inches. This process of trenching never ceases, and is unquestionably one of the most important characteristics of the Flemish husbandry.

The only other process particularly deserving of notice is the care and skill manifested in securing an adequate supply of manure. Every farm is fully stocked, and the cattle, instead of

being grazed in the fields, are fed at home, in winter on turnips and other roots, and in summer on green crops carefully arranged, so as to come forward in regular succession, and yield a full supply of rich, succulent food. In addition to this, every homestead has a tank, built and generally arched with brick, into which all the liquids of the cattle sheds are conveyed, and have their fertilizing properties increased by the dissolution of large quantities of rape cake. This liquid manure is of singular efficacy in promoting the growth of flax, which enters regularly into the Flemish rotation, and is perhaps the most valuable crop of all, the produce of an acre being not infrequently sold for $250. As this crop is one of the most exhausting which can be grown, and requires the richest manure, while it yields none, the growth of it to any great extent must, without the aid of the tank, have been impossible. At present, in Flanders alone, the value of flax annually raised has been estimated to amount to $7,500,000.

About two thirds of the whole kingdom is under cultivation, and nearly eight ninths profitably occupied, leaving only about one ninth waste. Of this last the far greater part belongs to the comparatively barren districts of the southeast and northeast, already described; and hence, in the more favored provinces, particularly those of South Brabant, the two Flanders, and Hainaut, the quantity of waste is so very small that the whole surface may be regarded as one vast garden. It is an error, however, to assert, as is sometimes done, that Belgium raises more corn than it consumes. For many years the import has considerably exceeded the export. Considerable attention has been paid in Belgium to the raising of stock, and the breeds both of cattle and horses are of a superior description. The horses of Flanders in particular are admirably adapted for draught, and an infusion of their blood has contributed not a little to form the magnificent teams of the London draymen. In general, however, Belgium stock of all kinds is inferior to that of England.

Mines.— The mineral riches of Belgium are great, and, after agriculture, form the most important of her national interests. They are almost entirely confined to the four provinces of Hainaut, Liége, Namur, and Luxemburg, and consist of lead, manganese, calamine or zinc, iron, and coal. The lead is wrought to some extent at Vedrin, in Liége; but the quantity obtained forms only a small part of the actual consumption. Manganese, well known for its important bleaching properties, is obtained both in Liége and Namur. The principal field of calamine is at Liége, where it is worked to an extent which not only supplies the home demand, but leaves a large surplus for export. All these minerals, however, are insignificant compared with those of iron and coal. The former has its seat in the country between the Sambre and the Meuse, and also in the province of Liége. At present the largest quantity of ore is mined in that of Namur. The coal field, already described, has an area of above 500 square miles. The export is about 5,000,000 tons, forming one of the largest and most valuable of all the Belgian exports. Nearly the whole of the coal thus exported is taken by France. There cannot be a doubt that this export adds largely to the national wealth; but a question has been raised as to the policy of thus lavishly disposing of a raw material which is absolutely essential to the existence of a manufacturing community, and the quantity of which, though great, is by no means inexhaustible. One obvious effect of the great foreign demand is to raise the price, and thus place some of the most important manufacturing interests of the country in an unfavorable position for competing successfully with so formidable a rival as Great Britain. Besides minerals, properly so called, Belgium is abundantly supplied with building stone, pavement, limestone, roofing slate, and marble. Of the last, the black marble of Dinant is the most celebrated. In 1899 the products of 1,601 quarries were valued at $11,100,000; of the iron mines, $200,000; of 220 coal mines (22,072,000 tons), $54,900,000.

Manufactures.— The industrial products of Belgium are very numerous, and the superiority of many of them to those of most other countries is confessed. The fine linens of Flanders, and lace of South Brabant, are of European reputation. Scarcely less celebrated are the carpets and porcelain of Tournay, the cloth of Verviers, the extensive foundries, machine works, and other iron and steel establishments of Liége, Seraing, and other places. The cotton and woolen manufactures, confined chiefly to Flanders and the province of Antwerp, have advanced greatly. Other manufactures include silks, glass and glassware, hosiery, paper, beet sugar, beer. There were 17 pig iron works in operation in 1899; 46 iron manufactories; 15 steel works; 123 sugar factories, and 25 refineries; and 240 distilleries.

Trade and Commerce.— The geographical position, the admirable facilities of transport, and the indefatigable industry of the inhabitants, early combined to place Belgium at the very head of the trading countries of Europe. The gradual rise of competitors still more highly favored has deprived her of this pre-eminence, and with the limited extent of her seacoast it is not to be expected that she can ever take high rank as a naval state; but her trade is still of great importance, and within recent years has made a rapid advance. Her coal and iron, and the numerous products of her manufactures, furnish in themselves the materials of extensive traffic; while the possession of one of the best harbors in the world (Antwerp), situated on a magnificent river, which directly, or by canals, stretches its arms into every part of the kingdom, and now made accessible by a system of railways with every kingdom of central Europe, naturally renders Belgium the seat of a transit trade even more important than that which it monopolized during the Middle Ages. This she owes chiefly to the admirable system of railway communication which, in the exercise of an enlightened policy, was early established throughout the kingdom. This system has its centre at Malines, from which a line proceeds north to Antwerp; another west to Ostend; another southwest through Mons, and on to the Northern R.R. of France, which communicates directly with Paris, and another southeast to Liége, and on into Prussia, where it first communicates with the Rhine at Cologne, and thence by that river and by rail gains access both east and south to all the countries of central Europe. In addition to these great trunks, one important branch connects Liége with Namur and Mons; and another from Antwerp,

after crossing the west trunk at Ghent, passes Courtray, and proceeds directly toward Lille. The ramification is thus complete; and there is not a town in Belgium of any importance which may not now, with the utmost facility, convey the products of its industry by the safest and speediest of all means of transport. The railways have a length of about 2,900 miles, three fourths belonging to the state. The value of the general commerce in 1900 was: Imports, $718,885,000, and exports, $659,501,950; imports for home consumption, $443,140,000; exports of Belgian produce and manufactures, $384,580,000; transit trade, $274,920,000.

The articles of import for home consumption include grain and flour, raw cotton, wool, hides, coffee, tobacco, chemicals, oil-seeds, yarn, timber, petroleum, etc. The exports are principally coal, yarn (chiefly linen and woolen), cereals, machinery, flax, woolens and cottons, chemicals, steel and iron, glass and glassware, sugar (raw and refined), zinc, manure, eggs, etc. The trade with Great Britain has grown considerably of late years; for while in 1869 the exports to Great Britain amounted to $46,957,015, and the imports of British produce from Great Britain to $20,017,675, these were in 1898 respectively $107,670,000 and $69,254,500. The chief exports to Great Britain are silks, woolen yarn, cottons, flax, glass, eggs; the chief imports cottons, woolens, raw cotton, metals, and machinery. The trade with France is even greater than with Great Britain. The external trade is chiefly carried on by means of foreign (British) vessels, and the great bulk of the shipping enters and clears from the port of Antwerp. Of the tonnage entered in 1896 only about seven per cent belonged to the Belgian flag. The total burden of the Belgian mercantile marine is over 113,250 tons. Important results are expected from the *Association Belgo-Hollandaise,* an international association of Belgian and Dutch manufacturers and business men founded in 1903 to effect a closer commercial union between the two countries. The trade with the United States is important, Belgium being classed as fifth in the value of its imports from this country and seventh in the exports it sends hither.

People.— The Belgian population is the densest in Europe, and is composed of two distinct races — Flemish, who are of German, and Walloons, who are of French extraction. The former, by far the more numerous, have their principal locality in Flanders; but also prevail throughout Antwerp, Limburg, and part of South Brabant. The latter are found chiefly in Hainaut, Liége, Namur, and part of Luxemburg. The language of each corresponds with their origin — the Flemings speaking a Germanic dialect, and the Walloons a dialect, or rather a corruption, of French, with a considerable infusion of words and phrases from Spanish and other languages. This distinct mixture of races, and the repeated changes of masters to which they have been subjected, have necessarily been very unfavorable to the formation of a national character. Still, in some leading features there is a remarkable uniformity in the population. Though the position of the country between France and Germany has made it the battlefield of Europe, the inhabitants show few warlike tendencies, and are unwearied in pursuing arts of peace. The fact bears strong testimony to the patient endurance of the Belgians, but bespeaks, perhaps, a deficiency of physical and moral courage.

Almost the entire population belong to the Roman Catholic Church. Protestantism is fully tolerated, and even salaried by the state, but cannot count above a mere fraction (some 10,000) of the population among its adherents. An interesting circumstance connected with this state of matters is, that Belgium early embraced, and at one time seemed on the eve of being gained to the Reformation. Persecution did what perhaps it has never done in any other part of the world — not only forced the people back to a religion which they had given up, but induced them to return to it as willing converts. The country is divided into six dioceses, each of which possesses an ecclesiastical seminary. Monks and nuns are numerous, especially the latter (over 25,000). Education is in a very unsatisfactory state. At the census of 1890 nearly 27 per cent of the population above 15 years of age could neither read nor write. By law each commune must have an elementary school, and the expense of primary instruction falls partly upon the communes, partly upon the state. In all the towns colleges and middle-class schools have been established, where a superior education may be obtained; while a complete course for the learned professions is provided by four universities, two of them, at Ghent and Liége respectively, established and supported by the state; one at Brussels, called the Free University, founded by voluntary association; and one at Louvain, called the Catholic University, controlled by the clergy. French is the official language of Belgium and in general use among the educated classes, and there can scarcely be said to be a national literature. Of late, however, patriotic feelings, to which the Belgians were too long strangers, have acquired new strength; and one of its first manifestations has been an eager desire to cultivate the vernacular Flemish, which differs little from Dutch.

The population generally is moral, and apparently in comfortable circumstances. The far larger proportion of it is rural; and though landed property is very much subdivided, the Belgians, instead of exhibiting the wretchedness so common among the small occupiers in Ireland, manage, by a happy combination of agricultural with other industrial employments, to derive from their little holdings all the necessaries and not a few of the comforts of life. It is not to be denied, however, that in some of the provinces, particularly in Flanders, population, in so far at least as it can be maintained by agricultural resources, has reached its limit, and that a deficiency of other employment, particularly spinning and hand-loom weaving, has placed large numbers on, if not within, the verge of pauperism. In Flanders and South Brabant a fourth of the people is dependent on total or occasional relief; and pauper riots have repeatedly occurred. Still the population continues to move on, as if with accelerated pace.

Government.— The Belgian constitution combines monarchical with a strong infusion of the democratic principle. The executive power is vested in a hereditary king; the legislative in the king and two chambers,— the Senate and the Chamber of Representatives,— the former elected for eight years, the latter for four, but one half

of the former renewable every four years, and one half of the latter every two years. The senators are elected partly directly, partly indirectly (by the provincial councils), and must be 40 years of age. Their numbers depend on population. The deputies or representatives are elected directly, one for every 40,000 inhabitants at most. All citizens of 25 years of age are electors, and according to certain qualifications one elector may have three votes. Each deputy is allowed $800 per annum, and a free railway pass between his place of residence and the capital. The army is raised by conscription, to which every able man who has completed his 19th year is liable, and also by voluntary enlistment. The peace strength of the army in 1899 amounted to 51,270 officers and men; in time of war the total strength is about 140,000 men. Besides this standing army there is a *garde civique*, numbering about 43,000 men in time of peace, in addition to which there are 90,000 non-active men belonging to this force. The navy is confined to a few steamers and a small flotilla of gunboats. The estimated revenue for 1902, chiefly from railways, customs, excise, and direct taxation, was $97,808,000; the estimated expenditure, $97,668,880. About one fourth of the expenditure is in payment of the interest of the national debt, the total of which in 1901 was $530,179,630. The coins, weights, and measures are the same, both in name and value, as those of France.

History.— The history of Belgium as a separate kingdom, beginning in 1830, when it was constituted an independent European state, would not truly represent the life of the people, or account even for the events of the period embraced in it. Situated between the two leading states of Europe, and deeply interested in all the political agitations resulting alike from their rivalries and their alliances, the Belgian people often changed masters. Moreover, the Belgian territory contained within itself one leading element of the dissensions which raged around it. The two great races of different origin and habits, the Celtic and Teutonic, or Latin and German-speaking peoples, whose different policies have divided Europe from the time of the Romans, were combined in its population, the Walloon provinces, Hainaut, Namur, Luxemburg, being nearly allied to the French, while Flanders, Brabant, and Limburg approximated more in character and language to the Germans. Thus not only were the great rivalries of Europe represented here in miniature, but their compression within the narrow limits of what is now one of the smallest of European states, has resulted in the formation of a distinct national character. While, therefore, the chief events in which Belgium was interested prior to 1830 are matters of European history, a brief outline of them is needed here to give a distinct conception of the character of the people which they contributed to form.

The territory anciently known as Belgian differed considerably from that which has assumed the name in modern times. According to Cæsar the territory of the Belgæ, who were one of the principal tribes of ancient Gaul, extended from the right bank of the Seine to the left bank of the Rhine, and to the ocean. This district continued under Roman sway till the decline of the empire, and subsequently formed part of the kingdom of Clovis, who subdued nearly the whole of Gaul from the Rhine to the Mediterranean. The Franks at this time did not recognize the law of primogeniture. On the death of a monarch his dominions were divided among his sons, the more ambitious of whom again strove to reunite them under their own sway. Thus the Frankish kingdoms under the descendants of Clovis were subject to continual vicissitudes, in which the Belgian territory shared, forming successively a portion of the kingdoms of Metz, Soissons, and Austrasia, till the whole was reunited under Charlemagne or Charles the Great. This great conqueror and administrator, the first who strove to unite the states of Europe in a civilized commonwealth, was of Belgian extraction. It was at Landen and Herstal, on the confines of the forest of Ardennes, that his predecessors, the great mayors of the palace, held sway, while his own capital was established at Aix. Charlemagne in great measure destroyed his own work by adopting the Frankish custom of dividing his kingdom among his sons at his death. This practice, which had proved so disastrous to the dynasty of Clovis, was continued for some time in his family, but was ultimately abolished in France. It long prevailed among the principalities of Germany, hindering their unity, and contributing to the ascendency of France in Europe. Thus Belgium fell to Lothaire, the grandson of Charlemagne, forming part of the kingdom of Lotharingia, which was dependent on the German empire; but by the treaty of Verdun (843) Artois and Flanders were united to France.

For more than a century this kingdom was contended for by the kings of France and the emperors of Germany. In 953 it was conferred by the Emperor Otto upon Bruno, Archbishop of Cologne, who assumed the title of archduke, and divided it into two duchies: Upper Lorraine, containing modern Lorraine, Luxemburg, and the dioceses of Metz, Toul, Verdun, and the Palatinate; and Lower Lorraine, containing Brabant, Guelders, the bishoprics of Cologne, Liége, and Cambray. These duchies were temporarily reunited under Gonthelan I., Duke of Lower Lorraine, who acquired Upper Lorraine in 1033. Among the dukes of Lower Lorraine may also be mentioned Godfrey of Bouillon, the great Crusade leader, who, in 1099, was crowned king of Jerusalem.

The feudal system, which had established itself over the greater part of Europe, likewise prevailed in the Belgian territory, which in the 11th century was divided into duchies, counties, and marquisates, under the sway of chiefs owing allegiance to the empire, or other of the greater princes, but exercising an almost absolute dominion over their own subjects. Thus were formed the counties of Holland, Brabant, Zealand, Friesland, Namur, Hainaut; the duchies of Limburg, Guelders, Juliers, Luxemburg; the marquisate of Antwerp, and others. In the frequent struggles which took place during this period, Luxemburg, Namur, Hainaut, and Liége were usually found siding with France, while Brabant, Holland, and Flanders commonly took the side of Germany. The princes and the people, however, particularly of Flanders, were not always found on the same side.

The 12th and 13th centuries were distinguished by a general uprising of the industrial communities, which had begun to grow in importance throughout Europe, against the

feudal system. This movement was very strongly manifested throughout the Netherlands, less strongly perhaps in Belgium than in Holland. In both countries prosperous municipalities began to arise and assert their freedom; but the spirit of centralization, more strongly developed among the Latin-speaking races, prevailed more in the southern provinces, while the love of individual liberty, more characteristic of the German races, was more strongly manifested in the north. Many of the towns of Flanders and Brabant, however, became extremely democratic. Ghent in particular distinguished itself for the violence and frequency of its revolts against its rulers.

From this time the popular and civic element began to count for something in political combinations. If one potentate secured the alliance of a count, another might strengthen himself by secretly encouraging insurrection in his towns. The people of Flanders often allied themselves with the English, with whom their commercial intercourse and their love of freedom gave them many common interests and feelings, and both their own counts and the French monarchy often felt the effects of this alliance.

The battle of Courtray in 1302 greatly weakened the feudal authority, but the ascendency of the popular element led to various excesses. The organization of popular power was reserved for a later age, and the battle of Rosebeque, 1382, in which the Ghentese under Philip van Artevelde (who had offered the crown of France to Richard II. of England as the price of his assistance) were totally defeated, restored the authority of the nobles. In 1384, Flanders and Artois fell to the house of Burgundy by the marriage of the Duke, a scion of the French crown, with Margaret, daughter of Louis II., Count of Nevers, the last ruler of these provinces. By a succession of happy marriages, by purchase, or by force, Holland, Zealand, Hainaut, Brabant, Limburg, Antwerp, and Namur had all by 1430 become the inheritance of the same house. In 1442 the duchy of Luxemburg was acquired, and in 1470 Guelders and Friesland. This extraordinary prosperity induced Charles the Bold, who succeeded in 1467, to attempt to unite his territories by the conquest of Alsace, Lorraine, and Liége, and raise his duchy to a kingdom. The details of this enterprise, which forms one of the most exciting episodes in European history, belong more immediately to the history of France. It ended in his defeat and death at the battle of Nancy in 1477. His daughter, Mary, who succeeded him, carried the fortunes of her house still higher, or rather she carried them into a house still more fortunate than her own, by her union with the Archduke Maximilian, son of the Emperor Frederick. Her splendid possessions had been coveted by many potentates, and there were five candidates for her hand, among whom the most important were the dauphin, son of Louis XI., and the archduke.

It now became the part of France to excite troubles in Flanders. The policy of Maximilian, conformably to the traditions of the house of Austria, was directed to the aggrandizement of his house. He was frequently at feud with his Netherlandish subjects, whose manners he took little pains to understand, and for whose liberties he had little respect. Wars and leagues succeeded each other, which belong to the history of the great states of Europe. The Netherlands were by this union again brought under the German empire, and especially under the house of Austria, destined soon to become the most powerful in Europe. In 1512 they were formed into a division of the empire, under the title of the circle of Burgundy. East Friesland was included in the circle of Westphalia. On being called to the empire, Maximilian conferred the government of the Netherlands on his son, Philip the Fair, under whom they began to experience the material advantages of an alliance with the house of Austria. The vast European possessions of this house opened up to its subjects the greatest facilities of the age for commercial intercourse, while the discovery of America gave them in addition the commerce of a new world. The industrial skill and enterprise of the Netherlanders fitted them much more than the Spaniards, whose haughty disposition made them apt to substitute rapacity for industry, to derive permanent benefit from these opportunities. Margaret, the aunt, and Mary, the sister of Charles V., who succeeded to the government of the Low Countries, exercised it in many respects wisely and well. The former, a patroness of arts and letters, kept her court surrounded with poets, artists, and men of learning. A Council of State, consisting of the governors or stadtholders of the 17 provinces, assisted them in the administration of affairs, and such was the prosperity of the country that more than one of the cities of the Netherlands rivaled in extent and opulence the capitals of the greatest European kingdoms. This bright day was too soon clouded. The reign of Charles V. is less distinguished for the political struggles excited by a too prosperous ambition, which shook nearly every nation of Europe, than for the religious dissensions, and the social troubles resulting from them, which attended the dawn of the Reformation. The reformed opinions made great progress in the Netherlands; but here again a remarkable illustration was afforded of the strength of those differences of race, language, and sentiment which divided their populations. In Holland, as in Germany, the Reformation triumphed. On the Belgian territory, especially where the Walloon or French element of the population prevailed, although these opinions spread widely, they yielded at length, as in France, to the force of authority, or the sentiment of unity. In 1535 Mary published at Brussels an edict condemning all heretics to death. An insurrection excited by persecution was suppressed by Charles V. in 1540, and the Netherlands were inseparably united by the law of primogeniture with the crown of Spain. No union could have been more unfortunate. The bigotry of the Spanish branch of the Austrian family has become proverbial, and a country torn with religious dissensions could not have found itself under a worse rule.

Charles V., himself a Netherlander, born in Ghent, and still more his son, Philip II., of Spain, strove to extinguish the reformed opinions among the Netherland subjects in seas of blood. Philip discarded all respect for the liberties of the Netherlands, and subjected them under his governors, particularly the Duke of Alva, to all the horrors of a hostile military rule. Thousands of victims perished by every variety of execution which a barbarous cruelty

could devise, hanging, beheading, burning, drowning, interring alive; to which tortures and imprisonments were added in still greater number. During this period of desolation, great numbers of artisans, abandoning their country, carried elsewhere, especially to England and Germany, which sympathized with their opinions, the arts which had enriched their own country, and which now acquired through them a wider scope, and contributed to the industrial progress of Europe. William of Orange, the Silent, now made himself the champion of the liberties of his country. Supported chiefly by the northern states, thwarted by the jealousy of the Flemish nobles, and opposed by the Walloon provinces, which remained faithful to Spain, and even supplied her with troops, he at length succeeded in freeing the seven northern states, and forming them into the confederation of the United Provinces, whose independence, declared in 1581, was ultimately acknowledged by Spain. These events belonged chiefly to the history of Holland.

Requesens, the successor of Alva, had tried too late a more humane policy. At Antwerp and Ghent the Spanish soldiers broke out into excesses. The confederates assembled in the latter town signed the pacification of Ghent, proclaiming liberty of conscience, and convoking the Estates-General. The Estates called in the aid of France, and offered the crown to Henry III., who declined to accept it, dreading the Roman Catholic league in his own country. It is a special feature of the history of those days, that while the great rulers, particularly those of France and Germany, persecuted their reformed subjects, each was ready to protect the Protestant subjects of the others when opposed to their political policy. The success of the revolutionary party, consummated in the north, was at length checked in the southern provinces by the ability of Alexander Farnes, Duke of Parma, the Spanish commander, and by the reactionary spirit evoked in the provinces themselves, strengthened by the emigration of many influential reformers to the northern states, and the Belgian Netherlands remained attached to Spain. From 1596 to 1633 the Spanish Netherlands were transferred to the Austrian branch of the family by the marriage of Isabella, daughter of Philip II., with the Archduke Albert of Austria. On the death of Isabella they reverted to Spain. By the Treaty of Rastadt in 1714 they were again placed under the dominion of Austria. During this period they were the subject of continual intrigues, and frequently of open warfare among the European states. Twice conquered by Louis XIV., conquered again by Marlborough, coveted by Holland, Spain, Germany, France, and England, they lay continually open to the invasions and the struggles of foreign armies, and it was at this period especially that they were, as they have been called, the battlefield of Europe. Some portions of maritime Flanders, Brabant, and Limburg, which had remained to Spain, were during this period conquered and annexed by Holland, while France acquired Artois and Walloon Flanders, the south of Hainaut, and part of Namur and Luxemburg, including the important towns of Douai, Lille, Valenciennes, Dunkirk, and many others. From 1714 Austria was left in undisturbed possession of the remainder of the southern Netherlands. Joseph II., styled the Philosophical Emperor, excited by his reforms a revolt, headed or stimulated by the monks of Flanders and Brabant, whom he had dispossessed of their convents. The Estates of the two provinces refused to vote the imposts, and were dissolved. The populace took to arms. The Virgin was proclaimed generalissimo of the patriot army. The Austrian army concentrated at Turnhout was totally defeated. After applying in vain for assistance to Holland and France, neither of which could be expected to have much sympathy with their movement, the insurgents were at length subdued, and the Austrians re-entered Brussels, October 1790. Soon after the whole Netherlands were conquered by the revolutionary armies of France, and the country was divided into French departments, a change which, as might be expected, provoked as much resistance as the people were able to offer. When Napoleon ruled France, his brother Louis became king of Holland.

Just before the battle of Waterloo, fought on Belgian territory, had once more changed the fate of Europe, Belgium was united by the Congress of Vienna to Holland, under the title of the kingdom of the Netherlands. This fusion had much to recommend it. The ports and colonies of the north formed a suitable complement to the arts and industry of the south. The Flemings and the Dutch spoke the same language and had the same origin; but there remained outside of this harmony the Walloon provinces, French in language and extraction. A most injudicious measure of the Dutch government, an attempt to assimilate the language of the provinces by prohibiting the use of French in the courts of justice, excited an opposition, which, encouraged, by the success of the French revolution of 1830, broke out into revolt. The electoral system, moreover, gave the preponderance to the northern provinces, though inferior in population, and the interests of the provinces were diametrically opposed in matters of taxation. Belgium was agricultural and manufacturing, Holland commercial; the one wished to tax imports and exports, the other property and industry. In the chambers three different languages were spoken, Dutch, German, and French; and the members frequently did not understand each other. Nothing but the most skilful government could have overcome these difficulties, and no statesman appeared fitted to grapple with them. The revolutionary movement became general in the south, and the Dutch troops, at first successful before Brussels, were finally repulsed, and compelled by the arrival of fresh bands of insurgents from all quarters, to retire. The Flemings saluted the volunteers of Liége, Mons, and Tournay by the ancient title of Belgians, and this name, which properly distinguished only a section of the people of the southern provinces, became henceforth recognized as the patriotic designation of the whole.

A convention of the great powers assembled in London to determine on the affairs of the Netherlands and stop the effusion of blood. It favored the separation of the provinces, and drew up a treaty to regulate it. In the meantime the National Congress of Belgium offered the crown to the Duke of Nemours, second son of Louis Philippe, and, on his declining it, they offered it, on the recommendation of England, to Leopold, Prince of Saxe-Coburg, who acceded

to it under the title of Leopold I., on 21 July 1831. In November of the same year the five powers guaranteed the crown to him by the Treaty of London. Some disputes with Holland in regard to the partition of territories still remained. A convention was concluded between France and England to bring these differences to a close, and in 1839 Holland acceded to a treaty, by which Belgium surrendered to her portions of Limburg and Luxemburg, which she had retained since 1830.

During the reign of Leopold, a prosperous period of 34 years, Belgium became a united and patriotic community. Arts and commerce flourished, and a place was taken in the family of nations upon which the Belgian people could look with complacency. On the outbreak of the French revolution of 1848 Leopold declared his willingness to resign the crown if it was contrary to the wishes of his subjects that he should retain it. This declaration disarmed the Republican party, and confirmed the stability of the monarchy at a critical moment. During his reign Belgium concluded various treaties of commerce, with Great Britain in 1851 and 1862, and with France in 1861. Leopold II. succeeded his father in 1865. In recent years the chief feature of Belgian politics has been a keen struggle between the clerical and the liberal party. At the elections in June 1878, the liberals gained a majority, which they lost in 1884, and failed to regain in 1890. Soon after followed a revision of the constitution, and at the elections in 1894 the clericals were returned with a great majority over liberals and socialists combined. In 1885 Leopold II. became sovereign of the Congo Free State (q.v.).

Belgorod, byĕl′ gō-rōt, or **Bielgorod,** a town in Russia, government of, and 76 miles south from the town of Kursk, on the Donetz. It is the seat of an archbishop's see, and has important fairs. Pop. (1897) 21,800.

Belgrade, the capital of the kingdom of Servia, situated in the angle formed by the junction of the Save with the Danube, overlooked by a citadel on a rocky eminence about 160 feet high. The town has been almost entirely transformed in recent times, and now contains a number of fine buildings and wide streets, being provided with the electric light, tramways, telephones, waterworks, etc., and having generally the aspect of any modern European town. It contains the royal palace, residences of various ambassadors or ministers, the chief courts and government departments, archiepiscopal cathedral, Protestant church and school, high school or college, gymnasia, military school, national library of 80,000 volumes, national museum, etc. The most numerous places of worship are the Greek-Catholic. There are no industries of any importance, but trade, however, is active, Belgrade being the chief emporium of the kingdom, the place to which most of the imports and exports of Servia are brought, and through which a large transit trade passes between Austria and Turkey. It is now connected by railway with Budapest and with Constantinople and Salonica, and carries on a large shipping trade by the Danube, and also the Save. Under the name of Singidunum, Belgrade was the station of a Roman legion, and in later years was several times destroyed in the contests of the Byzantines, Bulgarians, and Hungarians. Being the key of Hungary, it was long an object of fierce contention between the Austrians and the Turks. It was taken by the latter in 1521 and held by them till 1688, when it was retaken by the imperial army. Two years afterward it was again captured by the Turks, who perpetrated every sort of atrocity in the conquered city, besides killing 1,200 of the garrison. From this period it remained in possession of the Turks till 1717, when it was besieged by Prince Eugene. After a desperate conflict between the contending armies the Turks were defeated. In 1739 the Turks came into possession of it by treaty, retaining it till 1789, when it was taken by the Austrians. It was restored by treaty to the Turks in 1791; since which time it has shared the varying fortunes of Servia. In consequence of a quarrel with the Servians it was bombarded by the Turkish garrison in 1862. In 1867 it was evacuated by the Turks altogether, and since the Treaty of Berlin (July 1878) has been the capital of an independent state. An American consul resides here. See SERVIA. Pop. (1900) 69,097.

Belgrand, bĕl-grăñ, **Marie François Eugene,** French civil engineer: b. Ervy, 23 April 1810; d. 8 April 1878. He designed the gigantic sewerage system and water supply system of Paris, and published 'La Seine'; 'Les Tranvaux Souterrains de Paris'; 'Les eaux Anciennes de Paris'; etc.

Belgravia, the name given to the fashionable quarter of London south and west of Belgrave Square. Till the early part of the 19th century the district was a marshy farm. The district was drained and filled in about 1825.

Belial, bē′lĭ-ăl or bēl′yăl. By the translators of the English Bible, this word is often treated as a proper name, as in the expressions, "son of Belial," "man of Belial." In the Old Testament, however, it ought not to be taken as a proper name, but it should be translated "wickedness," or "worthlessness." To the later Jews Belial seems to have become what Pluto was to the Greeks, the name of the ruler of the infernal regions; and in 2 Cor. vi. 15 it seems to be used as a name of Satan, as the personification of all that is bad.

Belief. In a general sense belief is the assent of the understanding to the truth of a proposition, but in a technical and theological sense, has come to be used as a mental exercise somewhat depending upon the volition of the individual. The word is used to mean the acceptance of a proposition, statement, or fact as true on the ground of evidence, authority, or irresistible mental predisposition; the state of trust in and reliance on a person, thing, or principle; as also for the fact believed, and some-

times specifically for the Apostles' Creed. Belief is by some distinguished from knowledge, inasmuch as the latter rests on evidence, while belief rests on authority. Belief should, some say, not be used of facts occurring in one's own experience, or principles of which the opposite implies absurdity, such as the axioms of geometry. These we know, and, according to this view, the term should be limited to cases where a proposition is accepted without evidence, or where such evidence as is available implies only probability. On the other hand, the psychologists of what is called the intuitive school are accustomed to regard as beliefs the fundamental data on which reasoning rests; and to say that all knowledge rests ultimately on belief. Belief, they say, may admit of all degrees of confidence, from a slight suspicion to full assurance. There are many operations of mind in which it is an ingredient — consciousness, remembrance, perception. Kant defined opinion as a judgment which is insufficiently based, subjectively as well as objectively; belief, as subjectively sufficient but objectively inadequate; knowledge, as both subjectively and objectively sufficient. The strongest beliefs may, of course, be false; beliefs in ghosts, astrological prognostications, etc., are usually treated as superstitions. Beliefs as such rest on grounds regarded as sufficient by the person believing, who is prepared to act on his belief; but their grounds may have absolutely no validity for any other person. Such beliefs are nevertheless very real. On the other hand there are many propositions accepted traditionally, and spoken of as beliefs, which are not real, vital abiding truths for those who nominally accept them; which have no influence on character or mental tone, and on which those who hold them would not be prepared to act. Faith is a word used in very much the same sense as belief, but especially signifies the acceptance of and reliance on the truths of religion.

Belinda, a novel by Maria Edgeworth. Belinda Portman goes to spend the winter in London with Lady Delacour, a brilliant and fashionable woman; at her house she meets Clarence Hervey for the first time. Various obstacles keep the lovers apart, but the story ends happily with the marriage of Hervey and Belinda.

Belisa'rius, famous Byzantine general: b. about 505; d. 565. To him the Emperor Justinian chiefly owed the splendor of his reign. Belisarius first served in the bodyguard of the emperor, soon after obtained the chief command of an army of 25,000 men stationed on the Persian frontiers, and in the year 530 gained a complete victory over a Persian army of not less than 40,000 soldiers. The next year, however, he lost a battle against the same enemy, who had forced his way into Syria — the only battle which he lost during his whole career. He was recalled from the army, and soon became at home the support of his master. In the year 532 civil commotions, proceeding from two rival parties, who called themselves the green and the blue, and who caused great disorders in Constantinople, brought the life and reign of Justinian into the utmost peril, and Hypatius was already chosen emperor, when Belisarius with a small body of faithful adherents restored order. Justinian, with a view of conquering the dominions of Gelimer, king of the Vandals, sent Belisarius with an army of 15,000 men to Africa. After two victories he secured the person and treasures of the Vandal king. Gelimer was led in triumph through the streets of Constantinople, and Justinian ordered a medal to be struck with the inscription *Belisarius gloria Romanorum,* which has descended to our times. By the dissensions existing in the royal family of the Ostrogoths in Italy, Justinian was induced to attempt to bring Italy and Rome under his sceptre. Belisarius vanquished Vitiges, king of the Goths, made him prisoner at Ravenna (540), and conducted him, together with many other Goths, to Constantinople. The war in Italy against the Goths continued; but Belisarius, not being sufficiently supplied with money and troops by the emperor, demanded his recall (548). He afterward commanded in the war against the Bulgarians, whom he conquered in the year 559. Upon his return to Constantinople he was accused of having taken part in a conspiracy. But Justinian was convinced of his innocence, and is said to have restored to him his property and dignities, of which he had been deprived. His history has been much colored by the poets, and particularly by Marmontel, in his otherwise admirable politico-philosophical romance. According to his narrative, the emperor caused the eyes of the hero to be struck out, and Belisarius was compelled to beg his bread in the streets of Constantinople. Other writers say that Justinian had him thrown into a prison, which is still shown under the appellation of the Tower of Belisarius. From this tower he is reported to have let down a bag fastened to a rope, and to have addressed the passengers in these words: "Give an obolus to Belisarius, whom virtue exalted, and envy has oppressed." Of this, however, no contemporary writer makes any mention. The blind Belisarius forms the subject of a noted painting by Gérard. Tzetzes, a slightly esteemed writer of the 12th century, was the first who related this fable. Certain it is, that, through too great indulgence toward his wife, Antonina, Belisarius was impelled to many acts of injustice, and that he evinced a servile submissiveness to the detestable Theodora, the wife of Justinian. See Hodgkin, 'Italy and her Invaders' (1880–5); Bury, 'Later Roman Empire' (1893).

Belize, bĕ-lēz' (sometimes written BELICE or BALIZE), the capital of British Honduras. Lat. 17° 29′ N.; lon. 88° 8′ W. It has been suggested that the name is derived from the French *balise,* a beacon, but more probably it is a corruption of Wallace, a Scotch buccaneer named Peter Wallace, with 80 companions, having erected houses enclosed with a rude palisade at this point after the Spaniards abandoned Bacala, leaving a large part of the rugged, uninviting north coast of the Gulf of Honduras unoccupied, save by freebooters, during the latter half of the 17th century. Accordingly the name Walis, Balis, or Belize was applied by the

natives and Spaniards to the settlement, the river on which it was situated, and subsequently to the whole region occupied by the English (see Bancroft's 'History of Central America,' II., 624). Wood-cutting was the chief occupation of this piratical establishment. The value of the forests attracting other settlers, Belize was attacked by the authorities of Yucatan, who sought to expel them as trespassers, in 1733. Various unsuccessful attempts with the same object were made in subsequent years, the most formidable in 1754. Again in 1779, war existing between England and Spain, the governor of Yucatan organized an expedition against Belize; and Spain's last effort to regain possession by force was made in 1798. Before that time the settlers had organized a government. It is an interesting fact that, originating as it did, the town has become, with its population of more than 5,000, its church, schools, and hospital, a centre for the maintenance of good order. It has the characteristic features of a small English colonial capital,—the governor's house, etc. See HONDURAS, BRITISH. MARRION WILCOX,
Authority on Latin-America.

Belknap, George Eugene, American naval officer: b. Newport, N. H., 22 Jan. 1832; d. Key West, Fla., 7 April 1903. He was appointed midshipman in the navy in 1852; became lieutenant-commander in 1862; commander in 1866; captain in 1872; commodore in 1885; and rear-admiral in 1889; and was retired in 1894. He took part in the capture of the Barrier Forts on the Canton River, China, in 1856; and in the Civil War was present at the bombardment of the forts and batteries in Charleston Harbor, and in both of the attacks on Fort Fisher. In 1873, while engaged in deep sea sounding in the north Pacific Ocean, he made discoveries concerning the topography of the bed of the ocean that found high favor among scientists. He was appointed superintendent of the United States Naval Observatory in 1885, and, among other works, published 'Deep Sea Soundings.'

Belknap, Jeremy, American clergyman: b. Boston, Mass., 4 June 1744; d. there, 20 June 1798. He graduated at Harvard in 1762; was pastor of the Congregational Church in Dover, N. H., 1767–86, and of the Federal Street Church, in Boston, 1787–98; and was active for the American cause during the Revolution. The Massachusetts Historical Society, organized in 1790, recognizes him as its founder. In 1792 he became an overseer of Harvard College. He was the author of a 'History of New Hampshire' (1784–92); 'A Discourse Intended to Commemorate the Discovery of America by Columbus, with Four Dissertations' (1792); 'An Historical Account of Those Persons Who Have Been Distinguished in America,' generally known as the 'American Biography,' etc.

Belknap, William Goldsmith, American military officer: b. Newburg, N. Y., 14 Nov. 1794; d. near Fort Washita, 16 Nov. 1852. He distinguished himself in the attack on Fort Erie, in August 1814; was retained in service on the reduction of the army, in 1822, having been, in 1818, one of the assistant professors of tactics in the military academy. He became a captain in 1822, and was brevetted for faithful service, 10 years afterward. In 1842 he was appointed major of the 3d infantry, and, having served in Florida during the war, was made lieutenant-colonel by brevet. He served on the general staff at Buena Vista, and received a sword of honor from the citizens of his own State, for his services in that battle. He also received the brevet of brigadier-general. From December 1843 to May 1851 he was in command of his regiment, and of the troops in the Cherokee nation (Arkansas). In May 1851 he was ordered to upper Texas for the purpose of keeping the Indian tribes within the lines, and while there contracted a fever, of which he died.

Belknap, William Worth, American military officer, son of Gen. W. G. Belknap: b. Newburg, N. Y., 22 Sept. 1829; d. Washington, D. C., 13 Oct. 1890. In 1861 he entered the Union army as major of the 15th Iowa Volunteers and was engaged at Shiloh, Corinth, and Vicksburg; but became most prominent in Sherman's Atlanta campaign. He was promoted to brigadier-general, 30 July 1864, and major-general, 13 March 1865. He was collector of internal revenue in Iowa from 1865 to 13 Oct. 1869, when he was appointed secretary of war, which office he occupied till 7 March 1876. He resigned in consequence of accusations of official corruption. Subsequently he was tried and acquitted.

Bell, A. See BELL, NANCY R. E. M.

Bell, Acton. See BRONTE, ANNE.

Bell, Alexander Graham, American scientist, inventor of the telephone: b. Edinburgh, Scotland, 3 March 1847. He was a son of Alexander M. Bell (q.v.), and was educated at the Edinburgh high school and university, and trained by his father in the latter's system for restoring speech to deaf-mutes. In 1870 he removed with his father to Canada, and in 1872 came to Boston as professor of vocal physiology in Boston University, where he taught his father's system with success. He had long been experimenting on the electrical transmission of sound, had designed and partly constructed a speaking telephone while in Canada, and on 14 Feb. 1876 took out a patent for it. At the Centennial Exposition in Philadelphia that year he exhibited it to multitudes, including foreign scientists, who applauded it warmly; it was still crude, but a company was formed to float it, inventive genius was turned toward perfecting it, and it rapidly assumed a practical commercial form. A number of other telephones were almost immediately brought forward, with claim to priority of invention, and years of protracted and costly law suits followed; but the Bell Company finally established its right before the United States Supreme Court, has held a virtual monopoly of the business in this country, and has made its owners and Prof. Bell very wealthy. In 1880 he invented the photophone, a telephone in which the sound is conveyed by a vibratory beam of light instead of a wire; it has transmitted articulate sounds about 700 feet, but has not been practically used. He has also invented the graphophone, a form of the phonograph for recording and reproducing speech, which is coming largely into use for the teaching of languages. He has never abandoned his first field, however, the instruction and advancement of deaf-mutes, has investigated and written much on this subject, and published his papers through the Volta Bureau, which he founded; and has been president of the American Association to Promote Teaching of Speech

Copyright by the Scientific American.

ALEXANDER GRAHAM BELL.

to the Deaf. He has especially urged that the policy of educating deaf-mutes in asylums is pernicious, as forcing them to intermarry, and increasing the births of children so afflicted. He has been president of the National Geographic Society, and regent of the Smithsonian Institution. The French government in 1881 awarded him the Volta prize. Among his monographs are a 'Memoir on the Formation of a Deaf Variety of the Human Race.'

Bell, Alexander Melville, Scottish-American educator: b. Edinburgh, 1 March 1819; d. Washington, D. C., 7 Aug. 1905. He was a distinguished teacher of elocution in his native city; in 1865 removed to London to act as a lecturer in University College; and in 1870 went to Canada and became connected with Queen's College, Kingston. He invented the system of «visible speech,» in which all the possible articulations of the human voice have corresponding characters designed to represent the respective positions of the vocal organs. This system has been successfully employed in teaching the deaf and dumb to speak. Besides writing on this subject he wrote on elocution, stenography, etc.

Bell, Andrew, Scottish educator, author of the mutual instruction or «Madras» system of education: b. St. Andrews, 27 March 1753; d. Cheltenham, England, 27 Jan. 1832. He was educated at the university of his native town, resided for seven years in Virginia, and on returning took orders in the Church of England. In 1787 he went to India, where he became manager of the institution for the education of the orphan children of European soldiers at Madras established by the East India Company. The superintendence of this asylum was undertaken by Dr. Bell, who, having no object in view but the gratification of his benevolence, refused the salary of 1,200 pagodas (£480) which was attached to it. Failing to retain the services of properly qualified ushers, he resorted to the expedient of conducting his school through the medium of the scholars themselves. It was in the mode of conducting a school by means of mutual instruction that the new method of Dr. Bell consisted; and its value as an abbreviation of the mechanical part of teaching, and where large numbers were to be taught economically, could not be easily overestimated at the time. His system, however, is now abandoned. From the commencement of his experiment he made the scholars, as far as possible, do everything for themselves; they ruled their own paper, made their own pens, etc., while the teacher only directed them. The maxim of the school was that no boy could do anything right the first time, but he must learn when he first set about it, by means of his teacher, so as to be able to do it himself ever afterward. After superintending the school for seven years he found it necessary for his health to return to Europe. On his arrival he published in 1797 a pamphlet, entitled 'An Experiment in Education made at the Male Asylum of Madras, in which he gave an account of his system. The first place in England where the system was adopted was the charity school of St. Botolph's, Aldgate, and gradually, especially through the influence of Joseph Lancaster, it was widely carried out in England, and indeed in almost every other civilized country. Dr. Bell acquired in later life the dignity of a prebendary of Westminster, and was master of Sherborn Hospital, Durham. He employed himself during his latter years in writing several works on education, among which the most valuable were: 'The Elements of Tuition'; 'The English School'; and 'Brief Manual of Mutual Instruction and Discipline.' Before his death he gave over to trustees £120,000 three per cent stock for education, half of it for the purpose of founding an academy in his native city. See 'Life by Southey' (1844); Meiklejohn, 'An Old Educational Reformer' (1881).

Bell, Andrew James, Canadian educator: b. Ottawa, 12 May 1856. He was educated at the University of Toronto, and at Breslau University; became professor of Latin and literature in Victoria University in 1889. He is an active member of the Canadian Institute, and has contributed some important papers to its 'Transactions.'

Bell, Benjamin Taylor A., Scotch-Canadian mining expert: b. Edinburgh, 2 July 1863. He went to Canada in 1882, and became editor of the 'Canada Mining Review.' and of the 'Canada Mining, Iron, and Steel Manual.' In 1890 he was appointed by the Dominion government, with Dr. Selwyn, to conduct the excursions through the mining and industrial centres of Canada of the Iron and Steel Institute of Great Britain, and the Verein Deutscher Eisenhüttenleute. The same year he organized the General Mining Association of the Province, and in 1892 was instrumental in uniting the coal, gold, and other mineral interests of Nova Scotia into a like organization.

Bell, Sir Charles, Scottish anatomist: b. Edinburgh, November 1774; d. near Worcester, England, 28 April 1842. He studied anatomy under his brother, John Bell (q.v.), and had scarcely reached manhood before he had proved himself to be a first-rate anatomist as well as an excellent lecturer. In 1804, being already known by his published works, he went to London, and in 1811 published an essay entitled 'A New Idea of the Anatomy of the Brain,' containing the important discovery of the distinction between sensory and motor nerves, on which his fame chiefly rests. It at once attracted general attention, established his reputation, and was doubtless the main ground on which, on the accession of William IV., he was selected for the honor of knighthood. In 1812 he was appointed surgeon to the Middlesex Hospital, to whose prosperity he afterward greatly contributed. In 1824 he accepted the chair of anatomy and surgery to the London College of Surgeons, and in 1836 that of surgery in the University of Edinburgh. His principal works are 'Anatomy of Expression' (1806); 'System of Operative Surgery'; 'Anatomy and Physiology,' with his brother John; 'Animal Mechanics' (1828); 'Nervous System' (1830); and the Bridgewater Treatise on the Hand' (1833). There is a life in French by Pichot (1859), and in 1870 a selection from Sir Charles Bell's correspondence was published.

Bell, Currer. See BRONTE, CHARLOTTE.

Bell, Ellis. See BRONTE, EMILY JANE.

Bell, George Joseph, Scottish lawyer, brother of Sir Charles and John Bell: b. Edinburgh, 26 March 1770; d. 1843. He passed as advocate in 1791, and became one of the first

authorities on the subject of mercantile jurisprudence and the law of bankruptcy. This distinction he earned for himself by the publication of a work which first appeared in 1804, under the title of a 'Treatise on the Laws of Bankruptcy,' but in subsequent editions was extended and appeared as 'Commentaries on the Laws of Scotland and on the Principles of Mercantile Jurisprudence.' This work, notwithstanding recent changes in the law, is still a standard. Besides the work above mentioned, he published 'Principles of the Law of Scotland,' the 10th edition of which was issued in 1897; and other works.

Bell, Henry, Scottish engineer, the first successful applier of steam to the purposes of navigation in Europe: b. Torphichen, Linlithgowshire, 7 April 1767; d. Helensburgh, 14 Nov. 1830. He practised for several years, at Glasgow, the craft of a house carpenter, but in 1808 removed to Helensburgh, where he continued to prosecute his favorite task of mechanical scheming, without much regard to the ordinary affairs of the world, though he became proprietor of baths there. The application of steam to navigation had already been attempted by Mr. Miller of Dalswinton (among others), who, in 1788, had a vessel constructed, propelled by a small engine and paddle-wheel, the scene of operations being a loch on his own property in Dumfriesshire. Some further experiments were made, yet the scheme had no practical result for several years. Henry Bell seems to have turned his attention to the subject before the end of the century, and in January 1812 produced the Comet, a vessel 40 feet long, which was found in a great measure to answer the purpose contemplated. This vessel could make way against a head tide in the river at the rate of five miles an hour, and continued to ply on the Clyde for a number of years. It may be mentioned, that Mr. Robert Fulton, an American engineer, had launched a boat upon this principle in 1807, and that it performed long voyages upon the Hudson River; but it has been proved that Fulton had derived assistance in the construction of his vessel from Bell, who must therefore be allowed the praise of having done, in his own country, what all other men, notwithstanding the superior advantages of skill and capital, had failed in doing. Bell lived to see the bosom of the Clyde dotted far and wide by innumerable copies of his own invention; to know that steamboats promised to give a new turn to the art of general warfare; yet he reaped for himself little advantage. While mankind at large were enjoying the blessings which he had pointed out to them, he approached the confines of old age with the prospect of hardly the average comforts which attended that stage of existence in the humbler walks of society. Touched by his condition, a number of benevolent individuals instituted a subscription in his behalf, and it is creditable to the good feeling of the citizens of Glasgow and other places that a considerable sum was raised. The trustees on the river Clyde also gave him an annuity of £100, which he enjoyed for several years, the half of which sum was continued to his widow. A monument was erected to his memory at Douglass Point on the Clyde.

Bell, Henry Glassford, Scottish lawyer and author: b. Glasgow, 1803; d. 1874. He founded the Edinburgh 'Literary Journal' 1828, was admitted to the bar in 1832 and became one of the most esteemed Scottish mercantile lawyers of his day. He published a spirited defense of Mary Queen of Scots, (1830), 'Summer and Winter Hours' (1831); 'My Old Portfolio' (1832); 'Romances and Minor Poems' (1866).

Bell, Henry Haywood, American naval officer: b. North Carolina, 1807; d. 11 Jan. 1868. He was appointed a midshipman in 1823, and served on the Grampus when she was engaged in clearing the coast of Cuba of pirates. For many years he served with the East Indian squadron, and commanded one of the vessels of the squadron which, in November 1856 destroyed four forts near Canton, China. Shortly after the outbreak of the Civil War he became fleet captain of the Western Gulf squadron. He commanded one of the three divisions of the fleet which captured New Orleans, and was sent to raise the United States flag over the custom house and the city hall. In 1865 he took command of the East India squadron with the rank of commodore; in 1866 was promoted to rear-admiral; and, in 1867, retired. He was drowned at the mouth of the Osaka River, Japan.

Bell, Henry Thomas Mackenzie, English poet and critic: b. Liverpool, 2 March 1852. His collections of verse include 'The Keeping of the Vow' (1879); 'Verses of Varied Life' (1882); 'Old Year Leaves' (1883); 'Spring's Immortality' (1896); 'Pictures of Travel' (1898). He has also published such critical works as 'Charles Whitehead' (1884); 'Christina Rossetti' (1898).

Bell, Hillary, American dramatic critic: b. Belfast, Ireland, 1857; d. New York, 9 April 1903. After coming to the United States he painted portraits for some years and subsequently engaged in journalism and was the dramatic and musical critic of the New York *Press*. He also edited the 'Insurance Economist,' and was a vice-president of the Mutual Reserve Life Insurance Company. The life-size portrait which he painted of Ada Rehan as Katharine in 'The Taming of the Shrew,' was presented by Augustin Daly to the Shakespeare Memorial at Stratford-on-Avon.

Bell, Isaac, American philanthropist: b New York, 4 Aug. 1814; d. there, 30 Sept. 1897. He began his business life in a banking house when 14 years old, and in 1836 became interested in large financial and other concerns. About this time he began to devote himself to the work of benevolent institutions, and was president of the department of charities and correction 1857–73. It was principally through his efforts that the Bellevue Hospital, and also the Bellevue Hospital Medical College, were founded. In connection with the first institution he established the system of ambulance service. He was also largely instrumental in the establishment of the Normal College, and was responsible for the schoolship Mercury, which came under the control of the department of Charities and Correction, and of the St. Mary's, as well, loaned by the Navy Department to the Department of Education, of which he was also for a long time a member. During the Civil War he was active in raising and disbursing money for the benefit of New York volunteers,

and in aiding soldiers' wives, widows, and orphans.

Bell, James, Scotch geographer: b. Jedburgh, 1769; d. 1833. After receiving a liberal education he served an apprenticeship to the weaving business, and in 1790 commenced the manufacturing of cotton goods upon a large and respectable scale. In the universal depression occasioned by the shock of the French Revolution in 1793, he was reduced to the condition of a common warper; but having relinquished that line of life, he was about the year 1815 engaged to improve the 'Glasgow System of Geography,' a work which had met with considerable encouragement, and was now, chiefly by the labors of Mr. Bell, extended to five volumes. It was well received by the public, and formed the basis of his principal work, 'A System of Popular and Scientific Geography,' published at Glasgow in six volumes. His 'Gazetteer of England and Wales' was in the course of publication at the time of his death.

Bell, James, Canadian physician: b. North Gower, Ont., 10 Oct. 1852. He graduated at McGill University in 1877; became house surgeon of the Montreal General Hospital the same year, and medical superintendent of it in 1881. In 1885 he became a member of the hospital staff as assistant surgeon, and in 1886 full surgeon. In 1894 he was made consulting surgeon to the General Hospital, surgeon of the Royal Victoria Hospital of Montreal, and professor of clinical surgery in McGill University.

Bell, James Franklin, American soldier: b. Shelbyville, Ky., 9 Jan. 1856. He was graduated from the United States Military Academy 1878; served on the plains in the 7th United States Cavalry, 1878–94; and was aid to Gen. J. W. Forsyth in California, Arizona, and Washington. He went to the Philippines with the original expedition in 1898, and his military career there has been of the most daring and brilliant kind. As colonel of the 36th regiment of volunteers, he was not attached to any brigade, but acted as a free lance, reporting only to his division commander. He received a medal of honor for most distinguished gallantry in action 9 Sept. 1899, near Porac, in Luzon. While in advance of his regiment he charged seven insurgents with his pistol and compelled the surrender of the captain and two privates under a close and hot fire from the remaining insurgents, who were concealed in a bamboo thicket. In December 1900 he was made a brigadier-general in the regular army, being promoted over more than 500 captains, 200 majors, 98 lieutenant-colonels, and 77 colonels.

Bell, James Montgomery, American soldier: b. Williamsburg, Pa., 1 Oct. 1837. He entered the 86th Ohio infantry, and served with distinction throughout the Civil War, being twice brevetted for gallant and meritorious services in the battles of the Wilderness and Ream's Station, Va. Entering the regular army as 2nd lieutenant in 7th Cavalry, 1866, he took part in the Cheyenne and Arapahoe war, 1867–9; the Sioux wars, 1876–81, and the Nez Percés war, 1877. He received a brevet-commission of lieutenant-colonel for gallant services in action against the Indians at Cañon Creek, Montana, 13 Sept. 1877. He commanded in southern Luzon, Philippine Islands, 1900–1, and was appointed brigadier-general of volunteers, Jan. 20, 1900.

Bell, John, Scotch traveler: b. Antermony, 1691; d. there, 1 July 1780. Having gone to St. Petersburg in 1714, after the completion of his studies, he happened to be in that city when an embassy was being sent to the Sophy of Persia, and was appointed medical attendant to the ambassador. On his return from Persia to the Russian capital in 1718 he found another embassy preparing to set out for China, and through the influence of the ambassador whom he had attended to Persia he obtained an appointment in it also. The embassy arrived at Pekin «after a tedious journey of exactly 16 months.» The embassy returned in January 1722. The war between Russia and Sweden was now concluded, and the czar had determined to undertake an expedition into Persia, at the request of the sophy, to assist that prince against the Afghans, his subjects, who had seized upon Kandahar and possessed themselves of several provinces on the frontiers toward India. Bell's former journey to Persia gave him peculiar advantages, and he was accordingly engaged to accompany the army to Derbend, from which he returned in December 1722. In 1737 he was sent to Constantinople by the Russian chancellor, and Mr. Rondeau, the British minister at the Russian court. He seems now to have abandoned the public service, and to have settled at Constantinople as a merchant. About 1746 he married a Russian lady and returned to Scotland. The only work written by him is his 'Travels from St. Petersburg in Russia to Various Parts of Asia' (1763).

Bell, John, distinguished Scotch surgeon: b. Edinburgh, 12 May 1763; d. Rome, 15 April 1820. He was a brother of Sir Charles and George Joseph Bell, and after completing his professional education traveled for a short time in Russia and the north of Europe; and on his return began to deliver lectures on surgery and midwifery. These lectures, delivered between 1786 and 1796, were very highly esteemed, and speedily brought him into practice as a consulting and operating surgeon. The increase of his private practice, indeed, rendered it necessary for him, in 1796, to discontinue his lectures, and from that time forward he devoted himself to his patients, and to the preparation of the several publications of which he was the author. Patients came to him from all quarters, both of Scotland and England, and even from the Continent; and during that interval he performed some of the most delicate and difficult operations in surgery. Early in 1816 he was thrown by a spirited horse, and appears never to have entirely recovered from the effects of the accident. He was the author of 'The Anatomy of the Human Body' (1793–1802; 3d edition, with plates by Charles Bell, 1811); 'Engravings of the Bones, Muscles, and Joints,' illustrating the first volume of the 'Anatomy of the Human Body,' drawn and engraved by himself (1794, 3d edition); 'Engravings of the Arteries,' illustrating the second volume of the 'Anatomy of the Human Body' (1801); 'Discourses on the Nature and Cure of Wounds' (1795); 'The Principles of Surgery' (1801–8); 'Letters on Professional Character'; 'Observations on Italy.'

Bell, John, American statesman: b. near Nashville, Tenn., 15 Feb. 1797; d. Cumberland Iron Works, Tenn., 10 Sept. 1869. Graduating at Cumberland College (now University of Nashville) in 1814, he practised law until 1827, when he was elected to Congress. He received successive re-elections until 1841 when he became secretary of war in President Harrison's cabinet, but resigned when President Tyler withdrew from the Whig party. From 1847 to 1859 he was senator from his State. He was chairman of several important committees, and vigorously opposed the Kansas-Nebraska bill and the Lecompton constitution framed for Kansas. In May 1860 he was nominated for President by the Constitutional Union party (q.v.), but was defeated. During the Civil War he took no active part in politics.

Bell, John, English sculptor: b. Hopton, Suffolk, 1811; d. 25 March 1895. His best-known works are the 'Eagle Slayer'; 'Una and the Lion'; 'The Maid of Saragossa'; 'Imogen'; 'Andromeda'; statues of Lord Falkland, Sir Robert Walpole, Newton, Cromwell, etc., and the Wellington Memorial in Guildhall. He was one of the sculptors of the Guards' Monument in Waterloo Place, London, and the Prince Consort Memorial in Hyde Park. He was the author of several professional treatises and of a drama, 'Ivan: a Day and a Night in Russia.'

Bell, Lilian, American novelist: b. Kentucky, 1867. In 1900 she was married to Arthur Hoyt Boyne, but continues to write under her maiden name. Her writings include 'The Love Affairs of an Old Maid' (1893); 'A Little Sister to the Wilderness' (1895); 'The Under Side of Things' (1896); 'From a Girl's Point of View' (1897); 'The Instinct of Stepfatherhood' (1898); 'As Seen By Me' (1900); 'The Expatriates' (1900); 'Yessum' (1901); 'Abroad With the Jimmies'; 'Hope Loring'; 'Sir John and the American Girl.'

Bell, Sir Lowthian, English manufacturer and politician: b. Newcastle-on-Tyne, 1816; d. 20 Dec. 1904. He was mayor of his native city 1854–62, sat in the House of Commons for Hartlepool 1875–80, and was made a baronet in 1885. He founded the Clarence Iron Works on the Tees. His publications include 'The Chemical Phenomena of Iron Smelting' (1872); 'Report on the Iron Manufacture of the United States, and a Comparison of It with That of Great Britain' (1877).

Bell, Nancy R. E. Meugens, English art writer: b. Lambeth, London. Until her marriage to A. G. Bell in 1882 she wrote over the signature N. D. Anvers. She has published 'Elementary History of Art'; 'Masterpieces of the Great Artists'; 'Life of Gainsborough'; 'Representative Painters of the 19th Century'; 'St. Antony of Padua'; 'An Old Educational Reformer: J. M. D. Meiklejohn'; 'Memoirs of Baron Le Jeune'; 'Science Ladders Series' (8 vols.); 'Raphael'; 'Lives and Legends of the Saints'; 'The Saints in Christian Art.'

Bell, Robert, Irish journalist and miscellaneous writer: b. Cork, 16 Jan. 1800; d. London, 12 April 1867. He settled in London in 1828, edited an important weekly paper, the *Atlas,* for several years, and afterward the 'Monthly Chronicle,' 'Mirror,' and 'Home News.' He compiled several volumes of 'Lardner's Cabinet Cyclopædia'; wrote three plays, 'The Ladder of Gold,' a novel (1856); 'Hearts and Altar,' a collection of tales (1852), and did a great deal of miscellaneous literary work; but is best known by his annotated edition of the 'British Poets,' the first volume of which appeared in 1854, and which was carried through 29 volumes.

Bell, Robert, Canadian geologist: b. Toronto, Ont., 3 June 1841. He was educated at McGill and Queen's universities, and in 1867 joined the Canada Geological Survey, and in 1900 was an assistant director of it. In 1861 he was elected a member of the American Institute of Mining Engineers; in 1881 became a Fellow of the Royal Society of Canada; and in 1888–9 was a member of the Ontario Commission, which reported on the mineral resources of that province. During his connection with the geological survey, he made more extensive explorations throughout the Dominion than any other man. He was the author of about 130 reports and papers, a list of which is found in the 'Biblio of the Royal Society.'

Bell, Robert Stanley Warren, English writer, editor of 'The Captain': b. Long-Preston, Yorkshire, 27 June 1871. He has published 'The Cub in Love' (1897); 'The Papa Papers' (1898); 'Bachelorland' (1899); 'Tales of Greyhouse'; 'Love the Laggard' (1901).

Bell, Samuel, American statesman: b. Londonderry, N. H., 9 Feb. 1770; d. Chester, N. H., 23 Dec. 1850. He passed his boyhood upon his father's farm, graduated at Dartmouth College in 1793, and was admitted to practise law in 1796. He rapidly achieved distinction in his profession, and in 1804 was elected a representative to the State legislature, an office to which he was twice re-elected; and during his last two terms held the position of speaker of the house. He declined the attorney-generalship in 1807, after which he was successively a member of the State senate, and of the executive council, a judge of the supreme court, and in 1819 governor of the State. To the latter office he was re-elected four times in succession, till in 1823 he was elected to the senate of the United States, an office to which he was also re-elected. He retired from public life upon the expiration of his second term in 1835.

Bell, Samuel Dana, American jurist: b. Francestown, N. H., 9 Oct. 1798; d. 31 July 1868. He was graduated at Harvard in 1816; studied law in Exeter; and began practice in Meredith. He became a member of the legislature about 1825, and was the clerk of that body for several years. In 1830, 1842, and 1867, he was a member of the commissions appointed to revise the State 'Statutes.' In 1855 he was appointed justice of the supreme court of New Hampshire, and in 1859, became chief justice of the court, which office he held till 1864. He joined the New Hampshire Historical Society soon after its organization, and the Manchester Public Library was founded largely through his efforts.

Bell, Thomas, English zoologist: b. Poole, Dorset, 1792; d. Selborne, Hampshire, 1880. He studied medicine at Guy's and St. Thomas' hospitals, London, became a member of the Royal College of Surgeons in 1815, and soon secured a large practice as a dentist. In 1832 he was appointed professor of zoology in King's

College, London, a post which he held almost to the last. Latterly he lived for a number of years at Selborne in the residence that had belonged to the celebrated Gilbert White. His best-known separate works are his histories of 'British Quadrupeds'; 'British Reptiles'; and 'British Stalk-eyed Crustacea,' published in Van Voorst's series. In 1877 he published an excellent edition of White's 'Natural History of Selborne.'

Bell-Smith, Frederic Marlett, English artist: b. London, 26 Sept. 1846. He went to Canada in 1866, and was for seven years art director at Alma College, St. Thomas, and teacher of drawing in the public schools of London, Ont. About 1888 he became a portrait and figure painter; but he is best known as a painter of landscapes. In 1894 he produced 'Lights of a City Street,' his greatest achievement up to that year, and later, two canvases depicting incidents connected with the death of Sir John Thompson.

Bell, a hollow vessel, which, by its vibrations when struck, gives forth sounds; whence its name, from the old Saxon word *bellan,* to bawl or bellow. It is an instrument of great antiquity, being spoken of by Hebrew writers, as in Ex. xxviii., in which golden bells are prescribed as appendages to the dress of the high priest, that notice may thus be given of his approach to the sanctuary. And at this day the bell is used for a similar purpose before the priest, in Roman Catholic countries, as he proceeds to administer the Holy Viaticum to the soul that is passing away; and so when the bell is tinkled, in administering the sacrament, by the same priest, it is in pursuance of a custom founded on the ancient Hebrew use of the bell. More intimately than any other instrument are bells associated with the religious and imaginative, as also with the most joyous and the saddest feelings of mankind. The metal from which bells are usually made (by founding), is an alloy, called bell-metal, commonly composed of 80 parts of copper and 20 of tin. The proportion of tin varies, however, from one third to one fifth of the weight of the copper, according to the sound required, the size of the bell, and the impulse to be given. The clearness and richness of the tone depend upon the metal used, the perfection of its casting, and also upon its shape; it having been shown by a number of experiments that the well-known shape with a thick lip is the best adapted to give a perfect sound. The depth of the tone of a bell increases in proportion to its size. A bell is divided into the body or barrel, the ear or cannon, and the clapper or tongue. The lip or sound bow is that part where the bell is struck by the clapper.

The sound of a bell is a compound tone, presenting five and in many instances more notes to the ear. There is a great difference between the harmonics of a bell and of a vibrating string. In the case of the former a minor third is not infrequently one of the loudest tones next to the fundamental tone. When a bell is properly struck the first note which attracts the attention of the ear is known as the strike note, tap note, or fundamental, and forms what is called "the" note of the bell. The low sound heard after the strike note has lost its intensity is called the hum note, and the octave above the strike note the nominal. There are also present a minor third and a perfect fifth in the first octave, and a major third and a perfect fifth in the second octave. Very few bells agree with these conditions. Generally the hum note is a sixth or seventh, and in rare cases a ninth below the strike note. The nominal is somewhere about an octave or a ninth above the strike note, and the other notes diverge accordingly. Bells that are swung are more likely to conform to the conditions than those that are struck.

Bells were used very early in the form of cymbals and hand bells in religious services. In Egypt the feast of Osiris was announced through the ringing of bells. Bronze bells have been found in Assyria. Bells of gold were worn by Aaron and the high priests of the Jews on the border of their robes, and in Athens the priests of Cybele used them in their offerings. The Romans also used bells which they called tintinabula, to announce the public assemblies, and, according to Suetonius, Augustus had a bell suspended before the temple of Jupiter. In the Christian churches a similar custom early came into use, though it is not known that in the first Christian churches divine service was announced by any such method. They were used, however, in the early monasteries to announce the hours of prayer. Generally they were made of tubes struck with a hammer. They are said to have been first introduced into Christian churches about 400 A.D., by Paulinus, bishop of Nola in Campania (whence campana and nola as old names of bells); although their adoption on a wide scale does not become apparent until after the year 550, when they were introduced into France. They are rung to summon monks and choir nuns to the office, and the people to mass, to announce the Angelus, to toll during funerals, and peal on occasions of joy. They are blessed with elaborate ceremonies and consecrated or "baptized" in honor of some saint.

Until the 13th century they were of comparatively small size, but after the casting of the Jacqueline of Paris (6½ tons) in 1400, their weight rapidly increased. Among the more famous bells are the bell of Cologne, 11 tons, 1448; of Dantzic, 6 tons, 1453; of Halberstadt, 7½, 1457; of Rouen, 16, 1501; of Breslau, 11, 1507; of Lucerne, 7½, 1636; of Oxford, 7½, 1680; of Paris, 12½, 1680; of Bruges, 10¼, 1680; of Vienna, 17¾, 1711; of Moscow (the monarch of all bells), 193, 1736; three other bells at Moscow, ranging from 16 to 31 tons, and a fourth of 80 tons, cast in 1819; the bell of Lincoln (Great Tom), 5½, 1834; of York Minster (Great Peter), 10¾, 1845; of Montreal, 13½, 1847; of Westminster (Big Ben), 15½, 1856; (St. Stephen), 13½, 1858; the great bell of St. Paul's, 17½, 1882. Others are the bells of Ghent (5), Görlitz (10¾), St. Peter's, Rome (8), Antwerp (7¼), Olmutz (18), Brussels (7), Novgorod (31), Pekin (53½).

Bells, as the term is used on shipboard, are the strokes of the ship's bell that proclaim the hours. Eight bells, the highest number, are rung at noon and every fourth hour afterward, that is, at 4, 8, 12 o'clock, and so on. The intermediary periods are indicated thus: 12:30, 1 bell; 1 o'clock, 2 bells; 1:30, 3 bells, etc., until the eight bells announce 4 o'clock, when the series recommences 4:30, 1 bell; 5 o'clock, 2

bells, etc. The even numbers of strikes thus always announce hours, the odd numbers half hours. See Gatty, 'The Bell: Its Origin and Uses' (1848); Lukis, 'Church Bells and Their Founders' (1857); Andrews, 'History of Church Bells' (1885); Otte, 'Glockenkunde' (1884); Tyack, 'A Book About Bells' (1899).

Bell-bird, the name given to birds in various parts of the world, which utter bell-like notes; especially the "campanero" (*Chasmorhyncus niveus*), one of the chatterers of the South American family, *Cotingidæ*. It resembles, in form and size, the North American wax-wing, but is pure white, and has a remarkable appendage upon its forehead. This consists of a fleshy, tapering caruncle, which is black, thinly covered with star-like tufts of minute feathers. This caruncle ordinarily hangs loosely down at the side of the beak, but in moments of excitement becomes swollen and much extended, reaching a length of even five inches. This seems to be produced by air forced into its elastic tissues from the bird's lungs, and occurs whenever the characteristic notes are uttered. The bird's voice has been described by many travelers as like the sound of a loud, clear bell, which rings out over the forest at mid-day, when most other birds are silent. Waterton said: "You hear his toll and then a pause for a minute, then another toll, and then a pause again, and then another toll, and so on." Others have compared the sound to a blow upon an anvil, and all agree that it can be heard a great distance. Several other species exist in central and southern South America, all of which have caruncles, and utter extraordinary, ringing notes; but the former belief, that the loud voice was aided by these hollow appendages, is now known to be erroneous. These birds go about in small flocks, which flit through the tree-tops, and feed mainly upon forest fruits. They have been particularly studied by J. J. Quelch, a naturalist of British Guiana, an account of whose interesting investigations will be found in 'The Field' of London, for 26 Nov. 1892.

In Australia, the name "bell-bird" is given to one of the honey-suckers (q.v.), whose ching-ching is welcomed by travelers in the forest as an indication that water is near. The "bell-bird" of New Zealand is another honey-sucker (*Anthornis melanura*), whose voice, usually heard in chorus, resembles the tinkling of a silver bell.

Bell, Book, and Candle, a solemn mode of excommunication, used in the Roman Catholic Church. After the sentence is read, the book is closed, a lighted candle thrown to the ground, and a bell tolled as for one dead. See also Excommunication.

Bell-flower. See Campanula.

Bell, Liberty, the bell in Independence Hall, Philadelphia, that was rung to announce the adoption of the Declaration of Independence by the Continental Congress. The bell was cast in London by Robert Charles, and cost about $500. The specifications provided that it was to be made by the best workmen, to be examined carefully before being shipped, and to contain, in well-shaped letters around it, the inscription: "By order of the Province of Pennsylvania, for the State House in the City of Philadelphia, 1752." An order was given to place underneath this the prophetic words from Leviticus xxv. 10: "Proclaim liberty throughout the land and to all the inhabitants thereof." The reason for the selection of this text has been a subject of much conjecture, but the true reason is apparent when the full text is read. It is as follows: "And ye shall hallow the 50th year and proclaim liberty throughout the land and to all the inhabitants thereof." In selecting the text the Quakers had in memory the arrival of William Penn and their forefathers more than half a century before. In August 1752, the bell arrived, but though in apparent good order, it was cracked by a stroke of the clapper while being tested. It could not be sent back as the captain of the vessel who had brought it over could not take it on board. Two skilful men undertook to recast the bell, a bell being provided which pleased very much. But it was found to be defective also. The original bell was considered too high in tone, and in an attempt to correct this fault, too much copper was added. There were a great many witticisms on account of the sound failure, and the ingenious workmen undertook to recast the bell, which they successfully did, and it was placed in condition in June 1753. On Monday, 8 July (not the 4th), at noon, true to its motto, it rang out the memorable message of "Liberty throughout the land and to all the inhabitants thereof." For years the bell continued to be rung on every festival and anniversary, until it eventually cracked 8 July 1835, while being tolled in memory of Chief Justice Marshall. An ineffectual attempt was made to cause it to continue serviceable by enlarging the cause of its dissonance and chipping the edges. It was removed from its position in the tower to a lower story, and only used on occasions of public sorrow. Subsequently, it was placed on the original timbers in the vestibule of Independence Hall, and in 1873 was suspended in a prominent position immediately beneath where a larger bell, presented to the city in 1866, now proclaims the passing hours. In 1893 it was taken to Chicago and placed on exhibition at the World's Columbian Exposition.

Bell Rock, a dangerous reef of sunken rocks on the east coast of Scotland, about 12 miles from Arbroath, and directly in the way of vessels making for the firths of Forth and Tay. The Inchcape or Bell Rock reef was long the terror of seamen, and on it numerous vessels were wrecked. At a very early period the Inchcape Rock was unhappily too well known, and tradition has it that one of the Abbots of Aberbrothock succeeded in placing a bell upon it (hence the name), in such a way as to be rung by the motion of the waves, to warn sailors of its proximity. The legend tells us that a notorious Dutch sea pirate cut the bell from the rock, and on returning with his ship laden with spoils from one of his piratical expeditions, he and his crew perished, as an old historian has it, "by the righteous judgment of God," for want of the signal which he had so wantonly removed. On this legend Southey has founded his well-known ballad of 'Sir Ralph the Rover.' The lighthouse on the rock was designed by Robert Stevenson in 1800.

Bella, Stefano Della, Italian engraver: b. Florence, 1610; d. 1664. In 1642 he went to Paris, where he was employed by Cardinal

Richelieu. Returning to Florence he became the teacher in drawing of Cosmo, the son of the great duke. It is said that he engraved 1,400 plates.

Belladon'na, or **Dwale, Deadly Nightshade,** (*Atropa Belladonna*), a perennial disagreeable-smelling herb of the natural order *Solanaceæ*; is a native of the region from southern Europe to India, but widely naturalized in civilized countries. It is a low, spreading plant which sometimes attains a height of six feet; has entire, ovate leaves; purple, bell-shaped, nodding axillary flowers, single or in pairs; and shining, black, sweetish berries as large as large currants. The plant has long been reputed poisonous but is used in medicine, especially by oculists, because of its property of dilating the pupil of the eye. It is said to derive its name, belladonna ("beautiful lady"), from its use as a cosmetic for distending the pupil and giving the eye a bright glistening appearance and also from the use of the juice for staining the skin. Its names, deadly night shade, and dwale (which latter is believed by some to come from the same source as the French *deuil,* sorrow, and by others from the Anglo-Saxon dull, because of its stupefying effects), refer to popular belief in the plant's poisonous properties. The generic name came from Atropos, the fate who cut the thread of life.

Belladonna Lily. See AMARYLLIDACEÆ.

Bellaire, bĕl-lār', Ohio, a city in Belmont County, on the Ohio River, and several railroads; five miles south of Wheeling, W. Va. The river is here crossed by a costly iron railroad bridge. Bellaire is the centre of a region rich in coal, iron, cement, brick, clay, and limestone, and has manufactories of stoves, glass, carriages, boilers, and foundry and machine shop products. The city has a national bank, high-grade educational institutions, daily and weekly newspapers, and an assessed property valuation of over $3,000,000. Pop. (1900) 9,912.

Bel'lamont, or **Bellomont, Richard Coote** (EARL OF), royal governor of New York and Massachusetts: b. 1636; d. New York, 5 March 1701. To these offices he was appointed in May 1695, but did not arrive in New York until May 1698. He went from New York to Boston in May 1699, and was received by 20 companies of soldiers and a vast concourse of people. His administration was uneventful, his time having been occupied in the pursuit of the pirates who infested the coast, one of whom, the notorious Kidd, he secured and sent to England in 1700. He was disliked by the aristocratic party in New York, but very popular in New Hampshire and Massachusetts. Hutchinson speaks of Bellamont as being a hypocrite in a pretended devotion to religion. It appears, however, that while living at Fort George, in New York, he passed much time in meditation and contrition for his youthful excesses. He was accompanied to America by his countess. See De Reyster, 'Life and Administration of Richard, Earl of Bellamont' (1869).

Bellamy, Edward, American writer: b. in Chicopee Falls, Mass., 29 March 1850; d. there, 22 May 1898. He was educated in Germany; admitted to the bar; was on the staff of the *Evening Post* of New York in 1871–2; and on his return from the Sandwich Islands in 1877, founded the Springfield *News.* He is best known by his novel 'Looking Backward' (1888), a socialistic work, of which an immense number of copies were sold in two years. This led to the formation of Nationalist clubs, in which work Mr. Bellamy took active part. His other books are 'Six to One: a Nantucket Idyl' (1878); 'Dr. Heidenhoff's Process' (1880); 'Miss Ludington's Sister' (1884); 'Equality' (1897); 'The Duke of Stockbridge' (1901), a sequel to 'Looking Backward.'

Bellamy, Elizabeth Whitfield (CROOM), American novelist, writing under the pseudonym KAMBA THORPE: b. Quincy, Fla., 17 April 1838; d. 1900. She published 'Four Oaks' (1867); 'Little Joanna' (1876); 'Old Man Gilbert' (1888); 'The Luck of the Pendennings.'

Bellamy, George Anne, English actress: b. 1727; d. 1788. She was the natural daughter of Lord Tyrawley, by whom she was educated. Having forfeited his favor by going to live with her mother, she secured an engagement at Covent Garden in 1744, and appeared with Quin as Monimia in 'The Orphan.' Mrs. Bellamy's professional career was brilliant; but her extravagance and profligacy were notorious. In 1785, after many alternations of fortune, a free benefit released her from the debtors' prison, and in the same year she published an 'Apology' for her life.

Bellamy, Jacobus, Flemish poet: b. Flushing, 1757; d. 1786. In 1772 the second secular festival in commemoration of the foundation of the republic was celebrated throughout Holland. His genius, suddenly inflamed by the love of his native land, rendered him a poet, and his first productions met with success. He studied Latin, made himself better acquainted with his mother tongue, and composed several pieces of merit sufficient to induce the Society of Arts at The Hague to incorporate them in its collections. In 1785 he published his patriotic songs under the title 'Vaderlandsche Gezangen,' which secured him a place among the first poets of his nation. Bellamy sung likewise the praise of love. A biographical account of him has been written by G. Kniper.

Bellamy, Joseph, American clergyman and educator: b. North Cheshire, Conn., 20 Feb. 1719; d. 6 March 1790. In 1740 he became pastor of the church in Bethlehem, Conn., where he remained until his death. About 1742 he established a divinity school, in which many celebrated clergymen were trained. Among his published works, besides his 'Sermons,' are 'True Religion Delineated' (1750); 'The Nature and Glory of the Gospel' (1762), and 'The Half-Way Covenant' (1769).

Bellamy, Samuel, a notorious pirate, was wrecked in his ship, the Whidah, of 23 guns and 130 men, off Wellfleet, on Cape Cod, in April 1717, after having captured several vessels on the coast. Only one Indian and one Englishman escaped of his crew. Six of the pirates, who had been run ashore when drunk a few days previous, by the captain of the captured vessel, were hung in Boston in November 1717.

Bellangé, bĕl-läṅ-zhā, **Hippolyte,** French painter: b. Paris 1800; d. 1866. Attention was first directed to him by his painting of 'The Return of Napoleon from Elba,' exhibited in 1834. He was director of the museum at Rouen,

1837–53. Among his many noted battle pieces are 'Battle of Wagram' (1837); 'Kellerman's Charge at Marengo' (1847); 'Battle of the Alma' (1855); 'Assault on Malakoff' (1859); 'The Guard Dies' (1866).

Bellarmino, bĕl-lär-mē'nō, or **Bellarmine, Roberto Francesco Romolo,** Italian cardinal and celebrated controversialist: b. Monte Pulciano in Tuscany, 4 Oct. 1542; d. Rome, 17 Sept. 1621. At the age of 18 he entered the College of Jesuits, where he soon distinguished himself; and his reputation caused him to be sent into the low countries to oppose the progress of the reformers. He was ordained in 1569 by Jansenius, Bishop of Ghent, and placed in the theological chair of the University of Louvain. After a residence of seven years he returned to Italy, and was sent by Sixtus V. to France, as companion to the legate. He was made a cardinal on account of his learning, by Clement VIII., and in 1602 created Archbishop of Capua. At the elections of Leo XI. and Paul V. he was thought of for the pontificate, and might have been chosen had he not been a Jesuit. Paul V. recalled him to Rome, on which he resigned his archbishopric without retaining any pension on it as he might have done. Bellarmino had the double merit with the court of Rome of supporting her temporal power and spiritual supremacy to the utmost, and of strenuously opposing the reformers. The talent he displayed in the latter controversy called forth similar ability on the Protestant side; and for a number of years no eminent divine among the reformers failed to make his arguments a particular subject of refutation. The great work which he composed in this warfare is entitled 'A Body of Controversy,' written in Latin, the style of which is perspicuous and precise, without any pretension to purity or elegance. He displays a vast amount of Scriptural learning, and is deeply versed in the doctrine and practice of the Church in all ages. His maxims on the right of pontiffs to depose princes caused his work on the temporal power of the popes to be condemned at Paris. On the other hand, it did not satisfy the court of Rome, because it asserted, not a direct, but an indirect, power in the popes in temporal matters; which reservation so offended Sixtus V., that he placed it among the list of prohibited books. His society thought so highly of his sanctity, that proofs were collected to entitle him to canonization; but the fear of giving offense to the sovereigns whose rights he oppugned has always prevented a compliance with the ardent wishes of the Jesuits. His controversial works were published at Prague in 1721, and again at Mayence in 1842. Of his other works the most important is his 'Christianæ Doctrinæ Applicatio' (1603) — a work originally composed in Italian, but since translated into all European languages. He left an autobiography, which was re-issued and annotated by Döllinger and Reusch (1887).

Bellary, bĕl-lā'rę, or **Ballari,** a town in India, in the presidency of Madras, capital of a district of the same name, 280 miles northwest of Madras. It is the headquarters of the troops belonging to the districts of Bellary and Kadapah, and possesses two forts, one built on the summit, and the other on a lower eminence of a huge granite rock about two miles in circumference, and rising to the height of about 450 feet from the ground. Bellary is the terminus of a branch line of the Madras Ry., and carries on an active trade in cotton. Pop. (1901) 57,700.

Bellay, bĕ-lā, **Joachim du,** distinguished French poet, known as the French Ovid: b. about 1524; d. 1560. He joined Ronsard, Daurat, Jodelle, Belleau, Baif, and De Tisard in forming the «Pleiad,» a society, the object of which was to bring the French language on a level with the classical tongues. Bellay's first contribution was 'La Défense et Illustration de la Langue Française.' His chief publications in verse are 'Recueil de Poésie'; a collection of love-sonnets called 'L'Olive'; 'Les Antiquités de Rome,' a series of sonnets; 'Les Regrets'; and 'Les Jeux Rustiques.' In 1555 he became canon of Notre Dame, and a short time before his death he was nominated archbishop of Bordeaux. A statue of Bellay was unveiled in Ancenis in 1894. Spencer translated some of his Roman sonnets into English; and there are translations of poems by him in Andrew Lang's 'Ballads and Lyrics of Old France.' See 'Life' by Seche' (1880); Pator, 'Studies in the History of the Rennaissance' (1888).

Belle-Alliance, bĕl-ą-lę-äns, a farm 13 miles south of Brussels, famous as the position occupied by the centre of the French army in the battle of Waterloo, 18 June 1815. By the Prussians the battle was called that of Belle Alliance.

Belle Chocolatière, bĕl-shō-kō-lą-tyār, **La,** a noted portrait by the artist Liotard of the Princess Dietrichstien, who, prior to her marriage, was a waitress in a café in Vienna. The painting is now in the Dresden Gallery.

Belle-Isle, bĕl-ęl, or **Belle-Isle-en-Mer** (anciently VINDILIS), an island in the Bay of Biscay, belonging to France, in the department of Morbihan, eight miles south of Quiberon Point, about 11 miles long, and 6 miles across at the widest point. The soil is diverse, consisting of rock, salt marsh, and fertile grounds. Palais is the capital. The island is of much interest historically. In 1747 the French fleet was defeated by Admiral Hauke off the island, and it was captured by the English in 1761. Pilchard and sardine fishing is the important industry. Pop. 10,000.

Belle-Isle, an island, 15 miles north of Newfoundland and northeast of the Gulf of St. Lawrence, about 21 miles in circuit. On the northwest side it has a small harbor, called Lark Harbor, within a little island close to the shore. At the eastern point it has another small harbor or cove that will only admit fishing shallops. A rescue station has been established for persons who may be shipwrecked. Its area is about 15 square miles. At its southern end is a lighthouse whose light is 470 feet above the sea, and visible for 28 miles. The narrow channel between Newfoundland and the coast of Labrador is called the Straits of Bell-Isle. Steamers from Glasgow and Liverpool to Quebec round the north of Ireland commonly go by this channel in summer as being the shortest route.

Belle Isle, Va., an island in the James River, opposite Richmond, where nearly 12,000 Federal prisoners were confined in 1863.

Belle Jardinère, bĕl-zhär-dę-nyăr', **La,** a celebrated painting by Raphael, now in the Louvre. It represents the Madonna with the holy child, and the infant St. John.

Belle Plaine, Iowa, town in Benton County, on the Iowa River and on several railroads; 257 miles west of Chicago. It has flouring mills, furniture factories, creameries, machine shops, broom factories and numerous artesian wells. It was founded in 1862. Pop. (1900) 3,283.

Belle Savage, an old inn, on Ludgate Hill, London, celebrated in coaching days, and frequently mentioned by Dickens and other writers dealing with that period.

Belleau, bĕ-lō', **Rémy,** French poet: b. Nogent-le-Rotrou, 1528; d. Paris, 16 March 1577. He made an elegant and spirited translation of 'The Odes of Anacreon' (1576). His 'Bergerie' (1572), a compound of prose and verse, is of unequal merit; but it contains some passages,— for example, the «April,» — which are of great beauty.

Bellefontaine, Ohio, a city and county-seat of Logan County; on the Cleveland, C., C. & St. L. R.R.; 57 miles northeast of Dayton. It occupies the highest elevation in the State; and is surrounded by an agricultural region. It has extensive car-shops and other railroad works; two national banks; daily and weekly newspapers; an assessed property valuation of $2,250,000; a total debt of about $200,000. Pop. (1900) 6,649.

Bellefonte, Pa., a borough and county-seat of Centre County, 87 miles northwest of Harrisburg. It has important lime quarries, iron furnaces, glass works, manufactories and machine shops, and was incorporated in 1800. It is a summer resort much visited for its scenery and noted for its spring, whose waters have supplied the borough since 1807. Pop. (1900) 4,216.

Bellegarde, bĕl-gärd, **Henri** (Count de), French writer: b. Piriæ, 30 Aug. 1648; d. Paris, 1707. He was a member of the community of priests of St. Francis de Sales, and the recognized author of the 'Universal History of Voyages' (1707).

Belleisle, bĕl-ēl, **Charles Louis Auguste Fouquet** (Comte de), marshal of France: b. Villefranche, 22 Sept. 1684; d. Versailles, 26 Jan. 1761. He distinguished himself during the famous siege of Lille, and became brigadier in the royal forces. After the conclusion of the war of the Spanish Succession he went with Marshal Villars to Rastadt, where he displayed diplomatic talents. The cession of Lorraine to France in 1735 was principally his work. Cardinal Fleury reposed confidence in him; Louis XV. made him governor of Metz and the three bishoprics of Lorraine, which office he held until his death. Before the breaking out of the war in 1741 he visited the principal courts of Germany with the design of disposing them, after the death of Charles VI., to choose the elector of Bavaria emperor of Germany; and he displayed so much address on this occasion as to excite the admiration of Frederick II. After his return he placed himself at the head of the French forces sent to oppose those of Maria Theresa. He took Prague by assault; but, the king of Prussia having made a separate peace, he was compelled to a retreat which he performed with admirable skill. In December 1744, when on a diplomatic journey to Berlin, he was arrested in Germany and sent to England, but he was exchanged in 1746. In the following year he forced Gen. Browne, who had entered the south of France from Italy, to raise the siege of Antibes and to retreat over the Var. In 1748 the king made him a duke and peer of France, and the department of war was committed to his charge. He reformed the army by abolishing many abuses, enlarged the military academy, and caused an order of merit to be established.

Bellenden, William, Scottish writer: b. Lasswade (?) Midlothian, about 1555; d. about 1633. He was educated at Paris, where he was professor of belles-lettres in 1602; and though he was made master of requests by James I. he still continued to reside in the French metropolis. He was distinguished for the elegance of his Latin style, and in 1608 he published a work entitled 'Ciceronis Princeps,' containing a selection from the works of Cicero, consisting of passages relating to the duties of a prince, etc. He afterward published 'Ciceronis Consul,' 'Senator,' etc., with two other treatises, from one of which Conyers Middleton's 'Life of Cicero' was largely compiled — a plagiarism denounced by Dr. Parr in a Latin preface prefixed to a re-issue of Bellenden's writings (1787).

Bellermann, Ferdinand, German painter: b. Erfurt, 14 March 1814; d. Berlin, 11 Aug. 1889. He was educated at the academy at Weimar, and studied later at Berlin under Karl Blechen and Wilhelm Schirmer. He traveled in Norway, the Netherlands, Venezuela, and Italy, and in 1866 became professor of landscape painting at the Berlin Academy. He utilized the results of his travels in the production of many magnificent landscapes, among which may be mentioned 'Evening in the Valley of Caracas'; the 'Guacharo Cave, Venezuela'; 'Sierra Nevada'; etc.

Bellerophon, bĕl-lĕ'rō-fŏn, son of Glaucus, king of Ephyre, by Eurymede, at first called Hipponous. The murder of his brother, whom some call Alcimenus and Bellerus, procured him the name of Bellerophon, or murderer of Bellerus. After this murder Bellerophon fled to the court of Prœtus, king of Argos, whose wife became enamored of him; and because he slighted her passion she sought to destroy him. He escaped her machinations, was introduced to the court of Jobates, king of Lycia, and, after a number of adventures, in one of which he conquered the Chimæra, he married the daughter of Jobates and succeeded to the throne of Lycia. The latter days of Bellerophon were unfortunate. Attempting to soar to heaven on the back of Pegasus, Zeus sent a hornet which so stung his winged steed that he cast his rider to the earth, where lame and blind he wandered lonely in the Aleïan fields, a prey to corroding grief and melancholy, shunning men, and hated by the gods.

Bellerophon, a genus of gasteropodous mollusks, typical of the family *Bellerophontidæ*. The species are all fossil shells found in the limestones of the Silurian, Devonian, and Carboniferous periods. The best-known American species are found in the coal measures of the Mississippi valley and the southwest. The so-

called *B. cilobatus*, a fossil characteristic of the Trenton formation, is now assigned to the genus *Protowarthia*.

Belles-lettres, bĕl-lĕtr, the French term, for which the English equivalent is polite literature. It is impossible to give a satisfactory explanation of what is or has been called belles-lettres; in fact, the vaguest definition would be the best, as almost every branch of knowledge has at one time been included in, at another excluded from, this denomination. The most correct definition, therefore, would be, perhaps, such as embraced all knowledge and every science not merely abstract or simply useful. In the division of the departments at the Lyceum of Arts, established at Paris in 1792, the belles-lettres comprehended general grammar, languages, rhetoric, geography, history, antiquities, and numismatics; while philosophy, mathematics, etc., were called, in contradistinction, sciences.

Belleval, Pierre Richer de, bĕl-văl, pē-ār rē-chā dé, French botanist: b: Chalons-sur-Marne c. 1564; d. 1623. He was the first person in France who taught botany as a science distinct from medicine. Henry IV. established a botanical garden at Montpellier, and created a chair of botany. Belleval obtained the first appointment in 1593, and immediately began a collection of all the plants in Languedoc, in order to the production of an illustrated flora, for which about 500 quarto plates had been engraved, when he died. Through the carelessness of his representatives, almost all of these were lost.

Belleville, bĕl-vĭl, Canada, town, port of entry, and county-seat of Hastings County, Ontario, on the Bay of Quinte, at the mouth of the Moira River. It is on the Grand Trunk Railway and 60 miles west of Kingston. It has an excellent harbor, and the Moira affords abundant water-power for manufacturing. Belleville is in the heart of the finest dairying region of Canada; is in direct steamboat communication with many Canadian and United States points, and enjoys an extensive trade, especially in lumber. It has 13 churches. It is the seat of Albert College, which has an arts course, music, etc., and was established in 1857. The Ontario Business College, Belleville Business College, Saint Agnes Ladies' School, public and high schools, deaf and dumb institute, and public library are some of its institutions. The chief manufactories are lumber, pottery, cigars, sash and blinds, woolens, shirts, mining tools, machinery, lanterns, and tinware. A short distance east of Belleville are large cement works for the utilization of a limestone which exists in great abundance in the vicinity. The city has agencies for the principal banks of Canada, daily and weekly newspapers, and is the seat of a United States consulate. Pop. (1901) 9,117.

Belleville, Ill., a city and county-seat of Saint Clair County; situated on several rail roads; 14 miles east of Saint Louis, Mo. It is in the midst of very productive coal mines; has a large trade in flour, and general produce; and is chiefly engaged in the manufacture of glass, stoves, flour, nails, and machinery, and has one of the largest rolling mills in the West. The city has trolley lines to Saint Louis, a public library, Saint Peter's Cathedral (Roman Catholic), convent, four national banks, and an assessed property valuation of over $2,250,000. Pop. (1900) 17,484.

Bellevue, Ky., a city on the Ohio River opposite Cincinnati, of which it is practically a suburb. It is almost exclusively a city of residences. Pop. (1900) 6,332.

Bellevue, bĕl-view, Ohio, a village on Lake S. & M. S., Wheeling & L. E., and Nickel P. R.R.'s; situated in Huron and Sandusky counties; about 16 miles south of Sandusky. It has manufactures of agricultural implements, and a large farming trade. Pop. (1900) 4,100.

Bellevue, bĕl-vü (French, "fine prospect"), a name given to various villas and palaces, but particularly to a beautiful country palace in the neighborhood of Paris, situated on a ridge of hills stretching from St. Cloud toward Meudon. It was built by Mme. de Pompadour, commenced in July 1748, and finished in November 1750. The first French artists of the time had exerted all their talents in embellishing it; so that at the period when it was built, it was considered the most charming in all Europe. After the Revolution the Convention decreed that Bellevue should be kept in repair at the expense of the nation, and devoted to public amusements. Nevertheless it was publicly sold during the highest pitch of revolutionary excitement, and the purchaser had it demolished. There is a pretty village on its site, which, during the siege of Paris (1870–1) was an important strategic point.

Bellevue Hospital, New York, a hospital situated on the East River, between 26th and 27th streets. It is the seat of a medical school of high rank, and has accommodations for about 1,300 patients.

Belley, bĕl-lā, France (ancient BELLICA), a town in the department Ain, 39 miles southeast of Bourg, and 38 miles southwest of Geneva; situated in a fertile valley watered by the Furan. It is very ancient, having been a place of note in the time of Julius Cæsar, and is the seat of a bishopric founded in 412. It contains a communal college, has an agricultural society, and a court of primary resort. The episcopal palace, the belfry of the cathedral, the college, and the rich cabinet of medals and antiquities, are worth notice. Silk worms are reared; and lithographic stones, reckoned the best in France, are obtained from quarries in the neighborhood. Pop. (1896) 6,070.

Belli, Giuseppe Gioachino, bĕl'lē, joo-sĕp'pĭ jō-kē'nō, Roman humorist and satirical poet: b. 1791; d. 1863. He wrote in the popular dialect of the Trastevere; and in early life scourged the papacy and the clergy with stinging, irreverent, and often vulgar satire. Becoming afterward a zealous convert to the Roman faith, he endeavored to call in and destroy the indiscretions of his youth. In his last years he published a beautiful translation of the Roman Breviary. His published sonnets amount to more than 2,000; his other published Italian verses fill four considerable volumes; while two thirds of his vast remains have never been gathered and edited. Of this last, much is clothed in language too coarse to bear the light of modern culture.

Belliard, Augustin Daniel, bĕl-yär, ō-goos-tăn dän-vĕl (COUNT DE), French soldier and diplomatist: b. Fontenay-le-Comte, La Vendée, 1769; d. 27 Jan. 1832. He entered the military service very early, and Dumouriez soon made

him an officer of his staff. Under Napoleon, serving in Egypt, Germany, Spain, and Russia, he rose to great military distinction. After the emperor's abdication he received the order of Saint Louis from Louis XVIII. and was made a peer and major-general of the French army.

Bellig'erent, a nation or a large section of a nation engaged in carrying on war. When a revolted party of great numerical strength are able to form a regular government and rule over the whole or part of the territory which they claim, humanity dictates that they should not be treated as rebels guilty of treason, but should, if captured, be regarded as prisoners of war. To attain this result it is needful for those who have risen in arms against the government to make every effort to obtain for their party the position of belligerents. In the contest between the Federals and Confederates in the War of 1861–5, the latter section of the American people, at the very commencement of the struggle, claimed the privileges of belligerents. Their demand was promptly acceded to by the British government, at which the Federal authorities took umbrage, contending that the recognition had been premature, while the British maintained that it could not have been refused or delayed.

Bellingham, Richard, royal governor of Massachusetts: b. 1592; d. 7 Dec. 1672. He emigrated to the colony in 1634; in 1635 was made deputy-governor; and in 1641 was elected governor in opposition to Winthrop by a majority of six votes. He was re-elected in 1654, and after the death of Endicott was chosen again in May 1665, and continued in the executive chair of the colony as long as he lived, having been deputy-governor 13 and governor 10 years. He was chosen major-general in 1664, in which year the king sent Nichols, Cortright, Coon, and Moresick as commissioners to inquire into the state of the colony, when, according to Hutchinson, Bellingham and others obnoxious to James II. were required to go to England to account for their conduct. The general court, however, refused obedience and maintained the authority of the charter. His wife having died, in 1641 he married a second time, of which a contemporary speaks thus: "A young gentleman was about to be contracted to a friend of his, when on a sudden the governor treated with her, and obtained her for himself." The banns were not properly published, and he performed the marriage ceremony himself. He was prosecuted for a violation of the law, but at the trial he refused to leave the bench, sat and tried himself, and thus escaped all punishment. In his last will he provided that after the decease of his wife and of his son by a former wife, and his granddaughter, the bulk of his estate should be spent for the yearly maintenance "of goodly ministers and preachers" of the true Church, which he considered to be that of the Congregationalists. This will the general court set aside on the ground that it interfered with the rights of his family. A sister of his, Anne Hibbens, was executed at Salem in June 1656, during the witchcraft persecution.

Bellingham, Wash., city, county of Whatcom; on the eastern shore of Bellingham Bay, and on the Great Northern, Northern Pacific, Canadian Pacific, and Bellingham Bay & British Columbia R.R.'s.

History.— The first settlement was made in October 1852 by Capt. Henry Roeder, who built a saw-mill on what is now Whatcom Creek. The Lummi tribe of Indians maintained their chief camp on the beach near the mouth and falls of Whatcom Creek, and called the camp or rather the locality "*Whrap-cop,*" meaning "the noisy water" or "the place of the noisy water." The white men retained the Indian name for their town, modified as indicated by the spelling to Whatcom. This remained the name of the town until the consolidation of Whatcom and New Whatcom in 1891 under the name of New Whatcom, from which the prefix "New" was dropped by action of the state legislature 19 Feb. 1901. Fairhaven is the English interpretation of an Indian word or phrase, "*See-see-leechel,*" meaning "a safe harbor" or "the sheltered beach." The town was platted and named in 1883 by Daniel J. Harris, the original donation claimant. In 1890 Fairhaven and the adjoining town of Bellingham were incorporated as one city under the name of Fairhaven. On 27 Oct. 1903, the electors of Fairhaven and Whatcom voted to consolidate the two cities under the name of Bellingham and the consolidation was duly consummated. The new name went into effect 28 Dec. 1903, and the post-office became Bellingham 1 April 1904. Bellingham Bay was named by Vancouver in 1792, and the consolidated city takes its name from that bay.

Industries.— The city is the commercial centre of a large lumber and agricultural region; salmon fishing is also an industry of great importance, and mining and quarrying are carried on in the vicinity. The principal manufacturing establishments include lumber and shingle mills, salmon canneries, wood working and iron working plants, and brick kilns. There are four banks with a combined capital of $405,000.

Churches and Educational Institutions.— There are (in 1904) 27 established churches in Bellingham, representing practically all denominations. There are 11 city schools, including a high school, and two libraries, the Bellingham Bay Library, and the Carnegie Library. The city also contains the State Normal School, and three business colleges.

Government and Population.— The government is vested in a mayor, elected biennially, and a council of seven members, elected alternately every two years. Pop. (Official census 1904), 22,632.

FRANK C. TECK,
Bellingham Chamber of Commerce.

Bellini, Gentile, jĕn-tē'lā, the elder son of Jacopo (q.v.): b. 1421; d. 1501. He became much more distinguished than his father, but did not rival his younger brother, Giovanni. His fame attracted the notice of Mohammed II., conqueror of Constantinople, and Bellini visited the grand seignor, being sent by the Senate. He painted a number of pictures for Mohammed, and also struck a medal for him, with all of which he was greatly pleased, and rewarded the painter by presenting him with a gold chain and 3,000 ducats. A story is told of his exhibiting to Mohammed a picture he had painted of the head of John the Baptist in a charger, and the emperor, who had certainly great experience in decapitation, observing that the muscles of the neck were not correctly drawn, sent for a slave and had his head cut off in the presence of the artist, to convince him

of his mistake. Voltaire ridicules this tale, and Gibbon altogether rejects it. There is a very fine pen-and-ink drawing by Bellini in the British Museum, representing Mohammed and the sultana mother, in whole-length figures in a sitting position. After Gentile's return to Venice, he continued to paint, honored by the patronage of the state and of private individuals, until his death.

Bellini, Giovanni, bĕl-lē′nē, jo-vä-ni, Italian painter: b. 1426; d. Venice, 29 Nov. 1516. He was the second son of Jacopo Bellini (q.v.) and generally regarded as the founder of the Venetian school, though he himself was his father's pupil. Some of his earliest works were portraits, among them that of the doge, Leonardo Loredano, now, with another of his masterpieces, 'Peter Martyr,' in the London National Gallery. Having attracted the notice of the government, he was employed by the republic to decorate the great hall of the council with a series of magnificent paintings, covering the entire walls, and designed to represent the proudest historic glories of Venice. These were worthily accomplished, but were destroyed by a fire. Among his scholars were Giorgione and Titian, and it was from him that these masters acquired their magnificent coloring.

Bellini, Jacopo, yä′cō-pō, Italian painter: b. Venice about 1405; d. 1470. He was a pupil of Gentile da Fabriano, and is said to have been taught oil-painting, which was then a secret, by Andrea dal Castagno, and in turn taught it to his sons Gentile and Giovanni (qq.v.). The first works by which he acquired fame were portraits of Catharine Cornaro, the beautiful queen of Cyprus, and one of her brothers; a picture representing the passion of Christ, in which many figures were introduced, himself among the number; and a historical picture representing a Venetian legend of the miracle of the cross. This cross, containing a piece of the true one on which the Saviour died, was by some accident thrown into the Grand Canal at Venice, and although many persons plunged in after it, it was the will of God that only the guardian of the brotherhood to whom the cross belonged, Andrea Vindramino, could take it out again. This event was represented in the painting. Almost all of Jacopo's works have perished; one supposed to be authentic is in the Manfrini palace at Venice and represents the portraits of Petrarch and Laura.

Bellini, Vincenzo, vĭn-chĕn′zō, Italian composer: b. Catania, Sicily, 1802; d. near Paris, 1835. He was educated at Naples under Zingarelli, commenced writing operas before he was 20, and composed for the principal musical establishments in Europe. His most celebrated works are 'Norma,' 'I Puritani,' and 'La Sonnambula.' He is remarkable chiefly for sweetness of melody, suitableness of harmony, and an adaptation of sound to sense, and stood honorably distinguished from many of his profession by the excellence of his moral character.

Bellinzona, bĕl-ĭn-zō′nä, or **Belleny,** bēl-ā′nē, Switzerland, the capital of the canton of Ticino on the left bank of the Ticino, about five miles from its embouchure in the northern end of Lago Maggiore. It occupies a position of great military importance.

Bellis. See DAISY.

Bellman, Karl Mickel, Swedish poet: b. Stockholm, 1740; d. 1795. He grew up in the quietude of domestic life, and the first proofs he gave of his poetical talents were religious and pious effusions. The dissipated life of young men at Stockholm devoted to pleasure was afterward the subject of his poems. By these his name was spread over all Sweden. Even the attention of Gustavus III. was attracted to him, and he received from the king an appointment which enabled him to devote himself almost entirely to poetical pursuits, in an easy independence, until his death. His songs are truly national, and love and liquor their most common themes.

Bello, Andres, Spanish-American diplomatist and author: b. Caracas, Venezuela, 30 Nov. 1780; d. Santiago, Chile, 15 Oct. 1865. He represented Venezuela in London, 1810–28; in 1829 became an official of the bureau of finance; in 1834 was minister of foreign affairs for Chile; in 1842, the first rector of Santiago University. He was the author of 'Principles of International Law' (1832), and after his death his entire works were printed at the expense of the state.

Belloc′, Hilaire, English litterateur: b. 27 July 1870. He is the son of M. Louis Belloc, a French barrister; was educated at Balliol College, Oxford, after serving for a time in the French artillery at Toul, and in 1906 was elected to Parliament as a Liberal. He has published 'The Bad Child's Book of Beasts' (1896); 'More Beasts for Worse Children' (1897); 'The Modern Traveler' (1898); 'The Moral Alphabet' (1899); 'Danton,' a much-admired biography (1899); 'Lambkins Remains' (1900); 'Paris' (1900); 'Robespierre' (1901); 'The Path to Rome' (1902); 'The Old Road' (1905); etc.

Belloc, Marie Adelaide. See LOWNDES, M.A.

Bellomont, Earl of. See BELLAMONT, RICHARD, EARL OF.

Bel'lomont, Earl of. See COOTE, RICHARD.

Bello'na, the goddess of war, daughter of Phorcys and Ceto. She was called by the Greeks *Enyo,* and is often confounded with Minerva. She was anciently called *Duellona,* and was the sister of Mars, or, according to some, his daughter or his wife. She prepared his chariot when he was going to war, and drove his steeds through the tumult of the battle with a bloody scourge, her hair dishevelled and a torch in her hand. The Romans paid great adoration to her; but she was held in the highest veneration by the Cappadocians, chiefly at Comana, where she had above 3,000 priests. Her temple at Rome was near the Porta Carmentalis. In it the senators gave audience to foreign ambassadors and to generals returned from war. At the gate was a small column, called the "column of war," against which they threw a spear whenever war was declared. The priests of this goddess consecrated themselves by making great incisions in their bodies, and particularly in the thigh, from which they received the blood in their hands to offer as a sacrifice to the goddess. In their wild enthusiasm they often predicted bloodshed and wars, the defeat of enemies, or the besieging of towns.

Bellot, Joseph René, bĕl-lō, zhō-sef rẹ-nā, French naval officer: b. Paris, 1826; d. 1853. At the age of 16 he entered the naval academy at

Brest, and two years afterward received a commission as *élève de marine* on board the Berceau. He was promoted for bravery to the rank of *élève* of the first class, and also created a chevalier of the Legion of Honor, though not yet 20 years old. On his return to France in 1847 he was made a sub-lieutenant, and shortly after a two-years' voyage to South America in the Triomphante he volunteered his services on the Royal Albert schooner, fitted out by Lady Franklin, in June 1851, to search for her husband, Sir John Franklin. The expedition failed in its main object, but an interesting journal of it, kept by Bellot, was published after his death. In June 1853, he sailed again on board the Phœnix, under command of Capt. Inglefield, on a new Arctic expedition, the principal object of which was to convey dispatches to Sir Edward Belcher, then commanding H.M.S. Assistance in the Polar seas. Arrived in Erebus and Terror Bay, where lay the North Star, whose commander, Capt. Pullen, was absent on a journey of discovery, Capt. Inglefield set out in search of him; but in his absence it became desirable to get the despatches conveyed to Sir Edward Belcher — a duty which Lieut. Bellot undertook to perform by crossing the ice. Having set out with four sailors, a canoe, and a sledge, the party got separated in a gale of wind on 18 August, and Bellot, with two others, drifted away on a piece of ice. With the view of ascertaining the direction the ice was taking, he crossed over to the opposite side of the hummock and was never seen more. A handsome granite obelisk was erected to his memory in front of Greenwich Hospital, and a provision was made for his sisters.

Bellot Strait, the passage on the north coast of North America which separates North Somerset from Boothia Felix and connects Prince Regent Inlet with Franklin Channel. Its eastern entrance was discovered in 1852 by Lieut. Bellot (q.v.). After four unsuccessful attempts it was explored for the first time by McClintock on his crowning voyage. It is about 20 miles long, and, at its narrowest part, about one mile wide, running nearly on the parallel of 72°, between granite shores which, everywhere high, rise here and there to 1,500 or 1,600 feet. Through this funnel both the winds and the waters have full play; the latter, permanent currents and flood tides alike, coming from the west. A point on the southern shore, 71° 55′ N., 95° W., is the most northerly point of the North American continent.

Bellotto Bernardo, Italian painter and engraver: b. Venice, 1724; d. Warsaw, 1780. He studied under his uncle, Antonio Canal, and painted perspective and architectural views. He passed much time in Germany and was a member of the Academy of Dresden, where many of his pictures are exhibited. He etched, from his own designs, views of Vienna, Dresden, and Warsaw. His pictures are called by the name of Canaletto, which he assumed.

Bellows, Albert F., American painter: b. Milford, Mass., 20 Nov. 1829; d. 24 Nov. 1883. He was one of the first to succeed with water-colors. He studied in Antwerp, Paris, and England, becoming a National Academician (1861), and an honorary member of the Royal Belgian Water Color Society (1868).

Bellows, Henry Whitney, American Unitarian clergyman and writer: b. Walpole, N. H., 11 June 1814; d. 30 Jan. 1882. He became pastor of All Souls Church, New York, 1839; was chief founder and long editor of the 'Christian Inquirer' (1846); chief originator of the United States Sanitary Commission, and its president during the Civil War (1861–5). He wrote 'Public Life of Washington' (1866); 'Relation of Public Amusements to Public Morality'; 'The Old World in Its New Face' (2 vols. 1868–9), a record of travel in Europe. He was an effective preacher and public speaker.

Bellows, a machine for blowing fire, so formed as, by being dilated and contracted, to inhale air by an orifice which is opened and closed by a valve, and to propel it through a tube upon the fire. The invention of bellows is ascribed to Anacharsis the Scythian, though probably it took place in different countries. The forms of bellows at present are very various, as many attempts have been made for the improvement of this highly important machine, which becomes necessary wherever a powerful flame is required in the arts. As mining was carried on at an early date in Germany, and great heat is required in smelting the ores and working the metals, various new kinds of bellows were invented in that country, one of which consists of an empty box, which moves up and down in another, partially filled with water. Between the bottom of the empty box and the surface of the water is a space filled with air, which is driven out by the descent of the enclosed box. Bellows of very great power are generally called blowing-machines (q.v.). The common Chinese bellows consist of a box of wood about two feet long and one foot square, in which a thick, square piece of board, which exactly fits the internal cavity of the box, is pushed backward and forward. In the bottom of the box, at each end, there is a small conical or plug valve to admit the air, and valves above to discharge it.

Bellows Falls, Vt., a town in Windham County, on the Connecticut River, so called from several rapids and cataracts occurring there. The whole descent is about 44 feet. It was formerly a famous place for spearing salmon. A canal with locks has been cut around the falls, through the solid rock. The scenery is romantic, and various interesting minerals are found in the vicinity. The town contains several mills and manufactories, and is remarkable for its handsome dwellings. Pop. (1900) 4,337.

Bellows-fish. See Globe-fish.

Belloy, Pierre Laurent Buirette de, bĕl-lwä, pē-ār lôr-ŏn bwē-rĕt dė, French dramatist: b. St. Flour, Auvergne, 17 Nov. 1727; d. 5 March 1775. The first French dramatist who successfully introduced native heroes upon the French stage. He was designed by his uncle, a distinguished advocate in the parliament of Paris, who reared him after his father's death, for his own profession, but while he applied himself to the law with reluctance, he showed much genius for the drama. His uncle opposed this taste, and the young man secretly left his house. He next made his appearance as an actor under the name of «Dormont de Belloy.» Belloy had hoped to reconcile his family to him by the success of his first tragedy, 'Titus,' but this hope was disappointed by the failure of the

piece; and the author went to St. Petersburg. He returned to France, where he brought out his tragedy 'Zelmire,' which met with complete success. In 1765 followed his 'Siege of Calais,' a tragedy which produced a great sensation, and is still esteemed, though it owes the applause bestowed on it rather to its subject than to its poetical merit. He received the medal promised by the king to those poets who should produce three successful pieces, and which was awarded on this occasion only, the 'Siege of Calais' being counted as two, it being, in fact, only the second successful piece of Belloy. The city of Calais sent him the freedom of the city in a gold box. Belloy wrote sundry other dramatic pieces, of which 'Gaston and Bayard' procured his reception into the Academy.

Bell's Palsy, named after Sir Charles Bell (q.v.), a palsy of the muscles of the face supplied by the seventh or facial nerve, and due to some peripheral lesion, in distinction to facial palsy of a central, or of a nuclear origin. It may occur on both sides of the face. The causes are many, but exposure to cold, such as sleeping in the open with the wind blowing over the face, or sitting by an open window in a railway train or steamboat, is one of the most frequent causes. It may also occur in a multiple neuritis that is due to poisoning by alcohol, lead, arsenic, or the poison of diphtheria, etc., and in rare instances from fractures of the skull. It comes on suddenly, the patient often waking in the morning to find one side of his face stiff, and in two or three days the palsy has developed. There is a sense of discomfort on the paralyzed side. The patient cannot close one eye completely and cannot manage his food on the affected side. He cannot whistle, and his speech is peculiar. The wrinkles of the paralyzed side are smoothed out and every motion of the facial muscles seems to be an exaggerated one, so that many patients say their face is drawn to one side. The reality being that it is the opposite side that is affected and immovable. The paralysis usually gets well in from three to five months, especially if the treatment is begun early and perseveringly followed out. Some patients never entirely recover, although much improvement takes place in practically all. The treatment is electrical, massage, and general tonics. Particular attention should be paid to the care of the paralyzed eyelid. See also FACIAL PARALYSIS.

Consult: Starr, 'Text-book of Organic Nerve Diseases' (1903).

Belluno, Italy, a northern city, capital of a province of the same name, on the Piave, 48 miles north of Venice. It has a cathedral, a handsome theatre, etc.; and manufactures of silk, straw-plait, leather, etc. Pop. (1897) 18,348.

Bel'mont, August, American banker: b. Alzey, Germany, 1816; d. 24 Nov. 1890. He was educated at Frankfort, and was apprenticed to the Rothschild's banking house in that city when 14 years old. In 1837 he went to Havana to take charge of the firm's interests, and soon afterward was sent to New York, where he established himself in the banking business and as the representative of the Rothschilds. He was consul-general of Austria 1844–50; became charge d' affaires at The Hague in 1853; and was minister-resident there in 1854–8. He was a delegate to the Democratic National Convention in 1860, and when a portion of the delegates withdrew and organized the convention in Baltimore he was active in that body, and through it became chairman of the National Democratic Committee, an office he held till 1872. He was an active worker in the party till 1876, when he closed his political career.

Belmont, August, American banker: b. New York, 18 Feb. 1853; son of the preceding. He was graduated at Harvard University in 1875; at once entered his father's banking house, and on the death of his father became head of the firm of August Belmont & Company, also representing the European banking firm of the Rothschilds. In February 1900 he organized the Rapid Transit Subway Construction Company to back John B. McDonald, who had been awarded the $35,000,000 contract for the construction of a rapid-transit system in New York. The house, under the management of the son, has continued to exert the large influence in the financial and railroad affairs of the city and country that it gained under its founder.

Belmont, Perry, American lawyer: b. New York, 28 Dec. 1851 (son of August Belmont 1816–90). He was graduated at Harvard University in 1872, and at Columbia College Law School in 1876; was admitted to the bar and practised in New York till 1881, when he was elected as a Democrat to Congress and served till 1887, being a member of the Committee on Foreign Affairs, and in that capacity, in his first term in Congress, came into notice by his cross-examination of J. G. Blaine, then ex-secretary of state, as to his relations with a syndicate of American capitalists interested in Peruvian guano. In 1885 he was appointed chairman of the Committee on Foreign Affairs, and in 1888 United States minister to Spain. In 1889 he was commissioner to the Universal Exposition in Paris, and for his services received from the President of France, in 1890, the decoration of commander of the Legion of Honor. He was one of the principals in the rapid-transit contract in New York, in which his brother August (q.v.) was interested

Belmont, Cape Colony, a town midway between Orange River Junction and Kimberley. It was the scene of one of the earliest engagements in the war of 1899–1900, between the Boers and the British under Gen. Lord Methuen. The town was attacked by the British on 23 Nov. 1899, while on the march to the relief of Kimberley, and the battle resulted in a victory for them. Two days later Lord Methuen took Graas Pan, 10 miles north of Belmont, after again defeating the Boers.

Belmont Park, N. Y., a racing field on Long Island, 15 miles from New York city, probably the most magnificent establishment devoted to horse-racing in the world. The park covers an area of 666 acres, laid out in groves and gardens, among which are placed the palatial club buildings and stables.

Belmontet, bĕl-mŏn-tā, **Louis,** French poet and publicist: b. Montauban, 26 March 1799; d. Paris, 14 Oct. 1879. He studied and practised law in Toulouse until involved in difficulties with the magistracy on account of some satirical poems, when he went to Paris and there produced his principal works: 'The Sad Ones'

(1824), a cycle of elegies; 'The Supper of Augustus' (1828); and with Soumet, 'A Festival of Nero' (1829), a tragedy which exceeded 100 performances. In 1830 he edited the *Tribune* newspaper, opposed the accession of Louis Philippe, and predicted his downfall and a second revolution in a bold pamphlet addressed to Chateaubriand, for which he was arrested. In 1839 he established, together with Messrs. Laffitte and Mauguin, a manufactory, in which the men were to share the benefits with the employers. In 1852 he became a member of the legislative assembly. Subsequently he became an ardent partisan of Bonapartism, pleading its cause as a journalist and poetically extolling the Napoleonic dynasty in many enthusiastic odes.

Belodon, an extinct reptile of the Triassic Period, partly intermediate between dinosaurs and crocodiles, but with many archaic characters. The body was protected by bony plates, those on the back interlocking by a peg-and-socket joint. The snout was long and narrow, the external nares behind in contrast to their position in modern crocodiles, where they are at the tip of the snout. The limbs were longer than those of modern crocodiles, but the proportions were otherwise similar. Its remains have been found in the Triassic coal-beds of North Carolina and Pennsylvania, and the red beds (estuarine sediments) of New Mexico, as well as in European strata of corresponding age.

Beloe, William, English clergyman and writer: b. 1756; d. 1817. He was educated at Cambridge, and was presented to the rectory of All-hallows, London Wall, and subsequently to stalls in Lincoln Cathedral and St. Paul's. In 1803 he became keeper of the printed books in the British Museum. His chief publications are, 'Anecdotes of Literature and Scarce Books' (6 vols. 1806–12); a translation of Herodotus with a commentary; and 'The Sexagenarian' (1817).

Beloit', Wis., a city in Rock County, on the Rock River, and the Chicago & N. W. and Chicago, M. & St. P. R.R.'s, 85 miles southwest of Milwaukee and 91 miles west of Chicago. The city derives fine power for manufacturing from the river; and has the second largest wood-working machinery plant in the world, beside manufactories of gas-engines, windmills, iron, paper-mill machinery, plows, paper, rye flour (the oldest mill of its kind in the country), and bicycles. The city is widely known as the seat of Beloit College (q.v.). It was first settled in 1836. Pop. (1905) 12,855.

Beloit College, a co-educational (non-sectarian) institution in Beloit, Wis.; organized in 1847 by the Congregational and Presbyterian Churches; reported at the end of 1905: Professors and instructors, 30; students, 506; volumes in the library, 32,000; grounds and buildings valued at $335,000; productive funds, $420,000; income, $28,000; number of graduates, 869; president, Edward D. Eaton, LL.D.

Bel'omancy, divination by arrows, practised by the ancient Scythians and other nations. One of the numerous modes was as follows: A number of arrows, being marked, were put into a bag or quiver, and drawn out at random; and the marks or words on the arrow drawn determined what was to happen. See Ezek. xxi. 21.

Beloochistan. See Baluchistan.

Belot, bĕ-lō, **Adolphe,** French novelist and dramatist: b. Pointe-à-Patre, 6 Nov. 1829; d. Paris, 17 Dec. 1890. He traveled extensively and settled at Nancy as a lawyer. He won reputation with a witty comedy, 'The Testament of César Girodot' (1859, with Villetard); and, being less successful with his following dramatic efforts, devoted himself to fiction. Of his novels may be mentioned: 'The Venus of Gordes' (1867, with Ernest Daudet); 'The Drama of the Rue de la Paix' (1868); 'Article 47' (1870); all of which were dramatized.

Belper, England, a market town of Derbyshire, on the left bank of the Derwent, over which there is a handsome stone bridge of three arches; seven miles north of Derby, on the Midland Railway. It has three churches, besides other places of worship, a public hall, with reading-rooms, library, etc. There are large cotton-mills, hosiery works, engineering works, and foundries. It is a thriving town and has been very much improved since about 1890. Pop. (1901) 10,920.

Bel'phegor. 1. An arch-demon appointed by Pluto and his council to undertake an earthly marriage, who fled unable to endure female companionship. He has been made the subject of one of La Fontaine's 'Contes,' and also of an English play by Wilson, published in 1691.

2. An English play by Charles Webb, translated and adapted from the French 'Paliasse,' in which the chief character is Belphegor, a mountebank.

3. One of the deities of the Moabites.

Belsham, Thomas, English Unitarian clergyman: b. 1750; d. 1829. He became theological tutor of an academy at Daventry in 1781. At this time he was a Calvinist, but a change of views unfitted him for this situation, and he became tutor of an academy which had been recently established at Hackney. This institution soon failed for want of funds, and Belsham removed first to the Gravel Pit Chapel, which had been occupied by Dr. Priestly, and afterward to Essex Street Chapel, where he officiated for some time as the colleague of Lindsey, and latterly as sole pastor till his death in 1829. His works are chiefly of a controversial nature, and probably attracted attention as much from the celebrity of the works which they attacked as from their own merits. His first appearance in the polemical field was as an opponent of Wilberforce, of whose celebrated 'Practical View of the Prevailing Religious Systems' he published a review. He also published 'Memoirs of Mr. Lindsey,' which was reviewed by the celebrated Robert Hall.

Belsham, William, English writer: d. 1827, aged 75. He published in 1789 'Historical, Political, and Literary Essays' (2 vols. 8vo.); and he subsequently wrote on the test law, the French Revolution, parliamentary reform, and other subjects; but his principal work is a 'History of Great Britain, from the Revolution to the Treaty of Amiens' (1793–1806), 12 vols. 8vo.).

Belshazz'ar, the last of the Chaldæan dynasty who reigned at Babylon. He is supposed to have been the son of the Nabonnedus of Berosus, Labynetus of Herodotus, and Naboandelus of Josephus, and to have been adopted by

his father as joint king some time before the fall of Babylon. He perished 538 B.C. during the successful storming of Babylon by Cyrus. The interesting circumstances which immediately preceded this event, and are recorded at length in the book of Daniel, have repeatedly furnished subjects to painters and poets.

Belt, The Great and **Little,** two straits of Denmark, connecting the Baltic with the Cattegat. The former runs between the islands of Zealand and Funen, and is about 15 miles wide, where it is crossed from Nyborg, in Funen, to Corsoer, in Zealand. The greatest breadth of the strait is 20 miles. The navigation is very dangerous, on account of the many small islands and sandbanks by which the channel is impeded. The Little Belt is between the island of Funen and the coast of Jutland, and the narrowest part of the strait is not more than a mile wide. At this place stands the fortress Fredericia, where tolls were formerly paid. The fortress completely commands the entrance from the Cattegat. The Sound, between Zealand and the Swedish coast, is preferred for all large vessels entering or leaving the Baltic.

Belt, in astronomy, a varying number of dusky, belt-like bands or zones encircling the planet Jupiter parallel to his equator, as if the clouds of his atmosphere had been forced into a series of parallels through the rapidity of his rotation, and the dark body of the planet was seen through the comparatively clear spaces between.

Beltane. See BAAL.

Belton, Texas, a city and county-seat of Bell County, situated on the Leon River, northeast of Austin City, and on the Gulf C. & S. F., and the Missouri, K. & T. R.R.'s. Baylor Female College is located here. It is in a cotton-growing district, near some good building-stone quarries, and has a considerable export trade; its chief manufactories are cotton-mills, a cotton-seed oil-mill, flour-mills, and foundries. Pop. (1900) 3,700.

Beltraffio, bĕl-trăf'yō, or **Boltraffio,** Italian painter: b. Milan, 1467; d. 1516. He was a pupil of Leonardo da Vinci and imitated him in the treatment of his subject and in the use of color. Among his works are several portraits and a 'Madonna of the Casio Family.'

Beltrame, Giovanni, bĕl-tra'mā, jō-vän'nē, Italian philologist and missionary: b. 11 Nov. 1824. In 1854 he was sent in a missionary party to Khartum up the Blue Nile to Fazogl; in 1858 he went with Knoblecher and other missionaries up the White Nile to Gondokoro, whence he made several journeys into a country at that time wholly unknown. He returned to Italy in 1862 and occupied himself principally with researches in the languages of the Nile country. Among other philological works he published a grammar and a dictionary of the Denka speech. He was author also of 'Di un Viaggio sul Fiume Bianco nell' Africa Centrale'; 'Il Sennaar e lo Sciangallah'; 'Il Fiume Bianco e i Denka,' and 'In Palestina.'

Beltrami, Eugenio, bĕl-trä'mē, yoo-jān'yo, Italian mathematician: b. 16 Nov. 1835; d. 18 Feb. 1900. He studied at Pavia. In 1862 he was professor at Bologna, then professor at Pisa, Rome, and Pavia, and in 1891 again at Rome. He was president of the Academy of the Lincei. His work has been chiefly in non-Euclidian geometry; also in electricity, and magnetism. His 'Mathematical Works' (1902), and 'Bibliography of Mathematics' (1901), were published by the University of Rome after his death.

Beltrami, Giovanni, jō-vän-nē, Italian lapidary: b. Cremona, 1779; d. 1854. He was self-educated and at the time of French rule in Italy found a patron in Eugene Beauhamais for whom he made a chain of 16 cameos, illustrating the story of Psyche. Among his other notable works is a reproduction of the 'Last Supper' of Leonardo da Vinci on a topaz.

Beluga, bĕ-loo'gą, an old name, adopted as the name of its genus, of the white whale (q.v.).

Beluga, or **Bielaga,** bē-lä'gą. See STURGEON.

Be'lus, the Roman name of the Assyrian and Babylonian divinity called Bel in Isaiah xlvi. 1.

Belus, a Phœnician river at the base of Mount Carmel. Its fine sand, according to tradition, first led the Phœnicians to the invention of glass.

Belus, Temple of, an enormous temple in ancient Babylon, rebuilt by Nebuchadnezzar about 604 B.C. Its site is thought by some authorities to be the modern Bers-Nimrud, and by others, Babil, both situated near Hillah.

Belvedere, bĕl-vĕ-dēr', or It. bāl-vā-dā'rĕ (It. "*fine sight.*" See BELLEVUE). A name given in Italy to buildings destined for the enjoyment of prospects. The name is also given to small cupolas on houses built for the advantage of fresh air, or of the view which they afford. Many of the buildings in Rome are furnished with such cupolas; yet the term "belvedere" is generally applied only to those on the palaces of the rich. This is the name also of a part of the Vatican where the famous statue of Apollo is placed, which, on this account, is called Apollo Belvedere.

Belvidere, bĕl-vĭ-dēr', Ill., a city and county-seat of Boone County; on the Kishwaukee River, and the Chicago & N. W. R.R.; 78 miles northwest of Chicago. An important farming and dairying trade centre, and contains railroad shops, one of the largest sewing-machine and bicycle works in the country, manufactory of sewing-machine supplies, flour-mills, creamery, and other industries; and has two national banks, several daily and weekly periodicals, and a property valuation of about $2,000,000. Pop. (1900) 6,937.

Belzoni, Giovanni Battista, (JOHN BAPTIST), bĕl-zō'nē, jō-vän' nē bä-tēs'ta, Italian traveler: b. Padua, 1778; d. 3 Dec. 1823. Destined for a monastic life he was educated at Rome, but left the city when it was occupied by the French, and in 1803 went to England, where he acted in Astley's amphitheatre. Here he acquired, besides an acquaintance with the English language, much knowledge of the science of hydraulics, the study of which had been his chief occupation in Rome, and which afterward carried him to Egypt. He left England after a residence of nine years, and took his way through Portugal, Spain, and Malta, to Egypt. There he lived from 1815 to 1819, at first as a dancer, till he won the favor of the pasha.

Belzoni kept the rude inhabitants of the country in awe by his extraordinary stature and strength. He opened the second of the pyramids of Ghizeh, known by the name of Cephrenes. In the year 1816 he succeeded in transporting the bust of Memnon from Thebes to Alexandria, whence it was taken to the British Museum. In 1817 he entered several catacombs near Thebes, especially one in a fine state of preservation in the valley of Biban el Molook, which is considered to be the mausoleum of Psammetichus, and from which he took the splendid alabaster sarcophagus which is now in the British Museum. On 1 August in the same year he opened the temple of Ipsambul, near the second cataract of the Nile, which two Frenchmen, Cailliaud and Drovetti, had discovered the year before, but had not succeeded in opening. Belzoni discovered a subterranean temple in its ruins, which until that time had been unknown. He then visited the coasts of the Red Sea and the city of Berenice, discovering the emerald mines of Zubara and made an expedition into the Oasis of Jupiter Ammon. Belzoni refuted Cailliaud's assertion, that he had found the famous Berenice, the great emporium of Europe and India, by subsequent investigations on the spot, and by the actual discovery of the ruins of that great city four days' journey from the place which Cailliaud had taken for Berenice. Belzoni's 'Narrative of the Operations and Recent Discoveries within the Pryamids, Temples, Tombs, and Excavations in Egypt and Nubia; and of a Journey to the Coast of the Red Sea in Search of Berenice; also of another to the Oasis of Jupiter Ammon' (Lond. 1820); accompanied by a folio volume of 44 copper-plate engravings, was received with general approbation. Padua, his native city, requited his present of two Egyptian statues from Thebes with a medal by Manfredini. In the year 1823 this enterprising traveler had made preparations for passing from Benin to Houssa and Timbuctoo, when he died at Gato, on his way to Benin, 3 Dec. 1823. He believed the Nile and Niger to be different streams, and that the Niger emptied its waters into the Atlantic Ocean; opinions which have long been proved to be correct.

Bel'zu, Manuel Isodoro, mä'noo-el ē-sō-dôr'o, Bolivian revolutionist: b. LaPaz, 1808; d. March 1866. He led the revolutions of 1847 and 1848, and was killed in a street battle there while leading a revolt againt Melgarijo.

Bem, Jozef, a distinguished military commander b. Tarnow, in Galicia, 1795; d. Aleppo, Syria, 1850. He was educated at the University of Cracow, and in 1810 was admitted into the corps of cadets founded at Warsaw by Napoleon, afterward entered the horse artillery, and took part as lieutenant in the expedition of the French army to Russia. For the bravery here displayed by him he received the decoration of the cross of the Legion of Honor. On hearing of the outbreak of the Polish revolution, he at once hurried to Warsaw, and during the whole of the Polish struggle he displayed great gallantry and military skill. On the night of 7 Sept. 1831, he held the bridge of Praga with his artillery, but the following morning, on hearing of the agreement concluded with the Russians, withdrew to Modlin. After the fall of Warsaw he went to Prussia, and in 1832 to Paris, where he was occupied partly with political schemes, partly with scientific pursuits. Upon the commencement of the Austrian insurrection in 1848, Bem proceeded there, and took a prominent part in conducting the defense of Vienna against the imperial troops. Toward the end of the year he received a commission from the new Hungarian government to undertake the conquest of Transylvania, and crossed over into that territory at the head of a large army, raised by his own exertions in an incredibly short space of time. His progress here was marked by great successes, with occasional checks; and in March 1849 he succeeded in driving the Austrians, with their Russian auxiliaries, into Wallachia. He subsequently made an incursion into the Banat, which he compelled Puchner to evacuate. Returning to Transylvania, he found himself opposed by overwhelming numbers, and, after several reverses, returned to Hungary, where he took part in the disastrous battle of Temesvar. Shortly after he went to Turkey, became a convert to Mohammedanism, and received an appointment in the Sultan's army under the name of Amurath Pasha.

Bema (Gr. *bēma,* a stem), the name applied in the Greek Church to the sanctuary because of its position above the rest of the church. The iconostasis or choir screen divides it from the main portion of the church.

Bembato'ka, Bay of, a safe and commodious bay on the northwest coast of Madagascar, lying in lat. 16° S. and lon. 46° E. The river Betsiboka, with the Ikiopa, drain into the bay; the former, about 300 miles long, is navigable for small steamers for about 90 miles. Mojanga, on the north side of the bay, is the second town in the island, with about 14,000 inhabitants, Bembatoka being but a village.

Bemberg, bäṅ-bār, **Henri,** French composer: b. Paris, 1861. Besides songs and pianoforte numbers his principal works are 'Le Baiser de Luzon,' a one-act opera (1888); and 'Elaine,' a four-act opera successfully produced in London 1892, and in New York 1894.

Bembecidæ, bĕm-bĭs'ĭ-dē, a family of wasp-like hymenopterous insects with stings, mostly natives of warm countries, and known also as sand-wasps. The female excavates cells in the sand, in which she deposits, together with her eggs, various larvæ or perfect insects stung into insensibility, as support for her progeny when hatched. The insects are very active, fond of the nectar of flowers, and delight in sunshine. *Bembex* is the typical genus of the family.

Bembo, Pietro, a celebrated Italian scholar: b. Venice, 29 May 1470; d. 18 Jan. 1547. At Ferrara he completed his philosophical studies, and after visiting Rome went, in 1506, to the court of Urbino, at that time one of those Italian courts where the sciences stood highest in esteem. In 1512 he went to Rome, where Pope Leo X. made him his secretary. His many labors arising from his office, as well as his literary pursuits, and perhaps too great an indulgence in pleasure, having impaired his health, he was using the baths of Padua when he was apprised of the death of Leo X. Being by this time possessed of several church benefices, he resolved on withdrawing entirely from business, and on passing his days at Padua occupied only with literature and science, and enjoying the society of his friends. Bembo

collected a considerable library: had a cabinet of medals and antiquities, which at that time passed for one of the richest in Italy, and a fine botanical garden. In the year 1529 the office of historiographer of the republic of Venice was offered to him, which he accepted, declining the salary connected with it. At the same time he was nominated librarian of the library of St. Mark. Pope Paul III., having resolved upon a new promotion of cardinals, from the most distinguished men of his time, conferred on him, in 1539, the hat of a cardinal. From that time Bembo renounced the belles-lettres, and made the Fathers and the Holy Scriptures his chief study. Of his former labors he continued only the 'History of Venice.' Two years later Paul III. bestowed the bishopric of Gubbio on him, and soon after the rich bishopric of Bergamo. A collection of all his works appeared in 1729, at Venice, in four folio volumes.

Bembridge Beds, in geology, a fossiliferous division of the upper Eocene strata, principally developed at Bembridge, in the Isle of Wight, consisting of marls and clays resting on a compact, pale-yellow or cream-colored limestone, called Bembridge limestone. Their most distinctive feature is the mammalian remains of the Palæotherium and the Anoplotherium. The Anita group of Colorado and Wyoming, and the gypsum deposits near Paris, are supposed to belong to the same epoch as the Bembridge beds.

Bementite, a mineral occurring at Franklin Furnace, New Jersey, in radiated-stellate masses. It has a grayish-yellow color and pearly lustre, is soft and has a specific gravity of about 3.0. It is a hydrous silicate of manganese, having the approximate formula of $2MnSiO_3.H_2O$. It was named in honor of C. S. Bement, whose unrivaled private collection of minerals is now in the American Museum of Natural History in New York city.

Bemis, Edward Webster, American economist: b. Springfield, Mass., 7 April 1860. He graduated at Amherst College in 1880; was a pioneer lecturer in the University Extension System, 1887–8; professor of economics and history, Vanderbilt University, 1889–92; and associate professor of economics, University of Chicago, 1892–5. In 1897 he became professor of economical science in the Kansas State Agricultural College. He published 'History of Co-operation in the United States' (1888); 'Municipal Ownership of Gas' (1891); 'Local Government for the South and Southwest' (1893).

Bemis Heights, N. Y., a village in Saratoga County, on the Hudson River, famous as the scene of the first battle of Stillwater, 19 Sept. 1777. See also SARATOGA, BATTLE OF.

Bemmel, Peter von, German painter: b. Nuremberg, 1685; d. 1754. He was educated by his father, also an artist, and was employed by the Prince Bamberg, Franz Konrad von Stadion in adorning the walls of his palaces. Many of his paintings are preserved at Bamberg and Brunswick. Of the Bemmel family 14 were prominent as artists.

Ben (Hebrew, son), a prepositive syllable found in many Jewish names, as Bendavid, Benasser, etc., which, with the Jews in Germany, has been changed into the German sohn (son), for example, Mendelssohn, Jacobssohn, etc. In Arabic the plural form Beni occurs in the names of many tribes, as Beni Omayyah and in those of places, as Beni-Hassan.

Ben, Beinn, or **Bhein,** a Gaelic word signifying mountain, and prefixed to the names of many mountains in Scotland north of the Firths of Clyde and Forth, as Ben Nevis and Ben MacDhui. Pen, which occurs in Welsh and Cornish nomenclature is a corresponding term.

Ben Bolt, a noted poem by Thomas Dunn English (1843) set to an old German air. It had been partially forgotten when it was revived by its effective employment in Du Maurier's 'Trilby.'

Ben Hur: A Tale of the Christ, a popular novel, by Lew Wallace, published 1880. The scene of the story is laid in the East, principally in Jerusalem, just after the Christian era. The first part is introductory, and details the coming of the three wise men, Melchior, Kaspar, and Balthasar, to worship the babe born in the manger at Bethlehem. In the course of the narrative, which involves many exciting adventures of Ben Hur, hero, John the Baptist and Jesus of Nazareth are introduced, and Ben Hur is converted to the Christian faith through the miracles of our Lord. The tale has been successfully dramatized.

Ben-Lawers, a huge pyramidal mountain of Scotland, Perthshire, on the north bank of Loch Tay, 3,984 feet above the level of the sea, or 4,004 with the cairn at the top. Many rare Alpine mosses and other plants are found on it.

Ben-Ledi, a Scottish mountain, lying northwest of Callander, Perthshire, reaching the height of 2,875 feet above sea-level. It is somewhat difficult of ascent, but gives a splendid view. High up on it there is a small loch. It is mentioned in Scott's 'Lady of the Lake.'

Ben-Lomond, a Scottish mountain at the western extremity of Stirlingshire, on the east shore of Loch Lomond. The ascent is divided into three great stages, and the top has an elevation of 3,192 feet above sea-level. On the southeastern side it presents a sheer precipice of about 2,000 feet. From the hotel at Rowardennan, on the east shore of the loch, to the summit, the distance is four miles. The lower part is well wooded, and the upper affords excellent healthy pasture. It commands a most extensive prospect of the vale of Stirlingshire, the Lothians, the Clyde, Ayrshire, Isle of Man, Hills of Antrim, and all the surrounding highland territory. Like Ben-Lawers this is one of the botanical gardens of the highlands.

Ben-More (the great mountain), a conical hill between Loch Dochart and Loch Voil, western part of Perthshire, among the Braes of Balquhidder. It rises to an elevation of 3,843 feet above the level of the sea. Several other hills also bear this name.

Ben-Muich-Dhui, bĕn-măk-doo'e, or **Ben-Mac-Dhui,** the second highest mountain in Scotland, situated in the southwest corner of Aberdeenshire, on the borders of Banffshire. It is a granitic mass, rising to the height of 4,296 feet, and forms one of a cluster of lofty mountains, among which are Brae-riach, Cairntoul, Cairngorm, Ben-a-bourd, and Ben-A'an. Its upper parts are bare of vegetation. The view from the top includes the Moray Firth, the

BENARES, INDIA.

hills of Caithness and Sutherland, Ben Nevis, Benmore, etc.

Ben Nevis, a Scottish mountain now ascertained to be the most lofty height in Great Britain, is situated in the southwestern extremity of Inverness-shire, immediately east of Fort William and the opening of the Caledonian Canal into Loch Eil. It rises from the brink of the latter piece of water to the height of 4,406 feet. In clear weather a view can be obtained from its summit across nearly the whole of the north of Scotland from sea to sea. It consists principally of a fine brown porphyry, and contains red granite of a beautiful grain. It has some very lofty precipices, and in its fissures the snow remains unmelted, even in the warmest weather. An observatory occupied by a resident staff was established on the top of the mountain by the Scottish Meteorological Society in 1883.

Ben Nut. See BEN, OIL OF.

Ben, Oil of, the expressed oil of the ben-nut, the seed of *Moringa aptera,* the ben or horse-radish tree of India. The oil is inodorous, does not become rancid for many years, and is used by perfumers and watchmakers.

Benaiah, bĕ-nā'yą, the name of 12 different persons mentioned in the Bible, the most important being a son of Jehoida, a chief priest. He figures as a mighty and valiant warrior who overcame two Moabite champions, slew an Egyptian giant with the giant's own spear, went down into a dry cistern and slew a lion that had fallen in while it was covered with snow, and killed the rebels Adonijah and Joab. He was made commander-in-chief in Joab's place by Solomon.

Benalcazar, bā-nąl-kä'thär, **Sebastian de,** Spanish leader, the first conqueror of Popayan, New Granada: b. about the end of the 15th century, at Benalcaz, in Estremadura, Spain; d. 1550. He set out as a common sailor in the train of Pedrarias, the newly appointed governor of Darien, 1514. The ability and daring of young Sebastian gained for him the confidence of Pizarro, who sent him against the Indian leader, Ruminahui. Sebastian was favored at the moment of engagement by a happy accident; the volcano of Cochabamba suffered an eruption. The frightened Peruvian army fled to Quito and Sebastian then possessed himself of the smoking ruins of this city. From here he passed northward and conquered the territory possessed by a chief named Popayan, whose name he preserved to designate the territory over which the former had held sway. Inflamed by the speeches of an Indian captive, who spake strange words about a chief farther north, anointed with gold powder, Benalcazar and his band determined to visit and conquer this *El Dorado,* or chief of gold. After traversing vast forests, in 1534, he arrived at the country which afterward received the name of New Granada. Arrived there, he found himself forestalled by two other Spanish adventurers, or conquistadores. He returned to Popayan, and was made governor of this province by a decree dated 1538. When La Gasca succeeded in supplanting Diego Pizarro, he deprived Sebastian of his governorship.

Benares, bĕ-nä'rĕz, a division in the northwestern provinces of India, with an area of 10,414 square miles, largely made up of rich cultivated flats on each side of the Ganges. The heat in summer is excessive, but in winter fires are requisite. Garden stuffs, grain of different kinds, flax for oil, and sugar, are the principal objects of cultivation. Rice, for which many parts of the soil seem well adapted, is seldom grown. Muslins, silks, and gauzes, salt, indigo, and opium, are made very extensively. The principal town is Benares. Pop. (1901) 5,368,600, and the Hindus greatly outnumbering the Mussulmans.

Benares (in Sanskrit, *Vārānasī*), a town in Hindustan, northwest provinces, in the division of the same name, on the left bank of the Ganges, from which it rises like an amphitheatre, presenting a splendid panorama of temples, mosques, palaces, and other buildings, with their domes, minarets, etc. Fine ghauts lead down to the river. It is built of freestone, and contains many handsome and highly decorated houses, but the height of the houses and narrowness of the streets give it all the usual inconveniences of an Asiatic town. Kasi, the Splendid, as the Hindus commonly call it, is one of the most sacred places of pilgrimage in all India, being the headquarters of the Hindu religion. To die at Benares is the greatest happiness for a Hindu, because he is then sure of immediate admission into heaven. The number of pious foundations and temples is exceedingly great. There is a continual influx of wealthy pilgrims into the city, and many of the Hindu princes have a town residence here. The principal temple, called Bisheswar, is dedicated to Siva. Aurungzebe built a splendid mosque on the highest ground in the city, and it is the most prominent object from the river side. At the end of the 17th century an observatory was erected in this city by one of the rajahs, which still exists. One of the temples has a great number of sacred monkeys attached to it. Altogether there are about 1,500 Hindu temples. Among the municipal structures are the government college, hospitals, town-hall, asylums, swimming baths, and waterworks. Benares carries on a large trade in the produce of the district and in English goods, and manufactures silks, shawls, embroidered cloth, jewelry, etc. The merchants and bankers are numerous and wealthy. There are few English inhabitants, except the government officers, and the members of the various missions. Kasi was ceded to the East India Company by the Nabob of Oude in 1775. During the mutiny of 1857 a serious outbreak occurred here. Pop. (1901) 203,100. See Sherring, 'Sacred City of the Hindus' (1869).

Benaventé, bā-nä-vĕn'tā, a town of Spain, in the province of Zamora, on the western bank of the Esla, 34 miles north from Zamora. It is overlooked by a huge, half-ruined castle, and is now a dull and poverty-stricken place, built chiefly of mud cottages. It was here that Moore's retreat commenced, 28 Dec. 1808.

Benbow, John, famous English admiral: b. Shrewsbury, England, 1653; d. Jamaica, 4 Nov. 1702. After serving for some time in the navy he entered the merchant service, and fought so desperately against a pirate from Sallee, in one of his trips to the Mediterranean, about the year 1686, as to beat her off, though greatly his superior in men and metal. He re-entered the navy after the Revolution, and was employed in protecting the English trade in the channel, which he did with great effect. His valor and

activity secured him the confidence of the nation, and he was soon promoted to the rank of rear-admiral, and charged with operations against Dunkirk and the French coasts. In 1698 he was sent to put down the pirates in the West Indies, and not long after returning, he again sailed to the West Indies with a small fleet, having accepted a command previously declined by several of his seniors, from the supposed superiority of the enemy's force in that quarter. In August 1702, he fell in with the French fleet under Du Casse, and for five days maintained a running fight with them, when he at length succeeded in bringing the enemy's sternmost ship to close quarters. In the heat of the action a chain-shot carried away one of his legs, and he was taken below; but the moment the dressing had been applied to the wound he caused himself to be brought again on deck, and continued the action. At this critical instant, being most disgracefully abandoned by several of the captains under his command, who signed a paper expressing their opinion that "nothing more was to be done," the whole fleet effected its escape. Benbow, on his return to Jamaica, brought the delinquents to a court-martial, by which two of them were convicted of cowardice and disobedience of orders, and condemned to be shot; which sentence, on their arrival in England, was carried into execution at Plymouth.

Bench, in law, the seat which judges or magistrates occupy officially in a court of justice; also the judges or magistrates sitting together to try cases. The court of common pleas in England was formerly called *Bancus,* the Bench, as distinguished from *Bancus Regis,* the King's Bench. It was also called *Communis Bancus,* the Common Bench, and this title is still retained by the reporters of the decisions in the court of common pleas. Mention is made in the Magna Charta "*de justiciariis nostris de Banco,*" which all men know to be the justices of the court of common pleas, commonly called the Common Bench, or the Bench. Viner, Abr. Courts (n. 2).

Bench-mark, a mark placed upon some permanent object, as a stone or wall, for use in tidal observations and leveling surveys. Its position above the zero of the tide-gauge or other datum level is made a matter of record and any level once established may be readily ascertained at a future period. See also Leveling.

Bench Warrant, a warrant issued by the court before which an indictment has been found to arrest the accused, that he may appear and find bail for his appearance at the trial. Where a bench warrant is directed to the sheriff it cannot be executed by one having only verbal authority from the sheriff, and such arrest does not discharge the recognizance. A bench warrant is defective which does not direct that the party shall be brought before some judge or justice.

Benchers, in England, senior members of the Inns of Court, who have the entire management of their respective inns, the power of punishing barristers guilty of misconduct, and the right to admit or reject candidates to the bar. See also Inns of Court.

Bencoolen, bĕn-koo'lĕn (Dutch, *Benkoelen*), a seaport of Sumatra, on the southwest coast; lon. 102° 19′ E.; lat. 3° 47′ 36″ S. The English settled here in 1685, and in 1690 the East India Company built a fort here, calling it Fort York. In 1825 Bencoolen was yielded up to the Dutch in exchange for the settlements on the Malay Peninsula. A convenient river on its northwest side conveys pepper out of the inland country; but there is great inconvenience in shipping it, by reason of a dangerous bar at the river's mouth. The place, which is almost two miles in compass, is known at sea by a high, slender mountain, which rises in the country 20 miles beyond it, called the Sugar Loaf. It is inhabited by a mixed population. The medium heat throughout the year is from 81° to 82°. Pepper is the chief produce of the adjacent country, which is mountainous and woody. The place is unhealthy and subject to earthquakes; storms are frequent. Pop. 6,000.

Benczur, bĕn'tsoor, **Gyula (Julius),** Hungarian artist: b. Nyiregyhaza, 1844. He was made professor at the Academy of Munich in 1880 and was subsequently director of the Academy of Budapest. His paintings, which are of the School of Piloty, are noted for their splendid coloring. Among the most celebrated are 'Farewell of Ladislas Hunyady' (1867); 'Arrest of Rákóczy' (1701); 'Louis XV. in the Boudoir of Dubarry'; 'Family of Louis XVI. during the Assault on Versailles' (1872), owned by D. O. Mills, New York; 'Baptism of St. Stephen' (1875); 'Bacchanti' (1881); 'The Reconquest' of Buda by Charles of Lorraine' (1888).

Bend, in heraldry, one of the nine honorable ordinaries, containing a third part of the field when charged, and a fifth when plain, made by two lines drawn diagonally across the shield from the dexter chief to the sinister base point. The bend sinister differs only by crossing in the opposite direction, diagonally from the sinister chief to the dexter base. It indicates illegitimacy.

Ben'da, Franz, German violinist: b. Jungbunzlau, Bohemia, 1709; d. Potsdam, 1786. He exhibited, while a boy, a great desire to learn the violin, which he could gratify in no other way than by joining a band of strolling musicians. He found means, however, to acquire an extraordinary mastery of the instrument, and in 1732 entered the service of Frederick the Great, then prince-royal, with whom he remained the rest of his long life. He founded a school of violinists, whose method of playing was entirely original and quite effective. He also published some excellent solos for the violin.

Benda, Georg, German musician, the most distinguished of a notable musical family: b. Jungbunzlau, Bohemia, 1721; d. Köstriz, 1795. He was bandmaster to the Duke of Gotha (1748–87), and in this period produced several operas and cantatas, such as 'Ariadne auf Naxos' and 'Medea.'

Bendalou, Paul, a soldier of the American Revolutionary army: b. Montauban, France, 15 Aug. 1755; d. Baltimore, Maryland, 10 Dec. 1826. In October 1776 he embarked at Bordeaux for the United States, as a volunteer in the cause of liberty, and, on reaching the headquarters of Washington, received a lieutenant's commission. Transferred to the command of

Pulaski, he was captain of the first company in his famous legion at the siege of Savannah. There he carried off the field the body of the generous Pole, and preserved, also, the standard of the legion, which had been wrought and presented by the wives and daughters of Maryland. He was quartermaster-general, with the rank of colonel, in the Maryland militia during the War of 1812, and for many years United States marshal for the circuit and district courts of Maryland, his official conduct, from first to last, being marked with exactness and integrity.

Bendemann, bĕn'dĕ-man, **Eduard,** German painter: b. Berlin, 3 Dec. 1811; d. Düsseldorf, 27 Dec. 1889. As early as 1832 his great picture of the 'Captive Jews' was exhibited at Berlin, and in 1837 he gained the gold medal at Paris. In 1838 he was appointed professor of the Academy of Art at Dresden. Here he was intrusted with the execution of the larger frescoes in the palace, and on these his fame chiefly depends. In 1858 he succeeded his father-in-law as director of the Düsseldorf Academy, a post which he held until 1867. He afterward produced several large canvases and frescoes, some of which are among his best works. Tytler, 'Modern Painters and their Paintings' (1899).

Bender, Louis Prosper, Canadian-American physician and author: b. Quebec, 30 July 1844. He graduated at McGill University in 1865, after having interrupted his studies by a service in the medical department of the Union army during a portion of the American Civil War. In 1884 he settled in Boston, Mass., where he established himself in homœopathic practice. His writings include 'Literary Sheaves,' or 'La Litterature au Canada-Français' (1881); 'Old and New Canada, 1753–1844,' 'Historic Scenes and Social Pictures, or the Life of Joseph François Perrault' (1882), etc. He has frequently contributed to American magazines.

Bender, a city of Russia, in the government of Bessarabia. It is situated on the Dniester, and is a straggling place, chiefly consisting of low houses and mere huts. It formerly possessed a strong fortress, but this was dismantled in 1897. Its commerce is important. After being several times taken from the Turks by the Russians, it has belonged to Russia since the Peace of Bucharest, in 1812. Pop. (1897) 32,934.

Bendigo, formerly SANDHURST, Australia, a city in Bendigo County, Victoria, on Bendigo Creek, fully 100 miles north-northwest of Melbourne, with which it has direct railway communication. It is one of the chief cities in the colony and an important railway centre. Along one side of its main street (Pall Mall) there are fine buildings of brick and stone, and facing these, in Rosalind Park, are the elegant government buildings and the law courts, which together cost nearly £80,000. Other buildings worthy of mention are the handsome town-hall, mechanics' institute, with library and school of mines; free library; temperance, masonic, and other halls; hospital, benevolent asylum; some fine banks; Anglican, Wesleyan, Presbyterian, and other churches; Roman Catholic Cathedral, in course of erection; art gallery, jail, state and other schools, etc. The public parks comprise, besides the Rosalind Park, the fine Botanic Gardens and two others largely used for sports. The streets are lighted by gas and electricity, and there is an excellent water-supply from large reservoirs near the town. The chief industry of the district is gold-mining, which gives employment to 5,000 miners. Other important industries are brewing, iron-founding, stone-cutting, granite-polishing, tanning, and the manufacture of pottery, bricks, tiles, cordials, etc. Agriculture and viti-culture are carried on in the district, and there is a trade in wine and fruits. Bendigo was founded at the time of the gold discovery in 1851. Nearly £70,000,000 worth of gold has been obtained here, much of it from quartz reefs. Pop. (1901) 31,020. See Mackay, 'History of Bendigo' (1901).

Bendire, bĕn-dē'rę, **Charles Emil,** German-American military officer and ornithologist: b. Darmstadt, Germany, 27 April 1836; d. 1897. He came to the United States in 1852, and entering the army in 1854, served through the Civil War, becoming a captain in the 1st Cavalry. After the war he was transferred to the West, and was retired 24 April 1886. During his stay in the West he applied himself to the study of ornithology, and collected a vast amount of material in various branches of natural history. In 1870 he began to collect the eggs of North American birds, which finally numbered more than 8,000 specimens, and this collection he presented to the United States National Museum. He is the author of 'The Life Histories of North American Birds, with Special Reference to their Breeding Habits and Eggs.'

Bendzin, bĕnd'zen, the capital of a district in Russian Poland, in the government of Piotrkow, situated on the Black Przemsza, on a branch of the Warsaw & Vienna R.R. Its chief industry is the zinc works, under government control; there are also coal mines in the vicinity. Pop. 21,200.

Bene, bĕn'e, the plant that furnishes oil of sesamum.

Ben'edek, Ludwig von, Austrian military officer: b. Odenburg, Hungary, 14 July 1804; d. Gratz, 27 April 1881. He fought against the Italians in 1848, and afterward against the Hungarian patriots. He distinguished himself at Solferino in the campaign of 1859; and in the war with Prussia in 1866 commanded the Austrian army till after his defeat at Sadowa, when he was superseded.

Benedetti, bā-nĕ-dĕt'te, **Vincent** (COUNT DE), French diplomatist of Italian extraction: b. Bastia, Corsica, 29 April 1817; d. Paris, 28 March 1900. He was educated for public service, held consulates in Cairo, Palermo, Malta, and Tunis; and as secretary of the Congress of Paris in 1856, drew up the protocols of the treaty then agreed upon. In 1861 he was appointed ambassador to Italy, and in 1864 to Prussia. In 1870 great excitement was aroused throughout Europe by the publication in the London *Times* of the alleged draft of a secret treaty between France and Prussia. The authenticity of the document was not denied. The French government declared that although Benedetti had written the document, he had done so at the dictation of Bismarck. At the same time Benedetti was under orders to protest against the candidature of Prince Leopold of the house of Hohenzollern for the crown of Spain. He became so importunate in trying to carry out these orders that he was forbidden to seek further interviews with King William. The refusal of

the king to again receive Benedetti gave great offense in France, and was made a pretext for declaring war within a few days. After the fall of the empire, Benedetti withdrew from public life. In 1871 he published a pamphlet charging Bismarck with the whole responsibility of the secret treaty, to which the latter made a vigorous reply. Benedetti was author of 'Ma Mission en Prusse' (1871); and 'Studies in Diplomacy,' an English translation of which appeared in 1895.

Benedetto, da Majano, Italian architect and sculptor: b. Florence in 1442; d. there, 1498. He began his career as a worker in wooden mosaic, and with his brothers, Giovanni and Giuliana, he executed the 'Madonna dell Ulivo.' His own work, represented in the 'Madonna,' far excels the work of his brothers. His most celebrated work as an architect was the Palazzo Strozzi, began in 1489. In 1490, he carved the busts of Giotto and Squarcilupo, in the Duomo at Florence. In 1491, the monument to Filippo Strozzi was erected in Santa Maria Novella, a work which Strozzi had commissioned Benedetto to make before his death. It is the *chef-d'œuvre* of the sculptor, and one of the most notable sculptures of the 15th century.

Benedicite, bĕn-ę-dĭs'ĭ-tę, the song of the 'Three Children' in the fiery furnace, as given in the Apocrypha and the Septuagint version of Daniel, which is a part of the Roman Breviary in the office of lauds; it is also a part of the Anglican morning prayer, to be used when the Te Deum is not sung, usually from Septuagesima to Easter and during Advent.

Benedick, sometimes spelled **Benedict,** a married man; from the Latin *benedictus* (a happy man), and a skit on the order of St. Benedict, famous for their ascetic habits, and, of course, rigidly bound to celibacy. Shakespeare, in 'Much Ado About Nothing,' avails himself of this joke in making Benedick, the young lord of Padua, "rail against marriage," but afterward marry Beatrice, with whom he falls in love.

Benedict, Saint, the founder of the first religious order in the West: b. Norcia, Italy, 480; d. 21 March 543. In the 14th year of his age he retired to a cavern situated in the desert of Subiaco, 40 miles from Rome, and in 515 drew up a rule for his monks, which was first introduced into the monastery on Monte Cassino, in the neighborhood of Naples, founded by him (529) in a grove of Apollo after the temple had been demolished. This gradually became the rule of all the western monks. The abbots of Monte Cassino afterward acquired episcopal jurisdiction, and a certain patriarchal authority over the whole order. Benedict, with the intention of banishing idleness, prescribed, in addition to the work of God (as he called prayer and the reading of religious writings), the instruction of youth in reading, writing, and ciphering, in the doctrines of Christianity, in manual labors (including mechanic arts of every kind), and in the management of the monastery. With regard to dress and food, the rule was severe but not extravagant. Benedict caused a library to be founded, for which the aged and infirm brethren (*ordo scriptorius*) were obliged to copy manuscripts. By this means he contributed to preserve the literary remains of antiquity from ruin; for though he had in view only the copying of religious writings, yet the practice was afterward extended to classical works of every kind; and the learned world is indebted for the preservation of great literary treasures to the order of St. Benedict.

Benedict, the name of fourteen Popes.

Benedict I., succeeded John III. 575; d. 578, and was himself succeeded by Pelagius II.

Benedict II., succeeded Leo II. 684: d. 685, and was succeeded by John V.

Benedict III., succeeded Leo IV. 855. During his pontificate, the Saracens were ravaging Apulia and Campania. D. 858, and was succeeded by Nicholas I.

Benedict IV., succeeded John IX. about 900. He crowned Louis, son of Boson, king of Italy. D. 903, and was succeeded by Leo. V.

Benedict V., succeeded John XII. 964, and was appointed by the Romans in opposition to Leo VIII. The Emperor Otho, supporter of Leo, appeared before Rome with an army, reduced the city to famine, and a new assembly of the clergy declared to be null the election of Benedict, who was exiled. D. 965.

Benedict VI., succeeded John XIII. 972. After the death of the Emperor Otho I., the Romans imprisoned Benedict, who was strangled in the castle of St. Angelo, in 974. Owing to the mistake of later chroniclers in confusing Dominus Papa with a supposed proper name, Donus II. appears in many lists of the Popes between Benedict VI. and Benedict VII. Geisebrecht, in his 'Year-Book of the German Kingdom under Otho II.,' has clearly shown that no such Pope as Donus II. ever existed.

Benedict VII., of the family of Conti, elected in 975. During his pontificate, the Emperor Otho II. came repeatedly to Rome, where he died in 984. Benedict died about the same time, and was succeeded by John XIV.

Benedict VIII., of the same family, succeeded Sergius IV., in 1012. In 1016, the Saracens from Sardinia having landed on the coast of Tuscany, Benedict attacked and defeated them. He crowned the Emperor Henry II., and his wife, in the Church of St. Peter. D. 1024, and was succeeded by his brother, John XIX.

Benedict IX., a relative of the two preceding Popes, succeeded John XIX. in 1034. He was then very young, some say only 18 years old. He was deposed in 1048, and died in a convent in 1054, being succeeded by Leo IX.

Benedict X. was elected by a faction after the death of Stephen IX., in 1058; but the Council of Siena nominated Nicholas II. Benedict did not submit till the following year, when Nicholas came into Rome. D. 1059.

Benedict XI., a Dominican, succeeded Boniface VIII., in 1303. Contemporary historians speak highly of his character and virtues. He died 1304, and was succeeded by Clement V.

Benedict XII., Jacques Fournier, a native of France, succeeded John XXII., in 1334, the Popes residing then at Avignon. He put a stop to many abuses in the distribution of ecclesiastical patronage, enforced discipline among the monastic orders, and insisted that temporal rulers should observe their compacts with the Holy See. D. 1342, and was succeeded by Clement VI.

Benedict XIII., Cardinal Orsini, succeeded Innocent XIII., in 1724, but it was with difficulty that he coud be made to accept the pontificate. Benedict lived with the greatest frugality, and has been called more a monk than a Pope. He managed, however, to transact an extraordinary number of affairs. His great fault was his implicit confidence in Cardinal Coscia, who much abused it. D. February 1731. His works were published in 1728, in three volumes folio. He was succeeded by Clement XII.

Benedict XIV., Prospero Lambertini: b. Bologna, 1675; d. 3 May 1758. He applied himself with success to the canon and civil law, and became advocate to the consistory at Rome. Afterward he was appointed *promotor fidei,* and wrote a valuable work on the 'Ceremonies used in Beatifications' (1734). He was passionately fond of learning, of historical researches, and monuments of art, and also associated with the distinguished men of his time; among others with Father Montfaucon, who said of him, "Benedict has two souls; one for science and the other for society." He also made himself familiar with the best poetical works, whereby his mind became elevated and his style animated. Benedict XIII. made him, in 1727, bishop of Ancona; in 1728 cardinal, and in 1732 archbishop of Bologna. In every station he displayed great talents, and fulfilled his duties with the most conscientious zeal. He opposed fanaticism even at the risk of his own safety, defended the oppressed, and expressed himself with the greatest frankness to Clement XII. without losing his favor. When, after the death of Clement XII. in 1740, the election of a new Pope in the conclave was retarded by the intrigues of Cardinal Tencin, and the cardinals could not agree, Lambertini, with his usual good nature, said to them, "If you want a saint, take Gotti; if a politician, Aldobrandi; if a good old man, myself." These words, thrown out in a humorous manner, operated on the conclave like inspiration, and Lambertini, under the name of Benedict XIV., ascended the papal throne. His choice of the ministers and friends whom he assembled around him does the greatest honor to his judgment. The condition of the Church and of the Roman court had not escaped his penetration. Since the Reformation princes no longer trembled at the thunders of the Vatican. The power of the Popes in temporal affairs had notably declined, and Lambertini knew that respect for the papal authority could be maintained only by a wise moderation. He constantly regulated his measures by this principle, and thus succeeded, even in difficult circumstances, in satisfying not only the Catholic but even the Protestant princes. The sciences were a special object of his care. He established academies at Rome; promoted the prosperity of the academy at Bologna; caused a degree of the meridian to be measured; the obelisk to be erected in the Campus Martius; the Church of St. Marcellino to be built after a plan projected by himself; the beautiful pictures in St. Peter's to be executed in mosaic; the best English and French works to be translated into Italian; and commanded a catalogue of the manuscripts contained in the Vatican library (the number of which he had enlarged to 3,300) to be printed. His government of the papal states did equal honor to his wisdom. He enacted severe laws against usury, favored commercial liberty, and diminished the number of holidays. His piety was sincere, yet enlightened and forbearing. He strove to maintain purity of doctrine and of morals, giving in his own character the most praiseworthy example. The sole reproach brought against him by the Romans was that he wrote too much and governed too little. His works compose, in the Venice edition, 16 volumes folio. The most important of his works is that on the Synods, in which we recognize the great canonist.

Benedict Biscop, Anglo-Saxon ecclesiastic: b. of a noble Northumbrian family in 628 or 629; d. Wearmouth, 12 Jan. 690. He spent the first years of his life at court, but at the age of 25 he relinquished this manner of life and accompanied Wilfrid on a pilgrimage to Rome in 653. Here he lived for more than 10 years, when he returned to England; but not very long after again went to Rome, on a mission intrusted to him by Alchfrid, king of Northumbria. On his way back he stopped at Lerins in Provence, where he remained for the next two years, making himself acquainted with the rules of monastic life in the monastery of Lerins, of which he had become a member. In 668 he made a third journey to Rome, where he arrived just at the time when the Pope was about to appoint some one to fill the see of Canterbury, which was then vacant. Having fixed upon Theodore, a Cilician monk, he requested Benedict to accompany him to England to assist him in securing the favor of the Anglo-Saxons, which as a foreigner he might have difficulty in doing. Benedict agreed to do this, and was presented with the abbacy of St. Peter's in Canterbury; but at the end of two years he resigned the abbacy and again went to Rome. On this occasion he returned to England with a valuable collection of books and a large number of relics, which he had accumulated during his previous visits to Rome. With these he proceded first to Wessex with the intention of remaining there, but finding that the king of Wessex was dead he turned northward to his native Northumbria, and there he was fortunate enough to secure the favor of King Egfrid. From him he received a donation of land at the mouth of the Wear, on which he founded the monastery of Wearmouth. In 678 he made his fourth journey to Rome, and brought back additional stores of books for his library, as well as pictures, images, glass for windows, etc., with which he decorated the monastery he had founded. He was now presented by Egfrid with a further grant of land on the other side of the Wear, where he founded another monastery, that of Jarrow, dependent on the monastery at Wearmouth. During the remainder of his life he continued to live in the latter monastery, except on the occasion of a fifth voyage to Rome, made in 685, and from which he derived as before valuable additions to his various collections. It is chiefly by these collections that his services to learning are to be

estimated, and there can be no doubt that his great pupil, the "Venerable Bede," who was a monk in the monastery of Jarrow, was immensely indebted to them for the learning he acquired.

Benedict, David, American Baptist clergyman and historian: b. Norwalk, Conn., 10 Oct. 1779; d. 1874. He was pastor at Pawtucket, R. I., for 25 years, and preached till over 90 years of age. Among his chief works were 'History of All Religions'; 'Fifty Years Among the Baptists,' 'History of the Donatists.'

Benedict, Frank Lee, American novelist: b. Alexander, N. Y., 6 July 1834. Among his numerous novels are 'John Worthington's Name'; 'Miss Van Kortland' (1870); 'Her Friend Lawrence' (1879); 'The Price She Paid' (1883). A collection of his verses 'The Shadow Worshipper and Other Poems' appeared in 1857.

Benedict, Sir Julius, German-English pianist and composer: b. Stuttgart, 1804; d. London, 1885. In 1821 he went to Dresden to study under Weber, and two years later became conductor at a Vienna theatre. His first opera, 'Giacinta ed Ernesto,' was produced in Naples in 1829 without success. He took up his residence in England in 1835, and was knighted in 1871. He was for many years conductor at the Norwich festival, and during a number of seasons acted as operatic conductor in London, both for English and Italian opera. His principal works are the operas, 'The Gipsy's Warning' (1838); 'The Bride of Venice' (1843), 'The Crusaders' (1846); 'The Lily of Killarney' (1862), founded on Boucicault's 'Colleen Bawn,' and 'The Bride of Song' (1864); the cantatas, 'Undine' (1860) and 'St. Cecilia' (1866); the fine oratorio 'St. Peter' (1870); and the cantata 'Graziella' (1882).

Benedict-Beuern, bĕ'nĕ-dĭkt-boi'ĕrn, formerly an abbey situated in the Bavarian circle of the Iser, about 40 miles distant from the city of Munich, on the descent of the mountains toward the Tyrol. The convent was founded as early as 740, and was abolished in 1803. The fine abbey church still remains. The Bavarian government has here a depot for army horses, and a veterinary establishment; and there is also a residence for invalids.

Benedic'tine, a liqueur originally prepared by the Benedictine monks of the abbey of Fécamp, in Normandy, consisting of spirit (fine brandy) containing an infusion of the juices of plants, and said to possess digestive, antispasmodic, and other virtues, and to have prophylactic efficacy in epidemics. It somewhat resembles chartreuse and has been made in the same way since 1510. See LIQUEUR.

Benedictines. From the 6th to the 10th century almost all the monks in the West might be so called, because they followed the rule of St. Benedict of Norcia. The rules which at that time the monasteries in Spain and France received from their bishops, as well as the rule of the Irish St. Columba, were essentially the same as those of St. Benedict; and in the progress of his order the monasteries in Spain and France, as well as those of the order of Columba, united themselves with it. Monte Cassino, the magnificent primitive monastery of the Benedictines, became the model of all others. At that time the monasteries, having no common superiors, were under the immediate control of the bishops in their respective dioceses, and differed from one another in many qualifications of the primitive rule. Not even the color of their dress was the same. The disciples of Columba wore white garments like the first Benedictine nuns, who originated in France in the 6th century. After the unions which took place at a later period, all the members of this order wore black, as the founder is said to have done. The decline of monastic discipline after the 8th century occasioned the reforms of Benedict of Aniana in France, the renewed inculcation of the old rule, and the adoption of new ordinances suited to the times, by the Council of Aix-la-Chapelle (817), as well as the particular rules and fraternities of the celebrated monasteries in France, Germany, and England, which in those barbarous times became seats of civilization and finally the institution of the Cluniacs, a new branch of the Benedictines, which proceeded from the convent of Clugny in Burgundy, founded in the year 910. The Benedictine monasteries, in the Middle Ages, were often asylums in which science took refuge and found protection. In place of the discordant and uncertain rules which had hitherto existed, the Cluniacs made fixed regulations concerning the hours of worship, the obedience, discipline, and common government of all the monasteries belonging to their order, which were soon imitated in all Europe. In the 12th century their order contained 2,000 monasteries, whose luxury frequently called for reforms, and finally became the chief cause of their decline. The remains of the Cluniacs united themselves in the 17th century, under the patronage of Richelieu, with the Benedictine fraternities of St. Vannes and St. Maurus, the latter of which, founded in 1618, had in the beginning of the 18th century 180 abbevs and priories in France, and acquired by means of its learned members, such as Mabillon, Montfaucon, and Martène, merited distinction. To this family belong those new orders established on the foundation and observing the rule of St. Benedict, which have originated since the 11th century, and are distinguished from the proper Benedictines by their dress, names, and particular regulations; for example, the Camaldulians, the monks of Vallombrosa, the Sylvestrians, the Grandimontenses, the Carthusians, the Cœlestines, the Cistercians, and Bernardines, the Trappists, and the monks of Fontevraud. The Benedictine monasteries never constituted one society, constitutionally regulated and governed under an aristocratical or monarchical form; on the contrary, a great many monasteries which descended from the old Benedictines were compelled by the Council of Trent to unite themselves gradually into particular fraternities. Among these the Benedictines of Monte Cassino, of Monte Vergine, and Monte Oliveto (who called themselves *Olivetans*) in Italy and Sicily; those of Valladolid and Montserrat in Spain; those of Hirschau and Fulda in Germany, and that of Mölk in Austria, deserve particular notice on account of the extent of their possessions, the magnificence of their churches, and the mildness of their rules. To the fraternity of Mölk (or Melk), which still exists, but accommodated to the spirit of the times, the rest of the Benedictine convents in Austria are joined. Many of the nunneries of this order are reserved for the

nobility, because the places in them are equal to the most lucrative benefices. During the first French revolution the monasteries of the Benedictines along with all other monastic orders were abolished; but the Benedictines have since partially re-established themselves in France. In England the Benedictines were an important body at the dissolution of the monasteries, having then 186 abbeys, priories, and nunneries, besides many smaller houses. At present there are eight Benedictine abbeys in England, besides an extensive establishment at Fort Augustus in Scotland, comprising an abbey and college. In the United States there are 13 abbots, 545 priests, 133 clerics, and 345 lay brothers in the order. The Benedictines have charge of 16 colleges in the United States.

Bibliography.—Chateaubriand, 'Monks of the West'; Taunton, 'English Black Monks of Saint Benedict'; Digby, 'Ages of Faith.'

Benediction, the act of blessing, of wishing to a person or thing the grace of God. It has always existed as a custom among Jews and Christians. The Jewish priests bestowed benedictions upon the people when they remained obedient to the law, and maledictions when they neglected it. In the Catholic Church the term is generally applied to the religious public service at which the priest makes the sign of the cross over the congregation with the ostensorium containing the consecrated Host. The Anglo-Saxon term "blessing" is now commonly used to express the benediction invoked with prayer, sign of the cross, and holy water upon religious articles such as prayer-books, holy pictures, rosary-beads, etc. In Protestant churches the benediction is usually given in words similar to those prescribed by Moses to Aaron. It is often accompanied with laying on of hands, especially in the celebration of marriages, the ordination of pastors, the confirmation of converts, and the baptism of children.

Benedic'tus, the song of Zacharias used in the Roman breviary at lauds and also in the Anglican morning service.

Benedix, bā'nĕ-dĭks, **Roderich,** German playwright and actor: b. Leipsic, 21 Jan. 1811; d. 26 Sept. 1873. In 1831, he became an actor, and in 1838 staged his first play 'Das Bemuste Haupt.' He was connected with the management of several theatres at Cologne and Frankfort-on-the-Main. Among his plays are 'Dr. Wespe'; 'Die Hochzeitreise'; 'Die Männerfeinde'; 'Der Liebesbrief'; 'Der Prozess'; and 'Die Sonntagsjäger.' His dramatic works were collected and published at Leipsic in 27 volumes. He has written also concerning German folklore.

Benefice (Lat. *beneficium*), an ecclesiastical living, originally including every species of preferment, as well as those to which dignities and offices were attached, namely, bishoprics, deaconries, and prebends, as the lesser sort, namely, rectories, vicarages, perpetual curacies, and endowed chaplainries; but in its popular acceptation it includes only the latter class, and the distinction is recognized in recent acts of Parliament. The name is derived from the *beneficium* of the Romans, a grant of any kind to a subject by the sovereign. It was afterward the designation of a grant of land by any large proprietor to a retainer or follower as a reward of services, being the same that later was denominated a fief or fee, the essential incident of which was perpetuity, that is to say, it was a permanent stipendiary estate held of a superior, and usually subject to some condition indicating vassalage. The principle of the feudal tenure was applied, in the Middle Ages, to ecclesiastical benefices to this extent, that they were held of the Pope, as a superior lord, though these benefices had not the hereditary character of a fee, so far as respected the office or dignity connected therewith, and the lands or emolument conferred by a grant were usually attached to such office or dignity, and on the death of the incumbent, reverted to the ecclesiastical superior who was entitled to appoint a successor. This, at all events, was the claim of the Popes, though it was the subject of contest between them and the principal European sovereigns.

Benefit of Clergy, in English criminal law, the *privilegium clericale,* exemption of the clergy from penalties imposed by law for certain crimes. This privilege no longer exists, but it was for many centuries an important element in the administration of criminal law, and still is a curious and instructive part of the history of England. The origin of this privilege was a claim made by the ecclesiastics at an early period for the entire exemption of their order from the jurisdiction of the common law courts. In scattered instances the right was recognized in the colonies of Carolina and Virginia. An Act of Congress passed 30 April 1790 provided that benefit of clergy shall not be allowed for any offenses punishable by death. See Pollock and Maitland, 'History of English Law' (2d ed., 1899).

Beneke, bā'nĕ-kĕ, **Friedrich Eduard,** German philosopher: b. Berlin, 17 Feb. 1798; disappeared 1 March 1854; found drowned in a canal at Charlottenburg, 4 June 1856. After serving as a volunteer in the campaign of 1815, he studied theology and philosophy at Halle and Berlin, giving special attention to the English philosophers. In 1820 he lectured in the University of Berlin as a private teacher, but the continuance of his lectures was forbidden in 1822, on account of his departure from the philosophical principles of Hegel. He then taught for a few years in Göttingen, but, returning to Berlin in 1827, received permission to lecture in the university, in which he was elected extraordinary professor of philosophy after Hegel's death, in 1832. The starting point of his system is, that philosophy must be founded upon a strict and careful examination of the phenomena of consciousness. He thus adopts, in mental philosophy, the method observed by Bacon in the natural sciences, and his system is described as an empirical psychology. He was a voluminous writer and among his chief works 'Erfahrungsseelenlehre, als Grundlage alles Wissens, in ihren Hauptzügen dargelegt' (1820); 'Neue Grundlegungen zur Metaphysik' (1822); 'Pragmatische Psychologie, oder Seelenlehre in der Anwendung auf das Leben' (1850).

Benet, Stephen Vincent, American military officer: b. St. Augustine, Fla., 22 Jan. 1827; d. 22 Jan. 1895. He was graduated at the United States Military Academy in 1849, and assigned to the Ordnance Department; was assistant professor of ethics and law at the Military Academy in 1859–61; instructor of ordnance in 1861–4; became brigadier-general and chief of

ordnance in 1874; and was retired in 1891. He was author of 'Military Law and the Practice of Courts Martial' (1862); 'Electro-Ballistic Machines and the Schultze Chronoscope' (1866); and a translation from the French of Jomini's 'The Campaign of Waterloo.'

Beneven'to, a province of Italy, with an area of 680 square miles, and an archiepiscopal city. The surface of the province is hilly but the soil fertile in corn, fruit, and pasture. Game is very abundant, and cattle, grain, wine, oranges, and dead game are exported. Benevento was originally called Maleventum; but this was changed to Beneventum by the Romans when they founded a colony here after the defeat of Pyrrhus. Before it came into the hands of the Romans it belonged to the country of the Samnites. The Lombards in 571 made it a dukedom, which, long after the extinction of the Lombard kingdom, remained independent. At a later period it fell into the hands of the Saracens and Normans. The city, however, was not conquered by the latter, because Henry III. had given it to the Pope, Leo IX. In 1418 Benevento became part of Naples, but was given back to the Pope by Ferdinand I. In 1798 it was conquered by the French, and handed over to Naples; and then in 1806 Napoleon made a present of it to his minister Talleyrand, who received thence the title of Prince of Benevento. In 1815 it was restored to the Pope, and finally with Naples was annexed to the kingdom of Italy. The city of Benevento is situated on a hill between the rivers Sabato and Calore, is surrounded with a wall, has narrow dirty streets and some interesting buildings. Since 969 it has been the see of an archbishop. Few cities in Italy deserve so much attention on account of the antiquities which they contain as Benevento. Almost every wall consists of fragments of altars, sepulchres, columns, and entablatures. Among other things the well-preserved, magnificent triumphal arch of Trajan, built in 114, deserves particular mention. It is now called *Porta Aurea* (the golden gate), and is a gate of the city. The cathedral is a beautiful building in the Lombard-Saracenic style. Pop. (1901) 24,647.

Benevolence, a forced loan or contribution, by which the kings of England were wont, without any sanction from Parliament, to levy money from their subjects. Such benevolences had been denounced by Magna Charta; and even Richard III. had allowed the only Parliament of his reign to enact a statute declaring them illegal; but they still continued under some shape or other till finally abolished by the Bill of Rights in 1689.

Benezet', Anthony, American Quaker philanthropist; b. St. Quentin, France, 31 Jan. 1713; d. Philadelphia, 3 May 1784. His family came to Philadelphia from London in 1731. He earnestly opposed the slave trade, advocated the emancipation and education of the colored population of the colonies, and himself opened an evening school for negroes. Of his numerous tracts, distributed gratuitously, the most important are: 'A Caution to Great Britain and Her Colonies, in a Short Representation of the Calamitous State of the Enslaved Negroes in the British Dominion' (1767); 'Historical Account of Guinea' (1772); 'A Short Account of the Society of Friends' (1780); 'Dissertation on the Christian Religion' (1782); 'Observations on the Indian Natives of this Continent' (1784).

Benfey, bĕn'fi, **Theodor,** German Orientalist and comparative philologist: b. of Jewish parents, Nörlen, Hanover, 28 Jan. 1809; d. 26 June 1881. He studied in Göttingen, Munich, Frankfort, and Heidelberg, devoting himself especially to classical and comparative philology. In 1862 he was appointed to the chair of Sanskrit and comparative philology in the University of Göttingen, which he held till his death. One of his earliest literary efforts was a translation of 'Terence' (Stuttgart 1837); after this, however, he turned his attention almost exclusively to comparative philology, Oriental languages, especially Sanskrit, and mythology. In his 50 years devoted, with rare enthusiasm and persistency, to linguistic studies, he did more than any other scholar to enlarge the boundaries of Sanskrit philology. In comparative philology, though an adherent of Bopp, he deviated from his master in deriving all Indo-European words from mono-syllabic primitive verbs. This conception depends on his theory of the origin of stem suffixes. These, he holds, are almost all derived from a fundamental form, *ant,* which appears in the present participle of verbs. To support this view he assumes the most violent permutations of sounds, which set all phonetic laws at defiance. For his theory, see his 'Lexicon of Greek Roots' (1839); 'Short Sanskrit Grammar' (1868), and numerous essays. In Sanskrit he laid a foundation for the true study of the Veda by editing the 'Sâma Veda' (1848), with glossary and translation; and this work he continued by a scholarly translation of the first *mandala* of the Rig Veda in his magazine, 'Orient und Occident' (1863–4). His Vedic grammar, for which he had been collecting materials for many years, was left unfinished. He also published a 'Complete Sanskrit Grammar, Crestomathy and Glossary' (1854), and a 'Sanskrit-English Dictionary' (1866). In comparative folklore his principal work is a translation of the 'Panchatantra,' (1859). It is accompanied with elaborate notes, and the first volume consists entirely of an introduction in which he traces the course of these Indian stories in their wanderings and transformations both in eastern and western literatures.

Benga, an African tribe, living on the Spanish island, Corisco, off the western coast, having moved from the interior within a few generations. The American Presbyterian Board of Missions have Christianized many of the Bengas and translated books into their language, which closely resembles the Kamerun and Dualla.

Bengal (Hind. *Bangālā,* Skt. *Vangalam,* from *Vanga*). In the widest application the name presidency of Bengal is extended to the whole of British India, except what is under the governors of Madras and Bombay; so that it includes the provinces of Ajmir and Meirwara, Coorg, and Berar, which are under the direct administration of the governor-general; the lieutenant-governorships of Bengal, the Northwest Provinces and the Panjab; the chief commissionerships of Assam, Central Provinces, and Oudh, besides various native states, etc. But the name is now usually restricted to that portion which is under the lieutenant-governor of Ben-

gal, and which occupies the northeast of India, comprising the following divisions:

Divisions	No. of dists.	Area in sq. m.	Population in 1891
Burdwan	6	13,855	.....
Presidency	5	12,029	16,145,310
Rajshahi	7	17,428	8,003,740
Dacca	4	15,000	.....
Chittagong	4	12,118	13,965,230
Patna	7	23,647	.....
Bhagalpur	5	20,492	24,284,370
Orissa	5	9,053	3,865,020
Chota Nagpur	4	26,966	4,645,590
Total	47	150,588	70,909,260

The total population in 1901 amounted to 74,713,020.

The district composed of the first five of the above divisions forms the province of Bengal proper; Patna and Bhagalpur form the province of Behar. Besides these the lieutenant-generalship includes four native states under British protection, namely, Cooch Behar, Hill Tipperah, Chota Nagpur (part of), and Orissa (part of), having a total area of 37,515 square miles, and a population in 1891 of 3,428,390.

The general physical character of Bengal is that of a practically level country, though it is surrounded with lofty chains of mountains; the northern part rests on the terraces of the Himalaya Mountains, the east is bounded by the Garos or Garrows chain, and the west is ribbed with offsets of the Vindhya Mountains. It is intersected in all directions by rivers, the principal of which are the Ganges and Brahmaputra, whose annual inundations render the soil which they reach extremely fertile. In those tracts where this advantage is not enjoyed the soil is thin, seldom exceeding a few inches in depth. The most inhospitable part of Bengal is what is called the Sunderbunds (from being covered with the soondru or sunder tree), that portion of the country through which the numerous branches of the Ganges seek the sea, or the space lying between the Hoogly River and Chittagong, about 150 miles from east to west, and about 160 from north to south. This district is infested with tigers, is traversed in all directions by water-courses or nullahs, and interspersed with numerous sheets of stagnant water called jheels, which abound with fish and waterfowl, and are much resorted to by crocodiles.

Geology and Minerals.—In the northern part of Bengal, at the foot of the Himalayas, is a band of Tertiary formation; south from which, and along the course of the Ganges, more especially east from that river, and including the greater part of its delta and that of the Brahmaputra, the country is wholly composed of alluvium or modern detritus. Calcutta stands upon strata of the transition series, which stretch west into Bahar, and are flanked north and south by tracts of crystalline formation. In the Garo Hills coal, iron, and limestone are found; and nitre effloresces on the surface around Calcutta and elsewhere. Mineral springs are not numerous.

Rivers.— The principal rivers, besides the Ganges and Brahmaputra, the latter of which enters the province at its northeast extremity, and falls into the Bay of Bengal near the principal embouchure of the Ganges, are the Soobunreka, which falls into the Bay of Bengal, in lat. 21° 35′ north, south-southwest of the Hoogly; the Cosi or Coosee, which rises near Khatamandoo in Nepal, and falls into the Ganges near Bhagalpur, in lat. 25° 20′ N.; and the Dumooda, which, rising in Bahar, falls into the Hoogly about 22 miles below Calcutta. There are numerous other streams of less note, mostly tributaries of the Ganges and Brahmaputra, or their larger affluents.

Climate.— There is more regularity in the changes of the seasons in Bengal than perhaps in any other part of India; but it is subject to great extremes of heat, which, added to the humidity of its surface and the heavy dews that fall, render it generally unhealthy to Europeans. The prevalence of hot winds, which are sometimes loaded with sandy particles, is another source of disease. The seasons are distinguished by the terms hot, cold, and rainy. The hot season continues from the beginning of March to the end of May, within which period the thermometer frequently rises to 100°, sometimes to 110°. The month of September is also often intensely hot, and when so is the most unhealthy period of the year to natives as well as Europeans, owing to the profuse exhalations from stagnant waters left by the inundations, and from a rank decaying vegetation. The rainy season commences in June, and lasts till October. During the first two months of this period the rain is frequently so heavy that five inches of water have fallen in one day, the annual average being from 70 to 80 inches. It is in this season that the inundations take place, and that the Ganges overflows its delta, covering the land with its waters for more than 100 miles. The cold season, the most grateful and healthy of any to Europeans, continues from November to February, during which period north winds prevail, with a clear sky.

Forests.— In Bengal, as in India generally, great attention has been paid of late to the management of forests. Great destruction is caused among forests by fires, which are sometimes the result of accident, but more frequently made purposely by the natives in pursuance of a system of jungle cultivation that appears to prevail throughout India. This consists in cutting down and burning a patch of forest, and raising a crop in the open space, no plowing or digging being necessary. The next year this patch is abandoned, and another treated in the same way. Another cause of destruction is the wastefulness of those who use the timber. The sunder-trees, for example, which furnish the best wood for the boats which are built in great numbers throughout Eastern Bengal, have been cut down in so reckless a manner that the western parts of the Sunderbunds have already been to a large extent exhausted. In order to limit the destruction that goes on by such proceedings certain portions of the Indian forests are reserved and placed under the entire control of the government, and additions are made to these reserves every year. Of the total 11,669 square miles of forest in Bengal, in 1896 5,877 were reserved and 3,437 protected.

Animals.— Among the wild animals are tigers, elephants, boars, bears, wolves, foxes, jackals, hyenas, leopards, panthers, lynxes, hares, deer, buffaloes, antelopes, and monkeys. The most formidable of all these animals (and more so even than the lion) is the tiger, which here attains its utmost size, and perhaps also its greatest ferocity. The domestic animals include native horses, thin, ill-shaped animals, and not

well adapted for any kind of labor; cattle, of a very inferior breed, being extremely small and miserable looking; sheep likewise of diminutive size, with very coarse hairy wool, but when well fed their flesh is excellent. Hogs and goats are also plentiful, and buffaloes are domesticated for the sake of their milk. Reptiles are numerous and formidable, including gavials, a kind of crocodile, with which the larger rivers are infested; and among the serpent tribe, many of which are highly poisonous, the deadly cobra-de-capello. Turtles, frogs, and lizards also abound, with swarms of mosquitoes. The turtles are chiefly procured from the island of Cheduba, in the Bay of Bengal. Fish are so exceedingly plentiful as to be within the reach of almost every class of inhabitants. Game, poultry, and water-fowl of all descriptions abound in Bengal, particularly ducks, of which there is a great variety, and most of them of a superior kind. The gigantic crane, commonly called the adjutant, from the stately air with which he struts about, frequents the towns in considerable numbers, performing the office of scavenger by clearing the streets of garbage, in consideration of which duty he enjoys an entire immunity from all disturbance; his principal food is offal, toads, lizards, serpents, and insects. Crows, kites, sparrows, and other small birds are numerous.

Agriculture.— The staple crop of Bengal is rice, which is cultivated so as to produce three harvests in the year — spring rice, autumn rice, and winter rice. The last of these harvests is by far the most important. Besides sufficing for the wants of the population the rice crop leaves a large surplus for exportation. Oil seeds are also largely cultivated, chiefly mustard, sesamum, and linseed. The jute plant (*pât*) has long been cultivated, and in recent times the cultivation of it has greatly extended. It will grow on almost any description of land. Part of this crop is cultivated by those who use or manufacture it, almost all the Hindu farmers weaving cloth from it. It is now manufactured also in large mills under European management, and jute goods are now an export of some importance, though not nearly so much so as jute in the raw state for manufacture in Europe. The sunn plant, somewhat resembling the Spanish broom, is now quite extensively cultivated and exported to Great Britain, affording excellent material for both sails and cordage, and being made into fishing nets by the natives. Cotton is grown over all India, but the best of the herbaceous kind is raised in Bengal and on the Coromandel coast; the finest grows on light rocky soil. The cotton of India is generally inferior to that of the United States; but this is believed to be wholly owing to careless cultivation, and to the slovenly manner in which it is prepared for the market. The cultivation of the date palm and the manufacture of date sugar are carried on to a considerable extent, forming a profitable business for the cultivator. This kind of sugar forms an article of export. The sugar cane is cultivated, but not nearly to such an extent as might be expected. There are two kinds of sugar cane, a yellow hard cane, about the thickness of a finger; the other much thicker and deeply stained with purple. The latter is the most productive, but the most troublesome to cultivate, and therefore avoided by the more indolent farmers. Tobacco, which requires a light soil, is grown in three different situations,— in rich spots of land contiguous to the farmer's house,— in high land suitable for the growth of sugar cane,— and on the banks of rivers. The betel leaf, famous for its intoxicating quality and largely used over all India on that account, is cultivated in what is called a *voroj* or fort, and is carefully protected from the sun and wind. Indigo being one of the principal articles of foreign commerce with Bengal, is extensively cultivated in that province. The opium production of Bengal was a government monopoly under Mohammedan rule, and has been retained as such by the British. All the juice of the opium poppy must be sold to the government at a fixed price. This cultivation is carried on in the west of Bengal in the divisions of Chota Nagpur and Patna. Orchards of mango trees are to be found in every part of Bengal, the fruit being in general demand during the hot months. The cinchona tree and the tea plant have both in recent times been added to the agricultural products of Bengal; the former in the native state of Sikkim, the latter especially in Cooch Behar (Darjiling), Chittagong, and Chota Nagpur.

The luxuriance of vegetation in Bengal is perhaps unequaled in any other part of the world. The cultivation of the land requires little effort, and large crops are obtained without the application of any other manure than the sediment or mud deposited by the inundations. It is doubtful, however, how far this facility is good, since it seems to have had the effect of preventing all attempts at improvement either in the science of agriculture itself or in the implements used in its practice. The Indian plow is of wretched construction, having neither colter nor mold-board, and in some districts it wants even the share, while the animals by which it is dragged, two oxen or cows, are miserable half-starved creatures. The reaping hook (*kastya*) is a most inefficient implement,— the curved or cutting part of the blade is six inches long by one and a half broad, with teeth like a saw — the handle is about four and a half inches long. The *dengki*, by which the husks are separated from the grain, is another wretched implement, and so ill adapted to its purposes that one fifth part of the whole grain is sacrificed in the operation. Nearly all the other implements in use are of an equally rude and imperfect description. Rotation of crops and the use of fallows are unknown to the farmers of India; the land is generally in an exhausted condition, and the enclosures everywhere bad. Grain is trodden out by oxen, and stacking corn is unusual, the corn being often left exposed to the weather. Irrigation, however, is well understood,— necessity giving rise to invention,— and is accomplished by the most ingenious and efficient means.

Manufactures.—The principal manufacture of Bengal is that of cotton goods, including cotton piece goods of various descriptions, calicoes, thread, and sail-cloth. Muslins of the most beautiful and delicate texture were formerly made at Dacca, a city in this province, but the manufacture is almost extinct. «Some of these fabrics,» says Tavernier, «were so fine that they could hardly be felt in the hand, and the thread when spun was scarce discernible.» In Ward's 'History' of the Hindus this character in the muslin of Dacca is confirmed; though perhaps in both cases it is a little exaggerated. «When

this muslin is laid on the grass," says the latter, "and the dew has fallen on it, it is no longer discernible." The extraordinary fineness and beauty of India muslins, manufactured under the disadvantages of rude machinery and ill prepared material, is attributed to the exquisitely fine sense of touch possessed by the Hindus, and to the hereditary continuance of a particular species of manufacture in families through many generations.

The modern decay of the muslin manufacture of India has been owing in a great measure to the successful competition of Great Britain, and to the circumstance of British fabrics being subject to no duty in Bengal, while high duties were levied on the fabrics of Bengal in Great Britain. These duties are now abolished. Large quantities of a coarse cloth, manufactured from jute, are made in various districts of Bengal. Sericulture is carried on more largely in Bengal than in any other part of India, and silk-weaving is still a leading industry in many of the districts; but of late years there has been a serious decline. One branch of this industry, however, seems more flourishing than some others, namely, the cultivation of *tasar* or wild silk, the worm that produces it feeding upon the leaves of the sal and other forest trees. On the other hand, various new manufactures, carried on by machinery, are rising up. The most important of these are the industries connected with jute, cotton, and sugar. These are already affording employment to many thousands, and the natives are said to show great aptitude for factory work. The jute mills alone employ nearly 40,000 hands.

Commerce.— The commerce of Bengal, both internal and external, is very large. Multitudes of native boats and other craft navigate the rivers. The imports to Calcutta from the interior have been valued at over $13,000,000, consisting of rice, tea, jute, indigo, linseed, mustard seed, wheat, etc. The foreign trade is large and increasing. Almost the whole of it passes through Calcutta, and the value of it annually is over $275,000,000, over $170,000,000 being exports. The most important exports are opium, jute, indigo, oil seeds, tea, hides and skins, and rice; the chief import is cotton piece goods. The foreign trade is chiefly with Great Britain, China, the Straits Settlements, France, the United States, and Ceylon.

Finance.— The total revenue of the lieutenant-governorship of Bengal in the year ending 31 March 1898, was (calling the rupee 25 cents), $101,442,465, and the total expenditure $51,620,525. The surplus goes to meet the expenses of the general government of India. The principal sources of revenue are land, salt, opium, excise, stamps, and customs, assessed taxes, etc.

Education, Social, and Domestic Conditions, etc.— It is one of the consequences of the extreme povery of the bulk of the population of Bengal, that education should be there at a very low ebb. The proportion of boys of school-going age attending school is only about 28.6 per cent; of girls 2 per cent. The first rudiments of education are often given in small schools called *páthsálás*, in which the fees are extremely low, and in which only reading, writing, and arithmetic are taught. The greater number of these, although private establishments, receive aid from government. In the primary schools the principle of keeping the standard of instruction as low as possible is adhered to; and this is intended to be done till the whole of the poorer classes shall have been brought under some kind of instruction. In the meanwhile, all who have time or means for learning more are encouraged to resort to schools of a better class. With this view a system of intermediate schools was established in 1875 between the primary and what are called the middle schools, and this step has been rewarded with a satisfactory measure of success.

In addition to the schools already mentioned there are various educational institutions of a higher kind connected with government. The highest of these institutions is the Calcutta University, with the four faculties of arts, law, medicine, and engineering. Affiliated to the university are a number of general and professional colleges, in one of which all who have passed the university entrance examination and wish to proceed to a degree must enroll themselves. The majority of educated Bengal youths, according to official information, resort to two professions, the public service and the law, in consequence of which many cannot obtain employment. With a view to open out other lines of employment the government is endeavoring to establish technical and industrial schools of a superior kind in many places. A healthy ambition is said to exist among the natives of Bengal to raise themselves by education. Almost every Bengalee youth who can afford the means aspires to an English education as one of the main objects of his life. One result of the Prince of Wales' visit to Bengal at the end of 1875 was that the wealthier natives raised subscriptions to commemorate the event by founding educational institutions. The secondary schools are generally divided into "English" and vernacular. Those in which English forms part of the regular course of study of all the scholars, or at least of all in the higher classes, are reckoned as English; if English is optional only, they are reckoned as vernacular. In the common languages of the country there were till lately almost no books to be had; but the Bible, or parts of it, has now been printed in the various languages and widely circulated, as well as a number of other works.

The private houses of Bengal are huts, with pentroofs constructed of two sloping sides which meet in a ridge. One hut of this kind serves the poor man for himself, family, and cattle; wealthy men increase the number of houses without altering the plan, and without having any communication between the different apartments. The walls are generally made of mud, and the floor is raised a foot or two above the level of the plain, to prevent it being flooded in the rainy season, which, however, is not always accomplished. The frames of the houses consist of bamboos tied together — wooden posts and beams being used in the construction of the houses of the wealthy only. The huts collectively sufficient for the accommodation of a family are usually surrounded by a common fence. Farmers have in general larger and better houses than people living in towns. A rich farmer will sometimes have as many as 12 or 14 huts within his enclosure. The food of the class just above the rank of common laborers consists chiefly of rice, wheaten flour, fish, vegetables, and butter, with various condiments and seasonings.

In the case of the laborer there is neither flour, fish, vegetables, nor butter, the chief food of that class being a coarse description of rice.

History.— The English first got a firm footing in Bengal about 1644, when, through the influence of an English medical man named Boughton, a favorite of the emperor of Delhi, the East India Company obtained permission to locate themselves at Hugli or Hoogly, some 28 miles above Calcutta. In 1686 the company's factors, having had a rupture with the Moslem commander at the place where they were located, removed to Calcutta, then the village of Chuttanutty, where they continued to carry on their trade. In 1700 the viceroy of Bengal, being in want of money to dispute the succession to the Mogul throne, obtained a large sum from the company for the township on which their factory stood at Calcutta, and some adjacent lands. Seven years afterward, namely in 1707, Calcutta was erected into a presidency, and the foundation of British power in India laid — presenting a striking proof of the energy of the British character, there having been settlements in India by the Portuguese, Dutch, French, and Danes, previous to, and contemporary with, the location of the English in that quarter of the world; but the mighty achievement of obtaining the supremacy in that vast empire could, it appears, be accomplished only by the British. For nearly half a century the company pursued a peaceful and profitable commerce; but at the expiration of that period, 1756, Calcutta was attacked and taken by the Soubahdar of Bengal, who threw the Englishmen he found there, 147 in number, into a dungeon, the well-known "black-hole" of Calcutta, where 123 of them perished in 11 hours. In the ensuing year Calcutta was retaken by Lord Clive — an event which was followed by a series of victories on the part of the British, that terminated in the entire conquest of India. In consequence of unprecedented drought great scarcity of food prevailed in 1873 and 1874, but the prompt measures of the government were sufficient to prevent any widespread mortality. A bill conferring upon agricultural tenants a transferable interest in their holdings and protecting them against eviction was passed in 1885.

Bibliography.— Barton, 'Bengal'; Hunter, 'Statistical Account of Bengal'; Rawlinson, 'England and Russia in the East'; and official 'Reports on the Administration of Bengal,' appearing annually.

Bengal, Bay of, that portion of the Indian Ocean between Hindustan and Farther India, or Burma, Siam, and Malacca, and extending south to Ceylon and Sumatra. It receives the Ganges, Brahmaputra, and Irrawadi. Calcutta, Rangoon, and Madras are the most important towns on or near its coasts. On the west coast there are no good harbors, but the east coast has a considerable number, among them being Aracan, Cheduba, Negrais, Mataban, and Syriam. On account of the extreme heat the rate of evaporation is very high, sometimes amounting to an inch per day. The tide sometimes rises to the height of 70 feet. In summer the northeast monsoon prevails, and in winter the southwest monsoon.

Bengal, or **Bengola, Light,** a firework, giving a vivid and sustained blue light. It is used for signals at sea. It is composed of six parts of nitre, two of sulphur, and one of antimony tersulphide. These are finely pulverized and incorporated together, and the composition pressed into earthen bowls or similar shallow vessels.

Bengali, bĕn-gä'lę, the dealer's name, originating in a mistake as to their origin, for any of several of the beautiful little African waxbills (q.v.), bred and sold as cage-birds; especially the "blue-bellied finch" (*Estrilda bengala*), which is ashy-brown above, with the wing quills brown, and the sides of the head, the throat and whole lower surface azure blue, spotted under and near the wings. They add to this charming dress lively manners and an agreeable song. Their requirements in the cage are like those of a canary.

Bengali Era, The, one of the chronological eras of the Hindus, supposed to have been derived from the Hegira. The Hindus, however, use the sidereal year, and the Mohammedans the lunar, hence the Mohammedan epoch is at present some nine years in advance of the Bengali.

Bengali, or **Gaura, Language,** one of the five modern languages of Hindustan, which are derived from the ancient Sanskrit. Its name is derived from Banga, the Sanskrit name of the country, with the Arabic article *al* suffixed; the whole being corrupted into the present form. Gaura is derived from Gaur, the name of the ancient metropolis. It is spoken by 42,000,000 of British subjects, of whom about one fourth speak also some other dialect. It extends over the regions on the lower Ganges, from Patna down to its delta, being purest in the province of Bengal and in the eastern regions. This language consists of an aboriginal basis, with which a much greater portion of Sanskrit and Pracrit has been admixed than with any one of its cognates; with a considerable addition of Afghan, Persian, Arabic, Portuguese, Malay, and English words. Although the Sanskrit element predominates as regards the words, the grammatical forms of the language differ more from the Sanskrit than the forms of the Greek, Latin, Gothic, and Persian; most of the flexions of nouns and verbs having been lost, and their places being supplied by auxiliary words and by circumlocution. Notwithstanding this, it admits in the higher style, many of those forms which are intelligible only to more cultivated persons. There are no forms of gender, and only few feminine words are formed by the suffixes *i* and *ini*. There are seven cases made by suffixes — nominative, accusative, instrumental, dative, ablative, genitive, and vocative. The plural of nouns is made by suffixing *dig* to the genitive singular. It delights in compound words, formed especially by means of a sort of past participle; elegant Sanskrit compounds being unidiomatic. There is but one conjugation, whose radical is the imperative. Compound tenses are made by the auxiliaries, meaning to do, to be, to become. The singular and plural of verbs are often confounded; the plural with a singular noun denoting respect, the singular with the plural noun being used in speaking to inferiors. There are three simple moods, infinitive, indicative, imperative; four others being periphrastic, the potential, optative, inchoative, and frequentative. Any verb is conjugable negatively by the suffix *nā*. The system

of writing is that of the *dêvanāgari* of the Sanskrit language, but the forms of letters are more broken and twisted. B and v, however, are written by one character, and the characters of the sounds, s, z, sh, are interchangeable.

No book written in Bengali appeared before 1500 A.D. After the settlement of Moslems in Gaur, the Voisyas and Soodras (agricultural and servile castes) began to study Persian, to gain a livelihood, and were well rewarded by the conquerors. Except the stories of Krishna's study, the rules of arithmetic in verse, and a few other elementary books, the vernacular literature was very poor, until Rajah Krishnachandra Roy Bahadoor restored Hindoo literature in India, by bringing in pundits and endowing schools. Owing to the abundance of Sanskrit books, and the prejudice of most Brahmins against the Bengali, this was neglected until 1800, when the college of Fort William was founded, and the study of Bengali was made imperative and collateral to the Sanskrit. Many Bengali works have since been printed at Calcutta and Serampore. The first native newspaper was published at Serampore in 1818. Considerable change has been made since in the diction and composition of this language, which continues to be enlarged and ennobled, by being capable of borrowing indefinitely from the venerable Sanskrit mother. Gilchrist, H. P. Forster, Carey, W. Morton, Hunter, Mohun Persaud, Tahur, Tarachand Chukruburti, Sir G. C. Haughton, have published Bengali English dictionaries and vocabularies, and Ram Comul Sen has translated Todd's edition of Johnson's English dictionary into Bengali.

Bibliography.— Beames, 'Comparative Grammar of the Modern Aryan Languages of India'; 'Grammar of the Bengali Language'; Cust, 'The Modern Languages of the East Indies'; Dutt, 'The Literature of Bengal'; Nicolls, 'Manual of the Bengali Language'; Yates Wingler, 'Introduction to the Bengali Language.'

Bengazi, bĕn-gä'zę, or **Benghazi,** a town in North Africa, capital of the vilayet Barca, on the east coast of the Gulf of Sidrah. Next to Tripoli it is the most important seaport on this coast. The harbor is fast silting up, and admits only small vessels; but there is still a considerable trade, cattle, corn, etc., being exported, especially to Malta. It is sometimes identified as the ancient Hesperides and in the time of Ptolemy III. was called Berenice. Pop. about 15,000.

Bengel, bĕng'ĕl, **Johann Albrecht,** German theologian and philologist: b. Winnenden, Würtemberg, 24 June 1687; d. Alpirsbach, 2 Nov. 1752. He studied at Stuttgart and Tübingen, and became pastor and head of a school at Denkendorf. He especially applied himself to the critical study of the Greek Testament, of which he published an edition in 1723. Among his other works are 'Apparatus Criticus Novi Testamenti,' a work of great value for its suggestive condensed comments, which first appeared in 1742, and has been several times reprinted, etc. An attempt has been made to adapt his 'Gnomen' to English readers in the 'Critical English Testament,' by Blackley and Hawes (1866).

Benger, bĕng'gĕr, **Elizabeth Ogilvy,** English historical writer: b. Wells, Somersetshire, 1778; d. London, 9 Jan. 1827. She early displayed a turn for literature, but her straitened means preventing her from gratifying this taste by the purchase of books, she was in the habit of perusing the opened books in a bookseller's window, and would return day after day to see if the page had been turned over. In 1802 she removed with her mother to London. Her first literary attempts, including a poem on the abolition of the slave trade, and two novels, attracted little attention; but she was more successful with her 'Memoirs of Mary Queen of Scots,' and of 'Elizabeth Queen of Bohemia.' She also wrote the Lives of Anne Boleyn, Mrs. Elizabeth Hamilton, and John Tobin, the dramatist. Her chief merits are a clear style and industry in the collection and arrangements of facts.

Bengough, John Wilson, Canadian poet: b. Toronto, 5 April 1851. In 1873 he established the *Grip,* a humorous weekly in Toronto. His political cartoons in this paper were highly artistic. He is also widely known as a lecturer and a poet. His publications include: 'Ontario, Ontario' (a famous election song); 'Grip's Cartoons' (1875); 'Popular Readings, Original and Selected' (1882); 'Caricature History of Canadian Politics' (1886); 'Motley: Verses Grave and Gay' (1895); 'The Up to Date Primer: A First Book of Lessons for Little Political Economists' (1896); etc.

Benguela, bĕn-gā'lą, or **Benguella,** a district belonging to the Portuguese on the western coast of South Africa, forming one of the three provinces of Angola; bounded north by the province of Loanda, south by that of Mossamedes, and west by the Atlantic Ocean. The interior of the country is mountainous, the direction of the elevated lands being from northeast to southwest. It is well watered, being intersected by numerous rivers and streams. Its vegetation is luxuriant, and it possesses extensive forests. Its products are those of tropical Africa generally. Coffee grows wild. The soil in parts is well adapted for the production of grain; but little is grown. The larger animals of Africa are numerous, such as lions, elephants, and hippopotami. The minerals include copper, sulphur, lead, gold, and silver. The only town worth mention is the seaport, Benguela, founded in 1617 as San Felipe de Benguela, which is pleasantly situated and fairly healthy. It exports rubber, coffee, skins, ivory, etc. A short railway starts from the town, the population of which is about 3,000. The population of the province may amount to several millions.

Benha'dad, the name of three kings of Syria, all mentioned in Scripture. The most conspicuous is the second, who was equally remarkable for his arrogance in prosperity and his craven spirit in adversity. He first sent an insolent message to Ahab, claiming himself and all his subjects as his slaves; and after Ahab encountered and defeated him, Benhadad sent a message abjectly begging his life. Ahab was impolitic enough to grant it, and Benhadad, disregarding all his promises, proved a bitter enemy to his successor. He was murdered about 890 B.C.

Benham, Andrew Ellicott Kennedy, American naval officer: b. New York, 10 April 1832; d. at Lake Mahopac, N. Y., 11 Aug. 1905. He entered the navy in 1847; served in the East India and the Home squadrons in 1847–52;

attended the United States Naval Academy, 1852–3; was commissioned lieutenant in 1855; lieutenant-commander in 1862; commander, 1866; captain, 1875; commodore, 1885; and rear-admiral in 1890, and retired in 1894. During the Civil War he served in the South Atlantic and West Gulf Blockading squadrons. In April 1893 he commanded one of the divisions in the great naval display at New York; in 1894, as commander of a squadron at Rio de Janeiro, Brazil, he forced the commander of the insurgents' squadron to raise the blockade of the city and to discontinue firing on American merchant vessels; and in 1898 was naval prize commissioner in Savannah, Ga.

Benham, Henry W., American military engineer: b. Cheshire, Conn., 1816; d. 1 June 1884. He was graduated at the United States Military Academy in 1837; and became brevet major-general, United States army. He commanded the engineer brigade and laid several pontoon bridges under fire during the Chancellorsville battles; constructed and commanded the defenses at City Point; devised the picket shovel; and made many improvements in the construction of pontoon bridges, in which he was a recognized expert. After the war he was in charge of the Boston harbor sea wall and later of the New York harbor defenses; retired from active service, 1882.

Benham, William, English clergyman and author: b. West Meon, Hampshire, 15 Jan. 1831. He was vicar of Addington, 1867–73; of Margate, 1873–80; of Marden, 1880–2; and rector of St. Edmund's, Lombard Street, London, from the year last named. He was appointed canon of Canterbury in 1885. He has published among other works: 'The Church of the Patriarchs' (1867); 'Catharine and Crawfurd Tait'; 'How to Teach the Old Testament' (1881); 'Annals of the Diocese of Winchester' (1884); 'A Short History of the Episcopal Church in America' (1884); 'The Dictionary of Religion' (1887); 'Life of Archbishop Tait,' with Davidson (1891). He has edited the 'Ancient and Modern Library of Theological Literature.'

Beni, bā'nẹ, one of the nine departments of Bolivia, South America. It is in the northeastern part, with an area of 100,580 square miles. It is a level, fertile region, growing cocoa, coffee, sugar-cane, and tobacco, and containing vast forests of rubber-trees, and rich deposits of gold. Pop. 26,750; chief town, Trinidad.

Beni, a river of South America, formed by the junction of several streams flowing eastward from the Andes in about 18° south. Its course is north and northeast through Bolivia; and on the border of Brazil it unites with the Mamoré to form the Madeira, by which its waters are carried to the Amazon. It receives several tributaries of importance, the chief being the Madre de Dios from Peru, and it is navigable throughout a great part of its course. Its length is about 850 miles.

Beni-Hassan, bā'nẹ-häs'san, a village of middle Egypt, on the east bank of the Nile, remarkable for the rock-hewn tombs in the neighborhood, supposed to have formed a necropolis for the chief families of a city, Hermopolis, on the opposite bank, and exhibiting interesting paintings, and hieroglyphics. The paintings portray incidents in the ancient life of Egypt, and the inscriptions are of great value for the light they throw upon the history of the 12th dynasty.

Beni-Israel, bā'nẹ-ĭz-rā-ĕl, a race in the west of India (the Konkan sea board, Bombay, etc.), who keep a tradition of Jewish origin, and whose religion is a modified Judaism. By some persons they are supposed to be a remnant of the 10 tribes. Their number is estimated at 5,000, and in feature they resemble the Jews of Arabia.

Beni Israel, a small antelope. See MADOQUA.

Beni-Khaibir (sons of Keber), an Arabic tribe supposed to be a remnant of the ascetic tribe of Rechabites.

Beni-Mzâb, a race or tribe of Berbers that dwell in the Sahara, near its northern border, and recognize the supremacy of the French. They number some 60,000, of whom about 15,000 are in the town of Ghardaya. They are peacefully disposed, and numbers of them are employed in Algiers in various occupations.

Beni-Suef, bā'nẹ-swāf, the capital of a province of the same name in Egypt; is pleasantly situated on the left bank of the Nile, 70 miles south from Cairo, with which it is connected by railway. It is the entrepôt for the produce of the Fayoum, and contains cotton mills, controlled by the state, and alabaster quarries. Pop. 10,085.

Benicarlo, bā-nẹ-kär-lō', a seaport of Spain, in Valencia, in the province of Castellon, surrounded with walls, having an old castle, a fine church, with an octagonal tower, and some manufactures, etc. It is chiefly noted as being the place of export of the red wines called by its name which are produced in the surrounding country. These are chiefly sent to Bordeaux to be mixed with clarets, or to England to be manufactured into port. Pop. (1897) 7,900.

Benic'ia, Cal., a city in Solano County, at the mouth of the Sacramento and San Joaquin rivers, and on the Southern P. R.R.; 30 miles northeast of San Francisco. It contains a United States arsenal and barracks; St. Augustine College (Roman Catholic); St. Catherine's Convent (Roman Catholic); extensive shipyards, and large agricultural, tanning, cement, and meat-packing plants. The city was once the capital of the State. Pop. (1900) 2,751.

Benicia Boy, a popular name for a once noted pugilist, John C. Heenan, whose home was in California. His fight with Sayers attracted wide-spread attention.

Benin, bĕ-nĭn', Africa, a negro country or kingdom, on the Bight of Benin, Gulf of Guinea, extending along the coast on both sides of the Benin River, and to some distance inland, but the limits are not accurately known. The capital is Benin, a town which at one time had some 15,000 inhabitants, but is now said to have greatly decreased in population. It is situated about 50 miles from the coast, and consists of clay-built houses neatly thatched with reeds, straw, or leaves. The coast, which now belongs to the British, is thickly indented with estuaries, some of them of considerable breadth and studded with islands. The country is flat for some distance inland, when it begins gradually to rise till it attains a height of over 2,000 feet. It is very well wooded, and being likewise well watered, it is rich in all the vegetable produc-

tions of the tropics. Cotton is indigenous, and is woven into cloth by the women. Sugar-cane of good quality is grown; and yams, plantains, maize, rice, etc., are cultivated. The religion is Fetishism. The climate, especially at the mouths of the rivers, is very unhealthy. There is a considerable trade in palm oil and other products.

Benin, Bight of, Africa, a large bay on the west coast, forming a portion of the Gulf of Guinea, and extending from the Niger delta westward to about the river Volta.

Beniowsky, Moritz August von, bā-nē-ŏff'-skĭ, mō'rĭtz ow'goost fŏn, Hungarian adventurer: b. Verbova, Hungary, 1741; d. 23 May 1786. The son of án Austrian general, he served as lieutenant in the Seven Years' war and in the Polish war against Russia. In 1769 he fell into the hands of the Russians, who exiled him to Kamchatka. Availing himself of a knowledge of navigation, he succeeded in saving from wreck the vessel which was to convey him to Siberia. This feat won for him the sympathy of the governor of Kamchatka, which was still more strengthened by his proficiency in chess, and he appointed him tutor of his children. One of his pupils fell in love with him, and with her father's consent they were married. In 1771 he effected his escape from Kamchatka with the assistance of his wife, who, although she had since learned that he had another wife in Hungary, followed him to Formosa and Moscow, at which latter place she died. On his return to Paris he undertook to found a French colony at Madagascar, where he arrived in June 1774, founded his colony, and in 1775 was proclaimed king by some of the native tribes, while his wife was proclaimed queen. The governor of the Isle of France refusing to supply him with men to support his state, Beniowsky applied directly to the French government, but without success. Disgusted with the French and their colonies, he now entered the Austrian service, and was commander in the battle of Habelschwerdt, in 1778, against the Prussians. His subsequent efforts to interest the English government for Madagascar were fruitless, but with the support of a wealthy firm of Baltimore, U. S. A., he effected a landing in Madagascar, but was killed soon after in a conflict with troops from the Isle of France. He wrote his autobiography in French; it was translated into German by George Forster, into English by William Nicolson, and into various other languages. Kotzebue dramatized his character and career in his play entitled 'The Conspiracy in Kamchatka.'

Benish' Days, days (Mondays, Wednesdays, and Saturdays) on which the modern Egyptians don the *benish* (whence the name), or ordinary garment, relax their religious duties, and engage in pleasures.

Benjamin, the youngest son of Jacob and Rachel (Gen. xxxv. 16–18). Rachel died immediately after he was born, and with her last breath named him Ben-oni, "son of my sorrow"; but Jacob called him Benjamin, "son of my right hand." He was a great comfort to his father, who saw in him the image of the wife he had buried, and of Joseph, whose loss he also mourned. He could hardly be persuaded to let him go with his brethren to Egypt. The tribe of Benjamin, small at first, was almost exterminated in the days of the Judges, but afterward it greatly increased. On the revolt of the 10 tribes Benjamin adhered to the camp of Judah; and the two tribes ever afterward closely united. King Saul and Saul of Tarsus were both Benjamites.

Benjamin, Charles Henry, American engineer: b. Patten, Me., 29 Aug. 1856. He graduated at the University of Maine, and was professor of mechanical engineering there, 1880–6. Since 1889 he has been professor of the same subject in the Case School of Applied Science, Cleveland, Ohio. Publications: 'Notes on Heat and Steam' (1894); 'Notes on Machine Design' (1895); 'Mechanical Laboratory Practice' (1898); 'Evolution of the Machine Tool' (1898); 'Power Losses in Machine-Shops' (1900); 'Development of Fly Wheels' (1900); and monographs in the 'Transactions' of the American Society of Mechanical Engineers, Vols. XVIII.–XXI.

Benjamin, Judah Philip, American lawyer: b. St. Croix, West Indies, 11 Aug. 1811; d. Paris, 7 May 1884; of English parentage and of Jewish faith. He was educated at Yale College; admitted to the bar in New Orleans in 1832; and elected to the United States Senate in 1852 and 1858. At the beginning of the Civil War he resigned from the Senate and declared his adhesion to the State of Louisiana. In 1861 he accepted the office of attorney-general in the Cabinet of Jefferson Davis, and afterward became successively Confederate secretary of war and secretary of state. After the war he went to London, England, where he was admitted to the bar in 1866. He gained a successful practice, and in 1872 was formally presented with a silk gown. He wrote a 'Treatise on the Law of Sale of Personal Property' (1868).

Benjamin, Marcus, American editor and compiler: b. San Francisco, 17 Jan. 1857. He graduated at Columbia School of Mines, 1878, and was chemist at the United States Appraiser's Store, New York, 1883–5. Since 1883 he has been a reguar contributor to 'Appleton's Annual Cyclopædia' and the 'Cyclopædia of American Biography,' and edited a number of the Appleton guides and handbooks. He was on the editorial staff of the 'Standard Dictionary'; 'Encyclopædic Dictionary'; 'Johnson's Universal Cyclopædia'; and the 'International Year Book'; and has translated Bertholet's 'Explosive Materials' (1883). Since 1896 he has been connected with the United States National Museum.

Benjamin, Park, American journalist, poet, and lecturer: b. Demerara, British Guiana, 14 Aug. 1809; d. New York, 12 Sept. 1864. He studied law, but later took up literary work, helping to found 'The New World' in New York. His poems, of a high order of merit, have never been collected. 'The Contemplation of Nature,' read on taking his degree at Washington College, Hartford, 1829; the satires, 'Poetry' (1843); 'Infatuation' (1849); 'The Nautilus'; 'To One Beloved'; and 'The Old Sexton' are among his works. He was associated editorially with Epes Sargent and Rufus W. Griswold.

Benjamin, Park, American lawyer, editor, and miscellaneous writer, son of the preceding: b. New York, 11 May 1849. A graduate of the United States Naval Academy (1867), he served on Admiral Farragut's flagship, but resigned in

1869. As a lawyer he has been a patent expert. He edited the 'Scientific American' (1872–8), and Appleton's 'Cyclopædia of Applied Mechanics'. He has written 'Shakings: Etchings from the Naval Academy' (1867); 'The Age of Electricity' (1886); 'The Intellectual Rise in Electricity, a History'; 'The United States Naval Academy' (1900); etc.

Benjamin, Samuel Green Wheeler, American traveler, artist, and miscellaneous writer: b. Argos, Greece, 13 Feb. 1837. He was educated at Williams College; was assistant librarian in the New York State Library, 1861–4; and was United States minister to Persia, 1883–5. Among his numerous works, both in prose and verse, are: 'Art in America'; 'Contemporary Art in Europe' (1877); 'Constantinople' (1860).

Benjamin, William Augustus, American journalist, poet, composer: b. 26 July 1865. His most prominent poems are: 'From Then Till Now' (1889); 'The Storm' (1889); 'Musings of Shadow-Silence' (1890); 'Twilight Fancies' and 'The Tide of Life' (1891); etc. Of his musical compositions, 'The Surge of the Sea' (1890); 'The Promise' (1894); and 'Go to Sleep' (1895).

Benjamin of Tudela, Jewish traveler: b. Tudela, Navarre, in the 12th century; is chiefly known by his travels over large portions of Europe, Palestine, Mesopotamia, the East Indies, and Ethiopia. As the first European traveler who penetrated far into the East, he furnishes a great amount of interesting information, and though not free from error or fable, proves himself worthy of the high estimation in which he has always been held among his Jewish countrymen for soundness of judgment and extent of learning. His 'Itinerary,' first printed in Hebrew at Constantinople in 1543, has been translated into many languages. The edition of Asher (London and Berlin 1840–1) contains an English translation.

Benjamin-Constant, Jean Joseph, bŏñ-zhą-măñ-kŏn-stŏñ, zhŏn zhō-sĕf, French painter: b. Paris, 10 June 1847; d. there, 26 May 1902. He studied under Cabanel, and exhibited in the salon of 1869, a scene from 'Hamlet.' His taste inclined him to Oriental subjects and the nude, and his vivid coloring and dramatic treatment made his work fashionable in Paris and London. His work displays much finished and minute detail, but he paid chief attention to harmony of effect and decorative value. Among his Oriental pictures are 'Mahomet II.'; 'Les Chérifas'; 'Les Funérailles de l'Emir'; 'La Justice du Chérif.'

Benkulen. See BENCOOLEN.

Benndorf, Otto, German archæologist: b. 13 Sept. 1838; d. 2 Jan. 1907. He studied at Erlangen and Bonn, went to Italy and Greece, 1864–8, and was professor of archæology at the universities of Göttingen, Zurich, Munich, Prague, and Vienna. In 1875 he made a second archæological tour to Samothrace; in 1881 and 1883 he made two expeditions, at state cost, to southwestern Asia Minor; in 1898 he was made director of the Austrian Archæological Institute. He wrote 'The Ancient Sculptures in the Lateran Museum' (in conjunction with Schöne) (Leipsic 1867); 'Ancient Historical Helmets and Sepulchral Masks' (1878); 'Travels in Southwest Asia Minor' (1884); etc.

Benne Oil, a valuable oil expressed from the seeds of *Sesamum orientāle* and *S. indĭcum,* much cultivated in India, Egypt, etc., and used for purposes similar to those of olive oil. Also called sesamum oil and gingelly oil. See SESAME.

Bennet, Elizabeth, the heroine of Jane Austen's novel, 'Pride and Prejudice.' See Howells, 'Heroines of Fiction' (1901).

Bennet, Henry (EARL OF ARLINGTON), English statesman: b. Arlington, Middlesex, 1618; d. 28 July 1685. He was devoted to the cause of Charles I., and was appointed under-secretary of state; he fought in several battles, and was wounded at Andover, but after the battle of Worcester he retired to Spain. Upon the restoration he returned to England, and was appointed keeper of the privy seal, and shortly afterward secretary of state. In 1664 he was created Baron Arlington; in 1670 became noted as one of the famous Cabal, but is not accused of entertaining their extreme sentiments; he was created Earl of Arlington in 1672. He was one of the plenipotentiaries sent to Utrecht to negotiate a peace between Austria and France, but the mission not being successful, an endeavor was made by his colleagues to cast the odium of the failure upon him. He defended himself, however, before the House of Commons, and was acquitted. The war with Holland, which is said to have been caused by the machinations of the Cabal, lost to Arlington the favor of the king and people; but in spite of this he received the office of chamberlain. In 1679 he became a member of the new council, and retained his office of chamberlain on the accession of James II.

Bennett, Alfred Allen, American chemist: b. Milford, N. H., 30 Nov. 1850. He graduated at the University of Michigan 1877; became professor of chemistry and physics in Iowa Wesleyan University; and since 1885 has been professor of chemistry in Iowa State College. Publications: 'Text Book of Inorganic Chemistry,' 2 vols., and articles in the 'American Chemical Society Journal.'

Bennett, Charles Edwin, American educator: b. Providence, R. I., 6 April 1858. He graduated at Brown University 1878; pursued graduate studies at Harvard and in Germany 1881–4; was professor of Latin at the University of Wisconsin 1889–91; of classical philology at Brown 1891–2; and in the latter year was elected professor of Latin at Cornell. He has been a frequent contributor to classical journals and editor of classical texts. Publications: 'A Latin Grammar' (1895); 'The Foundations of Latin' (1898); 'Critique of Some Recent Subjunctive Theories' (1898); 'The Quantitative Reading of Latin Poetry' (1899); 'The Teaching of Greek and Latin in Secondary Schools' (1900). He has edited: 'Xenophon's Hellenica, Books V.–VIII.' (1892); 'Tacitus, Dialogus de Oratoribus' (1894); 'Cicero, De Senectute' (1897); and 'Cicero, De Amicitia' (1897).

Bennett, Charles Wesley, American Methodist clergyman and educator: b. East Bethany, N. Y., 18 July 1828; d. 17 April 1891. He was principal of Genesee Wesleyan Seminary (1869–71); professor of history and logic at Syracuse University (1871–85); professor of historical theology, Garrett Biblical Institute, Evanston, Ill.

(1885–91). He wrote 'National Education in Italy, France, Germany, England, and Wales' (1878); and 'Christian Art and Archæology of the First Six Centuries' (1888).

Bennett, Edmund Hatch, American lawyer: b. Manchester, Vt., 6 April 1824; d. 2 Jan. 1898. He was graduated at the University of Vermont in 1843, and admitted to the bar in 1847. He practised for many years in Taunton, Mass., and was mayor of that city 1865–7, and judge of probate and insolvency of Bristol County 1858–83. He was lecturer at Harvard Law School 1865–71, and afterward professor and dean at the Law School of Boston University. His works include 30 volumes of 'English Law and Equity Reports'; '9–12 Cushing's (Mass.) Reports'; 'Massachusetts Digest' (3 vols.); 'Bingham on Infancy'; 'Blackwell on Tax Titles'; 'Leading Criminal Cases' (2 vols.); 'Goddard on Easements'; 'Benjamin on Sales'; 'Pomeroy's Constitutional Law'; 'Indermaur's Principles of Common Law'; and 'Fire Insurance Cases' (5 vols.). He has made contributions to professional journals, and has been co-editor of the 'American Law Register.'

Bennett, Emerson, American novelist: b. Monson, Mass., 16 March 1822; d. Philadelphia, Pa., 12 May 1905. He began to write at an early age and published some 60 or more extremely sensational tales which have been popular with uncritical readers. Among them are 'Prairie Flower'; 'The Outlaw's Daughter'; and 'The Forged Will.'

Bennett, James Gordon, American journalist: b. Newmill, Keith, 1 Sept. 1795; d. 1 June 1872. Trained for the Roman Catholic priesthood, he emigrated to the United States in 1819, where he became in turn teacher, proof-reader, journalist, and lecturer. He had acted as casual reporter and writer in connection with several journals, and had failed in one or two journalistic ventures previous to the issue of the first number of the New York *Herald,* which he founded as an independent newspaper, 6 May 1835, price one cent. He spared no effort and expense in securing news, and laid the foundation of its subsequent enormous success. It was the first newspaper to publish the stock lists and a daily money article.

Bennett, James Gordon, American journalist, (son of the preceding): b. New York, 10 May 1841. He became managing editor of the New York *Herald* in 1866, and became its proprietor on the death of his father in 1872. In 1870 he sent Henry M. Stanley on the exploring expedition which resulted in the finding of Dr. Livingstone, and, in conjunction with the London *Daily Telegraph,* supplied the means for his journey across Africa by way of the Congo in 1874–8. He organized a system of storm prognostications of value to shipping-masters; fitted out the Jeannette Polar expedition; and in 1883 was associated with John W. Mackay in organizing the new Commercial Cable Company. He founded the *Evening Telegram* in New York, and established daily editions of the *Herald* in Paris and London. He early gave much attention to yachting, in 1866 taking part in an ocean yacht race from Sandy Hook to the Needles, Isle of Wight, which was won by his schooner Henrietta against two competing yachts in 13 days, 21 hours, 55 minutes. In 1870 he raced in his yacht Dauntless from Queenstown to Sandy Hook, but was beaten by the Cambria by two hours. He resides mainly in Paris, collecting foreign news, and directing by telegraph the management and policy of his newspapers. The New York *Herald* was incorporated in 1899.

Bennett, John, American writer: b. Chillicothe, Ohio, 17 May 1865. He has published 'Master Skylark' (1892); 'The Story of Barnaby Lee' (1900).

Bennett, John Hughes, English physician: b. London, 31 Aug. 1812; d. Norwich, 25 Sept. 1875. He graduated at Edinburgh in 1837, and after four years' study in Paris and Germany settled in Edinburgh as an extra-mural lecturer. A work published in 1841, in which he recommended cod-liver oil in all consumptive diseases, first brought him into notice, and in 1848 he was made professor of the institutes of medicine in Edinburgh University — a post which he held until 1874. His health gave way in 1871, and most of his last years were spent abroad.

Bennett, Joseph M., American philanthropist: b. Juliustown, N. J., 16 Aug. 1816; d. 29 Sept. 1898. He engaged in the clothing business in Philadelphia, Pa., when 16 years old. In 1880 he gave 40 acres of ground in what is now Fairmount Park, valued at $400,000, for a Methodist Orphanage, to the support of which he afterward largely contributed. He also established the Hays Home, and gave valuable properties to the Deaf and Dumb Institute, the University of Pennsylvania, and the Methodist Deaconesses. His property was said to be worth $3,000,000, and it is estimated that he gave $1,000,000 to charity. He bequeathed $500,000 to the University of Pennsylvania for its proposed college for women.

Bennett, Mary E. (Elizabeth Glover), American writer: b. Connecticut, 1841; a writer of New Haven, Conn., whose writings have been published over the pen name Elizabeth Glover. They include 'Cyril Rivers'; 'Six Boys'; 'Asaph's Ten Thousand'; 'Talks About a Fine Art'; 'Family Manners'; 'The Children's Wing'; 'Jefferson Wildrider'; 'The Gentle Art of Pleasing.'

Bennett, Samuel Crocker, American lawyer: b. Taunton, Mass., 19 April 1858. He is a son of Edmund Hatch Bennett (q.v.), and in 1898 succeeded his father as dean of the law school of Boston University. He is one of the editors of 'Federal Decisions'; 'Smith's Leading Cases'; 'Benjamin on Sales'; 'Cyclopedia of Law and Procedure.'

Bennett, Sanford Fillmore, American hymnologist: b. Eden, N. Y., 1836; d. 12 June 1898. He settled in Elkhorn, Wis., in 1860, and became editor of the *Independent.* Resigning this place, he entered the 40th Wisconsin Volunteers and served with them throughout the Civil War. In 1867 he aided J. P. Webster, the composer, in preparing 'The Signet Ring,' a Sunday-school hymn-book, to which he contributed about 100 hymns. 'The Sweet Bye and Bye' was one of the first of these. Many of Mr. Bennett's hymns and songs have been published in sheets.

Bennett, William Cox, English songwriter: b. Greenwich, 14 Oct. 1820; d. Blackheath, 4 March 1895. He suggested that the bust of Longfellow be placed in Westminster Abbey, and formed a committee of 500, with the Prince of Wales at its head, to effect it. He

was the author of 'Poems' (1850); 'The Trial for Salamis' (1850); 'Endowed Parish Schools and High Church Vicars' (1853); 'Queen Eleanor's Vengeance, and Other Poems' (1856); 'War Songs' (1857); 'Songs by a Song-Writer' (1858); 'Baby May, and Other Poems' (1859); 'Our Glory Roll, and Other National Poems' (1867); 'Contributions to a Ballad History of England, etc.' (1869); 'School-Book of Poetry' (1870); 'Songs for Sailors' (1872); 'Narrative Poems and Ballads' (1879); 'Songs of a Song-Writer' (1876); and 'Sea Songs' (1878).

Bennett, Sir William Sterndale, English composer: b. Sheffield 13 April 1816; d. London, 1 Feb. 1875. He became a pupil of the Royal Academy of Music in 1826, studying under Cipriani Potter, Crotch, and Lucas, and afterward Moscheles. By the advice of Mendelssohn, whose friendship he had gained, he studied in Leipsic from 1836 to 1838, and his performances and compositions were held in high esteem by the younger German musicians, and especially by Schumann. After a period spent in teaching, conducting, and composing, he was appointed professor of music at Cambridge in 1856, and was knighted in 1871. In 1868 he became principal of the Royal Academy of Music. He was too entirely dominated by Mendelssohn's influence to do great original work. He is best known by his overtures, 'The Naiads' and 'Parisina'; his cantatas, 'The May Queen' and 'Woman of Samaria'; and his little musical sketches, 'Lake,' 'Millstream,' and 'Fountain.'

Bennigsen, Levin Augustus (Baron Von), Russian soldier: b. Brunswick, 1745; d. 3 Oct. 1826. He entered the Russian service at an early age, and distinguished himself by his bravery in the war against Poland, under the Empress Catherine II. In 1806 he was appointed to command the Russian army which went to the assistance of the Prussians. He afterward fought the battles of Eylau and Friedland. After the Peace of Tilsit he retired to his estates. In 1813 he led the Army of Poland into Saxony, took part in the battle of Leipsic, and blockaded Hamburg. He was commander-in-chief in southern Russia, but finally settled in his native country, where he died.

Bennigsen, Rudolph von, German statesman: b. Luneberg, Hanover, 1825; d. Bennigsen, 7 Aug. 1902. After Hanover became a part of Prussia he was elected to the North German Diet and the Prussian Assembly, becoming vice-president of both. Entering the German Reichstag in 1871, he became prominent as leader of the National Liberals, warmly supporting Bismarck for years, but later opposing his policy toward the Socialists. After some years spent in retirement, Bennigsen re-entered politics in 1887 and continued active until 1898, when he resigned his position as president of the province of Hanover.

Bennington, Vt., town and county-seat of Bennington County, on the Bennington & R. and the Lebanon Springs R.R.'s; 36 miles east of Troy, N. Y., and 55 miles southwest of Rutland. It contains the villages of Bennington, North Bennington, and Bennington Centre; and has large woolen and knit-goods factories; a Soldiers' Home, a memorial battle monument, dedicated on the centennial of the admission of the State into the Union, 19 Aug. 1891; two national banks, public library, numerous churches, and graded public schools. There are valuable deposits of brown hematite ore in the town. The government consists of a town president and a board of trustees elected annually at town meetings under the charter of 1885. The town, which was named after Governor Benning Wentworth of New Hampshire, was settled in 1761, and for many years before Vermont became a State, was claimed by both New York and New Hampshire. Pop. (1900), 8,033.

Bennington, Battle of, one of the early battles of the Revolution, fought at Bennington, Vt., 16 Aug. 1777. The army of Gen. Burgoyne, marching to the south from Canada, and causing the abandonment of Ticonderoga by Gen. St. Clair, created the greatest commotion throughout New England, since Boston was supposed to be its point of destination. Gen. Stark chanced to be at the time at Bennington, having under his command a corps of New Hampshire militia, and he determined to confront a strong detachment of the enemy sent out under Col. Baum to procure supplies. He hastily collected the continental forces in the neighborhood, and on 16 August approached the British, whom, after a hot action of two hours, he forced to a disorderly retreat. The engagement was hardly over when a reenforcement arrived, sent by Gen. Burgoyne, and the battle was renewed, and kept up several hours till dark, when the British forces retreated, leaving their baggage and ammunition. The loss of the enemy was 207 killed, 600 taken prisoners, and 1,000 stand of arms. The Americans lost only 14 killed and 42 wounded.

Benno, Saint, bishop of Meissen (son of the Count of Bultenburg) and Apostle of the Slavs: b. Hildesheim, 1010; d. 1106. At 26 years of age he became a monk in the Benedictine convent of Saint Michael in his native town. His extraordinary virtues and learning caused his brethren to elect him abbot in 1042, but the dignity and office he resigned three months later. During the minority of Henry IV., he was appointed to the see of Meissen, and during his episcopate of 40 years he led the life of an ascetic. In the quarrel between Henry and the Saxon nobles he stood by the latter, and in consequence was led away prisoner when Henry passed through Meissen in 1075 after his victory on the Unstrut. He supported Pope Gregory VII. in the long dispute between the emperor and the Pope. He died at the advanced age of 96 years and his tomb in the Cathedral of Meissen was venerated as a shrine, until the remains were transferred to the cathedral in Munich. The Bavarians chose him as their patron saint after he was canonized by Hadrian VI. in 1523. See his 'Life' by Emser in the Bollandists for June 3d, also his 'Life' by Seyffort.

Benoit, Pierre Leopold Leonard, bĕ-nwä, pē-ār lā-ō-pōld lā-ō-nār, Flemish musician and composer: b. Harelbeke, Belgium, 17 Aug. 1834. He studied under Fétis. He has held the position of director of the Flemish School of Music in Antwerp since 1867, and has written a number of oratorios, cantatas, and operas. In

the first class of these compositions, his 'Lucifer,' 'The Drama of Christ,' and 'The War,' should be mentioned.

Benoit de Sainte-Maure, dė sănt-mōr, French trouvère and chronicler: b. Touraine; fl. in the 12th century. He wrote in about 42,300 octosyllabic verses a 'Chronicle of the Dukes of Normandy' to the year 1135. To him is usually ascribed the 'Romance of Troy,' founded on the story of the siege of Troy as written by Dictys Cretensis and Dares; it was translated into the languages of western Europe. Boccaccio, Chaucer, and Shakespeare would seem to be indebted to Benoit for the story of the loves of Troilus and Briseis (Cryseyde or Cressida being originally called Briseida).

Bensel, James Berry, American poet and novelist: b. New York, 2 Aug. 1856; d. 3 Feb. 1886. He lived most of his life at Lynn, Mass., and was a contributor to magazines. He wrote 'King Kophetua's Wife' (1884), a novel; 'In the King's Garden, and Other Poems' (1886).

Benserade, Isaac de, bäñ-s'räd, ē-säk dė, French poet: b. Lyons-la-Farêt, Normandy, 1612; d. Gentilly, 1691. He wrote for the stage, and composed a great number of ingenious verses for the king and many distinguished persons at court. In the first half of the reign of Louis XIV. the court and its followers patronized songs of gallantry, rondeaux, triolets, madrigals, and sonnets, containing sallies of wit, conceits, and effusions of gallantry in the affected style then prevalent. No one succeeded so well in this art as Benserade, who was therefore, by way of eminence, called *le poète de la cour.* He received many pensions for his performances and lived at great expense. Wearied at last with the life he led he retired to his country-seat, Gentilly.

Bensley, Thomas, English printer: d. 1833. He is much known for an edition of 'Lavater,' printed by him in 1789, in 5 volumes quarto, and for an edition of the English Bible between 1800 and 1815, in 7 volumes quarto. He also printed Shakespeare in 1803, in 7 volumes octavo, and in 1806 Hume's 'England' in 10 volumes folio, which is adorned with elaborate portraits and engravings on copper. He was prominent also in the construction of the machine printing-press invented by Köenig and applied to printing the *Times* newspaper in 1814.

Benson, Arthur Christopher, English author: (son of Edward White Benson, and brother of Edward Frederic, qq.v.) b. 24 April 1862. He was educated at Eton and Cambridge. In 1885 he was appointed master of Eton College. He is the author of several volumes of poems, published in 1893, 1895, 1896, and 1900; and also of 'Memoirs of Arthur Hamilton' (1886); 'Archbishop Laud' (1887); 'Men of Might' (with Mr. Tatham); 'Fasti Etonenses' (1899); 'Life of Archbishop Benson' (1899); 'The Schoolmaster' (1902); and 'Tennyson' (in the 'Little Biographies' Series).

Benson, Carl, pseudonym of **Charles Astor Bristed** (q.v.).

Benson, Edward Frederic, English author: (son of Edward White Benson and brother of Arthur Christopher qq.v.) b. Wellington College, 24 July 1867. He was educated at King's College, Cambridge; worked at Athens for the British Archæological School (1892–5), and in Egypt, for the Hellenic Society (1895). His writings include 'Dodo' (1893), a novel of London society; 'Six Common Things' (1893); 'Rubicon' (1894); 'Judgment Books' (1895); 'Limitations' (1896); 'The Babe' (1897); 'Vintage' (1898); 'The Capsina' (1899); 'An Act in a Backwater' (1904).

Benson, Edward White, Archbishop of Canterbury: b. near Birmingham, 1829; d. Hawarden, 11 Oct. 1896. He graduated at Cambridge in 1852 as a first-class and senior optime, and was for some time a master at Rugby. He held the headmastership of Wellington College from its opening in 1858 to 1872, when he was made a canon and chancellor of Lincoln Cathedral. In 1875 he was appointed chaplain in ordinary to the queen, and in December 1876 was nominated to the newly erected bishopric of Truro. Here he began the building of a cathedral (1880–7), most of the first cost, £110,000, having been gathered by his own energy. In 1882 he was translated to Canterbury to succeed Dr. Tait as primate of all England. A high-churchman, Dr. Benson was frequently select preacher at both universities, and published several volumes of sermons, a small work on 'Cathedrals,' and a valuable article on 'St. Cyprian.' A distinguished ecclesiastical lawyer and diplomatist, he gave the important judgment in the Lincoln case on ritual.

Benson, Egbert, American jurist and politician: b. New York, 21 June 1746; d. Jamaica, N. Y., 24 Aug. 1833. He was graduated at Columbia College 1765; was member of Congress 1784–8, 1789–93, and 1813–15; judge of the supreme court of New York 1794–1801; and became a judge of the United States circuit court. He wrote a 'Vindication of the Captors of Major André,' and 'Memoir on Dutch Names of Places.'

Benson, Eugene, American artist and miscellaneous writer: b. Hyde Park, N. Y., 1840. Residing in Rome, Italy, he has contributed to American magazines. He has written 'Gaspara Stampa' (1881), a biography, with selections from her sonnets; 'Art and Nature in Italy' (1882).

Benson, Frank Weston, American painter: b. Salem, Mass., 24 March 1862. He was educated at the Museum of Fine Arts, Boston, and in Paris; became a member of the Society of American Artists in 1888. He won the Hallgarten and the Clarke prizes at the National Academy of Design in 1889 and 1891; has done much in figure work with outdoor effects, but is best known for his portraits.

Bent, James Theodore, English traveler: b. Liverpool, 30 March 1852; d. London, 6 May 1897. He graduated at Oxford University in 1875, and managed excavations in Greece for the British Museums and the Hellenic Society. His publications include: 'A Freak of Freedom, or the Republic of San Marino' (1879); 'Genoa: How the Republic Rose and Fell' (1880); 'Life of Giuseppe Garibaldi' (1881); 'The Cyclades, or Life Among the Insular Greeks' (1885).

Bent, Silas, American naval officer: b. St. Louis, 10 Oct. 1820; d. 1889. He entered the navy in 1836; served in the Seminole war, and was with Commodore Glynn and Commodore Perry on several cruises to Japan. He was always especially active in survey work; on

Perry's Japan expedition he had charge of the hydrographic survey, and his excellent work became the basis of the surveys undertaken later by the Japanese government. His most important work was to delineate and describe scientifically the Kuro Shiwo, or Black Tide, the great northward-flowing stream of the Pacific, corresponding to the Atlantic Gulf Stream.

Bent-grass (*Agrostis*), a genus of grasses usually regarded as weeds except in soils which cannot produce better. Common bent-grass or purple bent (*A. vulgaris*) is a fine-leaved species with trailing stems rooting at the joints, and small thin panicles of purplish satiny flowers. It overruns dry, gravelly, sandy places with its wiry stems, and becomes a troublesome weed, only to be got rid of by pulling up early in the season before the seed is ripe, or by frequent harrowing. It is, however, sometimes sown in warrens and in places where nothing better will grow. March bent, white bent, or fiorin grass (*A. stolonifera*), has broader leaves than common bent, a much closer and larger panicle, and green or pale flowers. It is very common in low, damp places, which it overruns with its compact, trailing, rooting stems, and is a useful grass in newly reclaimed bogs or land liable to inundation. Brown bent-grass (*A. canina*) is known in the United States as Rhode Island bent-grass, and is highly prized as a lawn grass. Herd-grass (*A. cornucopia* or *dispar*) has large panicles of green flowers, which form an almost level top.

Bentang. See ERIODENDRON.

Benteen, Frederick William, American soldier: b. Petersburg, Va., 24 Aug. 1834; d. 22 June 1898. He was educated in his native state; and at the outbreak of the Civil War went to Missouri and organized a company of Union volunteers. He became first lieutenant of the 10th Missouri Cavalry, 1 Sept. 1861; promoted captain, 1 Oct. 1861; major, 18 Dec. 1862; lieutenant-colonel, 27 Feb. 1864; and colonel of the 138th United States Colored Infantry, 15 July 1865; mustered out of volunteer service 6 Jan. 1866. On 28 July 1866 he was commissioned captain in the 7th cavalry; promoted major of the 9th cavalry, 17 Dec. 1882; and retired 7 July 1888. His most brilliant service after the war was in his campaigns against the Indians.

Benthal Fauna, the abyssal or deep-sea fauna; the great assemblage of animals living at all depths below 150 fathoms in the North Atlantic, to 500 fathoms in the tropics. See also DEEP-SEA LIFE.

Bentham, George, English botanist; nephew of Jeremy Bentham (q.v.): b. near Plymouth, 22 Sept. 1800; d. 10 Sept. 1884. He was privately educated, early attached himself to botany, and having resided in southern France (where his father had an estate), 1814–26, he published in French (1826) a work on 'The Plants of the Pyrénées and Lower Languedoc.' Having returned to England he studied law, and on this subject, as well as logic, he developed original views. Finally, however, he devoted himself almost entirely to botany; was long connected with the Horticultural Society and the Linnæan Society; and from 1861 onward was in almost daily attendance at Kew (except for a few weeks occasionally), working at descriptive botany from 10 to 4 o'clock as a labor of love. Along with Sir J. D. Hooker he produced the great work of descriptive botany, 'Genera Plantarum'; another great work of his was the 'Flora Australiensis' (in 7 volumes). His 'Handbook of the British Flora' is well known.

Ben'tham, Jeremy, English jurist and publicist: b. London, 15 Feb. 1748; d. London, 6 June 1832. After an early education at Westminster School he went to Oxford in his 13th year, taking his bachelor's degree at 15, and his master's degree at 18. He studied English law, but never appeared at the bar, being enabled by easy circumstances to devote himself entirely to literary compositions. He did not, however, publish his chief works himself. They were arranged and translated into French by his friend, Etienne Dumont, and printed partly in Paris and partly in London. Among them are: 'Treatises on Civil and Penal Legislation' (Paris 1802, 3 vols.), and 'Theory of Punishments and Rewards' (London 1801, 2 vols.). Bentham advocated a thorough correction of civil and criminal legislation. His 'Fragments on Government,' in opposition to Blackstone, appeared anonymously in 1776, and with his name, London 1823. In France his literary labors found a better reception than in England or Germany. A small pamphlet on the liberty of the press (London 1821) was addressed by him to the Spanish Cortes during their discussion of this subject; and in another ('Three Tracts Relative to the Spanish and Portuguese Affairs,' London 1821) he refuted the idea of the necessity of a house of peers in Spain, as well as Montesquieu's proposition that judicial forms are the defense of innocence. One of his latest works was the 'Art of Packing' (London 1821), that is, of arranging juries so as to obtain any verdict desired. His previous work, 'Essay on Parliamentary Practice,' edited from the author's papers by Dumont (Geneva 1815), and translated into German, contains many useful observations. His 'Introduction to the Principles of Morals and Legislation' (London 1823, 2 vols.) treats of the principal objects of government in a profound and comprehensive manner. Zanobelli has translated Bentham's 'Theory of Legal Evidence' into Italian (Bergamo 1824, 2 vols.). Among the earlier works of Bentham was his 'Defense of Usury,' showing the Impolicy of the Present Legal Restraints on the Terms of Pecuniary Bargains' (1787). At his death Mr. Bentham bequeathed his body to be dissected for the benefit of science. A complete edition of his works, with a biography by Bowring, was published in London (11 vols. 1843). He was a man of primitive manners, unblemished character, and undoubted earnestness in the cause of the people at large. He is considered the father of the Utilitarians, or those moral, political economists who view everything as it is affected by the principle of «the greatest happiness of the greatest number.»

Benthos, the constantly or periodically submerged vegetation attached to the bottoms of seas and, to some extent, of lakes, distinguished from the floating vegetation. (See PLANKTON.) Commencing at the high-tide line and progressing toward the low-tide line the vegetation gradually becomes more abundant and luxuriant, but reaches its maximum below the low-tide mark in areas wholly submerged, in which at medium depths individual development is

greater than at greater depths. The benthos of the frigid zones are the most remarkable of the world. The leading plants of such formations are green, red, and brown algæ, eel-grass, and rockweed.

Ben'tinck, Lord William Charles Cavendish, English soldier and statesman (second son of the third Duke of Portland): b. 14 Sept. 1774; d. Paris, 17 June 1839. He entered the army at an early age, and served in the Duke of York's campaign in Flanders, and also in Italy with the Russian army under Suwaroff, 1799–1801. In 1803 he proceeded to India as governor of Madras, returned thence in 1805, and subsequently went to Spain, where he commanded a brigade under Sir John Moore at Corunna. In 1810 he visited Sicily as British plenipotentiary, and commander-in-chief of the English troops. The most noticeable feature of this expedition is his bestowment on the Sicilians of a constitution, which, however, was overturned on the restoration of the Bourbons. He conducted in 1813 the expedition from Sicily to Catalonia, and in 1814 took possession of Genoa on the revolt of the inhabitants from French rule. The same year he returned to England, and subsequently entered Parliament as member for Nottingham. In 1827, under Mr. Canning's administration, he was sent to India as governor-general, and held that office till 1835, when he returned to England. Among the principal events of his administration are the abolition of the practice of suttee, the repeal of the restrictions which prohibited all Europeans, except servants of the company, from settling in India, and the recognition of the liberty of the press. In 1836 he again entered Parliament as member for the city of Glasgow, but was now unable from ill health to take any active share in political matters.

Bentinck, Lord William George Frederick Cavendish, generally known as Lord George Bentinck, English statesman (son of William Henry Cavendish, fourth Duke of Portland); b. 27 Feb. 1802; d. 21 Sept. 1848. He entered the army, but quitted it early to become private secretary to Mr. Canning, who had married his mother's sister. In 1827 he entered Parliament as member for King's Lynn, and continued to represent that borough for the rest of his life. Up to 1846 he was a warm adherent of Sir Robert Peel and his measures; but on the latter announcing himself in that year a convert to free-trade principles, Lord George abandoned his old ally and came forward as the zealous and indefatigable leader of the Protectionists in the House of Commons. With the assistance of Disraeli he maintained this position for two years, and though often illogical, and sometimes unscrupulous in his statements, he nevertheless commanded much attention by the vigor and earnestness of his oratory and deportment.

Bentivoglio, Cornelio, bĕn-tē-vōl'yō, cornāl'yō, Italian ecclesiastic and poet: b. Ferrara, 1668; d. Rome, 1732. He early distinguished himself by his progress in the fine arts, literature, philosophy, theology, and jurisprudence, and was a patron of the literary institutions at Ferrara. Pope Clement XI. made him his domestic prelate and secretary to the apostolic chamber, and sent him, in 1712, as nuncio to Paris, where, during the last years of the reign of Louis XIV., he acted an important part in the affair of the bull Unigenitus. The Duke of Orleans, regent after the death of Louis, was not favorably disposed toward him; the Pope therefore transferred him to Ferrara, and in 1719 bestowed on him the hat of a cardinal, and employed him at first in Rome, near his own person, then as legate *a latere* in Romagna, etc. Poetry had occupied his leisure hours. Sonnets composed by him may be found in Gobbi's Collection, Vol. III., and in other collections of his time. Under the name of Selvaggio Porpora he translated the 'Thebais of Statius' into Italian.

Bentivoglio, Guy or **Guido,** gē'dō, Italian historian and ecclesiastic: b. Ferrara, 1579; d. Rome, 1644. He studied at Padua with great reputation, and afterward, fixing his residence at Rome, acquired general esteem by his prudence and integrity. He was an able politician, and his historical memoirs are valuable, especially his 'History of the Civil Wars in Flanders,' written in Italian, and first published at Cologne (1630), a translation of which, by Henry, Earl of Monmouth, appeared in 1654 (London, folio). His own 'Memoirs' and a collection of letters are reckoned among the best specimens of epistolary writing in the Italian language (an edition of which was published at Cambridge in 1727).

Bentley, Charles Eugene, American clergyman: b. Warner's, N. Y., 30 April 1841. He was educated at Monroe Institute and Oneida Seminary. In 1866 he removed to Iowa and in 1878 to Butler County, Neb., where he resided until 1890. He was ordained a Baptist clergyman in 1880 and was in charge of a church at Surprise, Neb. In 1884, he was chairman of the Nebraska Prohibition Convention, and became the unsuccessful candidate for congress, governor, and United States Senator during the next eight years. When the Prohibition party divided in 1896, he became presidential candidate of the faction known as the Liberty Party (q.v.).

Bentley, Gideon, American soldier: b. 1751; d. Constantia, Oswego County, N. Y., January 1858. He was remarkable for his longevity (107 years), and for the excellent though humble services which he rendered as a private soldier in the Revolutionary War.

Bentley, John Francis, distinguished English architect: b. Doncaster, England, 1839; d. Clapham, London, 2 March 1902. Upon the rebuilding of the great parish church in Doncaster, about 1856, Bentley was placed in the office of the clerk of the works, his architectural education practically beginning at this time. In 1862 he began practice as an architect on his own account, and his patrons from that date onward were mainly Roman Catholics. Among his lesser works are the Roman Catholic church and convent at Bocking, Essex; and the new Roman Catholic cathedral in Brooklyn, N. Y.; but the building with which his name will be inseparably associated is the Roman Catholic cathedral at Westminster, a structure of vast proportions with a nave wider than that of any church in England. Bentley left nothing in the way of design to subordinates, but designed and directed everything from the foundation to the minutest decorative feature. Bentley's death took place just as the Royal Institute of British Architects had voted to award him the royal gold medal.

Bentley, Richard, English divine, classical scholar, and polemicist: b. near Wakefield, Yorkshire, 1662; d. Cambridge, 14 July 1742. His father is said to have been a blacksmith. To his mother, a woman of strong natural abilities, he was indebted for the rudiments of his education, and in 1776 he entered Saint John's College, Cambridge. In 1682 he left the university, and became usher of a school at Spalding; a year later he took the position of tutor to the son of Dr. Stillingfleet, dean of St. Paul's. He accompanied his pupil to Oxford, where he availed himself of the literary treasures of the Bodleian Library in the prosecution of his studies. In 1684 he took the degree of A.M. at Cambridge, and in 1689 obtained the same honor at the sister university. His first published work was a Latin epistle to Dr. John Mill on an edition of the 'Chronicle of John Malela,' which appeared in 1691. It displayed so much profound learning and critical acumen as to excite the sanguine anticipations of classical scholars from the future labors of the author. Dr. Stillingfleet, having been raised to the bishopric of Worcester, made Bentley his chaplain, and in 1692 collated him to a prebend in his cathedral. He was chosen the first preacher of the lecture instituted by the celebrated Robert Boyle for the defense of Christianity. The discourses against atheism which he delivered on this occasion were published in 1694; they have since been often reprinted, and translated into several foreign languages.

In 1693 he was appointed keeper of the Royal Library at Saint James'— a circumstance which incidentally led to his famous controversy with the Hon. Charles Boyle, afterward Earl of Orrery, relative to the genuineness of the 'Greek Epistles of Phalaris.' In this dispute Bentley was victorious, though opposed by the greatest wits and critics of the age, including Pope, Swift, Garth, Atterbury, Aldrich, Dodwell, and Conyers Middleton, who advocated the opinion of Boyle with an extraordinary degree of warmth and illiberality. In 1699 Bentley, who had three years before been created D.D., published his 'Dissertation on the Epistles of Phalaris,' in which he proved that they were not the compositions of the tyrant of Agrigentum, who lived more than five centuries before the Christian era, but were written by some sophist under the borrowed name of Phalaris, in the declining age of Greek literature.

Soon after this publication Dr. Bentley was presented by the Crown to the mastership of Trinity College, Cambridge, worth nearly £1,000 a year. He now resigned the prebend of Worcester, and in 1701 was collated to the archdeaconry of Ely. His conduct as head of the college gave rise to accusations of various offenses, including embezzlement of college money. The contest, lasting more than 20 years, was decided against him, a sentence, depriving him of his mastership, being passed; but Bentley's superior skill and mastery of legal forms constantly baffled all attempts to oust him. In 1711 he published a quarto edition of Horace at Cambridge, which was reprinted at Amsterdam; and in 1713 appeared his remarks on 'Collins' Discourse on Free-Thinking,' under the form of a 'Letter to F. H. (Francis Hare), D.D., by Phileleutherus Lipsiensis.' He was appointed regius professor of divinity in 1716, and in the same year issued proposals for a new edition of the Greek Testament, an undertaking for which he was admirably qualified, but which he was prevented from executing in consequence of the animadversions of his determined adversary, Middleton. In 1726 he published an edition of Terence and Phædrus; and his notes on the comedies of the former involved him in a dispute with Bishop Hare on the metres of Terence. The last work of Dr. Bentley was an edition of Milton's 'Paradise Lost,' with conjectural emendations, which appeared in 1732, but this proved a failure. He died at the master's lodge at Trinity, and was interred in the college chapel. The German scholar, J. A. Wolf, wrote an excellent biography of Bentley; and an English biography of him was written by Monk (London, 2 vols. 1833). See also Prof. Jebb's monograph in the 'English Men of Letters Series' (1882).

Bentley, William, American clergyman: b. Boston, 1758; d. 29 Dec. 1819. He graduated at Harvard College in 1777, and was ordained pastor of a church in Salem in 1783. He was distinguished for his antiquarian learning, and collected a valuable and curious library and cabinet, which he bequeathed to the college at Meadville, Pa., and to the Antiquarian Society at Worcester. In theology he was regarded as a Unitarian, and he left several published sermons and discourses.

Benton, Angelo Ames, American clergyman: b. Canea, Crete, 1837. He graduated at Trinity College, Hartford, Conn., 1856, and at the General Theological Seminary, New York city. He was ordained in the Episcopal ministry in 1860. He was professor of Latin and Greek in Delaware College, Newark, Del., 1883–7, and professor of dogmatic theology in the University of the South, 1887–94. His chief publication has been 'The Church Cyclopædia: A Dictionary of Church Doctrine' (Phila. 1884).

Benton, Dwight, an American artist, writer and botanist: b. Norwich, N. Y., 1834; d. Rome, 8 May 1903. After close of the Civil War, in which he fought on the Northern side, he established himself in Cincinnati as a landscape painter. From there he went to Rome where he lived 25 years almost uninterruptedly. In 1895 Hawaii, before its annexation, appointed him its Consul-General to Italy. His most famous canvases are 'Tombs of Keats and Shelly,' 'Sunset in the Roman Campagna,' and 'A Gloomy Day' (*giornata de Tristezza*), owned by the King of Italy. His work, 'Flora of the Roman Campagna and Palatine' is his most important contribution to literature.

Benton, James Gilchrist, American soldier and inventor: b. Lebanon, N. H., 15 Sept. 1820; d. Springfield, Mass., 23 Aug. 1881. He graduated at West Point in 1842, and served in the ordnance department throughout his life. He was in command of the Washington Arsenal and principal assistant to the chief of ordnance during the Civil War, at the close of which he was transferred to the Springfield (Mass.) Arsenal. For signal bravery in rescuing exposed ammunition from fire, he was twice brevetted. The various models of the Springfield rifle, known as the models of 1866, 1868, 1873, and 1879, were made under his direction. He devoted himself especially to the improvement of firearms, and acquired distinction for his valuable inventions in this and other lines of his work. He refused to patent any of them, as he held that since the

THOMAS HART BENTON.

government had educated him it had every right to benefit from his time and talents. He published 'Course of Instruction in Ordnance and Gunnery for the United States Military Academy' (1861; 4th ed. 1875).

Benton, Thomas Hart, American statesman: b. Orange County, N. C., 14 March 1782; d. 10 April 1858. He was the greatest of that most valuable and scarcely appreciated class, the Border State leaders, whose sympathies were with the South, and who had no feeling against slavery, yet at the cost of their influence and much personal peril opposed the political aggressions of slavery and the doctrines of disunion. Early orphaned, the eldest of a large family, after part of a course in the University of Pennsylvania he went with his mother to Tennessee as a pioneer, settling at the present Bentontown. A few years later he took up the study of law, and was admitted to the bar in 1811 under the patronage of his friend Andrew Jackson, then a judge of the Supreme Court. Elected to the legislature, he pushed through a judiciary reform bill, and one to give slaves the right of jury trial. In the War of 1812 he was aide-de-camp to Jackson, raised a volunteer regiment, was made lieutenant-colonel in the regular army, but saw no active service; meanwhile, 4 Sept. 1813, a misunderstanding over a duel of his brother's led to an affray in which the brother was stabbed, Jackson shot, and Thomas H. thrown downstairs, and the former friends were at bitter feud for many years. In 1815 he removed to St. Louis, practised law, and established a newspaper, which involved him in duels (one of which cost his opponent's life, to Benton's lasting regret); but which he used so vigorously to advocate Missouri's admission to the Union as a slave State that she elected him one of her senators on her entrance in 1820, and re-elected him every term for 30 years. During this time he stood as one of the foremost public men of his generation — a speaker of great ability and mastery of facts, a hard-headed logician and tremendous debater, of astonishing memory, unwearying industry, an iron will and physique, and a power of wit, sarcasm, and denunciation that made most men shrink from a contest with him. Being the spokesman of the Western Democrats, his policy and political feelings were coincident with Jackson's, their personal quarrel was at last arranged, and Benton became Jackson's first lieutenant and admiring champion. In every regard he supported Western interests: he secured the passage of laws for pre-emption, donation, and graded prices of lands, for throwing open the government mineral and saline lands to occupancy, and for repeal of the salt tax; advocated transcontinental exploration and post-roads, a Pacific railroad, occupation of the mouth of the Columbia, trade with New Mexico, military stations through the Southwest, amicable relations with Indian tribes, and everything conducive to opening up the West and making it prosperous. This made him invincible there till the slavery question drove him into opposition. He supported Jackson in his refusal to re-charter the United States Bank; and made a series of speeches urging the adoption of a metallic currency only, which were widely circulated, gained him the nickname of «Old Bullion,» and had much to do with the creation of the sub-treasury scheme. When Jackson removed the secretary of the treasury, Duane, for refusing to check out the deposits in the bank, the Senate adopted a resolution censuring him for it; Benton set about having the resolution expunged from the records, and after a protracted struggle succeeded, despite the logical absurdity of his motion, in accomplishing his purpose by a series of fervid panegyrics on Jackson. In the Nullification contest, Benton was Calhoun's chief opponent, not only as Jackson's supporter, but by conviction; and the two men of might — the chiefs of the State-Rights and Nationalist wings of the Democracy — remained deadly foes until Calhoun's death. In the Oregon boundary dispute Benton opposed the «fifty-four forty or fight» war-cry; it was dropped, but the Polk administration was glad of an excuse to drop it in order to push the Mexican war, and had no notion of diminishing the area of slavery to enlarge that of freedom. He favored the vigorous prosecution of the war, and came near being made commander-in-chief, from his close acquaintance with the territory. But from this time on, the slavery problem swallowed up every other. Benton fought Calhoun's State-Rights resolutions in retort to the Wilmot Proviso (q.v.), and they never came to a vote; but Calhoun sent them to various State legislatures to adopt and utilize for instructing their senators, and they were pushed through the Missouri legislature without Benton's knowledge. He denounced them as misrepresenting the people, canvassed his State for re-election in a long-famous series of powerful and caustic speeches, and carried his party, but was defeated by a fusion of Whigs and anti-Benton Democrats, and his senatorial service ended with 1850. He opposed the Clay compromise resolutions of that year, however (see COMPROMISE of 1850), with sarcasm still quoted. In 1852 he canvassed Missouri for election to the lower House, and was triumphantly returned. He supported Pierce for election, and in Congress till the Kansas-Nebraska bill came up. Against that he made one of his greatest speeches, and the administration thereupon ousted all his Missouri supporters, and he was defeated for re-election by the now dominant ultra-Southern sentiment in the Democratic party. The time of mediators and middle courses had gone by. He now set about writing his remarkable 'Thirty Years' View' (1854–6), a most valuable account of his senatorial experiences and the secret political history of the years 1820–50. In 1856 he ran for governor, but a third ticket in the field defeated him. In the campaign of 1856 he supported Buchanan against his own son-in-law, Frémont, as representing the party of union; but materially changed his mind before his death. In these last two years, though in extreme old age, he carried through the immense and useful labor of compiling an abridgment of the debates in Congress, from the foundation of the government to 1850, published later in 15 volumes. He also published an 'Examination of the Dred Scot Case' (1857).

Benton Harbor, Mich., a city in Berrien County, situated on the St. Joseph's River, one and a half miles from Lake Michigan; on the Cleveland, C. & C., and Père Marquette R.R.'s. It is also connected with the lake by a ship canal and thus by steamboat lines with Chicago and Milwaukee. It has a large trade in lumber, grain, and fruits, especially the latter, and has

also considerable manufacturing interests, including manufactories of fruit packages, furniture, machinery, flour, vinegar, and canned fruit. Pop. (1900) 6,562.

Bentonville, Ark., a town and county-seat of Benton County, situated northwest of Little Rock; on the Arkansas & O. R.R. It is the seat of Bentonville College, and a Baptist academy; is the centre of a fruit-growing region, has some trade in fruit, tobacco, and grain. It has a large fruit-evaporating plant. Pop (1900) 1,843.

Bentonsville, N. C., a village in Johnston County, noted as the place of a stubborn battle during the Civil War. Here, during his march from Savannah through the Carolinas, Sherman, at the head of 65,000 National troops, encountered 24,000 Confederates under Johnston. A battle took place 18 March 1865, Johnston having come up in great haste from Smithfield, intending to surprise Sherman. The latter, however, was ready for him, and Johnston was thrown on the defensive near Mill Creek. Johnston was partially defeated and retreated to Smithfield.

Bentzel-Sternau, bĕnt'zĕl-stär'now, **Count Karl Christian Ernst von,** German novelist: b. Mentz, 9 April 1767; d. Mariahalden, Switzerland, 13 Aug. 1843. He is esteemed as a humorist after the manner of Jean Paul; and his satirical romances, 'The Golden Calf' (1802–3); 'The Stone Guest' (1808); 'Old Adam' (1819–20); 'The Master of the Chair,' together form a series.

Bentzon, Th., the pseudonym of **Marie Thérèse Blanc** (q.v.).

Benue, bĕn'wē, or **Binue,** a river of west Africa, the chief tributary of the Niger. It rises in the Bub'n Jidda hills on the east of Adamawa, flows for a short distance northwest then west to Bassama, after which its course is generally southwest to its junction with the Niger at Lokoja. Its length is about 850 miles. The source of the Benue was long unknown. Dr. Barth, who came upon the river in 1851, while traveling in Adamawa, near the confluence of the Faro, which joins it on its left bank about lat. 12° 30′ E., was told that it came from the southeast, a distance of nine days' journey. In consequence of this discovery an expedition was fitted out by the British government for the purpose of exploring the Niger from its mouth upward. The exploration was made in a small steamer called the Pleiad, and was under the command of Dr. William Balfour Baikie. After reaching the point of confluence of the Benue with the Niger, about lat. 7° 40′ N., Dr. Baikie followed the former eastward for a direct distance of about 370 miles. The point thus reached was about lat. 9° 25′ N.; lon. 11° 30′ E. There was sufficient depth of water, though the river was only rising, to allow a still further exploration. The natives, however, had begun to display their hostility in such a manner as made it necessary to return. The result was to show that a large, fertile, and populous tract of a region of Africa previously in a great measure unknown was accessible by means of a navigable river. A second expedition, also under Dr. Baikie, explored the same river in 1857. In 1879 a small steamer belonging to the Church Missionary Society went up the river 140 miles, and its source was discovered by Flegel in 1883.

Benvolio, bēn-vō'lĭ-o, in Shakespeare's 'Romeo and Juliet,' a friend of Romeo and nephew of Montague.

Benwood, W. Va., a town in Marshall County; on the Baltimore & O. R.R. It is the centre of a large iron-mining region and has several rolling mills and blast furnaces. Pop. (1900) 4,511.

Benzal'dehyde, or **Benzo'ic Al'dehyde,** a colorless, volatile oil, familiarly known as "oil of bitter almonds." Benzaldehyde does not occur in the bitter almond in nature, but is formed, when the kernels are crushed and allowed to stand in water, by the decomposition of a glucoside known as "amygdalin." It has the chemical formula $C_6H_5.CO.H$, boils at 354° F., and has a specific gravity of about 1.05, and a refractive index of 1.56. Benzaldehyde is prepared, artificially, by boiling benzyl chlorid with nitrate of lead, copper, or sodium, and subsequent treatment with sodium acid sulphite, with which the benzaldehyde forms a crystalline compound that may be easily separated from the mother liquor by filtration or otherwise.

Ben'zene, an aromatic hydrocarbon discovered by Faraday in 1825, and called, by him, "bicarburet of hydrogen." It has the chemical formula C_6H_6, and is the fundamental substance from which the extensive series of "aromatic compounds" is obtained. In 1849, C. B. Mansfield proved its existence in coal tar, and that substance now constitutes its most important commercial source. In the manufacture of benzene, coal tar is distilled at a temperature not exceeding 300° F., and the distillate is treated with caustic soda to remove phenols, and subsequently with sulphuric acid to remove basic substances. It is then re-distilled, the temperature (at least in the upper part of the still) being kept as low as 212° F., in order to prevent toluene from passing over. In order to effect a still further purification, the benzene so obtained may be cooled by a freezing mixture of ice and salt. The true benzene solidifies when thus treated, and the fluid impurities that it contains may be expelled by pressure, or by the aid of a centrifugal drier. Pure benzene is a colorless liquid, strongly refractive, boiling at about 176° F., and freezing at 43° F. It does not mix with water, but mixes readily with alcohol, acetone, glacial acetic acid, chloroform, and ether. It crystallizes in the trimetric system when solidified by cold, and dissolves iodine, phosphorus, sulphur, oils, resins, fats, and alkoloids. It expands by about 0.00075 of its own bulk, per degree increase in its temperature, on the Fahrenheit scale. Its specific gravity is about 0.88, and its specific heat is 0.40. For the chemical constitution of benzene, see Aromatic Compounds.

Benzene forms two general classes of compounds, known respectively as "addition" and "substitution" products. In forming an "addition" compound, benzene merely takes up atoms or molecules of some other substance, without parting with any of its own atoms; the new substance being simply "added" to the benzene. Benzene hexabromid, $C_6H_6Br_6$, is a good example of a benzene addition compound. It is formed by dropping bromine into boiling benzene, in direct sunlight; the hexabromid crystallizing out upon cooling. The "substitution" compounds of benzene are far more numerous

and important than the «addition» compounds, however. They are formed by replacing one or more of the typical hydrogen atoms in the benzene by an equal number of other atoms or monad radicals. The general theory of benzene substitutions is given under AROMATIC COMPOUNDS; but a few of the more important examples of such substitution products may be given here. The radical C_6H_5 (which is not capable of independent existence) is called «phenyl,» and is often represented by the symbol Ph. The mono-substitution compounds of benzene, in which one atom of the hydrogen in the original benzene has been replaced by a radical (or by an atom different from hydrogen), may then be regarded as addition compounds of the radical phenyl. Thus «monochlorbenzene,» $C_6H_5.Cl$, may also be regarded as chlorid of phenyl, and its formula may be written PhCl. Benzene itself may even be regarded as hydrid of phenyl, its formula being written $C_6H_5.H$, or PhH. Carbolic acid (or «phenol») is hydrate of phenyl, its formula being PhOH, the radical OH being here substituted for one atom of the hydrogen in the original benzene. Nitrobenzene, $PhNO_2$, is formed from benzene (PhH) by the action of nitric acid, in accordance with the equation

$$PhH + HNO_3 = PhNO_2 + H_2O.$$

It is used in the arts for the manufacture of aniline (q.v.). Aniline itself is an amide of phenyl, obtained by replacing an atom of H in ammonia (NH_3) by phenyl, or by replacing an atom of hydrogen in benzene by the radical NH_2. The formula of aniline may be written $PhNH_2$, and aniline may be called «amidobenzene,» or «phenylamine.» (See AMINE and AMIDE.) Methyl-benzene, $C_6H_5.CH_3$, in which one of the original hydrogen atoms of the benzene is replaced by the radical CH_3 («methyl») is also an important benzene substitution compound, and is known to chemists as toluene (q.v.). That portion of the original benzene which remains intact, after a substitution, is called the «benzene residue.» In a mono-substitution compound of benzene, further substitutions may be made, by replacing one or more of the hydrogen atoms in the «benzene residue» by monovalent radicals, and secondary, tertiary, and higher substitution compounds may be thus formed. The classification of the secondary substitution compounds is given under Aromatic Compounds. For the classification of higher compounds, special treatises on organic chemistry must be consulted. It may be mentioned, however, that if A, B, C and D are monad radicals, there are no less than 30 distinct substances possible, which shall all have the same general formula $C_6H_2.ABCD$. This fact illustrates the exceeding complexity of the general theory of benzene substitution compounds. The full theory is even more complex than this example indicates, however, for it often happens that the hydrogen in a substituted radical can be replaced by another radical, as well as the hydrogen of the «benzene residue.» Thus in methylbenzene (or toluene), $C_6H_5.CH_3$, the radical OH may be substituted for one of the hydrogen atoms. If the hydrogen so displaced occurs in the «benzene residue,» the resulting compound will be «cresol,» $C_6H_4(OH).CH_3$, a substance which (since it is a di-substitution compound) can exist in three isomeric forms. If, on the other hand, the OH takes the place of one of the hydrogen atoms of the «methyl» radical, the resulting compound will be «benzyl alcohol,» $C_6H_5.CH_2(OH)$.

When a primary amine of the fatty series is acted upon by nitrous acid (HNO_2), the NH_2 group of the amine is replaced by OH, with the formation of an alcohol; but when nitrous acid acts upon aromatic amines, the products are quite different, and are known as «diazo-compounds.» Thus when nitrous acid acts upon aniline nitrate, a compound having the formula $C_6H_5.N_2.NO_3$, and known as «diazobenzene nitrate,» is formed. This is regarded by chemists as a compound of the hypothetical monovalent radical $C_6H_5{-}N{=}N{-}$. When the free affinity of this radical is saturated by the addition of phenyl (C_6H_5), the resulting compound, $C_6H_5.N_2.C_6H_5$, is known as «azobenzene,» or as «benzene-azo-benzene.» Azobenzene may be prepared by heating nitrobenzene with a solution of $SnCl_2$ in aqueous caustic soda. It is deposited from a solution in benzene in the form of bright red trimetric plates, and owes its importance largely to the fact that aniline yellow, $C_6H_5.N_2.C_6H_4(NH_2)$, is one of its derivatives.

Benzene is an exceedingly inflammable substance, burning with a luminous flame and the generation of a great amount of heat. It is volatile, and its vapor forms a dangerously explosive mixture with air, when present in any considerable quantity. Mansfield, mentioned above as having first demonstrated its existence in coal tar, lost his life, on 25 Feb. 1855, while experimenting with a considerable quantity of benzene, through the mass accidentally taking fire. Benzene may be formed synthetically by heating acetylene gas (C_2H_2) to dull redness in a glass tube. Polymerization occurs, and, among numerous other substances, benzene is formed in accordance with the equation $3C_2H_2 = C_6H_6$. In works on chemistry, benzene is often called «benzol.» (Compare BENZINE.)

This product is so widely employed in the industry of the aniline dyes that chronic poisoning is by no means uncommon. It is usually breathed as vapor in the vat rooms, and causes, after some exposure, dizziness in the head, ringing in the ears, nausea and vomiting, coughing, and sleepiness, which latter may deepen to unconsciousness, somewhat resembling the narcosis caused by breathing chloroform. In some instances there are blood changes, with cyanosis and death. Treatment by fresh air, oxygen, free diuresis, catharsis and diaphoresis, and if the blood changes are marked, infusion of physiological salt solution may be necessary.

Ben'zidine, an important substance belonging to the benzene (or aromatic) series, and used in the arts for the manufacture of Congo red, chrysamin, and other so-called «coal-tar colors.» The coloring matters derived from benzidine have the unusual and valuable property of dyeing cotton without the use of a mordant to fix them upon the fibre. Benzidine has the formula $H_2N.C_6H_4.C_6H_4.NH_2$, and is prepared, commercially, by heating nitrobenzene (see BENZENE) with caustic soda and zinc dust, and subsequent treatment with hot dilute hydrochloric acid. Pure benzidine crystallizes in silvery scales which melt at 252° F., and boil at a temperature probably above 700° F. It is easily soluble in alcohol and ether; it also dissolves readily in hot water, but is almost insoluble in cold water.

Ben'zine, the commercial name for a mixture of the lighter and more volatile hydrocarbons that pass off in the earlier stages of the distillation of crude petroleum. It is essentially different from benzene (q.v.), the latter being a definite chemical substance, belonging in the group of Aromatic Compounds (q.v.); while "benzine" is a more or less indefinite mixture of hydrocarbons that chiefly belong to the paraffin series. Benzine differs but little from naphtha and gasolene, such slight differences as exist being due to variations in the proportions in which the constituent hydrocarbons are present. Benzine is a colorless, mobile liquid, very volatile and inflammable. It is valuable as a solvent for fats, oils, and resins, and is much used about the household as a cleansing agent. Its vapor, when mixed with air, is highly explosive, and serious accidents are common, as the result of using it in the vicinity of lighted lamps or tobacco pipes, or near stoves in which fires are burning. In printing offices it is used for cleaning type, and for removing ink from press rolls. It is also used in large quantities for enriching illuminating gas. Benzine is much lighter than water, and will not mix with it. It boils at from 160° to 190° F.

Poisoning by benzine is rare. The vapor has been used, combined with chloroform and ether, for purposes of narcosis, but it is questionable if it will ever be very popular. Instances of sudden death following the prolonged breathing of benzine vapor have been reported.

Benzo'ic Acid, an organic acid, belonging in the aromatic series, and having the formula $C_6H_5.COOH$. It occurs in benzoin gum, and in certain other resins and balsams. It may be obtained also from the hippuric acid that occurs in the urine of the horse and other herbivorous animals, by boiling that acid with concentrated hydrochloric acid. Benzoic acid is used as a mordant in calico printing, and in the manufacture of aniline blue. It is also used in medicine, and as a preservative agent for anatomical specimens. The benzoic acid that is used for medical purposes is obtained by the direct distillation of benzoin gum over a sand bath, at a temperature of about 340° F. When so prepared, the acid has a pleasant, vanilla-like odor, which is imparted to it by a trace of an aromatic oil that comes over with it from the gum. For most of the purposes for which it is used in the arts, benzoic acid is formed by oxidizing benzyl chlorid with dilute nitric acid.

Benzoic acid dissolves in hot water, but crystallizes out, upon cooling, in needles or pearly prisms. It is soluble in ether, alcohol, and benzene. It melts at 250° F., boils at 480° F., and may be sublimed at intermediate temperatures. Its salts are called "benzoates."

In medicine benzoic acid and its salts, the benzoates (sodium, ammonium, lithium), are widely employed for diseases of the bladder and of the mucous membranes of the lungs. They are also used as intestinal germicides. Benzoic acid has marked bactericidal properties, and may be used for sterilizing purposes. Taken into the intestines it prevents excessive bacterial decomposition; absorbed into the blood it is partly broken up, and in the kidneys is eliminated in part as hippuric acid, rendering the urine acid. It is therefore useful in alkaline fermentations of the urine, particularly in cystitis, pyelitis, etc. Benzoic acid is partly eliminated by the lungs, here acting to increase the amount of mucus; it is therefore used to loosen the mucus in tight coughs. As a parasiticide, benzoic acid is very valuable in scabies. Benzoates are practically useless in gout.

Benzo'ic Al'dehyde. See BENZALDEHYDE.

Ben'zoin, -zo-in, an aromatic compound, soluble in hot alcohol, and crystallizing in colorless, six-sided prisms having the formula $C_6H_5.CH(OH).CO.C_6H_5$. Benzoin is best prepared by acting upon pure benzaldehyde with a hot alcoholic solution of cyanide of potassium. Upon cooling, the benzoin separates and may be removed by filtration. The action of the cyanide is not known, because the chemical change involved in the foregoing process of manufacture appears to consist merely in the uniting of two molecules of benzaldehyde to form a single molecule of benzoin.

Ben'zoin Gum, -zo-in, or **Gum Benjamin,** a reddish brown resin that exudes from the tree *Styrax benzoin,* which grows in Sumatra, Java, and other parts of the East. It is a mixture of various resinous substances, together with free benzoic acid. Cinnamic acid is also present in the free state in many cases, but it is absent from the Siamese gum. Benzoin gum has a pleasant odor when burned, and for this reason has been much used for incense, and in making pastilles. It has antiseptic properties, and preparations of it are used as a dressing for wounds, and in the manufacture of court-plaster. Benzoin is also administered internally, especially in asthma and other pulmonary affections, and chronic catarrh. It is readily soluble in alcohol, and when the tincture so formed is dropped into water, it forms a white, milky fluid, which is used in France as a cosmetic, under the name "*lait virginal.*" The gum is obtained from the styrax-tree by making incisions in the bark, through which the resin oozes. It is allowed to harden by exposure to the air before removal. The best gum is obtained during the first three years of the tree's life, though a good quality may be had for seven or eight years subsequently. The Siamese gum is esteemed more highly than that from Sumatra.

Benzol. See BENZENE.

Benzoni, Girolamo, bĕn-zō'nē, jē-rō-lä'mō, Italian traveler: b. Milan, 1519; d. after 1566. He went to Spanish-America in 1542, visited the principal places then known, and frequently joined the Spaniards in raids on Indian settlements; and after returning to Italy (1556) published a narrative of his adventures, 'History of the New World' (Venice 1565).

Ben'zoyl, -zo-il, in chemistry, the monovalent radical $C_6H_5.CO$. Benzoyl cannot exist in the free state, but it occurs in the combined state in many organic substances. Benzaldehyde (or oil of bitter almonds), $C_6H_5.COH$, may be regarded as its hydrid, and benzoic acid, $C_6H_5.COOH$, as its hydrate.

Ben'zyl, the monovalent organic radical $C_6H_5.CH_2$, which does not exist in the free state, but which has numerous important compounds. Toluene (q.v.) is its hydrid. Benzylamine, $C_6H_5.CH_2NH_2$, is derived by substituting benzyl for one of the hydrogen atoms in ammonia, by heating benzyl chlorid with alcoholic ammonia. Benzyl chlorid, which is

used as a source of "oil of bitter almonds" ("benzaldehyde") and of benzoic acid, has the formula $C_6H_5.CH_2Cl$, and is obtained by passing chlorine into cold toluene, in direct sunlight. Benzyl alcohol, $C_6H_5.CH_2(OH)$, is the hydrate of benzyl, and is obtained by the action of an alcoholic solution of potash upon benzaldehyde.

Beothuk, bā'ō-thŭk, a linguistic stock of North American Indians, habitants of the region of the Exploits River in northern Newfoundland, and believed to have been limited to a single tribe, the last known survivor of which died in 1829. The Beothuks painted their bodies and their property with red ochre, and from this circumstance their stock and tribal name was derived. They were also known as the Goodnight Indians, from the incorrect translation of a Micmac word that sounded like Beothuk. It is not known whether the Beothuks became extinct by reason of wars and famine or by absorption among other tribes.

Beowulf, bā'ō-wŭlf, an Anglo-Saxon epic, the only manuscript of which belongs to the 8th or 9th century, and is in the Cottonian Library (British Museum). From internal evidence it is concluded that the poem in its essentials existed prior to the Anglo-Saxon colonization of Britain, and that it must be regarded either as brought to Britain by the Teutonic invaders, or as an early Anglo-Saxon translation of a Danish legend. From the allusions in it to Christianity, however, it must have received considerable modifications from its original form. It recounts the adventures of the hero Beowulf, especially his delivery of the Danish kingdom from the monster Grendel and his equally formidable mother, and, lastly, the slaughter by Beowulf of a fiery dragon, and his death from wounds received in the conflict. The character of the hero is attractive through its noble simplicity and disregard of self. The poem, which is the longest and most important in Anglo-Saxon literature, is in many points obscure, and the manuscript is somewhat imperfect.

Bibliography.— Morley, 'English Writers,' Vol. I. (1887); Ten Brink, 'Early English Literature' (1883); translation by Garnett (1885); English prose translation by Tinker (1892).

Beppo, a satirical poem on Venetian life by Byron, published in 1818, and named for the chief figure. In Auber's opera, 'Fra Diavolo,' is a character of the same name.

Beppu, bĕp'poo, Japan, a bathing place and seaport on the Island of Kyushu, famed for its hot alkaline baths.

Béranger, Pierre Jean de, bā-răñ-zhā, pē-ăr zhŏñ dĕ, national poet of France: b. Paris, 19 Aug. 1780; d. there, 16 July 1857. His father was a restless and scheming man, and young Béranger, left in a great measure to himself, ran a great chance of spending his life as a gamin and vagabond in the streets of Paris. A few days after the destruction of the bastile he was conveyed to Peronne and placed under the charge of an aunt who kept a tavern, and to whom for a time he acted as waiter. At the age of 14 he was apprenticed to M. Laisnez, a printer in Peronne, but after remaining in that employment for some time, was suddenly summoned to Paris by his father, who wished his assistance. The improvidence and prodigality of his father was constantly involving them in difficulties, and Béranger, with as yet no settled vocation in life, was enduring all the hardships and privation which men of genius in a similar position to himself have frequently had to encounter before the recognition of their talents. He had now, besides making an unsuccessful attempt in the drama, produced a number of poems, including his 'Roger Bontemps,' 'Le Grenier,' 'Les Gueux,' and 'Le Vieil Habit.' Some of these were sent by him in 1804 to Lucien Bonaparte, in the hope thereby of obtaining some patronage or assistance. In this, probably the only application he ever made for aid in the course of a long life, Béranger was not disappointed. Lucien sent for him, encouraged him to proceed in his poetical career, and made over to him his own income as member of the French Institute. He was afterward employed in editing the 'Annales du Musée,' and in 1809 received an appointment as clerk in the office of the secretary to the university. Many of his songs had now become extremely popular and in 1815 the first collection of them was published. A second collection was published in 1821, but Béranger had made himself extremely obnoxious to the Bourbon government by his satires on the established order of things; and in addition to being dismissed from his office in the university, he was prosecuted and sentenced to three months' imprisonment and a fine of 500 francs. A third collection appeared in 1825, and a fourth in 1828, which last publication subjected him to a second state prosecution, an imprisonment of nine months, and a fine of 10,000 francs. Nothing, however, could daunt his spirit, and in prison he still continued to busy himself in the composition of his songs and lyrical satires upon government. In 1833 he published his fifth and last collection, which contains some of the most powerful effusions of his genius. The concluding years of his life were spent in a dignified retirement and he received the honor of a public funeral, at which the most eminent men of France, both of the world of literature and politics, attended.

The great attraction of Béranger's songs is the unequaled grace and sprightliness which they display, combined with great descriptive powers, much comic humor, and occasional bursts of indignation and invective when some social or political grievance is denounced. They are sometimes also, it must be admitted, marked by a tendency to levity and looseness of morals, but in this respect they partake eminently of the French character. No one, indeed, was more thoroughly French than Béranger, and the glory of his beloved *patrie*, as paramount to all other considerations, appears constantly as the inspiring genius of his poetry. The intense nationality of his songs constitutes one of their principal charms, and in this respect he bears some resemblance to Thomas Moore. He has sometimes been called the Burns of France, but though like him essentially a poet of the people, he falls far beneath the pathos and depth of feeling displayed by the Ayrshire Bard in depicting the passion of love. In private life Béranger was the most amiable and benevolent of men, beloved by his friends alike for his social qualities and kindliness of heart, while his charities were so numer-

ous and extensive as often to exceed the bounds of prudence. See Janin, Béranger et son temps' (1866); Sainte Beuve, 'Portraits contemporaires'; Nivalet, 'Souvenirs historiques et étude analytique sur Béranger et son œure' (1892).

Berar, bā-rär', or the **Hyderabad Assigned Districts,** a commissionership of India, in the Deccan, south and west of the central provinces and north of Hyderabad, touching Bombay territory on the west; with an area of 17,718 square miles. It consists chiefly of a fertile plain bordered on the north and south by low ranges of hills. It is intersected by the Purna, and is partly bounded north and south by the Wardha and Penganga flowing east to the Godavari. It has a fertile soil, which produces much good cotton and millet, the best wheat in India, as well as oil-seeds and other produce. The rainfall is regular, and this province is in the position of being able to export food to other parts of India. It is intersected by the railway from Bombay to Nagpur, and ultimately to Howrah, opposite Calcutta. After being ruled by independent sovereigns, it was added in the 17th century to the Mogul empire, and latterly became part of the Nizam's dominions (Hyderabad), to which it still in a sense belongs. In 1853 it was assigned or handed over to the British authorities to provide for the payment of the body of troops which the Nizam had been previously bound to furnish in time of war for the Indian government. A new treaty was concluded in 1860 by which certain territorial alterations were brought about, and a considerable debt due by the Nizam was canceled. The province has greatly prospered under British rule. It consists of six districts: Ellichpur, Amraoti, Akola, Buldana, Basim, and Wun. The largest towns are Ellichpur and Amraoti (Oomrawuttee). Berar is under the administration of a revenue and fiscal commissioner superintended by the resident at Hyderabad. There is also a judicial commissioner, who superintends the working of the courts of justice. The surplus revenue, after the expenses of administration and the cost of the Hyderabad contingent of troops are defrayed, is handed over to the government of the Nizam. Pop. (1901) 2,752,400.

Berard, Augusta Blanche, American educator and historical writer: b. West Point, N. Y., 29 Oct. 1824; d. 1901. She was the daughter of a former professor at West Point Military Academy, and her life was spent mainly in teaching. She was the author of school histories of the United States and England; 'Spanish Art and Literature'; 'Reminiscences of West Point in the Olden Time.'

Berard, bā-rär, **Frédéric,** French physician: b. Montpellier, 8 Nov. 1789; d. there, 16 April 1828. When only 20 years of age he wrote a thesis entitled 'Theory of Natural Medicine, or Nature Considered as the True Physician, and the Physician as an Imitator of Nature.' He afterward went to Paris, where he was engaged to write in the 'Dictionary of Medical Science.' In 1816 he returned to Montpellier as professor of therapeutics in a private course of lectures to the medical students of the college. At this period he published a work explanatory of the 'Doctrines of the Medical School of Montpellier.' With Rouzet, he published Dumas' work on 'Chronic Diseases,' with instructive commentaries. In 1823 he also published in Paris his work on 'The Relations of the Physical and the Moral Organism, as a Key to Metaphysics and the Physiology of Mind.' In this he explains his own views of human nature and the principles of life, in opposition to the views of Cabanis. He also took occasion to publish at the same time, a manuscript letter of Cabanis, on 'Primary or Final Causes,' accompanied by numerous annotations.

Berat, bā-rät', a town of Albania, on the river Beratinos, the ancient Apsus. It is the seat of a pashalic and Greek archbishopric, and was taken by Ali Pasha fom his rival Ibrahim. Amurath II. captured Berat, and his troops held it notwithstanding a desperate attempt by Scanderbeg with a strong body of Italian auxiliaries to retake it. Pop. 12,000.

Béraud, Jean, bā-rō, zhŏn, French painter of great power: b. St. Petersburg, Russia, 1849. After serving with distinction in the French army during the Franco-Prussian war he became a pupil of Bonnat. His subjects are usually chosen from Parisian life. His latest works have been modernized scenes from the New Testament. 'La Madeleine' represents a Parisian harlot at the feet of Christ in a Paris restaurant; the scene of the 'Descent from the Cross,' is Montmartre overlooking Paris, with a group of working men and women.

Beraun, bā-rown', a town of Bohemia, 18 miles to the southwest of Prague, on the river Beraun, with manufactures of cotton, sugar, etc. Pop. (1890) 7,265.

Berbe, a west African, much-spotted genet (*Germetta pardina*). See GENET.

Ber'ber, a town of Nubia, on the right bank of the Nile, below the confluence of the Atbara. It is a station on the route from Khartum to Cairo, and a point to which caravans go from Suakin on the Red Sea. In the course of Gen. Graham's operations against Osman Digna in 1885, a railway was projected from Suakin to Berber, and the work was actually begun, but was ultimately abandoned when military protection was taken away. Pop. (estimated) 10,000.

Ber'bera, the chief port and town of British Somaliland, on the African coast, of the Gulf of Aden and south of Aden. It has a small but well-sheltered harbor and a long pier; a European quarter with stone houses and warehouses, and a native quarter laid out with broad streets but consisting chiefly of huts or sheds. There is a considerable export trade in the products of the country, such as hides and skins, gums, ostrich feathers, ghee, sheep, goats, and cattle; rice, millet, dates, cottons, tobacco, etc., being imported. The traffic is chiefly with Aden. The population is perhaps 5,000, increased to 30,000 during the trading season. The Somauli Coast Protectorate extends along the coast for about 400 miles and inland for about 200, the area being about 80,000 square miles. Besides Berbera it contains also the ports of Zeilah and Bulhar. It was acquired in 1884, and is administered by a political agent and a consul. A number of Indian troops are stationed in the territory. The trade is of some importance and is increasing.

Ber'berine, a poisonous alkaloid discovered by Buchner in 1837 in the root of the common barberry, and now known to exist in many other plants also. It crystallizes, ordinarily, in yellow, silky needles, having the composition $C_{20}H_{17}NO_4 + 4\frac{1}{2}H_2O$; but when thrown down from solution in alcohol the needles are said to be red — probably from the absence of water. Berberine forms numerous salts, and is used to a considerable extent in medicine, occurring in notable quantities in preparations of hydrastis. The alkaloid itself is soluble in from four to five parts of water at ordinary temperatures, and is also moderately soluble in alcohol; but it is insoluble in both ether and chloroform.

Ber'beris, the generic name of the barberry (q.v.).

Berbers, the name of a people spread over nearly the whole of northern Africa. From their name the appellation Barbary is derived. They are considered the most ancient inhabitants of the country. Their different tribes are scattered over the whole space intervening between the shores of the Atlantic and the confines of Egypt; but the different branches of Atlas are their principal abode; while to the south they extend to the Soudan. The chief branches into which they are divided are: the Amazirgh, Amazigh, or Mazigh, estimated to number from 2,000,000 to 2,500,000, and who inhabit Morocco. They are for the most part quite independent of the Sultan of Morocco, and live partly under chieftains and partly in small republican communities. Second, the Shillooh or Shellakah, who number about 1,450,000, and inhabit the south of Morocco. They practise agriculture and carry on some manufactures. They are more highly civilized than the Amazirgh. Third, the Kabyles in Algeria and Tunis, who are said to number about 1,000,000; and fourth, the Berbers of the Sahara, who inhabit the oases, and consequently live for the most part at wide intervals from each other. Among the Sahara Berbers the most remarkable are the Beni-Mezâb and the Tuareg. To these we may also add the Guanches of the Canary Islands, now extinct, but undoubtedly of the same race. The Berbers generally are about the middle height; their complexion brown, and sometimes almost black, with brown and glossy hair. Individuals of fair complexion and light hair and even with blue eyes are said to be not uncommon among them. They are generally thin, but extremely strong and robust, and their bodies are beautifully formed. The head of the Berber is rounder than that of the Arab, and the features shorter, but of an equally marked character, although the fine aquiline nose, so common among the latter, is not often seen among the Berbers. The language of the Berbers is said to have affinities with the Semitic tongues. Such of them as mingle with the Arabs speak or understand Arabic; but those who dwell in the interior of the mountains understand no other language than their own. The Berbers often leave their mountains to plunder travelers on the plain. They generally dwell in huts, or rude houses, the latter rectangular, with two gable ends, covered with thatch and entered by a low and narrow door. These dwellings are often built in little groups, scattered about in the valleys and upon the sides of the mountains, and in some parts each group of huts is situated in the midst of a plantation, with a portion of ground laid out as a kitchen-garden. Although the Berbers have always lived in ignorance, and have had but little connection with civilized nations, they are remarkably industrious. By working the mines in their own mountains they produce lead, copper, and iron. With the iron they manufacture gun-barrels, implements of husbandry, and many rudely formed utensils. They understand the manufacture of steel, from which they make knives, swords, and other instruments, not very elegant in form, but of good quality. They likewise make gunpowder for their own use, and this powder is said to be of very superior quality. One of their articles of commerce is a species of black soap, which they make with olive-oil and soda obtained from sea-weed. The tribes inhabiting the borders of the plains and some of the great valleys breed sheep and cattle in considerable numbers. Their sheep are small and yield very little wool. They have likewise numerous herds of goats, which supply them with milk, and of the flesh of which they are very fond. Their cows and oxen are of a small species, but their asses and mules are much esteemed.

Berbice, bėr-bēs', a district of British Guiana, intersected by the river Berbice. It extends from the river Abary on the west to Corentyn River on the east, about 150 miles along the coast, the boundary inland not being fixed. The chief town is New Amsterdam; pop. about 9,000. The principal productions are sugar, rum, cotton, coffee, cocoa, and tobacco. The coast is marshy and the air damp. Berbice came finally into British possession in 1815, having previously belonged to the Dutch. Till 1831 it formed a separate colony from Demerara and Essequibo. Pop. (1891) 51,176. See GUIANA.

Berbice, a river of British Guiana; flows generally northeast into the Atlantic. It is navigable for small vessels for 165 miles from its mouth, but beyond that the rapids are numerous and dangerous.

Berchem, bėrH'ėm, or **Berghem, Nikolaas,** Dutch painter: b. Haarlem, 1624; d. there, 18 Feb. 1683. Having studied under his father and Van Goyen, Weenix the elder, and other masters, he spent several years in Italy, where he soon acquired an extraordinary facility of execution. His industry was naturally great, and his innumerable landscapes now decorate the best collections of Europe. The leading features of Berchem's works, besides the general happiness of the compositions, are warmth and coloring, a skilful handling of lights, and a mastery of perspective. His etchings are also highly esteemed. See Buxton and Poynter, 'German, Flemish and Dutch Painting' (1881).

Berchet, bār-shā', **Giovanni,** Italian poet and prose writer: b. Milan, 23 Dec. 1783; d. 1851. He was a friend of Manzoni and Silvio Pellico. In 1826 he became a frequent contributor to a liberal journal at Milan, called the *Conciliatore.* When this was suppressed and its contributors cast into prison or exiled by the Austrian government, Berchet settled in Geneva. At the time of his death he was a member of the Sardinian parliament. His writings include: 'Profugi di Praga'; 'Romanze';

(Fantasie) (1829). His collected poems appeared in 1863, with biographical sketch.

Berchta, bĕrH'tạ, a female hobgoblin, in the folk lore of southern Germany, of whom naughty children are much afraid. Her name is connected with the word bright, and originally she was regarded as a goddess of benign influence.

Berchtesgaden, berH-tĕs-gä'dĕn, a village of Bavaria, situated in a most picturesque and much-visited region, about 12 miles south of Salzburg, on the Achen, or Alm, a stream which issues from the beautiful lake called the Königssee. It lies on a mountain slope surrounded by meadows and trees, consists of well-built houses, and has a fine old abbey, now a royal residence; the abbey church, with fine Romanesque transepts of the 12th century; a royal villa, etc. Wood-carving is extensively carried on, and there is an important salt mine. It is the principal settlement in the district of the same name. Pop. (1895) 2,349.

Berck, bărk, France, a bathing resort on the English Channel, an hour's ride south from Boulogne. It is the terminus of a railway, and has an excellent beach, a kursaal and two hospitals for children.

Berckheyde, bĕrk'hī-dĕ, **Gerrit,** Dutch painter: b. Haarlem, 1638; d. 1698. He was a younger brother of Job Berckheyde and with him was employed at the court of the Elector Palatine. Among his most important works are: 'View of Amsterdam'; 'View of Cologne'; 'View of Heidelberg Carlto.'

Berckhyde, Job, Dutch architectural and genre painter: b. Haarlem, 1630; d. 1693. He was a pupil of Jacob de Wet and Franz Hals and was accepted as master in the Haarlem Guild in 1654. Of the brothers Berckhyde Job is the finer artist. Some of his most famous paintings are: 'Joseph's Brethren in Egypt' (1669); 'Interior of Old Exchange at Amsterdam' (1678); 'Courtesan's Room'; 'Winter Landscape'; 'Interior of Haarlem Cathedral'; 'Artist's Portrait.'

Bercy, bĕr-sẹ, formerly a village on the Seine (here crossed by a suspension bridge), but since 1860 forming part of the southeastern quarter of Paris. The Parisian wine merchants have here their stores of wine, spirits, etc., and there are several important tanneries, sugar-refineries, and paper-mills. A large palace, Le Grand Bercy, was built by Levau at the close of the 17th century.

Berdiansk, bĕr-dyänsk', a seaport of southern Russia, in the government of Taurida, on the northern shore of the Sea of Azof. It contains many handsome houses, arranged in spacious streets, and has a good anchorage, sheltered on all sides except the south. It is the chief entrepôt for the surrounding governments, and exports large quantities of grain, oil-seeds, and wool. It has also a large inland trade in wood, coal, fish, and salt, the last obtained from apparently inexhaustible mines in the vicinity. Pop. (1897) 24,247.

Berditchev, bĕr-dẹ'chĕf, a city of European Russia, in the government and 129 miles southwest of Kiev. It is an ill-built place, mainly Jewish, but contains several churches and synagogues, and a large Carmelite convent, in the church of which is an image of the Virgin Mary, the object of pilgrimages. It carries on a considerable trade in corn, wine, cattle, honey, wax and leather. Pop. (1897) 53,728.

Berea, Ky., town in Madison County; on the Louisville & N. R.R., 41 miles southeast of Lexington. It is the centre of a large agricultural section and is the seat of Berea College (q.v.), founded in 1853. Pop. (1900) 1,000.

Bere'a, Ohio, a village in Cuyahoga County, on several railroads; 13 miles southwest of Cleveland, with which, and Elyria and Oberlin, it is connected by electric lines. It was founded in 1829; is lighted by natural gas and electricity; has extensive quarries of sandstone (Berea grit); and is the seat of Baldwin University, German Wallace College (both Methodist Episcopal), and a German orphan asylum. Pop. (1900) 2,510.

Berea College, a co-educational, non-sectarian institution, in Berea, Ky.; organized in 1855. It has 30 members in its faculty, and some 850 students. Its building and grounds are valued at $150,000, and its library contains 20,000 volumes. The distinguishing feature of the college is its work in the southern mountain region, where it carries on, through traveling libraries, social settlements, and lectures, a very valuable kind of university extension.

Berea Grit, a variety of sandstone, great deposits of which are found at Berea, Ohio. It is widely famous for its evenness of texture, and color, and exemption from the impurities that would deteriorate its marketable value. See CARBONIFEROUS SYSTEM.

Bere'ans, in modern Church history an insignificant sect of dissenters from the Church of Scotland, founded by Rev. John Barclay (1734–98) in 1773. They take their title from, and profess to follow the example of, the ancient Bereans (see Acts xvii. 10–13) in building their system of faith and practice upon the Scriptures alone, without regard to any human authority whatever. They agree with the great majority of Christians, both Protestants and Roman Catholics, respecting the doctrine of the Trinity, which they hold as a fundamental article of the Christian faith; but differ from the majority of all sects of Christians in various other important particulars. For instance, they say that the majority of professed Christians stumble at the very threshold of revelation by admitting the doctrine of natural religion, natural conscience, etc., not founded upon revelation or derived from it by tradition. With regard to faith in Christ, they insist, that as faith is the gift of God alone, so the person to whom it is given is as conscious of possessing it as the being to whom God gives life is of being alive, and therefore he entertains no doubts either of his faith or his consequent salvation through the merits of Christ, who died and rose again for that purpose. Consistently with the above definition of faith, they say that the sin against the Holy Ghost is simply unbelief. Their mode of practice and Church government differs but little from those of many other dissenting sects.

Berendt, bā'rent, **Karl Hermann,** German ethnologist: b. Dantzic, 1817; d. 1878. After studying medicine he began to practise in Breslau, where he lectured in the university. In 1851 he went to Nicaragua and thence to Vera

Cruz, where he devoted some years to ethnological study and research. He subsequently traveled in Yucatan and Guatemala, making a careful study of Mayan dialect. He published 'Analytical Alphabet of the Mexican and Central American Languages' (1869); 'Los escritos de Don Joaquin Garcia Icazbalceta' (1870); 'Los trabajos linguisticos de Don Pio Perez' (1871); 'Cartilla en lengua Maya' (1871).

Berengar, bā'rĕn-gär, two kings of Italy in the 9th and 10th centuries. BERENGAR I., son of the Duke of Friuli by a daughter of Louis-le-Debonnaire, during the confusion which followed on the dissolution of the empire of Charlemagne, laid claim to the crown of Italy, and after a civil war obtained it in 888. At a later period, having been invited by Pope John X. to repel the Saracens who were devastating the south of Italy, he was crowned emperor of Rome. His warlike expeditions had generally been fortunate, and his internal government was generally acceptable to his subjects; but his nobility, jealous of his authority, stirred up a new competitor for the throne in the person of Rudolf II., who invaded Italy in 921, and ultimately obliged Berengar to take refuge in Verona, where he was assassinated in 924. BERENGAR II., nephew of the former by a daughter, was at first Marquis of Ivrea, while the throne of Italy was occupied by Hugo, count of Provence, a tyrant who had incurred the enmity of almost all the great feudal lords of the kingdom. Berengar, taking advantage of this feeling, put himself at the head of a force collected in Germany in 945, and was almost universally welcomed. Hugo abdicated in favor of his son Lothario, who reigned nominally for a few years, and was succeeded in 950 by Berengar, in whom all the powers of the government had previously centred. A quarrel with the Emperor Otho in the following year deprived him of his throne, but he was permitted to resume it on agreeing to acknowledge Otho as his liege lord. In a second quarrel he was not allowed to escape so easily. After losing his territories he shut himself up in the fortress of St. Leo, and defended himself bravely till famine compelled him to submit. He was imprisoned at Bamberg, and died there in 966.

Berengaria, bā-rĕn-gā'rĭ-ạ, the queen of Richard I. of England: d. Le Mans, about 1230. She was a daughter of Sancho VI. of Navarre and was married to Richard at Limasol in Cyprus, 12 May 1191. She remained at Acre while the king was warring with the Saracens and resided in Poiton during his imprisonment in Germany. She became estranged from him soon after his release and seems never to have joined him again. She was buried at Espan in the Church of Pietas Dei, which she had founded.

Berenga'rio, Jacopo, Italian anatomist: b. Carpi, about 1470; d. Ferrara, 1530. He taught anatomy and surgery at Pavia, and finally settled at Bologna till a clamor caused by a rumor that he had got possession of two Spaniards affected by a loathsome disease, and was intending to dissect them alive, obliged him to retire to Ferrara. This rumor, caused doubtless by the fact that Berengario looked upon the dissection of the human body as the only means by which the science of anatomy could be advanced, points out the source of the many important discoveries which he made, and the others for which he paved the way, leaving them to be followed out by Vesalius, Eustachius, and Fallopius. He is justly regarded as one of the principal founders of modern anatomy. He was also a dexterous operator, and published a practical work entitled, 'De Cranii Fractura.'

Berenga'rius of Tours, French theologian: b. Tours, about 1000; d. 6 Jan. 1088. He is renowned for his philosophical acuteness as one of the scholastic writers. While admitting the real presence of Christ in the Eucharist, he questioned the doctrine of transubstantiation and held that the substance of bread and of wine continued to exist with the body and blood of Christ (consubstantiation). He was condemned by several councils and several times recanted, but finally died fully reconciled with the Church. He is the first in theological history to call the doctrine of transubstantiation in question. He was treated with forbearance by Gregory VII., but the scholastics belonging to the party of Lanfranc, Archbishop of Canterbury, were irritated against him to such a degree that he retired to the Isle of St. Cosmas, in the neighborhood of Tours, in the year 1080, where he closed his life in pious exercises. On the history of this controversy, which has long occupied the attention of theologians, new light was shed by Lessing in his 'Berengar' (1770), and also by Stäudlin, who likewise published the work of Berengarius against Lanfranc. This Berengarius must not be confounded with Peter Berenger of Poitiers, who wrote a defense of his instructor Abelard.

Berenhorst, Francis Leopold von, German military writer: b. 1733; d. 1814. He was one of the first writers by whom the military art has been founded on clear and certain principles. He was a natural son of Prince Leopold of Dessau, and in 1760 became the adjutant of Frederick II. After the Seven Years' war he lived at Dessau.

Berenice, bĕr-ẹ-nī'sẹ (a bringer of victory). (1) This was the name of the wife of Mithridates the Great, king of Pontus. Her husband, when vanquished by Lucullus, caused her to be put to death (about the year 71 B.C.), lest she should fall into the hands of his enemies. (2) The wife of Herod, brother to the great Agrippa, her father, at whose request Herod was made king of Chalcis by the Emperor Claudius, but soon died. In spite of her dissolute life, she insinuated herself into the favor of the Emperor Vespasian and his son Titus. The latter was at one time on the point of marrying her. (3) The wife of Ptolemy Euergetes; who loved her husband with rare tenderness, and when he went to war in Syria made a vow to devote her beautiful hair to the gods if he returned safe. Upon his return Berenice performed her vow in the temple of Venus. Soon after the hair was missed, and the astronomer Conon of Samos declared that the gods had transferred it to the skies as a constellation. From this circumstance the constellation near the tail of the Lion is called *Coma Berenices* (the hair of Berenice).

Berenice, a city of Egypt, on the Red Sea, whence a road, 258 miles in length, extended across the desert to Coptos, on the Nile. This

road was constructed in the reign of the second Ptolemy. Berenice was one of the principal centres by which the trade of Egypt, under the Macedonian dynasty, and that of the Romans subsequently, were carried on with the remote East. During the Roman period, a sum equal to $2,000,000 is said to have been annually remitted to the East by the Roman merchants as payment for its precious products, which sold at Rome for a hundred-fold more than their original price. Nothing now remains of Berenice but a heap of ruins, adjoining the modern port of Habest. BERENICE, or Hesperis, a city of Cyrenaica, near which the ancients imagined the gardens of the Hesperides to be situated. The village, named Bengazi (q.v.), now occupies a portion of its site.

Berenson, Bernhard, Russian-American art critic: b. Wilna, Russia, 26 June 1865. He was educated in the schools of Boston and at Harvard University and has lived for many years in Florence, Italy. He has contributed much in the way of art criticism to the New York *Nation* and to French and German art reviews, and has published 'Venetian Painters of the Renaissance' (1894); 'Lorenzo Lotto: An Essay in Constructive Art Criticism' (1895); 'Florentine Painters of the Renaissance' (1896); 'Central Italian Painters of the Renaissance' (1897); 'The Study and Criticism of Italian Art' (1901).

Beresford, Lord Charles William de la Poer, English naval officer: b. Ireland, 10 Feb. 1846. He became a rear-admiral in 1897. In 1882 he commanded the Condor in the bombardment of Alexandria, and was especially mentioned and honored for his gallantry. After the bombardment he instituted an efficient police system in the city. In 1884–5 he served on Lord Wolseley's staff in the Nile Expedition; and subsequently commanded the naval brigade in the battles of Abu Klea, Abu Kru, and Metemmeh. He commanded the expedition which rescued Sir Charles Wilson's party in «Safia,» and was commended for his gallantry in both Houses of Parliament. He received the thanks of the French government for assisting the grounded Seignalay. In 1893–6 he was in command of the naval reserve at Chatham, and in December 1899 was appointed the second in command of the British squadron mobilized in the Mediterranean Sea. Lord Beresford accompanied the Prince of Wales on his visit to India in 1875–6, as naval aide-de-camp, and held the same relation to the queen in 1896–7. He has sat at various times in Parliament, as member for Waterford, East Marylebone, York, and Woolwich. Besides numerous honors for gallantry as an officer he has received three medals for saving life at sea under trying circumstances. In 1898 he visited China at the request of the Associated Chambers of Commerce of Great Britain to make a study of the complicated commercial conditions existing there; and on his return, in 1899, he passed through the United States, and was received with distinguished honors by official and commercial bodies. He has done much to promote the «open door» policy as a condition of international commerce in China. His publications include 'Life of Nelson and His Times'; 'The Break-Up of China' (1899), and many essays and special articles.

Beresford, William Carr, Viscount, English general, was a natural son of the first Marquis of Waterford: b. 2 Oct. 1768; d. Bedgebury Park, Kent, 8 Jan. 1854. He entered the army, and served at Toulon, and in Corsica; in the West Indies under Abercromby; and in Egypt under Baird. In 1806 he was raised to the rank of brigadier-general, and the same year commanded the land force in the expedition to Buenos Ayres. Having been ordered to Portugal in 1808, he was intrusted there with the remodeling of the Portuguese army — an office which he accomplished with great success; and in acknowledgment of his services was created a Marshal of Portugal, Duke of Elvas, and Marquis of Santo Campo. He subsequently took part in the siege of Badajoz, and the battles of Salamanca, Vittoria, and Bayonne. For his bravery at the battle of Toulouse he was raised to the peerage, with the title of Baron Beresford, afterward superseded by that of Viscount Beresford, conferred on him in 1823. In political principles he was a high Conservative; and a thorough supporter of the Duke of Wellington. In 1828, when the Duke became premier, he was made master-general of the ordnance, a post he held till 1830.

Berezin, byĕr-yĕ-zēn′, **Ilya Nikolayevitch,** Russian Orientalist: b. 1818; d. 1896. He studied Oriental philology at the University of Kazan, where in 1846 he was appointed professor, and in 1855 became professor of Turkish at the University of St. Petersburg. Some of his important works in Russian are 'Library of Oriental Authors' (1849–51); 'Tour Through Daghestan and Trans-Caucasia' (1850); 'A Grammar of the Persian Language' (1853); 'The Mongol Invasion of Russia' (1852–4); 'Popular Turkish Sayings' (1857). He wrote in French 'Recherches sur les dialectes Musulmans' (1848–53), and edited the 'Russian Encyclopedic Dictionary' in 16 volumes.

Berezina, byĕr-yĕ-zẹ-na′, a river in the Russian province of Minsk, rendered famous by the passage of the French army under Napoleon, 26–27 Nov. 1812. Admiral Tchitchakoff, with the Moldavian army, forced his way from the south to join the main army, which, after Borizoff had been retaken, was to assist the army led by Wittgenstein from the Dwina, and in this manner cut off Napoleon from the Vistula. Napoleon was therefore obliged to make the greatest efforts to reach Minsk, or at least the Berezina, and to pass it earlier than the Russians. After the advanced guard of the Moldavian army had been repelled to Borizoff by Oudinot, and the bridge there burned by them, early in the morning of 26 November, two bridges were built near Sembin, about two miles above Borizoff, an undertaking the more difficult, because both banks of the river were bordered by extensive morasses, covered, like the river itself, with ice not sufficiently strong to afford passage to the army, while other passes were already threatened by the Russians. Scarcely had a few corps effected their passage, when the greater part of the army, unarmed and in confusion, rushed in crowds upon the bridges. Those who could not hope to escape over the bridges sought their safety on the floating ice of the Berezina, where most of them perished, while many others were crowded into the river by their comrades. Besides the multitudes who were obliged to remain beyond the Berezina, the division of Par-

touneaux, which formed the rear-guard, was also lost. It was intrusted with the charge of burning the bridges in its rear, but it fell into the hands of the enemy. According to the French bulletins only a detachment of 2,000 men, who missed their way, was taken; according to the Russian accounts the whole corps, 7,500 men and five generals. The river is a tributary of the Dnieper and has a course of some 335 miles. A canal system connects it with the Dwina.

Berezov, byĕr-yä'zōf (the town of birch-trees), a town in Siberia, in the government of, and 400 miles north from, Tobolsk, on a height above the left bank of the Sosva, one of the branches of the Obi. It consists of wooden houses carefully built of large timbers, and generally with high steps in front, and contains three churches and a chapel. Its inhabitants, who are chiefly Cossacks, subsist by the chase and by fishing; they barter furs, skins, fish, etc., for flour, flesh-meat, tobacco, ironware, and brandy, brought by the Tobolsk dealers, whose craft are floated down the Irtish into the Obi. Prince Menzikoff, the favorite of Peter the Great, died here in exile in 1731, having been banished by his grandson Peter II. Pop. (1897) 1,073.

Berezovsk, byĕr-yä-zōvsk', a village in the Russian province of Perm, near Ekaterinburg, which gives name to a famous gold field, wrought since 1744. The mines are on the eastern slopes of the middle Ural chain, and the field is more than five miles long. The washings on the Berezovka River are also very productive.

Berg, bĕrg, **Friedrich Wilhelm Rembert,** Russian general: b. 1790; d. 1874. He is chiefly notorious for the severity with which he treated the unfortunate population of Poland during the insurrection of 1863, and which excited the horror and indignation of the civilized world.

Berg, bĕrg, **Joseph Frederick,** American clergyman: b. Antigua, W. I., 3 June 1812; d. New Brunswick, N. J., 1871. He came to the United States in 1825, entered the German Reformed ministry, in which he served, 1835–52, and then entered the Dutch Reformed Church and was professor of theology in the Dutch Reformed Theological Seminary at New Brunswick from 1861 till his death. He was distinguished for the intensity of his opposition to the Roman Catholic Church, on which theme he wrote extensively, his best known work being 'Synopsis of the Moral Theology of Peter Dens, as Prepared for Romish Seminaries and Students of Theology' (1842).

Berg, an ancient duchy of Germany, now included in the governments Arnsberg, Cologne, and Düsseldorf. It extended along the Rhine from the Ruhr to the frontiers of Nassau, and is everywhere hilly. It is more a manufacturing than an agricultural district, and has long been famed for its minerals, which include iron of the finest quality, lead, copper, zinc, and the precious metals. In addition to the employment furnished by these minerals, the inhabitants, who are very industrious, have with considerable success superadded textile manufactures. It is now indeed the chief manufacturing district in Germany, and the most densely peopled. It contains the important towns of Elberfeld and Barmen. The duchy of Berg, founded in 1389. had been long consolidated with the Prussian dominions when (1806) Napoleon revived the title, and conferred it, with an enlarged territory, on Murat. On Murat's receiving the kingdom of Naples, Napoleon named his nephew Louis Napoleon (brother of the late Emperor Napoleon III.) hereditary Grand-duke of Berg, and increased its limits still farther. At the Congress of Vienna, in 1815, the whole was given to the king of Prussia.

Berga, a town of Spain, in the province of Barcelona, in a hilly district near the river Lobregat. There is an old castle overlooking the town, which carries on some manufactures of cottons. Pop. (1903) 6,072.

Bergama, bĕr'ga-ma, a town of Asia Minor, about 20 miles inland from the west coast, on the Selinus, a tributary of the Caïcus, 46 miles north by east of Smyrna. It occupies the site of the ancient Pergamus (q.v.), and contains numerous remains attesting its ancient magnificence. In the centre are the remains of a large Roman basilica, a Byzantine church now converted into a mosque, and a curious double tunnel 200 yards long through which the river runs. To the east of the town is a steep hill with the acropolis and the remains of a Roman palace on the top. To the west of the town are the ruins of the ancient amphitheatre with arches of fine workmanship. It was built so that the arena could be flooded with water from a stream, thus affording an opportunity for nautical sports. Bergama is a flourishing town noted for its manufactures of morocco leather. Pop. about 6,000.

Bergami, Bartolommeo. The celebrated trial of Queen Caroline, wife of George IV. of England, was principally founded upon a charge of adulterous intercourse with Bergami, who, in 1814, upon recommendation of the Marquis Ghislieri, in whose previous employment he had been, was attached to her household. Bergami, who had fought his way up in the Italian army from a common soldier to the rank of quartermaster, belonged to a respectable family, and the Marquis Ghislieri described him to the queen as a person of character and attainments superior to his condition, and bespoke for him a kind treatment. This, and the personal advantages of Bergami, who was singularly good-looking, combining athletic strength and stature with almost feminine beauty, naturally disposed the queen in his favor. Moreover, he was full of loyalty and devotion, and on one occasion nearly became the victim of poison intended for her. The queen treated his whole family, especially a little child of his, with the greatest generosity and kindness. All these circumstances were used by her enemies as so many indications of her criminality, and during the trial one of the Italian witnesses, Teodore Majocchi, excited special indignation by his admitting every fact unfavorable to the queen, and by answering every question which might tell in her favor with *Non mi ricordo.* Bergami, who was at Pesaro during the trial, exclaimed, when he was apprised of her acquittal, but at the same time of her death, that she had been poisoned, and never could be convinced to the contrary. To the last he ever spoke of the queen with the greatest reverence and affection, and his deportment before and after her death led to the

conclusion that he looked upon her rather as a benefactress than as a mistress. However, wherever he went he became the observed of all observers. During his occasional excursions to Paris his apartments were crowded with visitors, consisting principally of ladies, who, under the pretext of having been friends of Queen Caroline, gratified their curiosity and obtained an interview with the portly courier. When at home he lived in great splendor; in the capitals of Italy, Rome, Naples, Milan, he was a lion, and the houses of «the best families» were open to him. At the time of the trial many different statements about Bergami's character were circulated in the House of Lords, but however contradictory in many other respects, they all agreed in this one fact, that he was as inoffensive as he was good-looking a person, who probably would never have been heard of beyond the precincts of Italian barracks if it had not been for his relation with Queen Caroline, and for the peculiar construction which was put upon it by her enemies at the trial. His name in England was, by a curious mistake, spelled with a P.

Bergamo, bĕr'gą-mō, Italy, city and capital of the province of Bergamo, situated in the district lying between the rivers Brembo and Serio. It consists of two distinct portions, the Città Alta (High Town), situated on hills, and now attainable by a cable tramway, and the much more extensive new quarters in the plain. Bergamo trades largely in silk, silk goods, grain, etc. At its fair goods to the value of a million sterling have sometimes been sold. It has an academy of painting and sculpture, a museum, an athenæum, a public library, several secondary schools, and various manufactories, especially of silk. There is a cathedral, but some of the other churches are of greater interest. There is a small Protestant congregation. The comic characters in the Italian masked comedy are Bergamese, or affect the dialect of the country people in the neighborhood of this city. In 1796 Bonaparte took Bergamo, and it was subsequently made the capital of the department of the Serio, in the kingdom of Italy. Among many distinguished men born here are Tiraboschi, the historian of Italian literature; the composer Donizetti, and Cardinal Mai. Pop. (1901) 46,000.

Ber'gamot, a shrub or small tree of the genus Citrus (natural order *Butaceæ*) variously placed as a variety of the orange (*C. aurantium*) and of the citron (*C. medica*). The plant is largely cultivated in southern Europe, especially Italy, for its green, bitter volatile oil, known as oil or essence of bergamot which is expressed or distilled from its highly aromatic rind for use in perfumery. The name is also applied, mainly in Europe, to many varieties of pears and in both Europe and America to several species of the natural order *Labiatæ;* for example, *Mentha aquatica* (Europe), *Monarda didyma* and *M. fistulosa* (America). The name seems to be a corruption of the Turkish *beg armūdi,* a lord's pear. See Citrus.

Bergedorf, bĕrg'ĕ-dôrf, a town of Germany, 10 miles southeast of Hamburg, and in the territory belonging to that city, on the Bille, a tributary of the Elbe. It has flourishing glass works and manufactures of enamel ware. It was held jointly by Lubeck and Hamburg till 1867, when Lubeck assigned its rights to Hamburg on payment of 200,000 thalers. Pop. (1900) 10,243.

Bergen, Joseph Young, American educator: b. Red Beach, Me., 22 Feb. 1851. He graduated at Antioch College, Ohio, 1872, and for a time was on the Ohio Geological Survey and professor of natural sciences at Lombard University, becoming later a teacher of science in the Boston high and Latin schools. He is joint author of 'The Development Theory: the Study of Evolution Simplified for General Readers' (1884); Hall and Bergen's 'Physics'; 'Elements of Botany'; and 'Foundations of Botany.'

Bergen, Norway, a seaport on the west coast, capital of a province or diocese of the same name, formerly the principal town of the kingdom, but now the second. It is 186 miles northwest of Christiania, and about 25 from the open sea, and is situated on and about the head of two inlets, one of which forms the harbor. The tongue of land between the harbor and the other inlet (Puddefjord) is an elevated ridge crowned by an old fort, while the entrance on the other or northeast side is commanded by the old fortress of Bergenhus, now partly used as a prison. Rocky hills from 800 to 2,000 feet high encircle the town on the land side and furnish many picturesque spots. The climate is comparatively mild, on account of the sheltered situation, but is remarkable for rain, the annual rainfall being about 73 inches. The town is well built and clean, but the houses are mostly of wood, and many of the streets are crooked and uneven, on account of the irregularity of the site. There are a number of squares or open spaces, including the market-place. There is a cathedral (built in 1537), and several other churches, the oldest being St. Mary's, built after a fire in 1249. The public institutions include schools, a library of 60,000 volumes, a theatre, a museum, and other useful institutions. The inhabitants of the middle coast of Norway bring timber, tar, train-oil, hides, etc., and particularly dried fish (stock-fish), to Bergen to exchange them for grain, flour, and other necessaries. The town carries on a large trade in these commodities, and its exports of dried fish, herrings, tar, etc., are especially large. A considerable amount of ship-building is carried on. A United States consul is resident here. Bergen was founded by King Olaf Kyrre in 1070. The Hanseatic league established a factory here about 1340 and long monopolized the trade. Bergen is the native place of the poet Holberg. Pop. (1901) 72,179.

Bergen-Op-Zoom, berg'en-ŏp-zōm', a town of Holland, in a marshy situation on the Scheldt, where the Zoom enters it, 20 miles north-northwest of Antwerp. It was formerly a strong fortress, the morasses around it making it almost inaccessible to an assailing force, while its fortifications consisted of regular works, constructed by the celebrated Coehorn. It is well built, but has no edifices deserving of particular notice. It made an important figure during the Spanish war, and successfully resisted the attacks of the Duke of Parma in 1581 and 1588, and of Spinola in 1622. It was taken by the French in 1747 after a siege of nearly three months; and in 1795 the French under Pichegru again gained possession of it by capitula-

tion. It was unsuccessfully attempted by the British under Sir Thomas Graham, afterward Lord Lynedoch, in 1814. Its trade has suffered greatly from the proximity of Antwerp. Pop. (1899) 13,668.

Berg'engren, Anna (FARQUHAR), MARGARET ALLSTON, American novelist: b. Brookville, Ind., 23 Dec. 1865. She is the wife of R. Bergengren, (q.v.), and has published 'The Professor's Daughter' (1899); 'Her Boston Experiences' (1900); 'The Devil's Plough' (1901); 'Her Washington Experiences' (1901).

Bergengren, Ralph Wilhelm Alexis, American journalist and cartoonist: b. Gloucester, Mass., 2 March 1871. He has published a collection of verses and cartoons entitled 'In Case of Need' (1899).

Bergerac, bär-zhrąk, **Cyrano de,** a famous five-act tragedy by Edmond Rostand, founded on the life of Savinien Cyrano de Bergerac. It was first played in Paris, 28 Dec. 1897, with Coquelin in the title role and in New York 3 Oct. 1898 with Mansfield in the same role. See ROSTAND, EDMOND.

Bergerac, Savinien Cyrano de, French author: b. 1619; d. 1655. He was distinguished for his courage in the field, and for the number of his duels, more than a thousand, most of them fought on account of his monstrously large nose. His writings, which are often crude, but full of invention, vigor, and wit, include a tragedy, 'Agrippina,' and a comedy, 'The Pedant Tricked,' from which Corneille and Molière have freely borrowed ideas; and his 'Comical History of the States and Empires of the Sun and the Moon' probably suggested 'Micromégas' to Voltaire, and 'Gulliver' to Swift. His works have been frequently republished. He was made the hero of a drama bearing his name, written by Edmond Rostand, the French playwright, which had a phenomenal success in the United States in 1899–1900, and was the occasion of a suit for plagiarism. See ROSTAND, EDMOND.

Bergerac, a town of France, in the department of the Dordogne, and on the river Dordogne. Among its industries are paper-mills, ironworks, distilleries, etc. The town, 48 miles east of Bordeaux, gives the name to an agreeable wine cultivated on the banks of the Dordogne, in France sometimes called *petit champagne.* Pop. (1896) 15,642.

Bergerat, bärzh-ra, **Auguste Emile,** French journalist, playwright, and novelist: b. Paris, 29 April 1845. He is son-in-law of Théophile Gautier, and since 1884 particularly known as the amusing chronicler of the 'Figaro' under the pseudonym of CALIBAN. His *feuilletons* for that paper were published collectively as 'Life and Adventures of Sieur Caliban' (1886); 'The Book of Caliban' (1887); 'Caliban's Laughter' (1890), etc. He also wrote two novels, 'Faublas in Spite of Himself' (1884); 'The Rape' (1886); besides two volumes to the memory of his father-in-law, 'Théophile Gautier, Painter' (1877), and 'Th. Gautier, Conversations, Souvenirs, and Correspondence' (1879).

Bergh, bèrg, **Henry,** American philanthropist and author: b. New York, 1823; d. there, 12 March 1888. He was educated at Columbia College, and from 1861 to 1864 was in the diplomatic service, being secretary of the American legation and United States consul at St. Petersburg. In 1865 he founded the American Society for the Prevention of Cruelty to Animals, was chosen its president, and in 1866 secured the passage of an act giving the society the power of making arrests and carrying on prosecutions for violations of the statute on which the organization was instituted. He remained president of the society until his death, being ever its guiding spirit, living entirely in its work, and serving without compensation. At the beginning of his work no State or Territory had any statute relating to the prevention of cruelty to animals. At the time of his death 39 States had proper laws on the subject, and in 36 of them branch societies of the organization had been formed. He was the author of a volume of tales and sketches 'The Streets of New York'; a successful drama, 'Love's Alternative,' produced in Baltimore, 1881; 'The Portentous Telegram'; 'The Ocean Paragon'; and 'Married Off: a Poem' (1859).

Bergh, Johann Edvard, Swedish landscape artist: b. Stockholm, 1828; d. 1880. He was a professor in the Stockholm Academy and is looked upon as the founder of a new school of landscape art in Sweden, distinguished by accurate drawing, intelligent representation of nature, and a very decided nationalism. Among his most noted subjects are 'Wood Interior'; 'View of Stockholm'; 'View in Dalecarlia.'

Bergh, Pieter Theodoor Helvetius van den, Dutch dramatist and poet: b. Zwolle, 1793; d. 1873. He attracted attention with his comedy 'The Nephew' (1837), considered one of the best in modern Dutch literature, but did not justify expectations by his subsequent dramatic efforts. He also published 'De Nichten,' and a collection, 'Prose and Poetry' (3d ed. 1863).

Berghaan, bèrg'hän, a Dutch and colonial name in South Africa for several large hill-haunting eagles, especially the bataleur (q.v.).

Berghaus, bèrg'hows, **Heinrich,** German geographer: b. Cleve, 3 May 1797; d. Stettin, 17 Feb. 1884. He served in 1815 in the German army in France, and was from 1816 to 1821 employed in trigonometrical survey of Prussia under the war department. From 1824 to 1855 he was professor of applied mathematics in the Berlin Academy of Architecture. Besides his various maps and his great 'Physical Atlas' (republished in a remodeled form in 1886–92), he published 'Allgemeine Länder-und Völkerkunde' (1837–41); 'Die Völker des Erdballs' (1852); 'Grundlinien der physikalischen Erdbeschreibung' (1856); 'Grundlinien der Ethnographie' (1856); 'Deutschland seit hundert Jahren' (1859–62); 'Was man von der Erde Weiss' (1856–60); 'Sprachschatz der Sassen, or Low German Dictionary' (incomplete); etc.

Berghem, Nikolaas. See BERCHEM, NIKOLAAS.

Bergk, Theodor, German classical philologist: b. Leipsic, 22 May 1812; d. Ragaz, Switzerland, 20 July 1881. He became an indisputable authority on Hellenic poetry, producing two works of surpassing importance in that department of scholarship: 'Greek Lyric Poets' (4th ed. 1878–82), and 'History of Greek Literature' (1872); the latter not quite completed at his death, but brought to perfection with the aid of his posthumous papers. He contributed

much of value, likewise, to our knowledge of special departments of classical learning.

Berg'mann, Ernst von, German surgeon: b. Riga, 16 Dec. 1836; d. Wiesbaden, 25 March 1907. He served in the Prussian army 1866–70; was professor of surgery in the Univ. of Würtzburg 1878–82; and became director of the surgical clinic at the Univ. of Berlin in 1882. He wrote 'The Putrid Poison'; 'The Embolism of Fatty Tissues'; 'The Poison'; 'Instruction Concerning the Putrid Intoxication,' etc.

Bergmann, Julius, German philosopher: b. Opherdike, Westphalia, 1840. He was professor of philosophy at Marburg from 1875. Among his more important writings are 'Grundlinien einer Theorie des Bewusstseins' (1870); 'Zur Beurteilung des Kriticismus' (1875); 'Reine Logik' (1879); 'Sein und Erkunnen' (1880); 'Der Grundprobleme der Logik' (1882); 'Geschichte der Philosophie' (1892–4); 'Untersuchungen über Hauptpunkte de Philosophie' (1900).

Bergmann, Karl, American musician: b. Ebersbach, Saxony, 1821; d. New York, 10 Aug. 1876. Participation in the revolutionary outbreaks of 1848 obliged him to go into exile and he came to New York. He organized and conducted the first great German music festival, held in the Winter Garden Theatre (1855); in 1856 introduced German opera at Niblo's Garden, and for several years prior to his death conducted the concerts of the Philharmonic Society. He composed several orchestral pieces, and excelled as a player of the violoncello and the piano.

Bergmann, Torbern Olof, Swedish natural philosopher and chemist: b. Katharineberg, West Gothland, 20 March 1735; d. 1784. In 1758 he became doctor of philosophy and professor of physics at Upsal. Upon the resignation of the celebrated Wallerius, Bergmann was a candidate for the professorship of chemistry and mineralogy. His competitors charged him with ignorance of the subject, because he had never written on it. To refute them he shut himself up for some time in a laboratory, and prepared a treatise on the manufacture of alum, which is still considered as a standard work. In 1767 he became professor of chemistry, and devoted himself with ardor to this science. He invented the preparation of artificial mineral waters, and discovered the sulphuretted hydrogen gas of mineral springs. We are indebted to him for a knowledge of the characters which distinguish nickel from other metals. On a number of minerals he made chemical experiments, with an accuracy before uncommon. He published a classification of minerals, in which the chief divisions are based on their chemical character, and the subdivisions on their external form. In preparing this work he was much aided by his former discovery of the geometrical reations between different crystals of the same substance, which may be deduced from one primitive form, and are produced by the aggregation of similar particles, according to fixed and obvious laws. His theory of the chemical relations is still esteemed, and although it has received new developments from the further researches of Berthollet, has not been overthrown. The order of Gustavus Vasa was bestowed on Bergmann. Among his works the first place is due to 'Opuscula Physica, Chemica, et Mineralia' (1779–94), of which an English translation appeared. His famous essay on 'Elective Affinities' was translated into English by Dr. Beddoes.

Bergmehl, bĕrg'māl, a whitish earth, consisting almost entirely of the flinty shields of microscopic plant growths. It occurs in bog and ancient lake deposits in many parts of northern Europe, and, during times of great scarcity, it has been, when mixed with flour, eaten as food. Some writers assert that hundreds of carloads are consumed every year by the inhabitants of northern Sweden. From analysis, it does not appear to contain any positive nutriment.

Bergsoe, bĕrg'sę, Jorgen Vilhelm, Danish novelist, poet, and naturalist: b. Copenhagen, 8 Feb. 1835. While suffering partial blindness, caused by excessive use of the microscope in his memorable biological researches at Messina, he turned to literary composition; and soon appeared the first of a cycle of novels, 'From the Piazza del Popolo' (1866), which had an extraordinary success. The following year he published his first volume of poems, 'Now and Then.' Of his many novels, the one which excels for fineness of touch is, 'Who was He?' All his stories are characterized by rich imagination, fine observation, and great originality; his poetry is inferior in these respects to his prose.

Bergues, bărg, France, a town in the department of Le Nord, in a marshy district, five miles south of Dunkirk; population (1891), 5,380. It ranks as a fortress of the second class, is well built of brick, and having a basin which admits vessels of 250 tons, is the centre of a considerable trade. Its principal edifices are the townhouse, and a beautiful and richly ornamented belfry about 160 feet high. It owes its origin to the castle of Berg, to which St. Winnoc retired in 902, was first fortified by Baldwin II., Count of Flanders, afterward adorned with a magnificent monastery of St. Winnoc by Baldwin IV., and in the 13th century possessed flourishing manufactures. It suffered dreadfully during the wars in the Low Countries. Pop. (1896), 4,700.

Ber'gut, or **Bearcoot,** the Tartar name in Central Asia for the golden eagle (see EAGLE), there trained by Kirghiz for use in falconry.

Berhampur, bĕr-hăm-poor', the name of two towns of India. (1) The capital of the Ganjam district, Madras, 525 miles northeast of Madras, with which it is connected by rail. A good road leads from it to the coast town of Gopalpur, nine miles distant. As the headquarters town of the district, it contains the usual official buildings. Silk cloth is manufactured, and there is a considerable trade in sugar. The climate is unhealthy. Pop. (1891), with cantonment, 25,653. (2) A town of the Moorshedabad district, Bengal, on the left bank of the Bhagirathi, 5 miles south of Moorshedabad. The first open act of the Sepoy mutiny took place here on 25 Feb. 1857. The town contains a government college. Pop. (1891) 23,515.

Beriberi, bā-rĭ-bā'ri, an epidemic form of multiple neuritis formerly very prevalent in China, but now common in Japan, the Philippines, and associated tropical countries. It is said to be not infrequent among sailors in and about the ports on the Gulf of Mexico, particu-

larly New Orleans (Bondurant). It is supposed to be of bacterial origin, although an exclusive rice diet is claimed to be at least a predisposing cause. The disease exhibits three main types, an acute pernicious, the atrophic or dry, and the dropsical or wet forms. The symptoms are those of a multiple neuritis (q.v.), and the treatment is that for this disease.

Bering, bē'rĭng, or **Behring, Vitus,** Danish navigator: b. Horsens, 1680; d. 19 Dec. 1741. Being known as a skilful seaman, he was employed by Peter the Great in the navy established at Cronstadt. His talents and the undaunted courage displayed by him in the naval wars against the Swedes, procured him the honor of being chosen to command a voyage of discovery in the sea of Kamchatka. He set out from St. Petersburg, 5 Feb. 1725, for Siberia. In the year 1728 he examined the northeastern coasts of Asia, discovered the strait named after him, and proved that Asia is not united to America. It remained, however, to be determined whether the land opposite to Kamchatka was in reality the coast of the American continent, or merely islands lying between Asia and America. On 4 June 1741 he sailed, with two ships, from Okhotsk, and touched the northwest coast of America. Tempests and sickness prevented him from pursuing his discoveries; he was cast on a desolate island covered with snow and ice, where he died. See Life by Lauridson (Chicago 1890).

Bering Sea, that part of the north Pacific Ocean between the Aleutian Islands, in 55°, and Bering Strait, in 66° N., by which latter it communicates with the Arctic Ocean. It has on its west side Kamchatka and the Chukchi country, with the Gulf of Anadyr, and on its east the territory of Alaska, with Norton Sound and Bristol Bay; contains several islands, and receives the Yukon River from North America and the Anadyr River from Asia. Fogs are almost perpetual in this sea. Ice is formed and melted in the sea every year, the northern part becoming closed to navigation about the beginning of November. Pack ice gradually extends southward to a little below the latitude of St. Matthews Island (60½°), beyond which ice is found in floes. The southern limit of the ice usually extends from Bristol Bay, Alaska, to about 35 miles south of Pribilof Island, though in exceptionally severe winters it reaches as far south as Unimak Pass. It usually leaves Pribilof Island about 1 May, and vessels following in its wake may reach Bering Strait between about 15 and 25 June. A strong and comparatively warm current sets northward at about two to three knots an hour, through Bering Strait, and after following the Siberian shore turns north toward Herald Island. A cold current also passes out through the strait.

Bering Sea Controversy, an international dispute over the territorial status of that sea, chiefly between the United States and Great Britain, and growing out of attempts of the former to protect its fur-sealing industries there from the Canadian subjects of the latter. This industry rests on three great herds in the North Pacific, which resort regularly to certain islands in the breeding season, from May or June till the autumn storms, then move southward to about 35° N., and gradually work northward the next spring. At the islands the elder males remain with the young on the beach while the females go in search of food, sometimes 200 miles. The younger males, or "bachelors," two to four years old, herd apart, and should furnish all the commercial sealskins, the pelts of the old males being unsalable and the killing of females a blow at the continuance of the species. But this selection can only be made on shore; pelagic or ocean sealing is at best indiscriminate if done during migrations, and is almost exclusively of females during the breeding season, while every mother seal then killed means a young seal starved ashore. The largest of these "rookeries" is on the Pribiloff Islands in Bering Sea, where the Russian-American Company carried on sealing till their cession to the United States in 1867, when it was taking some 40,000 seals a year; the herd being protected by restrictive regulations. In 1821 Alexander I. issued a ukase claiming Bering Sea as Russian property, and forbidding trespass on pain of confiscation; but the United States and Great Britain protested so vigorously that the claim was dropped. After the cession, the rivalry of competing companies would speedily have made an end of the seals in the Northern Ocean, as it long since had in the Southern, had not the United States leased the islands for 20 years to the Alaska Commercial Company (which then leased the Russian seal-islands also) for $55,000 a year and $2.62½ a skin, restricting the catch to 100,000 a year. In fact the company kept a little under that mark; but the contract was so profitable that vessels were soon fitting out from British Columbia, Hawaii, and Australia, which intercepted the seals as they passed between the Aleutian Islands northward or southward, or entered Bering Sea and caught the females as they ranged the seas for food. The poaching grew in volume, and a stream of protest from the Alaska Company flowed in year after year to the government at Washington, which in 1881 was goaded into officially reversing its former contention, and declared Bering Sea east of the treaty meridian of 1867 American waters; but took no further step till 1886, when under President Cleveland it seized and condemned three Canadian sealers. Great Britain protested, and proceedings were suspended pending discussion; but in 1887 five more were seized, and the question at once became a burning one in our diplomacy. Secretary Bayard attempted to convene delegates from Great Britain, France, Germany, Sweden, Russia, and Japan, to meet with our own and frame regulations to prevent the extirpation of the northern seals; but in June 1888 Great Britain withdrew, under pressure from Canada. In 1889 several more Canadian vessels were seized, and Great Britain sent a practical menace of war if this were not stopped. There being but three alternatives, abandonment of the sealing interest to destruction, which the country would not endure; seizure of all poaching sealers, which meant war; and arbitration — the latter was decided on in 1890. The same year the Alaska Company, its lease expired, was succeeded by the North American Company; the herd, estimated in 1867 at over 3,000,000 on the Pribiloff Islands, had shrunk so enormously under the pelagic sealing that the price had risen from $2.50 to $30 per skin, and the new company's limit of capture was restricted to 20,000, with a royalty

of $10 a skin. On 15 June 1891 a *modus vivendi* was agreed on for joint policing of Bering Sea by British and American vessels; and on 29 Feb. 1892 a treaty of arbitration was signed, under which on 23 March 1893 a tribunal met at Paris, composed of Baron de Courcel (France), Marquis Emilio Visconti-Venosti (Italy), Judge Gregers W. W. Gram (Sweden-Norway), Lord Hannan (England), Sir John S. D. Thompson (Canada), Justice John M. Harlan, and Senator John T. Morgan (United States). The United States case was conducted by the secretary of state (John W. Foster); counsel, Edward J. Phelps, James C. Carter, Frederick R. Coudert, and Henry Blodget. The decision on the legal points was entirely against the United States; Bering Sea was held part of the high seas and no one's preserve, and seals *ferœ naturœ* and no one's property. But on the point of equity in our case, that the preservation of the seals from extinction was a common interest of the civilized world, it agreed with us, and framed regulations binding for five years to prohibit all pelagic sealing within 60 miles of the Pribiloffs, or from 1 May to 31 July in the North Pacific east of 180° or north of 35°, with other regulations. The restrictions proved absurdly ineffective, and Great Britain would not antagonize Canada to make them less so; in 1894 the pelagic catch was the enormous one of 142,000, far beyond any former record, and for several more seasons was very great, till the herds showed signs of rapid exhaustion. Great Britain obstinately refused to make any change in the regulations till the five years were up, sent an expert to the spot who laid all the blame on the North American Company, and refused to send a delegate to meet those of Russia, Japan, and the United States, who agreed to prohibit pelagic sealing to their subjects if Great Britain would do so. Meantime, to put pressure on the latter, Congress prohibited the importation of all sealskins except the North American Company's, in order to destroy the market for Canadian-caught skins and make their business unprofitable; but England still refused to agree to the provisional treaty, on the ground that it would injure Canada, was not necessary to protect the seals, and that the North American Company was solely in fault. But on 18 Nov. 1897 a joint meeting of English, American, and Canadian experts was held, and unanimously supported the American contention at every point; that the herds had diminished by from 66⅔ to 80 per cent, and markedly so even from 1896 to 1897; that the North American Company was handling its business with entire propriety; that pelagic sealing, involving the killing off of the females, was the sole cause of the reduction, which was threatening the entire extinction of the fur seal. Another year would bring about the time for changing the Paris regulations; and the United States agreed to prohibit all seal killing even on the Pribiloffs for a year, but Canada would not consent because it would scatter the crews of her sealing fleet. Meantime, Congress on 14 June 1898 appropriated $473,151.26 to pay for the Canadian vessels seized years before. On 30 May 1898, a joint Canadian and American commission was authorized; it met at Quebec in August, adjourned to November at Washington, continued till February 1899, adjourned to the summer, and never reassembled. Most unfortunately, its scope included all the questions at issue between the two governments: the sealing problem became entangled at the outset with impossible bargains for general commercial reciprocity, then with the Alaska boundary question (q.v.) made acute by the Klondike gold discoveries, and at the adjournment not a single issue before it had been decided. The Paris regulations had expired, no new ones had been established, and the seals were left wholly without protection; while even so, as the United States forbade pelagic sealing to its citizens while England did not, all the profit of the perishing industry was being reaped by foreigners. The Canadian fleet of 1899 numbered 26 vessels, that of 1900 numbered 33, with a catch of over 35,000 each year, considerably more than half females. The same conditions have prevailed since; the North American Company has been increasing its efforts in order to obtain its share while the seals last; and in the Congressional session of 1901–2 it was seriously proposed to kill off the entire herd at once, and thus end the question by putting an end to the seals. (The latest work on this subject is the chapter in Henderson's 'American Diplomatic Questions,' 1901; earlier aspects were discussed in Stanton's 'Bering Sea Controversy' 1892.) See U. S.— Diplomacy of the.

Bering Strait and **Island.** The strait is the channel that separates Asia from America, and connects the North Pacific with the Arctic Ocean. Its breadth at the narrowest part, between Cape Prince of Wales on the American coast and East Cape in Asia, is about 36 miles, and its depth in the middle varies from 29 to 30 fathoms. On both sides are several commodious bays; but the country is barren and rocky, with scanty vegetation. The sea here is frozen over every winter, and foggy, hazy weather is almost perpetual. Whales frequent the strait, and the walrus occurs in vast numbers. The inhabitants on either shore support themselves chiefly by hunting and fishing; but those on the Asiatic side are greatly superior, both physically and intellectually, to those on the American. The strait is called after Vitus Bering, by whom it was first discovered. It was more fully explored by Capt. Cook in 1778. Bering Island is in the southwest part of the above sea, off the east coast of Kamchatka. It is uninhabited, and is without wood. It has, however, several springs of excellent water. Here the navigator Bering died in 1741.

Ber'ington, Joseph, English Roman Catholic theologian: b. Shropshire, 1744; d. Berkshire, 1 Dec. 1827. His first work was 'A Letter on Materialism, and Hartley's Theory of the Human Mind' (1776). About this time, the English Roman Catholics found their position much stronger in the arena of public opinion, and began to think of appearing there openly. Berington, in 1779, published a letter to Fordyce, on his 'Sermon against Popery.' In 1780 appeared his 'State and Behavior of English Catholics from the Reformation till 1780.' In 1786 he came forward with 'An Address to the Protestant Dissenters,' who had lately petitioned for a repeal of the corporation and test acts. In 1787 appeared the 'History of Abelard and Heloise,' with their genuine letters, and 'An Exposition of Roman Catholic Principles, in reference to God and the Country,' and other

pamphlets. In 1790, Berington gave to the world a 'History of Henry II.' (of England), vindicating the character of Becket from Lord Lyttleton's attacks. In 1793 appeared his 'Memoirs of Gregorio Panzani,' papal legate to England in 1634–6, translated from the Italian. But his most important work appeared in 1814, a 'Literary History of the Middle Ages,' giving an account of the state of learning from "the close of the reign of Augustus to its revival in the 15th century."

Beriot, bā-rẹ-ō, **Charles Auguste de,** Belgian violinist: b. Louvain 20 Feb. 1802; d. there 20 April 1870. He studied with Robbrecht and Tiby, and, in Paris, with Baillot; and became a professor in the Conservatory in Brussels in 1842. In 1836 he married the celebrated singer, Malibran. He published a 'Violin Method' (1858).

Berislav, bā'rẹ-släf, or **Borislav,** Russia, a fortified town on the Dnieper River. It is the centre of trade for the district. Pop. (1903) 13,700.

Berkeley, George, English philosopher and bishop: b. Kilcrin, Ireland, 12 March 1685; d. Oxford, 14 Jan. 1753. He was educated at Trinity College, Dublin, where he took a keen interest in the philosophical problems then under discussion. He received the degree of A.B. with honors in 1704, being afterward successively scholar and fellow. Almost immediately he began his career of authorship. He published in 1709 his first important work, the 'New Theory of Vision,' which is the logical preliminary to his system and gives expression to certain of its fundamental principles. A year later his philosophy finds complete statement in the 'Treatise Concerning the Principles of Human Knowledge.' During the next 15 years Berkeley advanced to a position of prominence in the English Church. In 1711, shortly after his ordination to the diaconate, he published his 'Discourse on Passive Obedience,' a treatise upon ethics, in which he develops a system of theological utilitarianism. The 'Dialogues,' published in 1711, present his philosophy in literary form, clothing subtle argument in a garb of rhetorical beauty. In the years immediately following, several new works appeared, accompanied by increasing fame and prosperity. He was appointed successively to the deaneries of Dromore and of Derry, the latter of which yielded a large income. But this he resigned in order to devote himself to a plan for the establishment of a college in the Bermudas, where the Indians of America were to be enlightened and Christianized. For the furtherance of such a plan he obtained a promise from the government for a grant of £20,000. Upon the strength of this he sailed for America in 1728, accompanied by his wife and a few friends. They went first to Rhode Island, where they planned to await the expected grant. Here Berkeley purchased a farm and waited three years in quiet and study. Finally, upon the failure of the government to make good its promise, he was compelled to give up his cherished plan and return to England in 1731. Soon after his return he was made Bishop of Cloyne. During the remaining years of his life he published a number of works upon philosophy, economics, and other subjects. Notable among these were 'Alciphron, or the Minute Philosopher,' the result of his quiet studies in Rhode Island, and 'Sirus,' a remarkable essay in which the author interweaves his convictions concern the healing properties of tar-water with the deepest and most profound of his philosophic reflections.

Although the representative English idealist, Berkeley proceeds in his thought from the empirical philosophy of Locke. It was Locke's contention that in knowledge we are concerned with our own ideas only, and that these ideas are derived entirely from experience. He made an important distinction among these ideas, however, with reference to their representation of objective or material reality. Ideas of color, sound, taste, etc., called secondary qualities, are subjective processes, and reveal nothing of the nature of material reality. But ideas of extension, figure, motion, etc., called primary qualities, reveal directly the nature and constitution of that reality which exists without the mind in the material world. Berkeley agreed with Locke that we know only our own ideas, but he attacked vigorously this distinction between primary and secondary qualities. He maintained that ideas of primary qualities are wholly subjective, and tell us no more of the nature of material reality than do our ideas of secondary qualities. He attempts a partial proof of this in his 'New Theory of Vision,' by showing that distance, magnitude, and situation, are not directly perceived by sight, but are inferred in an indirect manner. These ideas of distance, magnitude, and situation are results of judgment based upon visual sensations. Such visual sensations have no essential relation to the ideas in question, however — they are simply associated with them in experience. For example, consider our idea of distance. We find connected with this idea: (1) Sensation of movement in the eye; (2) confusion in vision due to nearness of the object; and (3) strain of fixation. These sensations are associated by custom with degrees of distance. Hence we have in this idea of distance no direct revelation through vision of the nature of material reality. Rather we have the product of our own judgment, based upon sensations which have themselves no objective reference. So it is with other ideas of primary qualities which have been held to bring us into immediate contact with material reality. In ideas of figure and motion we have sensations of light, color, and strain, and the remainder is due to association and judgment. Thus Berkeley concludes that we have in visual ideas not a revelation of the nature of matter, but a universal language of symbols whereby we interpret our sensations of touch, and so regulate our actions as to preserve and promote our lives. In his 'Treatise Concerning the Principles of Human Knowledge,' he uses this conclusion to disprove the existence of a material world apart from, and independent of, the perceiving mind. The very notion of matter or corporeal substance involves insoluble contradiction. By matter is meant inert, senseless substance in which extension, figure, and motion reside. But these so-called attributes of matter are ideas in the mind, and are shown to be every whit as subjective as ideas of colors and tastes. Now, ideas can be similar only to ideas. Hence to suppose that our ideas copy or represent a material substance that is unperceiving and

unperceived, is a crass absurdity. Ideas are the only objects of our thought. To exist as an object is to be perceived. (*Esse est percipi.*) Although confined to our own ideas, we may observe their various characteristics and combinations. Sense qualities are simple states of consciousness. Sense-objects are sensation-complexes. There is in our consciousness a continuous succession of these perceptions, in which we perceive perceptions newly excited, perceptions changed, and perceptions obliterated. For all this phenomena there must be some cause. This cause cannot be an idea or combination of ideas; for it is the appearance and arrangement of ideas which must be explained. This cause must be a substance, a ground of existence. Matter, or corporeal substance, is an impossibility. We are compelled, therefore, to find the cause of our ideas in an incorporeal, active substance, or spirit. But we observe an important difference in the production of our ideas. Those ideas actually perceived by the senses of the individual are not dependent upon his own mind or will. Hence there must be some other will or spirit which produces them. This is God, the Author of Nature. The ideas of sense are imprinted upon our minds by the direct influence of the Divine Mind. Hence they are strong, orderly, and coherent. Their source guarantees their trustworthiness, and with good reason they may be called "real things." In this way our knowledge acquires an objective validity much more adequate than if our ideas were aroused by the action of a material substance upon our sense-organs. The laws of nature, which we properly regard, represent the regular operation of the Divine Mind upon our minds. There is consequently no difficulty in distinguishing the order of ideas which is real and objective, from the train of subjective fancies and imaginations.

The best edition of Berkeley's works is that by Fraser (2d ed. 1902), containing a 'Life.' Consult further: Fraser's briefer 'Life' (1881; new ed. 1901; in 'Philosophical Classics'); Frederichs, 'Ueber Berkeleys Idealismus' (1870); Spicker, 'Kant, Hume und Berkeley' (1875); Janitsch, 'Kants Urtheil über Berkeley' (1879).

H. W. WRIGHT,
Cornell University.

Berkeley, George Charles Grantley Fitzhardinge, English writer: b. 10 Feb. 1800; d. Poole, Dorsetshire, 23 Feb. 1881. In 1832–52 he was a member of the British Parliament, and for a time he was in the army. His 'My Life and Recollections' (1864–6), an extensive work, attracted some attention. Among his further works are: 'Berkeley Castle' (1836); 'Sandron Hall, or the Days of Queen Anne' (1840); 'The English Sportsman on the Western Prairies' (1861); 'Anecdotes of the Upper Ten Thousand at Home and Abroad' (1867); and 'Tales of Life and Death' (1870).

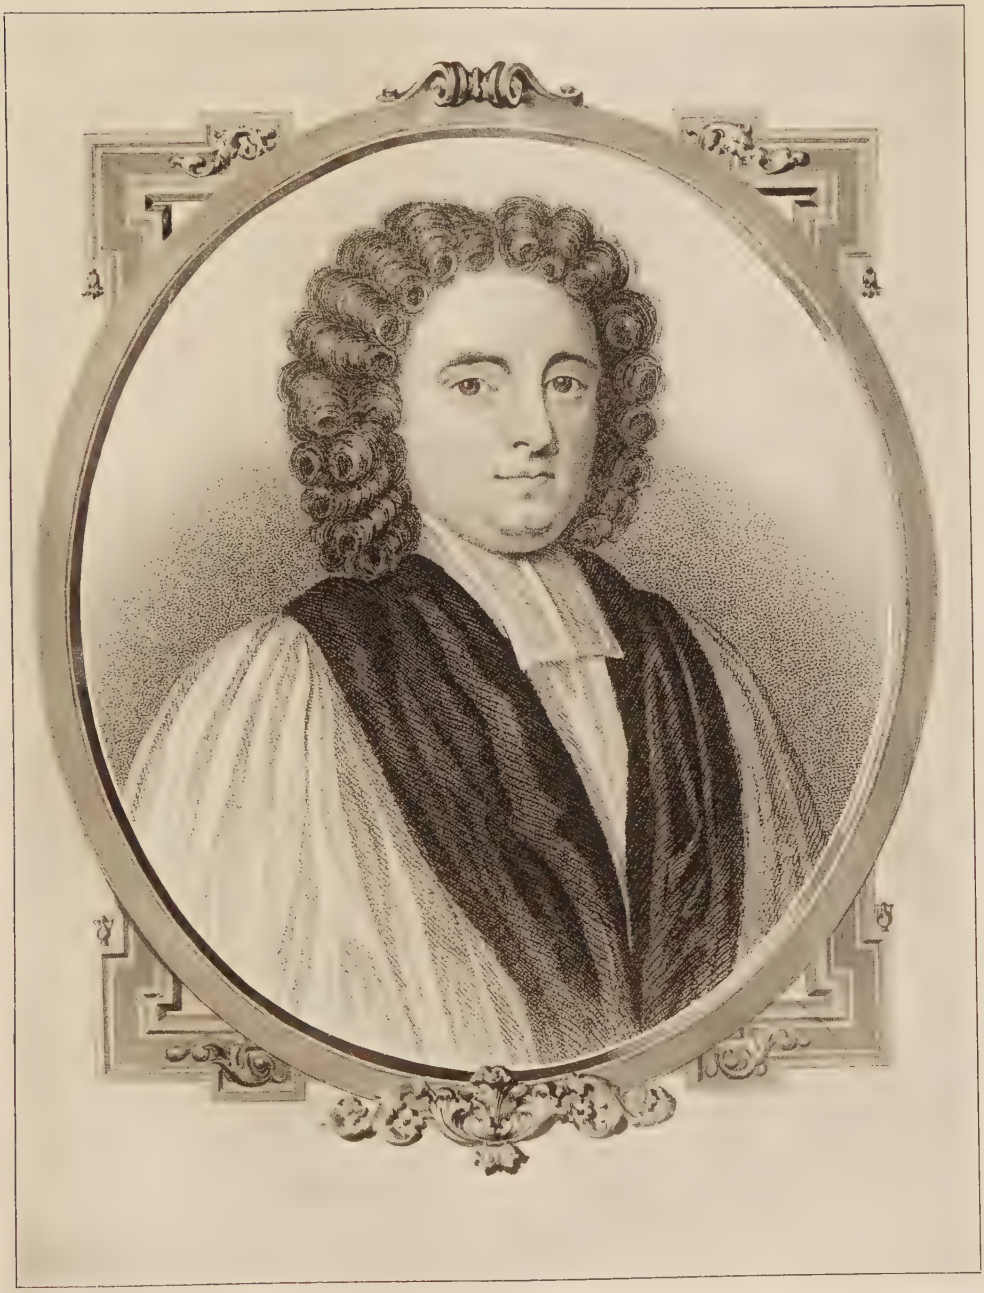
Berkeley, SIR **George,** English engineer: b. London 26 April 1821; d. there 20 Dec. 1893. In 1835 he began experimenting with methods for operating atmospheric railways. In 1841 he associated himself with Robert Stephenson and continued his experiments. On Stephenson's death he became engineer of the Great Indian Peninsular Railway. In 1892 he was made president of the Institute of Civil Engineers. He wrote papers on atmospheric railways and on the strength of iron and steel; and was knighted in 1893.

Berkeley, SIR **John,** English nobleman, one of the proprietors of New Jersey: b. 1607; d. 28 Aug. 1678. He was a prominent Royalist during the contest of Charles I. with Parliament. Charles II. granted him, with Sir George Cartaret, a proprietary interest in New Jersey and Carolina.

Berkeley, Miles Joseph, English botanist: b. Biggin, Derbyshire, 1803; d. Sibbertoft, Leicestershire, July 1889. Educated at Christ Church, Oxford, he took orders, was curate at Margate (Kent) and Market Harborough (Leicestershire), and subsequently was made vicar of Sibbertoft. He soon became the leading British authority on fungi and plant pathology, and especially well known for his achievements in mycology. About 6,000 species of fungi are credited to him; his most important work was the section on fungi contributed to Hooker's 'British Flora' (1836), and his 'Outlines of British Fungology' (1860), and he assembled a fine herbarium of more than 9,000 species, now at the Kew Gardens, and regarded as one of the most noteworthy in the world. A bibliography may be found in the 'Catalogue of Scientific Papers' of the Royal Society. Consult, also, Vol. XLVII. (1890) of the 'Proceedings of the Royal Society' for a sketch by Hooker.

Berkeley, Stanley, English artist. He has constantly exhibited at the Royal Academy in recent years, and is a national gold medallist and a member of the Royal Institute of Painter Etchers. Among his paintings are 'The Victory of Candahar'; 'For God and the King'; 'Prince Rupert at the Battle of Edgehill'; 'Completely Routed'; 'An Australian Bush Fire'; 'Heroes of the Tugela'; 'The Meet'; 'Atbara'; 'Omdurman'; 'The Charge of Scarlett's Three Hundred'; Gordons and Greys to the Front'; 'Full Cry'; 'Desperate Odds'; 'Dargai'; 'Cornered at Last'; 'The Death'; 'The Charge of the French Cuirassiers at Waterloo.' He has also done much in the way of illustrating books and newspapers.

Berkeley, SIR **William,** American colonial governor: b. near London about 1610; d. 13 July 1677. His father and brother were colonial proprietors. Graduating from Oxford 1629, he traveled on the Continent for a year; was appointed a commissioner of Canada 1632, and won a high reputation there. In 1641 he was made governor of Virginia, and arriving in 1642, was for a time very popular. He experimented in the cultivation of rice, cotton, indigo, hemp, flax, and silk, the manufacture of potash and naval stores, and the cutting and export of masts; pleased the Royalist party by expelling the New England Puritans in 1643, and all parties by capturing the Indian chief Opechancanough in 1644, after a series of Indian massacres. Always with an eye to profit, however, he received from the king a monopoly of the fur trade. During the English revolution he adhered to the royal side, and offered an asylum in Virginia to exiled or dissatisfied Royalists; many hundreds availed themselves of this. When Cromwell felt strong enough he sent a fleet (in 1651) to bring him back for punish-



GEORGE BERKELEY.

ment; but Berkeley succeeded in making terms with it by mingled "bluff" and finesse, and was allowed to retire in safety to his plantation, though deprived of his office. When the Restoration began to seem probable, the colonists elected Berkeley as governor to gain favor in such event; Berkeley accepted it provisionally, and Charles II. on accession confirmed it. But in this second term all Berkeley's evil side showed itself, till it ended in the atrocities of 1676. Besides expelling and confiscating the goods of Puritans and Quakers, a measure popular at the time, he frowned on the establishment of schools, and absolutely refused to have a printing-press set up, as making people too censorious of their superiors. He formed a council of the wealthier planters, and having obtained during the spasm of Restoration loyalty in 1662 an ultra-royalist House of Burgesses, would not issue writs for another election for 14 years, simply adjourning annually the "Long Assembly," as it came to be called; and in 1670 abolished universal suffrage, substituting a property qualification, purely as a precaution for the future, as no elections were held for years before and after. These, however, were only means to the end of profiting himself and his friends, and the rapacious crew of civil officers sent over by Charles to quiet their importunities. The heavy taxes and fees imposed on the colony, drove them to desperation, so that as early as 1667 they were ripe for revolt. Besides Berkeley's share in various extortions, he had one monopoly which led directly to the catastrophe, that of the Indian trade, which he gained by underhand means. The colony allowed no trade with the Indians without license; Berkeley therefore licensed a small number of men to trade in furs with them, which secretly included liquor, firearms, and other things, and exacted a third of the profits. It was believed to be this gain which led him to refuse permission to the colonists to protect themselves against the Indians in 1675–6, while hundreds of them were being massacred and tortured and scores of plantations laid waste, and to dissolve force after force assembled to protect them. How Nathaniel Bacon chastised the Indians in spite of him, was proscribed for it, forced into open rebellion, drove Berkeley into retreat and burned his capital, and died at the moment of his victory, is told under 'Bacon's Rebellion.' Berkeley's soul was as full of senile fury as it had been of senile avarice; he slaughtered right and left, hanging a score of victims with such vindictive haste and ruffianly insult that the Assembly remonstrated, and the royal commissioners, who came in January to investigate the condition of the colony, made a report that led the king to remove him, with the comment, "The old fool has put to death more people in that naked country than I for the murder of my father." He sailed 27 April, his departure celebrated with bonfires and salutes of cannon; and expected to justify himself to the king and return. But Charles kept postponing an interview, and in a few weeks Berkeley died — of chagrin, it was believed.

Berkeley, Cal., a town in Alameda County, on the Southern P. R.R.; 8 miles northeast of San Francisco. It is the seat of the State University of California (q.v.); the State Agricultural College; the State Institution for the Deaf, Dumb, and Blind; and six college preparatory schools. The town is well equipped with electric light and street railroads; and has soap works, iron foundries and machine shops, furniture factory, and other industries. Pop. (1900) 13,214.

Berkeley, England, a market town, 16 miles southwest of Gloucester, pleasantly situated on the right bank of the Avon, in the rich vale of Berkeley, and celebrated for its castle, where Edward II. was confined and barbarously murdered. Pop. (1901) 6,277.

Berkeley Divinity School, an Episcopal theological school at Middletown, Conn. It was organized by Bishop John Williams of Connecticut while he was president of Trinity College, at Hartford, and was at first intended to be the theological department of the college. It was later placed upon an independent basis and removed to its present location. The value of its buildings is about $90,000, and its endowment fund is not far from $350,000.

Berkeley Sound, next to Stanley Sound the most frequented inlet of the East Falkland Island, near its northeast extremity. Though it is difficult to enter, it contains some of the best harbors in the South Atlantic.

Berkeley Springs, W. Va., a town and county-seat of Morgan County; 2 miles south of the Potomac and 77 miles northwest of Washington; on a branch of the Baltimore & O. R.R. It is in an agricultural region, and has been widely known and popular for more than a century because of its mineral springs. The site of the town was a part of the vast estate of Lord Fairfax, and Washington owned considerable property here. It is the oldest pleasure resort in the South, and as far back as the colonial days the gentry of Virginia came here in warm weather and lived in log huts in order to enjoy or be benefited by the baths and swimming pools. Pop. (1900) 781.

Berk'enhout, John, Dutch-English physician and general writer: b. Leeds, about 1730; d. 1791. Having entered the Prussian service, he rose to the rank of captain. In 1756 he quitted that service and entered into that of England, where he obtained the same rank. At the peace in 1760 he went to Edinburgh and began the study of physic; while there he published his 'Clavis Anglica Linguæ Botanicæ,' a book of great merit, and later his 'Pharmacopœia Medici,' which passed through three editions. In 1778 he attended the British commissioners to America, and at Philadelphia he was committed to prison, but he soon afterward was set at liberty, and returned with the commissioners to England, where he obtained a pension. He was an industrious writer, and his publications possess considerable merit.

Berkhampstead, bĕrk'hăm-stĕd, or **Berkhamsted, Great,** a town in Hertfordshire, England, beautifully situated in a hollow, surrounded by hills, on the London & N. W. R.R. It consists almost wholly of one main street, and has a fine old church, restored 1871–87; several chapels; Berkhamsted School, with a fine chapel (1895); a high school for girls; many other schools; etc. There are works for wooden ware, a large chemical work, a boat-building yard, brush, coach, and mantle factories, an iron foundry, etc. The poet Cowper

was born here in 1731. In the small parish of Little Berkhampstead, some miles to the north, the famous Bishop Ken was born. Pop. (1891) 5,034.

Berkhey, bĕrk'hī, **Johannes Lefranca van,** Dutch writer of eminence: b. Leyden, 23 Jan. 1729; d. there, 13 March 1812. His work, entitled 'Naturlyke Historie van Holland,' first brought him into notice. He also distinguished himself as a poet, though he often manifests a tendency to bombast, and indulges in false pathos. One of his best poems is entitled 'Het Verheerligkt Leyden.'

Berkley, Va., a town in Norfolk County on the Elizabeth River opposite the city of Norfolk. It is on the Norfolk & W. and the Norfolk & S. R.R.'s. The Berkley College and Military Institute and several private schools are located here. Shipyards, foundries, and knitting-mills are also among the features of the town. Pop. (1900) 4,988.

Berkshire, a midland county of England, with an area of 450,132 acres or 712 square miles. Its shape is very irregular, and has been compared to that of a shoe or slipper. A range of chalk hills crosses the country in a westerly direction, and forms a boundary to the fertile vale of Whitehorse, so called from the gigantic form of a horse which has been scooped out on the side of a chalk hill, so as to become conspicuous to all the country round, referred to in Thomas Hughes' 'The Scouring of the White Horse.' The cultivated parts of the county, and more especially this vale, are peculiarly fruitful in barley. They also contain much rich pasturage and many excellent dairy farms. Timber abounds, particularly oak and beech, in Windsor Forest and toward the west. Turnips are an important crop. There are but few manufactures carried on in this county, the principal being agricultural implements and artificial manures, flour, paper, sacking and sailcloth, and biscuits (at Reading). Malt is made in great quantities, and chiefly sent to London. The principal towns of Berkshire are Reading (the county town), Newbury, Maidenhead, Wokingham, Wallingford, Windsor, Abingdon, Wantage, and Farringdon. Pop. (1901) 255,000. See Graves, 'The Way About Berkshire' (1898).

Berkshires, The, or **Berkshire Hills,** a range of mountains in the northwest of Massachusetts; in Berkshire County; stretching 16 miles north and south on the east of the valley of the Upper Hoosic River. They are a favorite summer and autumn resort. The highest summits are Greylock in the north, 3,535 feet, and Mount Everett, or the Dome, in the south, 2,635 feet.

Berlad, bĕr-lăd', Rumania, a town on the Berlad River, and Teucuci-Baslui R.R., about 68 miles northwest of Bucharest. It is the trade centre of a grain-raising district and has many distilleries. It is a well built town, with good schools and a theatre. Pop. (1903) 26,892.

Berleburg, bĕr'lĕ-boorg, or **Berleburger Bible,** a translation of the Scriptures published at Berleburg, Germany (1726–42). Its unknown editors have given an original version with accompanying exposition more or less mystical in character.

Berlichingen, bĕr'lih-ĭng-ĕn, **Götz,** or **Godfrey von,** German soldier of fortune: b. Jaxthausen, Swabia 1480; d. 23 July 1562. He was a bold, restless, warlike, and honorable knight. He placed himself at the head of a body of the rebellious peasants, in the war which they waged against their oppressors, but was soon made prisoner. Before that time he had lost his right hand, and therefore wore one made of iron. His biography, written by himself, was printed at Nuremberg in 1731 and 1775, and, for the third time, at Breslau in 1813. This book contains an excellent picture of the social life and customs of the time, and has furnished Goethe with the subject of his drama, 'Goetz von Berlichingen,' translated by Sir Walter Scott.

Berlin, Canada, town and county-seat of Waterloo County, Ont.; on the Grand R. and the Grand T. R.R.; 62 miles west of Toronto. It has manufactories of furniture, leather, boots and shoes, pianos and organs, buttons, gloves, etc.; excellent sewerage system, waterworks, street railway, and gas and electric light plants; a Roman Catholic college, 15 churches, and several daily, weekly, and monthly periodicals. Pop. (1901) 9,747.

Berlin. No account of the earliest settlement of Berlin has come down to us, but it is supposed that the city was founded during the decade from 1230 to 1240. Indeed, the margraves John I. and Otto III. are said to have established the city as a stronghold against the Slavs. The name Berlin is probably of Slavic origin, although some scholars trace the word to «Bärlein,» from the fact that a bear appears on the coat of arms of the city. The new city, or town, was situated on the old commercial highway which led from Leipsic to Stettin and was known especially as a market for herring, grain, and wood. Cologne (Colonia), the near-by sister city on the river Spree, seems to have been established as an independent municipality simultaneously with Berlin and was united with Berlin, temporarily, in the year 1307. Though the margrave had his castle in the city, the municipal government was left to the mayor and aldermen, who enjoyed full sway.

In 1134 the mark of Brandenburg had come into the hands of Albrecht the Bear, of the House of Ascan, to which family also belonged the founders of Berlin, who ruled in common. After the extinction of this family (1323) the German emperor, Ludwig of Bavaria, gave Brandenburg to his son Ludwig as a fief, who in 1351 passed it to his brother, Ludwig the Roman. His successor, Otto the Lazy, sold the mark to the emperor Karl IV. (1373). Karl's son, the emperor Sigismund, appointed Friedrich von Hohenzollern, burggrave of Nürnberg, viceroy of the mark in 1411 and made him an elector in 1415. This increased dignity, which indeed had already been worn by Ludwig the Roman, gave the ruler of the mark an importance that redounded to the good of the country and of the city. The first Hohenzollern had a difficult position to fill, in that he had to put down a rebellious and, in part, thievish nobility. This nobility, especially the family of Quitzows, did great damage to the trade of Berlin (1406–1410). Just as his father had had to contend with the nobility, Frederick II., the second Hohenzollern, had to fight against the populace of Berlin-Cologne. Soon after he un-

dertook the government he began a strong citadel in Cologne, on the bank of the Spree.

This same citadel, enlarged and extended during the centuries, now serves the present emperor both as a residence, and as the palace where he receives his princely guests. With the building of the citadel the margrave removed to Berlin; and the result was that Berlin and Cologne had to surrender much of their authority to him. At first the cities had become involved in a dispute over constitutional and administrative matters and had called in Frederick II. as arbiter; but soon they were quarrelling with the prince himself, and he defeated both of them.

Since Berlin-Cologne has been the residence of the Hohenzollerns the history of the city has been intimately connected with that of the reigning family. The rulers have always been particularly interested in building up the city. In this respect the work of the Great Elector, Frederick William (1640–88), was noteworthy. He added two new wards to the city, Friedrichswerder and Dorotheenstadt, built magnificent fortifications (though later these were removed), and summoned architects and engineers from Holland to finish the palace and lay out public grounds, as the Lustgarten and the Linden-promenade. His successor, Frederick III., the first king of Prussia, added to the city Friedrichstadt and other suburbs. Supported by artists like Schlüter and Eosander he enlarged and beautified the palace and gave the city a number of fine statues and public buildings, particularly the Zenghaus, which is one of Berlin's conspicuous monuments of architecture. The fine equestrian statue of the Great Elector, on the bridge near the palace, is by Schülter. Frederick William I. was especially interested in building private residences. He made presents of building-lots and even furnished lumber gratis and made other concessions.

His son, Frederick the Great, turned his attention to the erection of new buildings in Potsdam, his favorite residence. After the Seven Years' War, in which Berlin had been burned twice, the king began, at great personal expense, the construction of houses for those who enjoyed his favor. External architectural beauty was aimed at, rather than convenience. Among the public structures erected by Frederick the Great may be mentioned the two domes of the German and the French church, the King's Colonade, and the Royal Library. In 1763 he established the Royal Porcelain Manufactory.

The famous Brandenburg Gate, a triumphal arch in classic style, was erected in 1793, during the reign of Frederick William II. It was ornamented by the sculptor Schadow with a bronze statue of Victory driving a four-horse chariot. When Berlin was taken by the French in 1807 this was taken to Paris, but was recovered in 1814 after Paris had been taken by the allies. Under Frederick William III. the present Royal Theatre and the Old Museum were built, and under Frederick William IV. the statue of Frederick the Great. The wonderful progress made by Berlin during the reign of William I. gave the city quite a different appearance in a short time. Buildings of a monumental character, both public and private, sprang up everywhere.

This development continues; and the present emperor is doing all he can to beautify the city, chiefly with monuments and statues. Likewise the activity of private citizens along the same lines is now far greater than in former centuries. The great historical events which created the German Empire and made Berlin the capital of it found a happy echo in the populace. The new development of the city to the metropolis of the political life and of national and international trade has not been external and artificial as formerly, but has been internal and necessary. This fact cannot be set forth in an account of buildings and monuments. It would be necessary to examine the statistics of trade and commerce, of banking, and of the industries, etc., etc. If one studies the statistics, then it becomes clear that those material aspects of the city that amaze one and compel admiration are the only manifestation of a powerful historical development, which cannot by any means be regarded as having reached its zenith.

Area, Population, Suburbs, etc.— Besides Cologne, other neighboring towns were built up later, as Friedrichwerder (with Friedrichstadt), and Dorotheenstadt. All four of these towns, though lying in immediate proximity to one another, remained completely independent of each other till 1709, when Frederick I. fused them into one municipal corporation. At that time the population was about 57,000. Now, after nearly 200 years, we find a similar situation as regards a plurality of independent cities. Immediately adjoining Berlin there are some 20 completely independent municipalities of one kind and another. For the most part these towns and cities have, to all appearance, become fused with Berlin, and boundary lines have been obliterated; but each one has its own independent municipal government. As yet there is no centralized, unifying government to bind them together. Among the larger cities thus related to Berlin may be mentioned Charlottenburg, with 237,000; Rixdorf, with 153,000, and Schöneberg, with 141,000 inhabitants. Berlin proper has at present a population of 2,036,000; or, including the immediate suburbs, nearly 3,000,000. The area of Berlin is 6,350 hectares (1 hectare = 2½ acres), being less than that of several other German cities, for instance, Cologne (11,100 hectares), Frankfurt-on-Main (8,000 hectares), Strasburg (7,800 hectares), Munich (7,500 hectares), and Mannheim (6,600 hectares). Though, to be sure, if we include the immediate suburbs, the area runs up to 16,500 hectares.

There has been no considerable extension of the corporate limits of Berlin into this neighboring territory since 1860, though the necessity for such a proceeding has been urged repeatedly in various quarters. To do this, and thus effect a union of these several municipalities, the consent of both the State government and the Parliament is necessary. For a long time the Prussian government was inclined to carry out such a plan, but the city of Berlin objected to assuming the burden which the poor condition of the streets and public utilities of the suburbs would have imposed upon her. At present the State government encourages the incorporation of the smaller country suburbs into towns, and sooner or later all these elements, large and small, will be brought together under one municipal government.

The present fragmentary condition of the city entails upon Berlin many practical difficulties. For instance, the city has bought in the suburbs not less than 14,200 hectares of land for the utilization of the sewage, and the laying of the pipes through these neighboring municipalities often gives occasion for long and tedious negotiations. Similar difficulties attend the construction of street-car lines. In every case the company in question has to secure a concession from every suburb concerned. This always involves long negotiations as to details.

Municipal Government.— The administration of the city of Berlin is in the hands of a municipal council of 34 members, including the mayor. Half of these fill honorary positions, half receive pay. Among the salaried members may be mentioned, the chief mayor (Oberbürgermeister), the mayor, two syndici, a minister of finance, two school commissioners, and two commissioners on buildings. The members of the council are elected, for a limited period, by the board of aldermen. The aldermen themselves are elected by vote of the citizens. The sessions of the council are secret; those of the board of aldermen are usually public. All important innovations require the consent of both bodies. Besides, there are a number of committees, composed of members of the council and of the board of aldermen. In certain branches of the administration the authority of these committees is competent, but in important matters transcending their special departments their authority is conditioned by the consent of the municipal council.

The aldermen, 144 in number, receive no salary, their position being honorary. They are represented by a chairman and his deputy. A further category of honorary and unsalaried officials is formed by the citizen-deputies, who are elected by the board of aldermen; also the poor-law guardian and the members of the poor commission. Altogether, there are several thousand persons working for the city without any salary. The city police force is employed and controlled by the State, but the city has to make appropriation for this object.

Finances.— The administration of the city of Berlin costs something more than $35,700,000 yearly. The city owns real estate worth $110,000,000, and other assets to the extent of $170,000,000. The obligations of the city run up to about $80,000,000.

The receipts come principally from taxes. The taxes collected for the year 1904–5 amounted to nearly $20,000,000, *i.e.*, about $10 per head. Of this amount $7,400,000 was from the income tax. This tax is levied on incomes just as is the corresponding State tax, and at present the rate is the same in both cases. Further, $2,260,000 was realized from the special tax assessed against incomes derived from trade. The tax on real estate was $6,400,000, to which must be added a sewage tax of $1,450,000. The tax on transfers of real estate was $1,300,000, not to mention other and less important sources of income. It may be added that the State taxes in Berlin, direct and indirect, amounted to $7,740,000 and $11,900,000, respectively, while the imperial taxes were $13,100,000. Thus we see that in the year 1904–5 the citizen of Berlin paid, on an average, about $25 in taxes.

Of the expenditures, schools and education received $6,550,000. Other items were, gas manufacture, $5,000,000; administration, $4,290,000; charity, $3,800,000; interest on loans, $2,850,000; care of health, $2,620,000, and $1,790,000 borrowed money returned. In considering these figures it must be noted that general indebtedness forms a separate account, the expenditures under this head not being reckoned to the departments concerned; further, that the commercial enterprises of the city, as gas-works, water-works, sewage, stock-yards, slaughter-houses, etc., are included in the general budget.

Public Utilities.—As regards gas and lighting, the city has not a monopoly. By reason of old contracts a small part of the city is entirely dependent for gas on an English company, and the same company operates, but not exclusively, in a large part of the city. The water supply is entirely in the hands of the city. There are several water-works, the water being obtained in part from deep wells. Other wells are to be bored soon. Sewage is also provided for by the city, the waste being brought through pressure pipes to the city's farms in the country, where it is prepared for agricultural purposes.

The city has a stock-yard, which serves as a general market for live stock, also a slaughter-house, where all slaughterings must take place. Here the fresh meat is at once officially inspected. All meats shipped into Berlin are inspected, unless an official inspection has taken place elsewhere. There are 14 city market-houses for the retail trade and one special market-house for the wholesale trade.

There are five regular city hospitals and a smaller sick-house, which are open to the public; also three State hospitals and nine other public hospitals. The large Virchow city hospital is in course of construction. Besides, there are three city asylums for the insane. The city also maintains a disinfecting establishment for furnishings, flats, etc. There are seven public bathing places for hot baths, and 16 with cold running water.

The city also runs a savings bank («Sparkasse»). The deposits amount to some $75,000,000. There is also a royal pawn-office, and a number of private benevolent institutions which are, in part, supported by the city.

The Central Employment Office is of particular significance, and its management is unusual. In many German cities such an institution is managed directly by the city administration. A special office is fitted up for the purpose, notices of vacancies of one kind and another are received, and those seeking employment are informed of such opportunities for work. Now, in Berlin, this general employment agency is not directly in the hands of the city, but receives support from the city. This support on the part of the city, which has been extended to $10,000, was given after a number of high city officials had identified themselves with the management of the agency in question, which was called the *Central-Verein.* This employment agency has a special building for its purposes, containing separate offices for different kinds of work; also youthful applicants are separated from the mature. A number of

smaller employment agencies and unions of one kind and another have joined this general union. The condition for thus joining is that an executive committee be formed for each trade, consisting equally of workmen and employes, with a chairman belonging to neither party.

Charities, etc.— The city council spends annually about $80,000, aiding various private charitable associations; for instance, nine organizations for nursing the sick, 15 for the care of children, five for the care of women lying-in, and 43 other aid associations; also 23 educational institutions, besides a large number of foundations partly under the administration, partly under the inspection of the city.

The city has two asylums for the homeless, one for families, the other for such persons as only require a shelter for the night. A similar institution, an "Asyl," is maintained by a private association. In fact, it is characteristic of Berlin that public and private charity supplement each other. The care of the poor, as such, is in the hands of the city administration, and about 4,000 persons are employed in this work, though in honorary positions and without salary. The daily expenditure on the poor is about $13,000, the average number receiving aid being 34,000. The number of orphans in the care of the city is about 6,000.

In addition to these means of providing for the poor must be mentioned the system of insurance for the working classes. The statute regulating insurance against sickness was passed in 1883, though previous to that time such insurance had already been made compulsory. The obligation is placed upon the employer, who pays the assessments and deducts the amount from the wages of the workman. At present there are 129 branches of this kind of insurance under the control of the city council, besides a few branches that are controlled by the State, and a number of private associations. The number of workingmen and women insured already exceeds 700,000, and in 1904 the sum of $6,430,000 was paid out in sick insurance. According to the law, the weekly allowance during sickness is paid for as long as 26 consecutive weeks, but, under special circumstances, it may be paid for as long a period as 52 weeks. The city has built upon its own land homes for the convalescent, which are for the complete recovery of the sick. For the rest the city hospitals are open to the insured, but their expenses must be paid out of the insurance money.

There is in Berlin a State institution for the care of invalid workmen. In connection with the same there are several sanatoria which care for those who are about to become invalids. The sanatorium at Belitz may be mentioned. It is fitted up in magnificent style and is probably the best sanatorium on the continent of Europe.

Educational Institutions.— In the field of education the University of Berlin takes the first place. It was founded by Frederick William III. in 1810. During the winter term of 1904–5 there were enrolled 7,400 regular students, besides almost as many more so-called *Zuhörer, i.e.,* mostly persons who have secured permission to attend lectures, but whose previous education is not sufficient to enable them to take up systematic studies leading to a degree. In connection with the university is the Seminary for Oriental Languages.

Further, of special significance is the "Technische Hochschule," which has nearly 3,000 students; also the "Bergakademic," and the Hochschulen for agriculture, for fine art, and for music.

All these are State institutions. To them will soon be added a Hochschule for Commerce, which is being erected by the "Aeltesten der Berliner Kaufmannschaft." This is a society of merchants which was licensed by Frederick William III. in 1820. Formerly they exercised the function of a board of trade. Since the Chamber of Commerce was formed some years ago they have had to give up this function and have extended their activity into the field of commercial education.

As to Gymnasia and Realgymnasia, Berlin has five royal and 20 city institutions. There are, besides, 13 city Realschulen, two royal, and six city high schools for girls, four city finishing schools, a normal school, a royal seminary for male teachers, a similar one for female teachers and teachers of gymnastics, a royal theatre-school and school for deaf-mutes, a city school for deaf-mutes, and a city school for the blind. Elementary instruction is represented by 273 city district schools, with 5,000 teachers, 222,000 children, and 4,800 classes. Instruction in these schools is free. It may be added that each of the suburbs has its own schools of various kinds.

Museums and Collections.— The more important picture galleries and collections are, the Old and the New Museums, the National Gallery, the Pergamon Museum, and the Emperor Frederick Museum — all maintained by the State. Further, the Ravené Museum. Among historical collections may be mentioned the Royal Hohenzollern Museum, the Zenghaus, the Provincial Museum — a city institution, the Post Museum, and the royal museums for anthropology and German ethnology. The liberal arts are represented by the Royal Museum for Liberal Arts and by the exhibit of the Royal Porcelain Manufactory. Further, there are the royal museums for science, for agriculture, for mining and smelting, and for pathology. The Zoölogical Garden belongs to a private company, but it is in the nature of a public utility. The Acquarium is also owned by private parties, but is subventioned by the authorities. The State maintains a botanical garden. There is also the Hygienic Museum, the Colonial Museum, and the Institute for Hydrography, which serve further the interests of science and the technic of shipbuilding. A curious recent creation is a permanent exhibition of contrivances for the betterment of the conditions of labor. There are three astronomical observatories, a State observatory, and two private ones. The latter are always open to the public.

Many libraries, including the Royal Library of about a million volumes, provide opportunities for study in every field of knowledge.

Monuments and Public Buildings.— There are a large number of monuments on the streets and public squares of the city. A considerable number of them have been erected during the reign of the present emperor, and, in fact, under his immediate influence.

The number of the palaces and public build-

ings is likewise very large, though, as compared with other German cities, Berlin is poor in specimens of old architecture.

There are numerous theatres, including the Royal Play House, the Royal Opera House, the New Royal Opera-Theatre, 13 other large theatres, and about a dozen smaller ones, a number of so-called "cabarets," and two permanent circuses.

Churches.—The oldest churches in Berlin are the Nokolai Church and Saint Mary's. Both were built in the 13th century but have been restored. Further, Saint Peter's may be mentioned. There are more than 40 evangelical churches, the most important being: the Emperor William Memorial Church, built in 1891–1895 in beautiful Romanic style (two large neighboring houses are in the same style of architecture); the Emperor Frederick Memorial Church, beautifully situated in the Thiergarten; and the New Cathedral (dedicated in 1905), built in Italian Renaissance style and ornamented with numerous sculptures. A French church was built in 1701–1705; and there are also an English and an American church. Saint Hedwig's Church (Catholic) dates from the middle of the 18th century. Of the two larger synagogues the oldest and finest dates from the year 1866.

Monumental Buildings.— To be mentioned here especially are: the Royal Palace, the palaces of Emperor William I., Emperor Frederick, and Prince Albrecht, and the palace at Charlottenburg; further numerous state buildings, *e. g.*, those occupied by the Departments of War and Education, the Foreign Office, the Imperial Health Office, the Imperial Insurance Office, the Patent Office, the Abgeordnetenhaus, and the large Reichstag building, in Italian Renaissance style; also various railway stations and palatial structures of the Postal Department. Of municipal buildings the City Hall deserves mention; further, the city museum and numerous public schools; also the new City Hall in Charlottenburg. The magnificent structures of the large banks, stores, breweries, insurance companies, etc., add much to the beauty of the city. The arcade between Frederick street and Unter-den-Linden may also be mentioned.

Bridges, Statuary, Fountains.— The following are the more notable of the monumental bridges in Berlin: Heydtbrücke, Potsdamerbrücke, Belle Alliancebrücke, Kurfürstenbrücke, Wilhelmbrücke, Friedrichbrücke, Schlossbrücke, Moltkebrücke, and Oberbaumbrücke. Aside from the National Monument, the most noteworthy statues in the central part of the city are those of William I., Frederick the Great, the Great Elector, Frederick William III., Emperor Frederick, Empress Augusta, the two Humboldts, Helmholz, Luther, Schiller, Waldeck, and Schulze-Delitzsch. In front of the Reichstag building is an immense bronze statue of Bismarck. Near by are the statues of Moltke and Roon and the Column of Victory, which overlooks the 32 marble groups of Brandenburgian and Prussian statesmen and rulers in the Avenue of Victory. Other notable statues in the Thiergarten are those of Goethe, Lessing, Richard Wagner, Frederick William III., and Queen Louise. Some of the numerous fountains worthy of note are: the large fountain before the palace, which was designed by Begas and presented by the city on the accession of the present emperor; the Hercules Fountain on Lützowplatz, which was designed by Lessing; further, the artificial water-fall in Victoria Park.

Transportation and Population.— The character of the population of Berlin is subjected to a gradual change, which is caused partly by the building up of new industries, partly by the removal of well-to-do taxpayers to the suburbs. This migration of the wealthier classes is attended by an influx of the laboring classes, especially in the newly-built parts of the city, so that the laboring population is constantly increasing. Again, the inner residential part of the city is coming to be used more and more for business purposes, so that here the population is decreasing continuously.

The development of facilities for transportation has contributed much to these changes. The "Stadtbahn," a railway which crosses the city from east to west, then encircles it both on the north and on the south, was and is yet the cause of the wonderful growth of the western suburbs. Migration was encouraged by the exceedingly low fare of 10 pfennigs to the fifth station, or 20 pfennigs for the entire distance, not to mention the great reduction allowed on monthly tickets. This has led to the building of new stations along the outer parts of the "Stadtbahn" and to the institution of suburban trains, on which one may have a monthly ticket at a price varying with the distance.

In this connection must be mentioned also the "Grosse Berliner Strassenbahn." This is a private traction company which owns nearly all the street cars in the city. Since on most of the lines the fare is only 10 pfennigs this company has had great influence in the development of the suburbs. In the inner part of the city there are many omnibuses, drawn mostly by horses, but partly by motors. The fare is 5 and 10 pfennigs. The electric elevated and underground road passes along the southern periphery of the city from east to west. The prices are higher than on the other lines. A plan is now being agitated to supply Berlin with a number of such subways.

In the year 1904, the "Stadtbahn" carried 111,000,000 persons; the street-car lines, 395,000,000; the omnibus lines, 94,000,000; the elevated-subway line, 32,000,000.

Under the influence of improved facilities for transportation the composition of the population in the various parts of the greater city has become quite varied. The well-to-do live in the west and in the western suburbs, while the working classes have settled in the east and the north, and partly in the southeast. The large factories are situated in the east and in the northwest. While in Berlin 80 persons out of every thousand pay tax on an income of $750 and upward, the proportion of people in Rixdorf, a southeastern suburb, who have such an income is only 27 out of a thousand. On the other hand, in the wealthy western suburbs, Grunewald and Wilmersdorf, the proportion is 441 and 228, respectively, out of every thousand. Similar differences can also be noted in the interior of the city.

The city maintains a statistical bureau that keeps a careful record of all these conditions. Undoubtedly, such differences in the composition of the population will be found to account

1. Schlossbrücke, with Lust Garten.
2. Palace of Emperor William I.

for the varying rate of mortality in the different parts of the city, as well as for the varying rate of taxation.

Death Rate.— To be sure, the mortality in Berlin is not only low, but is still decreasing. In 1904 the rate was 17 out of a thousand, while in the seventies of the past century the death rate was almost double this. Still, the rate is not uniform, varying from 8 in the wealthier parts of the city to 22 per thousand in the poorer quarters. The decrease of mortality is due to better hygienic conditions, especially to water-supply and sewage. Though the death rate among children is still high the city authorities are doing everything possible to combat the evil. Building ordinances have been made stricter, and the hygienic conditions of flat-houses have been thereby greatly improved, especially in the newly-built portions of the city.

Tenements.— Still the principal evil persists, *i.e.*, the crowded condition of apartment-houses. On an average such a house in Berlin shelters 77 persons, and the flat of a workman, which usually consists of only two rooms, closet, etc., must not only shelter the family, but provide sleeping quarters for one or two outsiders. The explanation of this is to be found in the relatively high rents for such flats, the minimum being $5 per month, or about one fourth of a laborer's income. The desire to cut down the rent by letting sleeping quarters is amply met by the large number of workmen moving into Berlin.

The building of model tenements for the betterment of living conditions among the poor has not taken place to any considerable extent. Aside from a co-operative company that built 269 small homes for workingmen in the suburbs, which were sold to the members of the company, there are seven building companies of philanthropic nature, but their houses offer accommodations for less than 10,000 persons. Besides, the administrations of some of the State industries have placed homes at the disposal of their workmen, and both the city and the State aid such benevolent enterprises by furnishing capital at a low rate of interest.

Aside from the evils of high rents, and, consequently, overcrowded flats, the conditions are not bad. The plumbing in the newer flat-houses leaves nothing to be desired. In fact, both in Berlin and the suburbs, the better class of such houses have all modern conveniences, and are comparatively luxurious.

Streets.—The streets of Berlin are well cared for and are in excellent condition. Already 40 per cent. of the streets are paved with wood or asphalt, the rest being paved with stone or cement. But the work of improvement continues. The yearly pay-roll for street cleaning amounts to $531,000. Much more is spent now on parks than formerly. Within the city limits there are seven State and five city parks. For the most part, the city is illuminated by gas, but, since recently, in part by electricity. The city maintains an efficient fire department, which also acts as a good Samaritan in all cases of distress, whether from fire or otherwise. In accordance with an ordinance of more than a hundred years standing, all buildings must be insured in the city «Feuercasse.» The average insurance valuation per house is $41,500.

Naturally, the great demand for real estate and the more luxurious style of architecture have increased valuations considerably. On an average property is worth about $65 per square metre. The total real valuation may be placed at about $2,000,000,000.

Climate.— The mean temperature is 9° Centigrade, the thermometer varying from about 0.7° below zero in the middle of January to 19° above zero in the middle of July. During the months of December, January, and February the mean temperature varies from 0.7° below zero to 0.8° above zero. The mean temperature for other months is as follows: March, 3.5°; April, 8.5°; May, 13.3°; June, 17.4°; July, 18.9°; August, 18.1°; September, 14.6°; October, 9.5°; November, 3.8°. The mean barometer is 76.2, the lowest, 56.9 centimetres. West winds prevail.

While, in general, healthful, the climate has been found to be unfavorable to young children in the summer. Stomach troubles are aggravated by the heat, and the death rate among infants is thereby considerably increased. The city has been free of epidemics for years.

Recent Development.— Since about 1865 the capital city of the empire has had, in many respects, a brilliant development. In this short period the population has trebled, hygienic conditions have been wonderfully improved, and the city has become one of the most beautiful, and one of the most visited, cities in the world. More than a million strangers register in the hotels annually, not including the large number of visitors who find their temporary quarters in those parts of the greater city which are under separate municipal control. Indeed, for the stranger, who cannot see the imaginary boundary lines, it is all Berlin. Socially and industrially it is really only one city, and the entire complex of separate municipal corporations might be fittingly called Greater Berlin.

Doctor E. Hirschberg,
Director of Statistical Bureau of Berlin.

Berlin Cathedral. This edifice was planned by the emperor Frederick and his empress to be the «Westminster Abbey» of Germany, and has been 14 years in building. The architecture corresponds nearly to the Italian Renaissance, and is the design of Prof. Raschdorff, who had visited all the principal cathedrals in Europe before completing it. The corner stone was laid in 1894. The cathedral consists of four principal parts — the church for divine worship the church for marriages and christenings, the immense crypts, and the long porch. It is constructed of yellow sandstone and the pillars of the porch are of vari-colored marbles — Brazilian anyx, black Silesian marble, and various beautiful specimens from Sienna. The building is 341 feet long; the cupola, with its lantern, rises 325 feet above the pavement, and the two bell towers each reach up to a height of 211 feet. The Prussian Diet contributed $2,500,000 toward its erection, but this sufficed only for the actual building the extensive decorations and mosaic work being hardly yet begun, and the entire building will probably cost more than $5,000,000. Emperor Frederick originally intended the memorial church in the crypt to be the resting place of the Hohenzollerns only, and already the remains of

87 have been placed there, but in future the church will be the burial place, beside the sovereigns, for the nation's celebrated dead. The organ, which is the largest in the world, except that at Riga, has 113 so-called voices and 7,000 tubes. It cost $37,500 and was the gift of Prince Henckel of Donnersmarck. The chancel is of marble and bronze and is the gift of Privy Councilor Paetel. Kaiser Wilhelm has taken great interest in the erection of the building, and by his direction an epitaph in memory of Bismarck will be placed over the entrance. The cathedral was dedicated 27 Feb. 1905.

Berlin Congress, a gathering at Berlin, Germany, where the European powers undertook the settlement of the questions growing out of the Russo-Turkish war of 1877–8. The Congress met 13 June 1878; and completed its labors with the signing of a treaty on 13 July following. The treaty of San Stefano (3 March 1878) between Russia and Turkey did not suit the other powers; and the congress, convened, at the suggestion of Germany, so modified the agreement between Russia and Turkey that the former lost nearly all the fruits of victory. By the new arrangement Bulgaria was divided into two parts, Bulgaria proper and eastern Rumelia. Parts of Armenia were given to Russia and Persia; the independence of Rumania, Servia, and Montenegro was guaranteed; Bosnia and Herzegovina were transferred to Austria; and Bessarabia restored to Russia. Greece was also to have an accession of territory. By a separate arrangement previously made between Great Britain and Turkey, the former got Cyprus to administer. Bismarck was the president of the congress. The more important members were: Prince Gortchakoff, Count Andrassy, Lord Beaconsfield, Lord Salisbury, M. Waddington, Count Corti, Karathéodori Pasha, Prince Hohenlohe, and Gen. von Bülow.

Berlin Decree, a decree issued by Napoleon, 21 Nov. 1806, which declared the British Islands in a state of blockade. It forbade commerce with them and trade in their merchandise, and declared all merchandise belonging to Englishmen, or transported from England, lawful prize. Its effect was to inflict great injury on the American carrying trade.

Berlin, University of, a celebrated institution of learning in Berlin, Germany. It is, with the exception of Bonn, the youngest of the German universities, but is probably the most famous of them all. It was founded in 1810, when the Napoleonic victories had left Prussia apparently crushed, and had even transferred her great University of Halle to the newly formed kingdom of Westphalia. Wilhelm von Humboldt was minister of education at the time, and Prussia's debt to him for organizing her national school system, with the University of Berlin at its head, during that period of national defeat and disaster, is certainly very great. It should be borne in mind, too, that Humboldt was ably seconded by Fichte and Schleiermacher. The first rector of the university was Schmalz; the first deans of its faculties were Schleiermacher, Biener, Hufeland, and Fichte; and before it was 10 years old it had for professors such men as Niebuhr, Wolff, Böckh, Bekker, and Hegel. In more recent years, Ranke, Mommsen, Helmholtz, Virchow, and other famous scholars have upheld the reputation which the university won for itself at the very start. There are four faculties, theology, medicine, jurisprudence, and philosophy, with a total of 377 professors and teachers. At the satisfactory completion of the course, the doctor's degree is conferred.

Berliner, Emile, bär-lē'nėr, ā'mēl, American inventor: b. Hanover, Germany, 20 May 1851. After graduating at Walfenbüttel in 1865, he came to America five years later, and in 1878 was appointed chief inspector of instruments by the Bell Telephone Company. He invented the loose contact telephone transmitter or microphone, known by his name, and the device called the gramophone. He has devoted his energies to perfecting the telephone, and has secured many patents for his inventions.

Berlioz, bär-lē-ōs, **Hector,** French composer: b. Côte St. Andre, near Grenoble, 11 Dec. 1803; d. Paris 9 March 1869. He forsook medicine to study music at the Paris Conservatoire, where he gained the first prize in 1830 with his cantata 'Sardanapalus,' enabling him to study at Rome. His chief literary works (besides his 'Memoirs') are the 'Traité d' Instrumentation' (1844); 'Voyage Musical' (1845); 'Les Soirées d'Orchestre' (1853); and 'A Travers Chants' (1862). His musical works, which display remarkable originality, belong to the Romantic school, and are especially noteworthy for the resource they display in orchestral coloring. His more important works are 'Episode de la Vie d'un Artiste'; 'Symphonie Fantastique' (1829); 'Lélio, ou Le Retour à la Vie' (1832); 'Harold en Italie' (1834); 'Romeo et Juliet' (1839); 'Damnation de Faust' (1846), one of the best-known and most admired of his works; the operas 'Benvenuto Cellini' (1838); 'Beatrice and Benedict' (1862); and 'Les Troyens' (1864); 'L'Enfance du Christ' (1854), the 'Te Deum,' and the 'Requiem.' After his death appeared 'Mémoires' (1803–65), written by himself (English translation, 2 vols. 1884).

Berm, or **Berme.** *In fortification,* a narrow, level space at the foot of the exterior slope of a parapet, to keep the crumbling materials of the parapet from falling into the ditch.

In engineering, a ledge or bench on the side or at the foot of a bank, parapet, or cutting, to catch earth that may roll down the slope, or to strengthen the bank.

Bermejo, bėr-mā'hō, a South American river rising in Bolivia, and flowing across Argentina to the Paraguay River, which it enters about 140 miles south of Ascension. It is navigable for about half of its length of 1,300 miles.

Bermuda, bėr-mū'da, or **Somers Islands,** a cluster of small islands in the Atlantic Ocean, belonging to Great Britain, and situated 580 miles southeast of Cape Hatteras. They are in number about 400, but for the most part so small and so barren that they have neither inhabitants nor name. They were first discovered by Juan Bermudez, a Spaniard, in 1522; in 1609 Sir George Somers, an Englishman, was wrecked here, and after his shipwreck, formed

1. Lust Garten, showing Statue of Frederick William III.
2. Brandenburg Gate.

the first settlement. The most considerable of these islands are St. George, Bermuda or Long Island (with the chief town, Hamilton, forming the seat of the governor), Somerset, St. David's, and Ireland. They are chiefly used as a naval and military station. The island of Ireland is occupied by a government dockyard and other naval establishments, while Boaz and Watford islands have the military depots. The military headquarters are at Prospect. An immense iron floating-dock was constructed at London for the Bermudas in 1868; it is capable of receiving a vessel of 3,000 tons. The climate is generally healthy and delightful, the air being mild and moist at all seasons. It is not adapted, however, for consumptive patients. The thermometer seldom falls below 40° F., and rarely rises above 85°. These islands have therefore become a popular holiday resort for Americans, and plentiful hotel accommodation is supplied at St. George's and Hamilton. The surface is rather irregular; the soil, though light and stony, is in general rich and fertile. The islands form a nearly continuous chain, and are connected almost uninterruptedly by roads, bridges, and causeways. The water is in general salt; there is but little fresh except rain-water, preserved in cisterns. The inhabitants export early potatoes, onions, lily bulbs, etc., nearly all of these products being shipped to New York. The value of the exports is from $585,000 to $635,000 annually; that of the imports is about $1,460,000 to $1,560,000. The revenue is about $166,000. Pop. (1897) 16,098.

Bermuda Grass (*Cynodon dactylon*), a grass cultivated in the West Indies and the United States, where it is of special value on the sandy soils of the southern States. It is a valuable fodder grass for warm climates. It will grow in any soil not too damp, but in America it matures only in the extreme south.

Bermuda Hundred, Va., a peninsula formed by the junction of the Appomattox and James rivers, occupied by Gen. B. F. Butler, who, in 1864, commanded the Army of the James, numbering about 25,000 Federals, where he might intrench himself and await Grant's arrival. In the vicinity of this position there was constant fighting between Butler's troops and those of the Confederates under Gen. Beauregard, whose forces were 20,000 strong. The fighting continued from 16 May to 30 May. On the 16th Heckman's brigade was destroyed by the Confederates, who were then pushing on to Bermuda Hundred, when Ames and Gillmore came up and Beauregard's plans miscarried. On the 19th the Confederates assaulted the Federal rifle pits under Ames and Terry, but without success. Skirmishing continued until the 30th, when the Confederates desisted. Bermuda Hundred was a valuable position, since it was very near both Richmond and Petersburg; but Butler was charged with military incapacity in having "corked himself up in a bottle."

Bermudez, Remigio, Morales, bār-moo'-dāth, rā-mē'jē-ō mō-rä'lĕz, Peruvian statesman: b. Tarapaca Province, 30 Sept. 1836; d. Lima, 31 March 1894. He began business in the nitrate trade in his native province. In 1854, as a lieutenant, he joined the revolutionary army which finally overthrew Gen. Echinique's government. In 1864 he joined the revolution against President Castilla. In the war with Chile he led the force that marched to Arica. When Caceres was elected president in 1886, Bermudez was chosen vice-president, and was elected president in 1890.

Bermudez, bĕr-mū'dāth, Venezuela, a northeastern state situated between the Orinoco and the Caribbean Sea, formed in 1881 from the former states and present sections of Barcelona, Cumana, and Maturin. Area, 32,243 square miles; Pop. about 325,000.

Bern, bārn, or bĕrn, Switzerland, the chief canton of the confederacy, situated in the western half and surrounded by the cantons of Neufchâtel, Freiburg, Vaud, Valais, Uri, Unterwalden, Lucerne, and Solothurn, being partly bounded also by France and Alsace; area, 2,657 square miles. The more northern portion of the canton has beautiful plains and valleys, and a fertile and highly cultivated soil, producing corn, wine, and fruits; the Emmenthal, one of the richest and most fertile valleys in Switzerland, raises the finest cattle, and produces a celebrated cheese. The southern portion of the canton, the Bernese Oberland, begins at the foot of the high mountain chain between this canton and that of the Valais, and extends to its summit. The lower valleys produce good fruits, and are fertile and agreeable: higher up are excellent Alpine pastures; then succeed bare rocks, extensive glaciers (the source of magnificent streams and waterfalls), and some of the highest mountains of Switzerland, as the Finsteraarhorn, the Schreckhorn, and Wetterhorn, the Eiger, the Jungfrau. The chief trade of the canton is in linen and woolen manufactures, and cattle-raising. Pop. (1897) 548,061.

After belonging to the Franks and Burgundians the Bernese territory became part of the German empire. In the long wars with Austria, Milan, Burgundy, and Savoy, the Confederacy came off victorious, and Bern conquered Aargau. In 1528 the citizens of Berne embraced the cause of the Reformation. In the subsequent war with the Duke of Savoy they conquered the Pays de Vaud. From that time till 1798 the prosperity and wealth of Bern constantly increased, so that the canton then contained above 5,000 square miles and about 380,000 inhabitants. On 5 March 1798, 30,000 French troops marched against Bern and conquered it, the result being that it now lost about half of its possessions; the northern part was united with the present canton of Aargau, and out of the southwestern (Pays de Vaud) the present canton of Vaud was formed. By the decrees of the Congress at Vienna, however, the greater part of the bishopric of Basel was joined to the canton. The present constitution dates from 1893 and is purely democratic. The legislative power is vested in a Great Council elected by the people voting in 62 electoral districts, there being one member for every 3,000 inhabitants. The executive is vested in a governing council of nine members elected by the Great Council, both being chosen for four years. The referendum is in force, and all laws may be submitted to popular vote before they become valid. The "initiative," or right to propose new measures, may be exercised by 12,000 voters acting together, but a demand for revision of the constitution must be supported by 15,000 voters.

Bern, Switzerland, the capital of the canton of the same name (see above) and of the whole confederation; situated on an elevated rocky peninsula, washed on three sides by the Aar, which is crossed by several bridges, including the handsome Nydeck Bridge, the huge iron Kirchenfeld Bridge, and the Kornhaus Bridge (opened in 1898), with a roadway 160 feet above the Aar, and a principal arch of 380 feet span. The streets are, for the greater part, straight, wide, and well paved; and the houses, partly provided with piazzas, are substantially built of stone. The streets are purified by rills of water and adorned with fountains. Among the public buildings are the great Gothic cathedral 1421–1573; the Church of the Holy Spirit; the University; the hall of the Swiss Federal Council; the art museum, containing the municipal picture-gallery; a hospital; the town-house, a Gothic edifice of the 15th century, restored 1868; the mint, corn hall, historical and archæological museum; the natural history museum; observatory; deaf-and-dumb institution; infirmary; orphan and lunatic asylums. The public library possesses great treasures of printed books and manuscripts. Trade and commerce are lively; the manufactures consist of woolens, cottons, silks, machinery, chocolate, etc. The city was founded in 1191, and in 1218 the German emperor Frederick II. declared it a free city of the empire and confirmed its privileges by a charter, which is still preserved. In 1353 it entered into the Helvetic Confederacy. In 1405 the greater part of the city was destroyed by fire, but it was afterward regularly rebuilt. The bear, as the heraldic emblem of Bern, figures frequently in a sculptured form; and a number of these animals in the flesh are kept at the cost of the municipality. There is a curious clock-tower containing mechanism by which the striking of the hours is heralded by the crowing of a cock and a procession of bears. Pop. (1897) 49,030.

Bern, University of, a state educational institution having its origin in a minor school which in the early part of the 16th century was much enlarged by the demand for accommodations for theological students. About 200 years later it expanded by the institution of departments of law, science, and medicine, and about 1830 was formally reorganized as a State university. It has a library of about 40,000 volumes and manuscripts, and educates about 1,300 students.

Ber'nacle Goose, a large goose of northern Europe and Greenland, allied to the brant, and named *Bernicla cucopsis,* a name identified with strange old fables. It differs from the brant mainly in its white cheeks, as the lavender-gray of the mantle. This goose is a common winter visitor to western Europe, retiring in summer to Arctic regions to breed, but the region and the character of its nesting remain undiscovered. Up to comparatively recent times it was the belief of the European peasants that this goose was born from the stalked barnacles which adhere to driftwood, and sometimes to the branches of trees that reach down into the sea at high tide. Circumstantial accounts were given of the birth of the young, whose tiny wings (the waving filaments of the feeding cirripeds) could be seen sticking out of the shells from which they were supposed to escape. So firmly was this fixed in the minds of the people that it is given and illustrated with much detail as truth in many books of the time; and the Roman Church permitted these geese to be eaten on holy days because they were sea-born, and therefore "fish"! What is less generally known is that the cirripeds were named after the bird, as their supposed parent; and not the bird after the crustacean. Bernicle, like "brant," refers to the "burnt" black color of the birds, as explained in the 'English Dictionary' and by other authorities. The name has been adopted as generic for a large group of the geese usually distinguished by sportsmen as "brants" (q.v.).

Bernadotte, Jean Baptiste Jules, bär-nä-dŏt', zhŏñ bäp-tēst zhool, king of Sweden: b. Pau, 26 Jan. 1764; d. 8 March 1844. He was the son of an advocate of Pau, and enlisted in a French regiment of marines at the age of 17. He was made a subaltern in 1790, and thereafter his promotion was rapid. In 1794 he was appointed general of division, and distinguished himself greatly in the campaign in Germany and on the Rhine. After the battle of Neuwied he was introduced for the first time to Bonaparte, who conceived the highest opinion of his abilities, though a constant suspicion of Napoleon seems always to have been present in the mind of Bernadotte. In 1798 he married Mademoiselle Clary, sister-in-law of Joseph Bonaparte. The following year he became minister of war, but was shortly obliged to resign. On the establishment of the empire Bernadotte was created Marshal of France and Prince of Ponte-Corvo. At the head of an army of observation stationed in the north of Germany, he fixed his headquarters at Hamburg. At this time Gustavus IV. had been driven from the throne of Sweden. The Duke of Sudermania assumed the crown under the name of Charles XIII.; and as he was far advanced in years the diet had nominated, as his successor, the Prince of Holstein-Augustenburg, when the latter died in a mysterious manner. The heir-apparency to the Swedish crown was then offered to the Prince of Ponte-Corvo. This offer was accepted by Bernadotte with the consent of the emperor; and in October 1810 he arrived in Sweden, where, having previously abjured the Roman Catholic religion, he was proclaimed heir-apparent to the throne under the title of Prince Charles John. He had not long been established in this dignity before serious disagreements took place between him and Bonaparte, whose blockade of the Continental ports was very detrimental to the commercial interests of Sweden. The result was a complete rupture, and the accession of Sweden in 1812 to the coalition of sovereigns formed against Napoleon. At the battle of Leipsic Prince Charles John contributed effectually to the victory of the allies. On the general re-establishment of the European dynasties at the termination of the war, strenuous but unsuccessful attempts were made by the emperor of Austria and other sovereigns to restore the family of Gustavus IV. to the crown; and Bernadotte, retaining his position as crown-prince, became king of Sweden on the death of Charles XIII. in 1818, under the title of Charles XIV. During his reign agriculture and commerce made great advances, and many important public works were completed; among others, the Götha Canal.

He was succeeded by his son Oscar, father of the present sovereign, Oscar II.

Ber'nadou, John Baptiste, American naval officer: b. Pennsylvania, 1858. Educated at the Naval Academy in Annapolis, he entered the navy and in the Spanish-American war commanded the torpedo boat Winslow and was wounded in a naval engagement off Cardenas in May 1898. He has written 'The Development of the Resources of the United States for the Production of War Material'; 'The Development of Smokeless Powder'; 'A Trip Through Northern Korea in 1883–4.'

Bernard, bėr'nard, bėr-närd', or (Fr.) bär-när, **Saint** (OF CLAIRVAUX), French ecclesiastic: b. Fontaine, Burgundy, 1091; d. 1153. In 1113 he became a monk at Citeaux; in 1115 first abbot of Clairvaux, near Langres. An austere manner of living, solitary studies, an inspiring eloquence, boldness of language, and the reputation of a prophet, rendered him an oracle to all Christian Europe. He promoted the crusade of 1146, and quieted the fermentation caused at that time by a party of monks against the Jews in Germany. He declined all promotion, and in the rank of abbot of his "beloved Jerusalem" (as he used to call Clairvaux) he continued with all humility, but with great boldness, his censures of the clergy and his counsels to the Popes. Innocent II. owed to him the possession of the right of investiture in Germany, and Eugenius III. his education. He was, at the same time, the umpire of princes and bishops, and his voice in the synods was regarded as divine. By his rigid orthodoxy and his remarkable eloquence, which were always directed to the promotion of practical Christianity, he did much to confirm the power and influence of the Church in the Middle Ages. He was a strong opponent of Abelard and Gilbert of Porée in their philosophical teachings. He was canonized by Alexander III. in 1174. The best edition of his works is that of Mabillon (Paris 1690, 2 vols.; reprinted, Paris 1839-40).

Bernard, Saint, of Mentone: b. Mentone, Savoy, 923; d. Novara, May 1007. Very little is known of his life except that he was at one time archdeacon of the city of Aosta, and that he later entered upon a monastic life and founded the hospices on the Great and Little Mount Saint Bernard, about 962 A.D.

Bernard, bä-när', **Charles de,** properly **Bernard du Grail de la Villette,** French novelist: b. Besançon, 25 Feb. 1804; d. Neuilly, 6 March 1850. He was a disciple of Balzac, whom he resembles in his power of realistic description and psychological analysis; but he possesses a purer and more nervous style, and above all is content with a less minute elaboration of story and characters. His first piece, 'The Gerfalcon,' made a hit with its clever description of the literary cliques. Everywhere he evinces clear insight into the foibles of society. Of his novels, the following may be named as only second in rank to his masterpiece, 'The Gerfalcon'; 'A Magistrate's Adventure'; 'The Gordian Knot'; 'Wings of Icarus'; 'The Lion's Skin'; 'The Country Gentleman.'

Bernard, Claude, French physiologist: b. Saint-Julien, department of the Rhône, 12 July 1813; d. Paris, 10 Feb. 1878. Educated at Villefranche and Lyons, he went to Paris in order to devote himself to a literary career, but soon turned to medicine. In 1839 he became assistant to Magendie, who directed his attention to experimental physiology. He became professor at the Collège de France in 1855, and about the same time he was appointed to the chair of experimental physiology at the Sorbonne. In 1868 he resigned the latter chair in order to take up a similar one in the Museum of Natural History, and in that year also he was elected to Flourens' place in the Academy. He was one of the foremost physiologists of his age, and several important discoveries are associated with his name. Among his published works are 'Experimental Physiology Applied to Medicine' (1854–5); 'Physiology and the Pathology of the Nervous System' (1858); 'Physiological Properties and Pathological Alterations of the Liquids of the Organism' (1859); 'Properties of Living Tissues' (1866); 'Experimental Pathology' (1871); 'General Physiology' (1872); 'Animal Heat' (1876); 'Phenomena of Life Common to Animals and Vegetables' (1878–9); 'Experimental Science' (1878); etc. He was accorded a national funeral.

Bernard, bėr'nard, **Sir Francis,** English administrator: b. Nettleham, England, 1714; d. Aylesbury, England, 16 June 1779. He was governor of New Jersey 1758–60, and of Massachusetts Bay 1760–9. He did a great deal toward precipitating the Revolution by his aggressive attempts to strengthen the royal authority. He was finally recalled on account of the unpopularity resultant on his bringing troops into Boston.

Bernard, Jacques, French Protestant clergyman and author: b. Nions, in Dauphiné, 1 Sept. 1658; d. 27 April 1718. When the Edict of Nantes was revoked, Bernard went to Holland, and while there founded a school of philosophy and belle-lettres at The Hague. He became editor of the 'Bibliothèque Universelle,' and later editor of the 'République des Lettres.' He wrote and published: 'Recueil de traites de paix, de trêves, de neutralitè . . . et d' autres actes publics faits en Europe' (1700); 'Actes et mémoires des négociations de la paix de Ryswick' (1725); etc.

Bernard, Montague, English lawyer: b. Gloucestershire, 28 Jan. 1820; d. Overross, 2 Sept. 1882. He was professor of international law at Oxford 1859–74. In 1871 he was one of the high commissioners who signed the Treaty of Washington, and on his return home was made a privy councilor. In 1872 he assisted Sir Roundell Palmer in preparing the British case for the Geneva Arbitration Tribunal.

Bernard, Pierre Joseph, bär-när, pē-är zhō-sĕf, or **Gentil** (zhŏn-tēl) **Bernard,** French poet: b. Grenoble, 1710; d. 1775. At an early age he showed a great taste for poesy, and was at first only an attorney's clerk, but afterward became secretary to Marshal de Coigny, who had command of the army of Italy. After the marshal's death he obtained a lucrative appointment, and was then able to indulge his poetic faculties. He wrote an opera, 'Castor and Pollux,' which met with great success; the 'Art of Loving,' and a number of odes, songs, etc. His works were collected and reprinted in 1803.

Bernard, Simon, bär-när, sē-mŏn, French engineer: b. Dole, 28 April 1779; d. 5 Nov. 1839. He served as aide-de-camp to Napoleon; was wounded at the battle of Leipsic; superintended the defense of Torgau, and was present at Waterloo. In 1816 he came to the United States; was commissioned brigadier-general of engineers; and planned an elaborate system of seacoast defences, the most important of the works built by him being Fortress Monroe. In 1831 he returned to France; was made aide-de-camp to Louis Philippe, and designed the fortifications of Paris. In 1834 he was appointed minister of war.

Bernard, bėr-nard, **William Bayle,** Anglo-American dramatist: b. Boston, Mass., 27 Nov. 1807; d. 5 Aug. 1875. His first work was a nautical drama called 'The Pilot.' This proved successful and encouraged him to pursue a literary career. He wrote in all 114 plays, of which the best known are 'Rip Van Winkle'; 'The Man About Town'; 'Marie Ducange'; and 'The Boarding School.'

Bernard de Chartres, bär-när dė shärtr (surnamed Sylvestris), a writer of the 12th century, who has been lauded as the ablest Platonic of his time, and wrote two works, now lost, in one of which he endeavored to reconcile Plato and Aristotle, and in the other maintained the doctrine of a Providence, and proved that all material beings, possessing a nature subject to change, must necessarily perish. Another work under the name of Bernard Sylvestris still exists, and is composed of two parts, distinguished by the names of 'Megacosmus' and 'Microcosmus,' or the 'Great World' and the 'Little World.' He reduces all things to two elements — matter and ideas. Matter is in itself devoid of form, but susceptible of receiving it; ideas reside in the divine intellect, and are the models of life, and from their union with matter all things result. M. Cousin has published extracts from these works.

Bernard of Cluny, Benedictine monk: b. at Morlaix, about 1100; d. 1156. He was a member of the Benedictine monastery at Cluny under Peter the Venerable, and is best known as the author of three hymns included in almost every English collection: "Jerusalem the Golden"; "For Thee, O Dear, Dear Country"; and "The World is Very Evil." These are a part of his 3,000-line poem 'De Contemptu Mundi,' translated by J. M. Neale.

Bernard (bėr'nard) **of Treviso** (trĕ-vē'zō), Italian alchemist: b. Padua, 1406; d. 1490. His most important work was 'Treatise on the Most Secret Chemical Labor of the Philosophers.'

Bernard de Ventadour, bär-när de vŏn-tä-dôr, French troubadour: b. about 1125; d. Dalon, about 1197. Love songs 'To Eleonore,' and various amatory lays to courtly dames, form the riches of his delicate verse.

Bernard, bėr'nard, **Great St.,** a celebrated pass of the Pennine Alps, Switzerland, in the canton Valais, on the mountain-road leading from Martigny to Aosta in Piedmont. On the east side of the pass is Mount Velan, and on the west the Pointe de Dronaz; there is no mountain known by the name of St. Bernard. Almost on the very crest of the pass is the famous hospice, among the highest permanently inhabited spots in Europe, 8,200 feet above the level of the sea. There is a massive stone building capable of accommodating 70 or 80 travelers with beds, and of sheltering 300. As many as 500 or 600 have received assistance in one day. It is situated on the highest point of the pass, exposed to tremendous storms from the northeast and southwest, and is tenanted by 10 or 12 brethren of the order of St. Augustine, who have devoted themselves by vow to the aid of travelers crossing the mountains. The climate of this high region is necessarily rigorous. There is a lake on the summit, at a short distance from the hospice, on which ice has frequently remained throughout the whole year. The severest cold recorded is —29° F., but it has often been —18° and —20° F.; the greatest summer heat recorded is 68° F. From the difficulty of respiration in so elevated a locality, and the severity of the climate, few of the monks survive the time of their vow, 15 years from the age of 18, when they are devoted to this service. The dogs kept at St. Bernard to assist the brethren in their humane labors are well known. In the midst of tempests and snowstorms the monks, accompanied by some of these dogs, set out for the purpose of tracking those who have lost their way. If they find the body of a traveler who has perished they carry it into the vault of the dead, where it is wrapped in linen and remains lying on a table till another victim occupies the place. It is then set up against the wall among the other dead bodies, which, on account of the cold, decay so slowly that they are often recognized by their friends after the lapse of years. Adjoining this vault is a kind of burying-ground, where the bones are deposited when they accumulate too much in the vault. It is impossible to bury them, because there is nothing around the hospice but naked rocks. The institution is supported partly by its own revenues, partly by subscriptions and donations. The pass appears to have been known at a very early period; and a Roman road led down the Piedmontese side of the mountains. The remains of a massive pavement are still visible; and the cabinet of the hospice contains votive tablets, bronze figures, and other antiquities found in the vicinity. The hospice was founded in 962 by St. Bernard of Menthon, an Italian ecclesiastic, for the benefit of those who performed pilgrimages to Rome. In May, 1800, Napoleon led an army of 30,000 men, with its artillery and cavalry, into Italy by this pass.

Bernard, Little St., a mountain of Italy, belonging to what are called the Graian Alps, about 10 miles south of Mont Blanc. It stands between Savoy and Piedmont, having the valley of the Isère, in the former, on the west, and that of the Doire, in the latter, on the east. The pass across it is one of the easiest in the Alps, and is supposed by many to be that which Hannibal used. The hospice, at the summit of the pass, has an elevation of 7,192 feet.

Bernardakis, Demetrios, bėr-när'dä-kĭs, dā-mā'trē-ōs, Greek poet and dramatist: b. Santa Marina, Lesbos, 2 Dec. 1834. After a course of study at Athens and in German universities he was (with one considerable intermission) professor of history and philology in the University of Athens, 1861–82, when he went back to Lesbos. He is author of a spirited Pindaric ode for a jubilee occasion, of several dramas, and of a satire, 'The Battle of Cranes and Mice'; he

has also written a 'Universal History'; a 'Church History'; and a spirited tractate, 'Confutation of a False Atticism,' directed against the would-be Attic purists.

Bernardes, Diego, bėr-när'dĕs, dē-ā'gō, Portuguese poet: b. Ponte de Lima about 1530; d. 1605. He was called "the Sweet Singer of the Lima," a streamlet immortalized in his verse. He left his native valley in 1550 and attached himself to the master-singer, Sá de Miranda, who lived retired on his estate, Quinta da Tapada, a devotee of the Muses. Here Bernardes composed verses of all kinds — elegies, sonnets, odes, and songs, full of tender sympathies and perfect melody. Here he wrote 'The Lima'; 'Various Rimes — Flowers from Lima's Banks'; 'Various Rimes to the Good Jesu,' and other poems.

Bernardin of Sienna, Italian ecclesiastic: b. Massa, Italy, 8 Sept. 1380; d. Aquila, Abruzzo, 20 May 1444. He became a Franciscan friar in a monastery near Sienna in 1404, but, desiring to make a pilgrimage to the Holy Land, was appointed a commissary of that country, and was thus enabled to gratify his wish. After his return he acquired a great reputation as a preacher, and three cities were rival suitors for the honor of having him as bishop. Bernardin, however, was unwilling to accept the distinction, and was made vicar-general of the friars of the Observantine order in Italy. He is said to have founded more than 300 monasteries. In 1450 he was canonized by Pope Nicholas V. His works appeared at Venice in 1591 in 4 volumes quarto, and at Paris in 1636 in 2 volumes folio. They consist of essays on religious subjects, sermons, and a commentary on the book of Revelation. A biography by J. P. Toussaint was published (Regensburg 1873), and one by L. Bianchi (Sienna 1888).

Bernardines, bėr'när-dēnz. See CISTERCIANS.

Bernardo del Carpio, bėr-när'dō dĕl kär'pē-ō, Spanish knight-errant (the fruit of a secret marriage between Chimena, the sister of Alphonso the Chaste, and of Don Sancho, lord of Saldagua): b. in the 9th century. Alphonso, irritated at the marriage, put out the eyes of Don Sancho and imprisoned him in a castle, but spared Bernardo and brought him up carefully at his court. In course of time Don Bernardo grew up to be a warrior, and distinguished himself in the Moorish wars, in the hope that the king would be bent to pity and set his father at liberty. Alphonso was inflexible, and Bernardo withdrew to his paternal domains; and, leaguing with other lords opposed to the court, set him at defiance.

On the accession of Alphonso the Great, Bernardo returned to court, and again performed many exploits against the Moors, hoping to be rewarded with his father's freedom. He was once more denied the boon, and withdrew as before, not only leaguing with his friends, but making alliance with the Moors. Alphonso agreed at length to give up his father on receiving the surrender of the castle of Carpio. Bernardo, true to his word, performed his part of the stipulation, and then learned with indignation that Alphonso had practised an infamous deception upon him, as his father had been for some time dead. He disdained any longer to tread the Spanish soil, and removed to France, where he spent the remainder of his life as a knight-errant. Many fabulous exploits have been attributed to him, both in Spanish romances and in more reliable histories.

Bernauer, Agnes, Bavarian lady celebrated for her beauty and her unfortunate fate; d. 2 Oct. 1435. She was the daughter of a poor citizen, said to be a barber of Augsburg. Duke Albert of Bavaria, only son of the reigning prince, met Agnes at a tournament given in his honor by the grandees of Augsburg, became enamored of her, and, as he could not prevail on her to be his mistress, secretly married her. He conducted her to his own castle of Vohburg, and for a time succeeded in concealing the alliance he had contracted; but his father wishing to marry him to Anne, daughter of the Duke of Brunswick, he was compelled to acknowledge his marriage with Agnes. His father refused to credit it, and having caused the Duke to be denied admission to a tournament on the plea that he was living unlawfully with a woman, Albert openly proclaimed his marriage and caused Agnes to be recognized as Duchess of Bavaria, giving her for residence the castle of Straubing on the Danube. The Duke of Bavaria, incensed at this open avowal of a misalliance, caused Agnes to be seized in her castle during the absence of his son, brought her before a tribunal specially constituted, where she was accused of magic, and being condemned, had her hands tied together and was thrown into the river. Albert in revenge took arms against his father, but the Emperor Sigismund finally reconciled them. The Duke Ernest raised a chapel to the memory of Agnes, and Albert married the princess of Brunswick. Her story, though well authenticated, has become legendary from the interest attached to it, and is a favorite theme with the Bavarian poets.

Bernay, bār-nā, France, a town in the department of Eure, 25 miles west-northwest of Evreux, on the right bank of the Charentonne. It has two fine old churches, a communal college, a hospital, a court of first resort, a board of manufactures, an agricultural society, and a savings bank. It has important manufactures of cloth and flannel, tape, linen, and cotton goods; and spins a good deal of cotton, thread, and worsted. It has also bleachfields, dyeworks, tanneries, etc. Its trade is principally in grain, cider, cloth, iron, paper, leather, linen, horses, and cattle. The horse-fair, held in Lent, is one of the greatest in France, and is attended by purchasers from all parts of the country. Pop. (1891) 5,788.

Bernburg, bėrn-burH, Germany, a town in the duchy of Anhalt, capital of the former duchy of Anhalt-Bernburg; on both sides of the Saale, northwest from Leipsic, with which, as well as with Berlin and Magdeburg, it is connected by railway. It is divided into the old, the new, and the high town; the first two surrounded by walls, and communicating by a bridge 173 feet long. Bernburg is well built, and contains several well-paved and well-lighted streets. The principal building is the palace, situated, with a garden, on the highest part of the high town. It is very ancient, but has received numerous modern additions, and contains a picture-gallery, theatre, and church. Besides an oil-mill, and several breweries and distilleries, there are manufactories of paper and

earthenware, copper and tin wares, etc. Pop. (1895) 32,374.

Berne-Bellecour Étienne Prosper, bărn-bĕl-koor, ā-tē-ĕn prŏs-pĕr, French painter: b. Boulogne, 29 July 1838. After some years of study under Barras and Picot, he made a reputation by his spirited representations of episodes in the Franco-Prussian war of 1870. He received a first-class medal in the Paris Salon of 1872; the Legion of Honor in 1878; and a second-class medal at the Paris Exposition of 1889. His best known works are: 'Cannon Shot'; 'In the Trenches'; 'Attack on the Château'; and 'To Arms!'

Ber'ners, John Bourchier, boor'shē-ā, **Lord,** English baron, a descendant of the Duke of Gloucester, youngest son of Edward III.: b. 1474; d. 1532. He was member of Parliament, 1495–1529; aided in suppressing the Cornish insurrection, 1497; chancellor of the exchequer, 1515; ambassador to Spain, 1518; and for many years governor of Calais. He translated 'Froissart's Chronicles' (1523–5) and other works, his translation of the former being a sort of English classic.

Ber'ners, or **Barnes, Juliana,** English prioress and author: fl. 15th century. She was the daughter of Sir James Berners, who was beheaded in the reign of Richard II. Little more is known than that she was prioress of the nunnery of Sopewell, near St. Alban's, and has her name prefixed as writer or compiler to one of the earliest and most curious productions of the English press. The first edition, entitled 'The Treatyses Pertynynge to Hawkynge, Huntynge, and Fysshynge with an Angle' (of which only three perfect copies are known), printed in the abbey of St. Alban's in 1486, treats of hawking, hunting, and heraldry. A second edition was printed by Wynkyn de Worde in 1496. This work, under the title of the 'Book of St. Alban's,' became a popular manual of sporting science, and was many times reprinted in the 16th century. It has latterly been issued in facsimile of the original print.

Bernhard, bèrn'härt, (Duke of Weimar), Dutch soldier (fourth son of Duke John of Saxe-Weimar): b. 6 Aug. 1604; d. 8 July 1639. He entered first the service of Holland, and afterward the Danish army employed in Holstein against the troops of the emperor, and commanded by the margrave of Baden-Durlach, and was present at the Conference of Lubeck, 1629, for negotiating peace. When Gustavus Adolphus entered Germany, Bernhard joined him, and was present at the attack upon Wallenstein's camp in the neighborhood of Nuremberg, 24 Aug. 1632. In the battle of Lützen, 6 Oct. 1632, he commanded the left wing of the Swedish army, avenged the death of Gustavus Adolphus, and although himself severely wounded, put the right wing of the imperial troops to flight. In 1633 he took Bamberg, Cronach, Höchstädt, and Aichstädt; but his attempt upon Ingolstadt miscarried. He also brought the cities of Ratisbon and Straubing into his power, and frustrated Wallenstein's intentions. The king of Sweden made him Duke of Franconia. His impetuosity caused the defeat at Nördlingen (q.v.), 24 Aug. 1634. He himself narrowly escaped being made prisoner. The prudence of Oxenstiern and the valor of Bernhard soon made amends for this fault. France, now entering into a closer alliance with Sweden, concluded a separate treaty with Bernhard, who went to Paris, 16 Oct. 1634. Bernhard promised for 4,000,000 livres to raise an army of 18,000 men on the Rhine to act against Austria. He now carried on the war in the country adjacent to the Rhine, took the fortress of Zabern in Alsace, spread his army over Lorraine and Burgundy, and vanquished the forces of the emperor in several battles. At the commencement of the year 1638 he laid siege to Rheinfelden, not far from Basel. Here he was unexpectedly attacked in his camp, 18 February, by an Austrian army. Bernhard was obliged to retreat before superior numbers; but, having soon collected his forces, he surprised the Austrians, 21 February, and obtained a complete victory. Several Austrian generals were made prisoners, and the fortress of Rheinfelden was obliged to surrender, 13 May. He then undertook the siege of Breisach, the possession of which was necessary for maintaining himself in Alsace. An imperial army, under General Goetze, was defeated with great loss by Bernhard, 30 July. Bernhard captured several places of inferior importance during the siege of Breisach, which, however, did not surrender until he had repeatedly defeated the Austrians, and then upon very moderate conditions, which Bernhard signed in his own name without mentioning France. The possession of Alsace, which he had before ceded to France under certain conditions, was now secured; but he also demanded Breisach as an appurtenance to Alsace. He garrisoned all the conquered places with German troops, and ordered money to be coined with the Saxon coat of arms and that of Breisach. In vain were the efforts of France to deprive the duke of the possession of Breisach by proposing to place a French garrison in the fortress; the Duke declined not only this proposal, but also an invitation to Paris and the offer of a marriage with the Duchesse d'Aiguillon, niece of Cardinal Richelieu. Instead of that match he proposed one with the princess of Rohan, to which, however, the French court would not accede, lest the party of the Huguenots should be strengthened. It is probable that Richelieu had recourse to poison in order to rid France of the Duke, who was becoming formidable by his growing power. Immediately after his death several French commissioners appeared, who enlisted his troops into the French army; the command of them was committed to Marshal Guébriant. With Bernhard fell one of the chief supports of the Protestants. His successors, Banér and Torstenson, pursued his victorious course, and France seriously exerted herself in the war which continued for the benefit of the Protestants. In Bernhard a graceful person, intelligence, and valor were united with a magnanimity which could not be shaken by adverse events; his only fault was too great impetuosity.

Bernhardi, August Friedrich, bèrn-här'dē, ow'goost frē'drĭH, German scholar: b. Berlin, 1768; d. there, 1820. In his youth his attention was directed to universal language (that is, to language as far as it is common to all rational beings), to the mystery of its construction — the mathematics, as it were, of language. Bernhardi, considering all different languages as a whole, endeavored to discover a universal grammar common to them all. The result of his researches appears in his works:

'Abstract Grammar' (2 vols. 1801); 'Grammar in Its Application' (1803); and 'Elements of the Science of Language,' in which many philosophical principles of language are laid down. Bernhardi was a man of cultivated mind and extensive knowledge. He was also a professor and director of a classical school in Berlin.

Bernhardi, Theodor von, tā'o-dôr fŏn, German historian and diplomat: b. Berlin, 6 Nov. 1802; d. Kunersdorf, Silesia, 12 Feb. 1887. His diplomatic career was important, and afforded him special facilities for compiling a 'History of Russia and of European Politics During the Years 1814–31' (1863–77); 'Frederick the Great as a Military Commander' (1881); and similar works, all of value.

Bernhardt, Rosine, bărn-härt, rō-zēn, better known as SARAH, French actress: b. Paris, 22 Oct. 1844. Of Jewish descent, her father French, her mother Dutch, her early life was spent largely in Amsterdam. In 1858 she entered the Paris Conservatoire and gained prizes for tragedy and comedy in 1861 and 1862; but her début at the Théâtre Français in 'Iphigénie' and Scribe's 'Valérie' was not a success. After a brief retirement she reappeared at the Gymnase and the Porte Saint-Martin in burlesque, and in 1867 at the Odéon in higher drama. Her success in Hugo's 'Ruy Blas' in 1872 led to her being recalled to the Théâtre Français, since which she has abundantly proved her dramatic genius. In 1879 she visited London, and again in 1880, about which time she severed connection with the Comédie Français under heavy penalty. In 1880, 1887, 1891, 1896, and 1900 she made successful appearances in the United States, and between and after these dates visited Switzerland, Holland, South America, Italy, Algeria, Australia, etc. In 1899 she appeared in a new rendering of 'Hamlet' in Paris, and scored a most flattering triumph. Among her most successful impersonations are 'Théodora,' 'Fédora,' 'La Tosca,' and 'Cléopâtre' in the plays bearing those titles. In 1882 she married M. Damala, a Greek, whom she divorced not long afterward. She is also known as a sculptor, painter, and playwright.

Bernhardy, Gottfried, bèrn'här-dē, gŏt'frēd, German classical philologist: b. Landsberg-on-the-Warthe, 20 March 1800; d. Halle, 14 May 1875. He lectured very brilliantly at the leading universities, his principal works being 'Greek Syntax Scientifically Considered' (1829), a historical study of the subject; 'Outlines of Roman Literature' (5th ed. 1872); 'Outlines of Greek Literature' (Part I. 5th ed. 1892; Part II. 2d–3d ed. 1876–80; Part III. wanting), and a supplement to the first-named treatise, entitled 'Paralipomena [Omission] in [the Work on] Greek Syntax' (1854–62); although he has written many other important books.

Berni, Berna, or **Bernia, Francesco,** bèr'nē, bèr'nä, or bèr'nē-a, frän-ches'kō, Italian poet: b. Lamporecchio, Tuscany, toward the close of the 15th century; d. 26 July 1536. His family was noble, but poor, and young Berni went to Florence, and at the age of 19 to Rome, where he lived under the care of his relation, Cardinal Bibiena. At length he entered the service of Ghiberti, bishop of Verona, datary of the papal chancery, as secretary. In the hope of promotion he took orders; but sought recreation in amusements which displeased the prelate. A society had been established at Rome, consisting of young ecclesiastics of a jovial temper like Berni, and of a poetical vein, who, in order to denote their love for wine and their careless gaiety, called themselves *i vignajuoli* (vine-dressers). They laughed at everything, and made sport in verse of the most serious, nay, the most tragic matters. Berni's verses were the most successful, and were written in so peculiar a style that his name has been given to it (*maniera Bernesca* or *Berniesca*). When Rome was sacked by the troops of the Constable Bourbon, 1527, Berni lost all that he possessed. He afterward made several journeys, with his patron Ghiberti, to Verona, Venice, and Padua. At length, wearied with serving, and satisfied with a canonship in the cathedral at Florence, he retired to that place. The favor of the great, however, which he was weak enough to court, brought him into difficulties. He was required to commit a crime, and his refusal cost him his life. Alessandro de' Medici, at that time Duke of Florence, lived in open enmity with the young Cardinal Ippolito de' Medici. Berni was so intimate with both that it is doubtful which first made him the proposal to poison the other. Certain it is that the cardinal died by poison in 1535, and it is probable that Alessandro caused Berni's death.

In the burlesque style of poetry, Berni is still considered the best model. His satire is often very bitter, and frequently unites the good humor of Horace with the causticity of Juvenal. The extreme licentiousness of his writings is his greatest fault. Berni also wrote Latin verses very correctly, and was well acquainted with Greek. His 'Burlesque Verses' have great merit; so also has his rifacimento of Bojardo's 'Orlando Innamorato.'

Bernicia, bèr-nĭsh'yą, a Latinized form of the English word Brynelch, used to indicate the north part of what became the kingdom of Northumbria, the part north of the river Tees. The Anglian kingdom of Bernicia is said to have been founded by Ida, who made his capital at Bamborough about 550 A.D.

Bernier, bèr-nyā, **Camille,** French painter: b. 1823. He did not exhibit until 1863, but in a few years became one of the leading landscape artists of France, a position he has held for 40 years. His best-known works are: 'The Abandoned Lane'; 'Evening'; 'A Farm in Brittany'; and 'Landes, Near Bannalec.'

Bernier, François, French physician and traveler: b. Angers, about 1625; d. Paris, 1688. He set out on his travels in 1654, and after visiting Egypt and Palestine, went into India, where his skill in medicine brought him into notice; and he remained for 12 years, residing chiefly at Delhi, as physician to the Great Mogul Emperor Aurungzebe. On one occasion he accompanied the prime minister on his march, at the head of an immense army, to the conquest of Cashmere, and in his travels, recording all that he saw, has given accounts full of interest, and recognized by subsequent travelers as remarkable for their fidelity. After his return to France he not only compiled his 'Travels' and several volumes of history relating to the empire of the Great Mogul, but turned his attention to philosophical subjects, and published

an abridgment of the philosophy of Gassendi. He also wrote a treatise, entitled 'Traité du Libre et du Volontaire.'

Bernina, bĕr-nē'na, a mountain of the Rhætian Alps, 13,290 feet high, in the Swiss canton of Grisons, with remarkable and extensive glaciers. Its summit was first attained in 1850. The Bernina Pass, which attains an elevation of 7,642 feet, and over which a carriage road was completed in 1864, leads from Pontresina to Poschiavo.

Bernini, Giovanni Lorenzo, bĕr-nē'nę, jō-vän'nę lō-rĕn'zō, called Il Cavaliere Bernini, Italian sculptor and architect: b. Naples, 7 Dec. 1598; d. Rome, 28 Nov. 1680. Richly endowed by nature and favored by circumstances, he rose superior to the rules of art, creating for himself an easy manner, the faults of which he knew how to disguise by its brilliancy. From his early youth he manifested a great power to excel in the arts of design, and one of his first works was the marble bust of the prelate Montajo. He was not yet 18 when he produced the 'Apollo and Daphne,' in marble, a masterpiece of grace and execution. Looking at this group near the close of his life, he declared that he had made very little progress since the time when that was produced. Without forsaking sculpture, Bernini's genius embraced architecture, and he furnished the design for the canopy and the pulpit of St. Peter's, as well as for the circular place before the church. Among his numerous works were the palace Barberini, the belfry of St. Peter's, the model of the monument of the Countess Matilda, and the monument of Urban VIII., his benefactor. Urban had scarcely closed his eyes, and Innocent X. ascended the papal throne, when the envy engendered by the merits of the artist and the favor bestowed on him broke forth. His enemies triumphed; but he regained the favor of the Pope by a model for a fountain. About the same time he erected the palace of Monte Citorio. Alexander VII., the successor of Innocent X., required of him a plan for the embellishment of the Piazza di San Pietro. The admirable colonnade, so beautifully proportioned to the Basilica, was built under the direction of Bernini. We may also mention the palace Odescalchi, the Rotunda della Riccia, and the house for novices, belonging to the Jesuits, on Monte Cavallo. Louis XIV. having invited him to Paris, he set out from Rome, in 1665, accompanied by one of his sons and a numerous retinue. Never did an artist travel with so great pomp and under such flattering circumstances. The reception which he met with in Paris was highly honorable. He was first occupied in preparing plans for the restoration of the Louvre, which, however, were never executed. Cardinal Rospigliosi having become Pope, Bernini was admitted to an intimate intercourse with him, and charged with several works; among others, with the decoration of the bridge of St. Angelo. In his 70th year this indefatigable artist executed one of his most beautiful works, the tomb of Alexander VII. He was buried with great magnificence in the church of St. Maria Maggiore. To his children he left a fortune amounting to about 3,300,000 francs. Bernini's favorite maxim was, *Chi non esce talvolta della regola, non passa mai.* Thus he was of opinion that, in order to excel in the arts, one must rise above all rules, and create a manner peculiar to one's self.

Bernis, François Joachim de Pierres de, bār-nes, frŏñ-swä jō-ā-kēm dĕ pē-ār dĕ, French cardinal and minister of Louis XV.: b. St. Marcel, de l'Ardèche, 1715; d. Rome, 2 Nov. 1794. Madame de Pompadour presented him to Louis XV., who, being pleased with him, assigned to him an apartment in the Tuileries, with a pension of 1,500 livres. He went as ambassador to Venice, and after his return enjoyed the highest favor at court, and soon became minister of foreign affairs. The political system of Europe was changed at that time. France and Austria, hitherto enemies, united in an offensive and defensive alliance, which was succeeded by the Seven Years' war, so unfortunate for France. Bernis has been designated by several writers as the chief author of this alliance. Duclos, however, asserts that it was the intention of Bernis to maintain the old system, which, since the time of Henry IV., and especially since the time of Richelieu, had made France the protectress of the less powerful states of Germany, and the rival of Austria. Oppressed by the misfortunes of his country, which, in part at least, were ascribed to him, Bernis surrendered his post, and was soon after banished from court. His disgrace lasted till the year 1764, when the king appointed him Archbishop of Albi, and, five years later, ambassador to Rome. Here he remained till his death. In the name of his court, and against his own opinion, he labored to effect the abolition of the order of the Jesuits. When the aunts of Louis XVI. left France in 1791 they fled to him for refuge, and lived in his house. The Revolution deprived him of his fortune, and the means of indulging his generous disposition. The easy poetry of youth had procured him a place in the French Academy, but he himself is its severest critic. Voltaire had a great esteem for his talents, his judgment, his criticisms, and his character, as is evident from their correspondence, which, in every other respect, is very honorable to Bernis. A collection of Bernis' works was published in 1797 by Didot, and another in 1825.

Bernissar'tia, an extinct genus of primitive crocodiles (*Mesosuchia*) of lower Cretaceous (Wealden) age. It resembles the modern crocodiles in the arrangement of the bony plates on the back more nearly than do other contemporary species, but was of quite small size, only three or four feet in length. A complete skeleton was found at Bernissart, in Belgium, and is now mounted in the Brussels Museum.

Bernouilli, bār-noo-ye, or **Bernoulli,** a family which has produced eight distinguished men, who have all cultivated the mathematical sciences with success. The family, emigrated from Antwerp on account of religious persecutions, under the administration of the Duke of Alva, fled first to Frankfort, and afterward removed to Bâle, where it was elevated to the highest dignities of the republic.

Bernouilli, Daniel, Swiss philosopher: b. Groningen, 9 Feb. 1700. He studied medicine, in which he took the doctor's degree, and at the age of 24 was offered the presidency of an academy about to be established at Genoa, but in the following year accepted an invitation to St. Petersburg. Accompanied by his younger brother

John, he returned to Bâle in 1733; became there professor of anatomy and botany; in 1750 professor of natural philosophy; resigned this place, because of his advanced age, to his brother's son, the younger Daniel Bernouilli, in 1777, and died in 1782. He was one of the greatest natural philosophers as well as mathematicians of his time. At 10 different times he received a prize from the Academy of Paris. In 1734 he shared with his father a double prize, given by this academy for their joint essay on the causes of the different inclinations of the planetary orbits. Most of his writings are contained in the Transactions of the St. Petersburg, Paris, and Berlin academies, of which he was a member.

Bernouilli, Jakob, or **James,** Swiss mathematician: b. Bâle, 1654; d. 1705. The differential calculus discovered by Leibnitz and Newton was applied by him to the most difficult questions of geometry and mechanics; he calculated the loxodromic and catenary curve, the logarithmic spirals, the evolutes of several curved lines, and discovered the "numbers of Bernouilli," as they are called.

Bernouilli, Johann, Swiss mathematician: b. Bâle, 1667; d. 1 Jan. 1748. He was one of the greatest mathematicians of his time, and the worthy rival of Newton and Leibnitz. He was destined for commerce, but his inclination led him to the sciences, and from the year 1683 he principally devoted himself to medicine and mathematics. To him and his brother James we are indebted for an excellent treatise on the differential calculus. He also developed the method of proceeding from infinitely small numbers to the finite, of which the former are the elements or differences, and called this method the *integral calculus.* In 1690–2, he made a journey to France, where he instructed the Marquis de l'Hôpital in mathematics. At this time he discovered the exponential calculus, before Leibnitz had made any communications respecting it, and made it known in 1697. In 1694 he became doctor of medicine at Bâle, and in 1695 went, as professor of mathematics, to Groningen, where he discovered the mercurial phosphorus or luminous barometer, for which he received, from King Frederick I. of Prussia, a gold medal, and was made a member of the academy in Berlin, afterward of that in Paris. After the death of his brother in 1705, he received the professorship of mathematics at Bâle, which he held until his death.

Bernouilli, Nicolas, nephew of Johann Bernouilli, Swiss mathematician: b. Bâle, 1687; d. 1759. He studied law, but more particularly devoted himself to mathematics; in 1705 went to Groningen to Johann Bernouilli; returned however with him to Bâle toward the close of the year, and became there professor of mathematics. He traveled through Switzerland, France, Holland, and England, and in 1713 became a member of the Academies of Science in London and Berlin. On the recommendation of Leibnitz he went as professor of mathematics to Padua in 1716, but returned to his native city in 1722 as professor of logic. In 1731 he became professor of the Roman and feudal law in that place.

Bernouilli, Nicolas, Swiss jurist, son of Johann Bernouilli: b. Basel, 1695; d. St. Petersburg, 1726. He was professor of jurisprudence at Bern and subsequently professor of mathematics at St. Petersburg.

Bernstein, bĕrn'stīn, **Aaron,** German publicist and novelist: b. Dantzic, 1812; d. 1884. He was in politics a Radical, and in religion a reformer, and his life was a continued battle against obscurantism and conservatism. Yet he wrote some charming stories of life among the Jews, among them 'Mendel Gibbor' (1860). He wrote also some notable historical sketches, as 'The People's Years' and 'The Years of Reaction.'

Bernstein, Eduard, leader of the German social democracy: b. Berlin, 6 Jan. 1850. As a young man he edited socialistic newspapers in Berlin until the vehemence of his opposition to the government of Bismarck made it desirable for him to leave Germany. Returning in 1901, he became editor of *Vorwärts.* He contends that every movement for the advancement of the people should be encouraged and taken advantage of by the common people, whom he urges to take an active part in politics. Besides his newspaper work, he has published several volumes of discussions on politico-economical subjects, such as 'Zur Geschichte und Theorie des Sozial is mus' (1900).

Bernstorff, Andreas Peter, bĕrn'stôrf, ändrā-as pā'tĕr (Count), Danish statesman: b. 1735; d. 1797. He was appointed prime minister in 1769, when he ceded to Russia the Gottorp part of Holstein in exchange for Oldenburg and Delmenhorst. He introduced a new system of finance, and prepared the abolition of villanage in Schleswig and Holstein. He was a pronounced Liberal, and contended for the freedom of the press.

Bernstorff, Johann Hartwig Ernst (Count), Danish statesman in the service of the king of Denmark: b. Hanover, 1712; d. 1772. He was employed in divers embassies, and afterward held the office of foreign minister to Frederick V. for about 20 years, resigning in 1770. He was called by Frederick the Great "the oracle of Denmark."

Beroaldo, bā-rō-äl'dō, **Filippo,** Italian scholar: b. Bologna, 1453; d. 1505. He early gave proofs of great abilities and a prodigous memory, and after completing his education opened a school, successively at Bologna, Parma, and Milan, and taught with great success. He afterward went to Paris, and gave lectures which greatly extended his fame. His townsmen now became desirous to possess him, and he returned to Bologna, where he spent the remainder of his life as professor of belles-lettres. He is now chiefly known as the editor of some good editions of the classics, and the author of a curious tract entitled 'Declamatio Ebriosi, Scortatoris et Aleatoris,' in which the drunkard, rake, and gambler, represented as three brothers, debate which of them, as being the most vicious, should be excluded from sharing in his father's inheritance.

Bero'e, daughter of Oceanus; also the name of several women connected with Thrace, Illyria, etc.; also a genus of animals, the typical one of the family *Beroidæ.* The beroes are oval or globular-ribbed animals, transparent and gelatinous, with cirri from pole to pole, and two long tentacles fringed with cirri, which aid them in breathing and in locomotion. They have a

mouth, a stomach, and an anal aperture. They are free swimming organisms inhabiting the sea, sometimes rotating, and at night phosphorescent.

Bero'sus, according to some a Chaldæan by birth, and a priest of the temple at Belus at Babylon, and according to others a contemporary of Alexander the Great, is celebrated both as a historian and an astronomer, though it has been alleged that his name merely has been used for the purpose of giving a reputation to what others had written. His history, giving an account of the Babylonian Chaldæans and their kings, consisted of two books written in Greek, and professed to be founded on the ancient archives of the temple of Belus. It exists only in fragments, contained in the writings of Josephus, Eusebius, and others, and given in a collected form by Richter (1825). According to Pliny the astronomical observations contained in the works of Berosus extended over a period of 480 years.

Berquin, Arnaud, bĕr-kăń, är-nō, French writer: b. Bordeaux, 1749; d. 1791. He first attracted notice by some poems which he entitled 'Idylles,' and by several translations from the English under the name of 'Tableaux Anglais,' but is best known by his work entitled 'Ami des Enfans,' for which he received the prize of the French Academy in 1789, as the most useful work which made its appearance during that year. It has been translated into most European languages, and still continues a standard work for the amusement and instruction of young people. It cannot, however, lay claim to the merit of originality, as both the title and much of the substance are derived from a work in German by Weiss, entitled 'Kinderfreund.' Berquin, though specially devoted to the instruction of youth, was not incapable of excelling in graver literature, and was for some time the editor of the *Moniteur.*

Berquin, ber-kań', **Louis de,** the first Protestant martyr in France: b. 1490; d. Paris, 17 April 1529. He was a gentleman of Artois, a friend of Badius, the savant. When, in 1523, the police began to seize Luther's works, with a view to suppressing Protestantism, they found among Berquin's books some manuscripts of his own writing that were pronounced heretical. As he refused to retract, he was thrown into prison. Francis I., whose counselor he was, obtained for him his freedom; and Erasmus, always his friend, tried in vain to prevent him from exposing his life in a useless struggle. His fixed opinions and intrepid nature, however, having thrown him into prison three times, caused him to be condemned to death, and he was burned alive.

Berredo e Castro, bār-rā'dō ē käsh'trō, Portuguese soldier and historian: b. Serpa, about 1680; d. Lisbon, 13 March 1748. Having entered the army he fought at the battle of Saragossa (1710), so distinguishing himself on that occasion that he was made governor-general of the province of Maranhão, Brazil, and in 1718 he became captain-general of Mazagao. The rest of his life was spent upon his history which is of great value as an original source of information for the period of which it treats. It is entitled 'Annals Historicos, do estado do Maranhão' (1749).

Berret'ta. See Biretta.

Ber'rian, William, American Episcopal clergyman and writer: b. New York, 1787; d. 7 Nov. 1862. He was rector of Trinity Church, New York, 1830–62. Besides various religious works, he wrote 'Travels in France and Italy' and a 'Historical Sketch of Trinity Church.'

Ber'rien, John Macpherson, American lawyer and politician: b. New Jersey, 23 Aug. 1781; d. Savannah, Ga., 1 Jan. 1856. He was the son of an officer in the war of the American Revolution, graduated at Princeton in 1796, was admitted to the bar of Georgia at the age of 18, and gradually rose in reputation till he was elected, in 1809, solicitor of the eastern district of Georgia. He became judge of the same district the next year, retaining the latter office till 1822, when he entered the Georgia Senate, from which he was transferred, in 1824, to the Senate of the United States. He established in that body a high reputation as an orator and statesman, was appointed attorney-general of the United States in 1829, resigned this office in 1831 when Gen. Jackson's cabinet became inharmonious, resumed the practice of his profession in Savannah till 1840, when he was elected again to the national Senate, and was re-elected in 1846.

Berro, Bernardo Prudencio, bār'rō, bĕr-när'dō prū-dĕn'cē-o, Uruguayan statesman: b. Montevideo, about 1800; d. April 1868. In 1852 he was vice-president and president of the senate. Under Giro he was minister of government till the revolution of 1853; again president of the Senate in 1858, and president of the republic in 1860–4. The revolution of Flores was successful soon after the expiration of his term. In 1868 he stirred up a revolt against Flores, was imprisoned, and soon afterward shot through a window in his cell.

Berruguete, bĕr-roo-gā'te, **Alonzo,** Spanish painter, architect, and sculptor: b. Paredez de Nava, Spain, 1480; d. Toledo, 1561. He went in early life to Italy, studied in the school of Michael Angelo, and became intimate with Andrea del Sarto, Baccio Bandinelli, and other celebrated artists. On his return he was appointed painter to Charles V. His principal architectural works are the royal palace at Granada, and the town-house of Seville; his skill as a sculptor is seen to great advantage in the choir of the cathedral of Toledo, and the tomb of the vice-chancellor of Aragon at Saragossa. His best paintings are at Valladolid, Toledo, and Salamanca.

Berry, bă-re, **Carolina Ferdinanda Louisa, Duchesse de,** widow of the second son of Charles X. of France; daughter of Ferdinand I. of the Two Sicilies: b. 5 Nov. 1798; d. 17 April 1870. Her futile attempt at insurrection in 1832, to place her son on the French throne, caused her imprisonment and subsequent withdrawal to Sicily.

Berry, Charles Ferdinand, Duc de, second son of the Count d'Artois (afterward Charles X.) and Maria Theresa of Savoy: b. Versailles, 24 Jan. 1778; d. 14 Feb. 1820. He was educated along with his elder brother, the Duke of Angoulême. In 1792 he fled with his father to Turin, served under him and Condé on the Rhine, and early learned the art of winning the love of the soldiers. Subsequently he lived alternately in London and Scotland, continually occupied with plans for the restoration of the

Bourbons. Landing at Cherbourg, 13 April 1814, he passed through the cities of Bayeux, Caen, Rouen, etc., gaining over the soldiers to the cause of the Bourbons, distributing alms, and delivering prisoners. When Napoleon landed from Elba, the king committed to Berry the chief command of all the troops in and around Paris. All his efforts to secure their fidelity proving ineffectual, he was obliged to retreat on the night of 19 March, with the troops of the household to Ghent and Alost, where the king then was. The battle of Waterloo enabled him to return to Paris, where he arrived 8 July, and surrendered his command over the troops of the household into the hands of the king. At the opening of the chambers in Paris he took the oath to maintain the constitution, and was appointed president of the fourth bureau; but soon retired from public life. He died of a blow inflicted by a political fanatic named Louvel (see Louvel). The duke left a daughter, Louise Marie Thérèse, afterward Duchess of Parma; and a posthumous son, subsequently known as Count de Chambord.

Ber'ry, Hiram George, American soldier: b. Rockland, Me., 27 Aug. 1824; d. Chancellorsville 2 May 1863. He entered the Union army as colonel of the 4th Maine infantry, and was present at the battle of Bull Run, the siege of Yorktown, took a conspicuous part in the battles of Williamsburg, Fair Oaks, Chantilly, and the second Bull Run campaign. President Lincoln nominated him a major-general of volunteers, January 1863, and he succeeded Gen. Sickles in command of the 2d division of the 3d army corp. At a critical point in the battle of Chancellorsville, 1 May 1863, Hooker ordered Gen. Berry to charge with the bayonet the advancing enemy. He did so, and for three hours his division, almost alone withstood the enemy's assault, and regained for the Federal forces a portion of their lost ground. He was killed at the head of a successful bayonet charge, upon the renewal of the battle the following day.

Berry, Mary, English author: b. Kirkbridge, Yorkshire, 16 March 1763; d. London, 20 Nov. 1852. She and her sister Agnes were intimate friends of Horace Walpole. In 1798 she edited the 'Works of Horace Walpole.' Her most ambitious work was her 'Social Life in England and France' (1844).

Ber'ry, or **Berri,** a former province and dukedom of France, of which Bourges was the capital. With the exception of the arrondissement St. Amand, which belonged to the Bourbonnais, it now forms the departments Indre and Cher. At several periods it gave a title to French princes, the younger son of Charles X. being the last to assume it.

Berry, Canal de, one of the most important canals in France as regards the amount of its traffic. It begins at Montluçon on the Cher, the chief trading centre of the coal fields of the Allier; descends the Cher valley to St. Amand, and ultimately enters the Cher itself near St. Aignan, below which point the canalized Cher continues the line of navigation to Tours. Length of navigation 200 miles, of which 36½ miles belong to the canalized Cher. Constructed 1807–41.

Berry, a succulent fruit in which the seeds are immersed in a pulpy mass enclosed in a thin skin; for example, grape, gooseberry, tomato. Popularly the term is applied to fruits not strictly berries; for example, strawberry, raspberry, etc., which bear external seeds on a pulpy receptacle.

Berryer, bār-yā, **Antoine Pierre,** French advocate and orator: b. Paris, 4 Jan. 1790; d. 29 Nov. 1868. In 1814 he proclaimed at Rennes the deposition of Napoleon, and remained till his death an avowed Legitimist. He assisted his father in the defense of Ney, secured the acquittal of Gen. Cambronne, and defended Lamennais from a charge of atheism. His eloquence was compared with that of Mirabeau, and after the dethronement of Charles X. (1830) he remained in the chamber as the sole Legitimist orator. In 1840 he was one of the counsel for the defense of Louis Napoleon after the Boulogne fiasco. In 1843 he did homage to the Count de Chambord in London, adhering to him through the revolution of 1848, and voting for the deposition of the prince-president the morning after the *coup d'état.* He gained additional reputation in 1858 by his defense of Montalembert, and was counsel for the Patterson-Bonapartes in the suit for the recognition of the Baltimore marriage. In 1863 he was re-elected to the chamber with Thiers, and in 1864 received a flattering reception in England.

Bersaglieri, bĕr-sạ-lyā'rẹ, a corps of riflemen or sharpshooters, introduced into the Sardinian army by Gen. Della Marmora, about 1849. They took part in the Russian war and also assisted at the battle of the Tchernaya, 16 Aug. 1855. They were likewise employed in the Italian wars of 1859 and 1866. In 1901 they comprised 12 regiments, each regiment composed of three battalions of four companies each.

Ber'serker, a descendant of the eight-handed Starkader and the beautiful Alfhilde, and according to the Scandinavian mythology, a famous warrior. He disdained the protection of armor, whence he received his name, which signifies, according to Ihre, armorless. He raged like a madman in battle. He killed King Swafurlam, and married his daughter, by whom he had 12 sons as untamable as himself. They were also called Berserker, and after their time the name was given to wild and fierce Scandinavian warriors.

Bersezio, ber-sets'yō, **Vittorio,** Italian novelist and playwright: b. Peveragno, Piedmont, 1830. Both as a writer of tales and of comedies he is conspicuous for vivid and faithful delineation of Piedmontese life; especially in his dialect comedies, among which 'The Misfortunes of Monssù Travett' is considered to be his masterpiece. He also wrote an excellent historical work, 'The Reign of Victor Emmanuel II.' (1878–93).

Bersier, bār-syā, **Eugène Arthur François,** a French Protestant pulpit orator of note: b. Morges, near Geneva, 1831; d. Paris, 19 Nov. 1889. He became in 1855 a preacher in Paris where he was much admired and his sermons were translated into several languages. Among his writings are 'Coligny avant les guerres de religion' (1884); 'Histoire d'une petite fille heuveuse' (1890); in English, 'Sermons' (1881–1901). See Tinling, 'An Analysis of the Published Sermons of Pastor Eugène Bersier' (1901).

Bert, bār, **Paul,** French statesman and physiologist: b. Auxerre, 17 Oct. 1833; d. Ketcho, Tonquin, 11 Nov. 1886. He studied both law and medicine, became assistant to Claude Bernard at the College of France, and successively occupied the chairs of physiology at Bordeaux and Paris. Entering political life in 1870, on the proclamation of the republic, he was four time re-elected to the chamber. He brought forward laws removing primary instruction from the control of the religious orders, and making it compulsory. During the premiership of Gambetta he held the post of minister of public instruction and worship. While engaged in public life, M. Bert still pursued with ardor his scientific investigations, attracting world-wide attention by his experiments in vivisection. The anti-religious views of M. Bert excited much controversy. He was also the author of several works on anatomy and physiology, and of numerous educational and political writings. He rendered a service to natural science by the clear and simple style of his text-books.

Berthelot, bār-tlō, **Pierre Eugene Marcellin,** French chemist: b. Paris, 25 Oct. 1827; d. there 18 March 1907. He early studied chemistry, and in 1859 was appointed professor of organic chemistry in the Superior School of Pharmacy. In 1865 a new chair of organic chemistry was organized for him in the College of France. In 1870 he was elected president of the scientific committee of defense, and during the siege of Paris was entrusted with the manufacture of ammunition and guns, and especially dynamite and nitro-glycerine. In 1878 he became president of the committee on explosives, which introduced smokeless powder. His labors also led to the discovery of dyes extracted from coal tar. He received the decoration of the Legion of Honor in 1861; was made commander in 1879, and grand officer in 1886. In 1889 he was elected permanent secretary of the Academy of Sciences. He has contributed to the knowledge of synthetical processes and to the relations between the phenomena of heat and of chemistry. His works include: 'Chimie organique fondée sur la synthèse' (1860); 'Leçons sur les principes sucres' (1862); Leçons sur l'Isomerie' (1865); 'Traite elementire de chimie organique' and 'Sur la force de la poudre et das matieres explosives' (1872 and 1889); 'Verifications de l'areometre de Baume' (1873); 'Les Origines de l'alchimie' (1885); 'Collection des anciens alchimistes grecs' (1888); 'Chimie des anciens' (1889); 'Traité partique de calorimetrie chimique' (1893).

Berthier, bār-tyā, **Louis Alexandre,** marshal of France, prince and duke of Neufchâtel and Valengin, prince of Wagram: b. Versailles, 20 Nov. 1753; d. Bamberg, 1 June 1815. In the American war of independence he served under Lafayette. In 1789, Louis XVI. appointed him major-general of the national guard of Versailles, and on 5 and 6 Oct. 1790, as well as 19 Feb. 1791, he did good service to the royal family. During the reign of terror he avoided suspicion by exhibiting zeal in the Vendean war. After the 9th Thermidor, he was appointed chief of the general staff of Kellermann, and by causing the French army to take up the lines of Borghetto, contributed to arrest the advance of the enemy. Thus his reputation as a chief of the general staff was established before Bonaparte singled him out for that post. In October 1797 Gen. Bonaparte sent him to Paris to deliver to the directory the treaty of Campo-Formio. In 1798 he received the chief command of the army of Italy, and in the beginning of February made his entrance into Rome, abolished the papal government, and established a consular one. After the 18th Brumaire, Bonaparte appointed him minister of war. He afterward became general-in-chief of the army of reserve, accompanied Bonaparte to Italy in 1800, and contributed to the passage of St. Bernard and the victory of Marengo. He signed the armistice of Alessandria, formed the provisional government of Piedmont, and went on an extraordinary mission to Spain. He then received again the department of war, which, in the meantime, had been in the hands of Carnot. He accompanied Napoleon to Milan, June 1805, to be present at his coronation, and in October was appointed chief of the general staff of the grand army in Germany. In the campaign against Austria in 1809, he distinguished himself at Wagram, and received the title of Prince of Wagram. In 1810, as proxy of Napoleon, he received the hand of Maria Louisa, daughter of the Emperor Francis I., and accompanied her to France. Somewhat later Napoleon made him colonel-general of the Swiss troops. In 1812 he was with the army in Russia, as chief of the general staff, which post he also held in 1813. After Napoleon's abdication he lost his principality of Neufchâtel, but retained his other honors, and possessed the favor and confidence of Louis XVIII. Snbsequently he retired to Bavaria, where, in a fit of insanity, he committed suicide. See 'Mémoires d'Alexandre Berthier, Pr. de Neufchâtel et de Wagram' (1826).

Berthold, bĕr'tōlt, **Franz,** pseudonym of **Adelheid Reinbold,** German novelist: b. 1802; d. 1839. She was warmly appreciated and furthered by Ludwig Tieck. Her story 'Fred of the Will-o'-the-Wisp' (1830), met with great favor; after her death appeared 'King Sebastian' (1839), a historical romance, and 'Collected Tales' (1842).

Berthold von Regensburg, bĕr'tōlt fŏn rā'gĕns-boorg, German Franciscan preacher: b. about 1220; d. 13 Dec. 1272, and buried in the Franciscan convent at Ratisbon, of which he was a member. From 1250 to the close of his life, he preached to immense congregations in Switzerland, Hungary, Austria, Moravia, Bohemia, Saxony, Swabia, etc., speaking to them from the summits of mountains or from the tops of trees. In the Heidelberg university library some MSS. of his sermons are preserved. The eloquent manner with which he exposed the iniquities of his times seems to have produced an electric effect upon his hearers. Near Glatz, in Silesia, a tent under which he had preached was exhibited long after his death, and revived the feelings of affection and reverence in which his name is held by the people. See 'Life by Unkel' (1882).

Berthollet, bār-tō-lā, **Claude Louis** (COUNT), French chemist of distinction: b. Talloire, Savoy, 9 Dec. 1748; d. Paris, 7 Nov. 1822. He studied medicine at Turin; went to Paris, where he became connected with Lavoisier, was admitted in 1780 a member of the Academy of Sciences in that city; was made in 1794 professor in the normal school there, and was sent to

Italy in 1796, in order to select the plunder that was to be carried to Paris. He followed Bonaparte to Egypt, and returned with him in 1799. After the 18th Brumaire he was made a member of the *senat-conservateur;* afterward count and grand-officer of the Legion of Honor. In 1804 Napoleon appointed him senator for the district of Montpellier. In 1813 he received the grand cross of the Order of the Reunion. He voted, however, for the establishment of a provisional government and the dethronement of Napoleon. Louis XVIII. made him a peer; but Napoleon passed him by in 1815. After the restoration of Louis, he took his seat again in the chamber of peers. Among the inventions and new processes with which the sciences and the arts were enriched by him, the most important are those for the charring of vessels to preserve water in ships, for the stiffening and glazing of linen, for the artificial production of nitre, etc., but principally that for the bleaching of vegetable substances by means of chlorine, which, since 1786, has been in general use in France. Besides different essays in the collections of the Academy and the Institute, he has written several larger works, among which his 'Essai de Statique Chimique' (1803; translated into English, German, and Italian) must be considered as the most important. The complicated phenomena of chemistry were here treated as under the strict and simple laws of mechanics. He had also a large share in the reformation of the chemical nomenclature, as well as in the publication of the work that appeared on this subject in Paris, 1787 — 'Méthode de Nomenclature Chimique.'

Bertholletia, bėr-thŏl-lē'shĭ-a, the generic name of Brazil nut (q.v.).

Berthoud, băr-too, **Ferdinand,** Swiss mechanician, celebrated for his marine chronometers: b. Plancemont, Neufchâtel, 19 March 1727; d. 20 June 1807. His father caused him to be instructed in the art of watchmaking, and, to afford him an opportunity of perfecting his knowledge, sent him to Paris. He resided in this city from 1745, and there made his first marine chronometers, which have been used by French navigators on so many occasions for extending and correcting geographical knowledge. He left several works relating to his art. His nephew, Louis Berthoud, his pupil and the heir of his talents, extended his improvements still further. His chronometers came to be very widely used by French navigators, and were even more convenient than those of his uncle.

Bertie, Willoughby, fourth Earl of Abingdon, English politician: b. 16 Jan. 1740; d. 26 Sept. 1799. He was a vigorous opponent in the House of Lords of the policy of England toward the American colonies that culminated in the Revolution; wrote a famous and very popular tract called 'Thoughts on Mr. Burke's Letter on the Affairs of America,' was active in promoting favorable legislation for Ireland, and sympathized with the French Revolution.

Bertier, băr-tyā, **Francisque Edouard,** French painter, now living in London: b. Paris, 1841. He was a pupil of Bouguereau and Cabanel, and among his many portraits of notables are those of De Lesseps, Grand Duchess Olga, Countess of Warwick, Prince of Wales, and Max O'Rell. He has several times visited the United States in order to paint the portraits of prominent American society leaders.

Bertillon, băr-te-yôn, **Alphonse,** French anthropologist: b. Paris 1853. He is widely noted as the founder of a system of identification of criminals. In 1880, while chief of the bureau of identification in the prefecture of police, he established his system of measurements which has given results marvelous for their precision. The system has since been adopted by the police authorities of the large cities of Europe and the United States. He was one of the expert witnesses in handwriting in the trial of Capt. Dreyfus in 1899, and soon after its close was removed from his office. He is author of numerous works bearing upon his system, including 'Identification anthropometrique' (1893); 'La Comparison des ecritures et l'identification graphique' (1897). See BERTILLON SYSTEM.

Bertillon System, a plan of identifying suspected criminals, invented March 1879, and set forth in 1885 by Dr. Alphonse Bertillon of Paris. Properly speaking, it is not a single system, but a combination of one invented by himself with two others approved by use, or as many more as the officers choose to employ for security. The former is that of anthropometry, or exact measurements of certain dimensions of the human body and its members; the latter are those of description — as in passports, but more extended, more precise, and with a better terminology — and photography, with still others at will. The first-named is the heart of the system, the feature which makes it instantly available; its accuracy is great, but so is that of some others; this however is the only one which can be indexed and referred to as readily as the titles of books in a library catalogue. For this reason it is rapidly becoming the standard in all countries with civilized judicial systems. It rests on three principles: (1) Easy and exact measurement of the parts of the body in a living subject; (2) extreme diversity of such dimensions in different subjects, no two ever closely approximating each other; (3) almost absolute fixity of the skeleton after 20. The measurements are taken with compasses, and include: Height, standing and sitting, reach of outstretched arms; length and width of head; length and width of right ear; length of left foot, forearm, middle and little fingers. The descriptive elements are color of eyes (the most important detail of all, as it never changes and is impossible to disguise), hair, beard, and complexion; deformities and peculiarities of shape; marks on body, as moles, scars, the tattooings frequent among criminals, etc., carefully located — as "mole six centimetres to left of fifth vertebra," or "horizontal scar on back of second phalanx of right forefinger, three millimetres below middle." A photograph of full face and one of profile are taken when thought desirable, from a fixed chair and a fixed camera. The entire process, by a measurer and a secretary who writes from dictation, takes five to seven minutes, and the measurements are correct to one thirty second of an inch. Descriptions and photograph are put together on cards of uniform size, and in the great Paris collection of 120,000,— the model for all others,— are thus classified for reference. First, approximately 20,000 females and 10,000 minors

are separated for special classification. Second, the 90,000 remaining are divided into three equal sections according to length of head: short heads, of 187 millimetres and less; medium, 187 to 194; long, 194 and above. Experience proves that these make very closely equal numbers; and their cards are placed in three tiers of drawers, the short heads uppermost. Each of these is subdivided into three of 10,000 according to width of head, without further reference to length; each of these into three of about 3,300, according to length of middle finger; each of these into three of 1,100, by length of foot; these are subdivided successively by length of forearm, full height, length of little finger, and color of eyes. These last groups contain from 12 to 14, and are classed by length of ear. The women and children are similarly classified. Thus any new measurement can be compared with its duplicate, in this enormous mass, or the absence of such record shown, with marvelous celerity and almost infallible accuracy. Its index value alone is of the first order. Under the old systems, the entire mass of descriptions and photographs had to be searched and compared with any given arrested person, and with the immense number accumulating in great cities it became physically impossible to apply it with any certainty, the senses grew so jaded and resemblances were so many; not only did the guilty escape,— it was estimated that more than half the habitual criminals remained undetected,— but the innocent were often mistaken for them. International criminals, like bank robbers and pickpockets, traveled from one city and country to another under assumed names and disguises; sometimes, when wanted for grave crimes, they committed trivial misdemeanors to be arrested and imprisoned under false names. This is now rendered futile by the combination of anthropometry with the descriptive features; and with regard to the confusion of identity, the laws of probability render it practically impossible. The system is also of great value in distinguishing new criminals from old offenders: it not merely registers identity, but the fact of a first offense. It has strengthened even the old descriptive system, by giving it a more precise vocabulary and training the officers of the law in physiognomy. It has already done admirable work, as in the discovery of King Humbert's murderer; but to make it more efficient, the local records should be gathered into national and even international bureaus. With a proper enforcement of habitual-criminals' acts, a great step would be taken toward suppressing the class of professional felons. This has been mooted in our own country, where it was introduced in 1887 by Maj. R. W. McClaughry; that it has not been fully adopted here is one reason for the infesting of the country by professionals driven out of Europe by the system. Bertillon has fully described his system in his 'Identification Anthropométrique' (1893); and Maj. McClaughry has edited 'The Bertillon System of Identification' (1896).

Bertin, bär-tăń, **Antoine,** French poet: b. Isle of Bourbon, 1752; d. San Domingo, 1790. He was much admired by his contemporaries, who, somewhat extravagantly, styled him the French Propertius. He was a friend of Parny, and like him excelled in elegiac and epistolary verse. His principal works are 'Voyage in Burgundy' (1777); and 'The Loves' (1780).

Bertin, Louise Angelique, French musician and composer: b. Les Roches, near Bievres, 15 Jan. 1805; d. Paris, 26 April 1877. She was a daughter of L. F. Bertin (q.v.), and composed 'Faust,' 'Esmeralda,' 'Guy Mannering,' and other operas. Her volume of verse, 'Les Glanes' (1842), received the prize of the Academy.

Bertin, Louis François (called BERTIN L'AINE), French journalist; b. Paris, 14 Dec. 1766; d. 13 Sept. 1841. The Revolution made him a journalist, and in 1799 he started the famous *Journal des Débats.* His royalist principles offered Napoleon, and cost him imprisonment and banishment to Elba; thence, however, he escaped to Rome, where he formed a friendship with Châteaubriand. In 1805 he returned to Paris, and resumed the editorship of the *Débats,* but was much hampered by Napoleon. The second restoration of the Bourbons restored once more to Bertin the free control of his journal, and henceforward he gave almost constant support to the ministerial party. He supported the July monarchy, and edited the *Débats* till his death.

Bertin, Nicolas, French artist: b. Paris, 1668; d. 1736. His picture, 'The Building of the Ark,' obtained the grand prize, in 1685, and 'Prometheus Liberated by Hercules' brought him, in 1705, membership in the Academy, where he became professor in 1715. His paintings will be found in the galleries of Dresden, Stockholm, St. Petersburg, Antwerp, Amsterdam, Orleans, and Toulouse.

Bertini, Giuseppe, bĕr-tē'nę, gwē'sĕp, Italian painter: b. Milan, 1825; d. 1898. The Milan Academy awarded him the prize for the best historical picture in 1845, and his painting on glass of 'Dante and the Divine Comedy,' exhibited in London in 1853, has been greatly admired. He became professor of painting at the Academy in 1860. Among notable pictures by him are: 'The Vision of Saint Francis of Assisi'; 'Death of Saint Joseph'; 'Tasso Introduced to the Duke of Ferrara.'

Bertrand, Henri Gratien, bărträn, ŏn-rę gra-tyăn (COUNT), French military officer: b. Châteauroux, 1773; d. there, 31 Jan. 1844. He distinguished himself at Austerlitz and became Napoleon's adjutant; and, after the battle of Aspern, in 1809, for his share in saving the French army by bridges, was created count and governor of Illyria. After serving with credit in the subsequent campaigns, he retired with the emperor to Elba, was his confidant in carrying out his return to France, and finally shared his banishment to St. Helena. On Napoleon's death, Bertrand returned to France, where, though sentence of death had been pronounced upon him, a sentence which Louis XVIII. had wisely recalled, he was restored to all his dignities, and, in 1830, appointed commandant of the Polytechnic School. In 1840, he formed part of the expedition which brought back the remains of Napoleon to France.

Bertrand, James, French historical painter: b. Lyons, 1825; d. 1887. He studied in Rome, and his 'Saint Benedict Taking Communion,' exhibited at the Salon in 1859, was highly approved. He worked in the classical style, and his paintings are as notable for their careful finish as for their religious tone. They have

been frequently engraved. Among them are 'Death of Virginia' (1869); 'Charlotte Corday's Last Day' (1883); 'Calvary' (1884).

Bertrand, Joseph Louis François, bär-trän, jō-sĕf loo-e frŏn-swä, French mathematician: b. Paris, 1822; d. 1900. He taught at the Polytechnic and Normal schools, and the College de France, and in 1884 became a member of the French Academy. He wrote treatises on arithmetic, algebra, calculus, thermodynamics, and probabilities, and in 1881 was appointed commander of the Legion of Honor.

Bérulle, bā-rül, Pierre de, French cardinal: b. near Troyes, 4 Feb. 1575; d. Paris, 2 Oct. 1629. He early showed remarkable mental acuteness and knowledge, and became distinguished for skill in controversy. He instituted, and was the first superior of, the order of Carmelites in France, and also founded the congregation of the Oratory notwithstanding the opposition of the Jesuits. He was a statesman as well as priest, and took a leading part in politics. He was often opposed to Richelieu, whose jealousy he excited, and who could not conceal his satisfaction at the news of his death. He accompanied the Princess Henrietta to England, on her marriage with the Prince of Wales. He shunned elevated positions, and was very unwillingly obliged to accept the hat of a cardinal. This elevation made no difference, however, in his humble way of life, and did not prevent him from sometimes taking part, as he had always done, in the servile work of the religious community to which he belonged. He was also a man of letters, and was the first to appreciate and encourage the genius of Descartes urging him, by his sense of obligation to his Creator, to make known to the world his discoveries. The most noted of his writings is 'Les Grandeurs de Jésus.'

Bervic, bār-vĕk, Charles Clement, French engraver: b. Paris, 1756; d. 1822. The works of Bervic are among the best of the French school, but are not numerous. The most celebrated of them is the full-length figure of Louis XVI., after a picture of Callot. The copies are very rare and dear, because the plate was broken to pieces in the revolutionary tumults of 1793. The exactness of his drawing, the firmness and brilliancy of his touch, the purity and correctness of his design, and the happiness with which he transferred to his plate the beauties of the original, gave a high character to his productions.

Berwick, James Fitz-James (Duke of), French marshal: b. Moulins, 1670; d. 1734. He was the natural son of the Duke of York, afterward King James II., and Arabella Churchill, sister of the Duke of Marlborough; and first went by the name of Fitz-James. He received his education in France, and served his first campaigns in Hungary under Charles, Duke of Lorraine, general of Leopold I. He returned to England at the age of 17, and received from his father the title of Duke. On the landing of the Prince of Orange in 1688 he went to France with his father, whom he afterward accompanied on the Irish expedition. He fought bravely and was wounded at the battle of the Boyne, 1 July 1690. He afterward served under Luxembourg in Flanders; in 1702 and 1703 under the Duke of Burgundy; then under Marshal Villeroi, and was naturalized in France. In 1706 he was made marshal of France, and sent to Spain, where he gained the battle of Almanza, which rendered King Philip V. again master of Valencia. In 1709 he went to take the command in Dauphiné, and the measures which he took to cover this and the neighboring provinces against the superior forces of the Duke of Savoy gained him a great reputation. In 1718 and 1719 he was obliged to serve against Philip V., who from gratitude to the marshal had taken a son of his into his service. On his entrance into the Spanish dominions he wrote to his son, the Duke of Liria, admonishing him to do his duty to his sovereign. At the siege of Philipsburg, on the Rhine, his life was terminated by a cannon-ball. His memoirs were published originally in French, and have gone through two or three editions in English. Consult Wilson, 'Duke of Berwick, Marshal of France' (1883).

Berwick-on-Tweed, England, a seaport town, once forming a county of itself, but now incorporated in Northumberland, on the north or Scottish side of the Tweed, within half a mile of its mouth. It is surrounded by walls which are well preserved, and along which is an agreeable promenade. The streets are for the most part narrow, steep, straggling, and irregular, though some of the principal ones are wide and open. The Tweed is crossed at the town by an old bridge of 15 arches, 1,164 feet long and only 17 wide, and by a magnificent railway viaduct of stone, 667 yards long and 184 feet in extreme height, with 28 semicircular arches. The chief industries are iron-founding, the manufacture of engines and boilers, agricultural implements, feeding-cake, manures of various kinds, ropes, twine, etc. The chief exports are grain, artificial manures, and herrings. A dock affording accommodation for large vessels was opened in 1876. In the beginning of the 12th century, during the reign of Alexander I., Berwick was part of his realm of Scotland, and the capital of the district called Lothian. Soon after this date it became populous and wealthy, was the chief seaport of Scotland, contained a strong castle, with churches, hospitals, and monastic buildings, and was created one of the four royal burghs of Scotland. In 1216 the town and castle were stormed and taken by King John. During the competition between Baliol and Bruce for the Scottish throne the English Parliament sat in Berwick; and in the hall of the castle Edward I. pronounced judgment in favor of Baliol. Bruce retook the town and castle in 1318; but, after undergoing various sieges and vicissitudes, both were surrendered to Edward IV. in 1482, and have ever since remained in possession of England. Pop. (1901) 13,437.

Ber'wickshire, a maritime county of Scotland, nominally divided into the three districts of Lauderdale, Lammermoor, and the Merse or March. The principal rivers of the county are the Tweed, the Leader, the Eye, the Whiteadder, and the Blackadder; and all except the last contain salmon, of which great quantities are shipped from Berwick for London. Vast quantities of agricultural produce are shipped from the ports of Berwick and Eyemouth, and much is also sent to Edinburgh, Dalkeith, Haddington, and Dunbar. Very few manufactures are established in this county, the principal one

which it supplies beyond domestic consumption being that of paper. The North Sea fisheries are of great importance. Berwick formerly abounded in strong castles and fortified places, traces of which are to be found everywhere. The county town is Greenlaw. Other small towns are Duns and Eyemouth. Pop. (1901) 30,816.

Ber'yl, a native silicate of aluminum and the rare metallic element glucinum (or "beryllium"), having the formula $3GlO.Al_2O_3.6SiO_2$, and crystallizing in the hexagonal system. It commonly has a specific gravity of 2.70, and a hardness of from 7.5 to 8. A portion of the glucinum is sometimes replaced by lithium, sodium or cæsium, and chemically combined water is also occasionally present. In the latter case the formula of the mineral appears to be $H_2Gl_6Al_4SI_{12}O_{37}$. Beryl is usually transparent or translucent, and in color may be green, blue, yellow, white, or light red. A variety which is transparent, and bright green from the presence of oxide of chromium, is known as "emerald," and is highly esteemed as a gem (see GEMS); the "Oriental emerald" (see SAPPHIRE), however, is not a variety of beryl), but a green variety of sapphire. A bluish-green variety of the common beryl, known as "aquamarine," is also used as a gem. Beryl occurs in all parts of the world, being commonly associated with granite. Its crystals are sometimes enormous in size, and two specimens from Grafton, N. H., are known, which weigh 2,900 pounds and 2½ tons, respectively. The finest emeralds (q.v.) are from Bogota; aquamarines (q.v.), from Siberia, Brazil, Maine, North Carolina and Colorado; golden beryls, from Connecticut and North Carolina.

Beryl'lium, a rare metallic element, called "beryllium" from the fact that it was first found in the beryl. Its salts have a sweetish taste, and from this circumstance the element itself has received the name glucinum (q.v.).

Beryx, bĕr'ĭks, the designation of a genus of deep sea fishes in tropical waters belonging to the group *Berycoidei* and family *Berycidæ. B. splendens,* deep red with bright streaks, is one of the most beautiful of the Cuban fishes.

Berzelius, ber-tsā'lĭ-ŭs, **Jöns Jakob** (BARON), Swedish chemist of distinction: b. Westerlösa, East Gothland, Sweden, 29 Aug. 1779; d. Stockholm, 7 Aug. 1848. The first fruit of his studies, and of a year's residence as assistant to a physician at the famous watering-place of Medewi, was the 'Nova Analysis Aquarum Medeviensium' (1800). After publishing a tract entitled 'De Electricitatis Galvanicæ in Corpora Organica Effectis' (1802), and taking his doctor's degree, he was appointed by the board of health in 1802 adjunct of medicine and pharmacy in Stockholm. In 1807 he became professor of medicine and pharmacy in Stockholm. Here, along with other medical practitioners, he instituted the Swedish Medical Society. In 1808 he was admitted a member of the Academy of Sciences at Stockholm, in 1810 one of its directors, and in 1818 its perpetual secretary. This office he continued to hold during the remainder of his life. In 1818 the king, while allowing him to retain his own name, made him a noble; and in 1835, on the occasion of his marriage with a daughter of Poppius, a councilor of state, he was named a baron. The existing state of chemistry is founded in a great measure on his discoveries and views, though, by the rapid development of the science, the edifice which he erected has undergone many alterations, and several defects have been discovered in it. Hence his views in regard to atomic weights, his electro-chemical theory, and his mode of procedure in organic chemistry, have met with many opponents. He discovered selenium and thorium, first exhibited calcium, barium, strontium, tantalum, silicium, and zirconium in the elemental state, and investigated whole classes of compounds, as those of fluoric acid, the metals in the ores of platinum, tantalum, molybdenum, vanadium, sulphur salts, etc. He introduced a new, or at least a wholly altered nomenclature and classification of chemical compounds. In short, there is no branch of chemistry to which he has not rendered essential service; and his labors are so numerous that, when the accuracy with which they have been executed is kept in view, it becomes almost incomprehensible how one man should have been able to perform them. It ought to be especially mentioned that he never rested satisfied with the bare investigation of isolated facts, but always extended his investigations over a wide field, so as to contribute to the advancement of chemistry as a whole. In addition to his numerous communications to the journals and periodicals of the period, may be mentioned, among his separate works, his 'View of the Composition of Animal Fluids,' 'New System of Mineralogy,' 'Essay on the Theory of Chemical Proportions,' and above all his 'Text-book of Chemistry,' which has been translated into most European languages. As secretary of the Academy of Sciences, he published an annual account of the progress of chemistry and mineralogy, which, having been continued during 27 years, extends to as many volumes. See Söderbaum, 'Berzelius, Werden und Wachsen' (1899).

Berzsenyi, bĕr'zhā-nyĭ, **Daniel,** Hungarian poet: b. Heyte, 1776; d. 1836. An authorized version of his 'Versei' appeared in 1813 and in 1816 was reprinted with his consent and speedily became classic in Hungarian literature.

Bes, an Egyptian god, represented clad in a lion's skin, with the head and skull of the animal concealing his features, and with a dwarfish and altogether grotesque appearance. He was supposed to preside over art, music, the dance, and childbirth.

Besançon, bĕ-zăń-sôń, France, a fortified town, capital of the department Doubs, 206 miles southeast of Paris. The town is surrounded by hills, covered with vineyards. The isthmus or peninsula on which it is built is composed of a mass of rocks crowned by the citadel, which commands the country toward the north, but the citadel itself is commanded by several eminences in the neighborhood, on which forts have been erected for the purpose of securing the approaches. Besançon is one of the strongest towns in France, and also one of the best built. The streets are spacious and well laid out, and the squares are adorned with fountains. The citadel is one of Vauban's finest works. There are here a theatre, a large and valuable public library, a museum, a botanic garden, school of artillery, lyceum, etc. The trade and manufactures are extensive. The latter comprise linen, cotton, woolen, and silk goods, ironmon-

gery, etc.; but the principal industry is watch-making. It employs about 15,000 workmen who make as many as 400,000 watches yearly. There are also extensive foundries, breweries, saw-mills, and tanneries. Besançon is the ancient Vesontio, Besontium, or Bisontium, which is mentioned by Cæsar, who drove the Sequani from it in 58 B.C., as a place of great extent and natural strength. Several of the streets and places still bear their old Roman names, and there are numerous Roman remains, especially a triumphal arch of the Emperor Aurelian, an aqueduct, an amphitheatre, and a large theatre. Pop. (1903) about 59,000.

Besant, bĕs-ănt, **Annie,** English theosophist and author: b. London, 1 Oct. 1847. She was married in 1867 to the Rev. Frank Besant, brother of Sir Walter Besant, but was legally separated from him in 1873. She manifested an earnest interest in social and political topics, and, in 1874, became connected with the National Secular Society. Owing to the publication of 'Fruits of Philosophy,' Mrs. Besant was prosecuted, in connection with Charles Bradlaugh (June 1877), but the prosecution failed. Mrs. Besant has since stated her disagreement with the sentiments expressed in this book. In 1883 she announced her adhesion to Socialism. For three years she was a member of the school board of London. She has been prominently connected with various socialistic movements, and a frequent speaker at meetings for workingmen, and in 1899 joined the Theosophical Society, and has since been active in theosophical propaganda in Great Britain and the United States. She visited the United States in 1891 and 1892–3 and lectured on Madame Blavatsky and reincarnation, and on theosophy and occultism. Among her numerous publications are 'Reincarnation'; 'Seven Principles of Man'; 'Autobiography'; 'Death and After'; 'Building of the Kosmos'; 'In the Outer Court'; 'Karma'; 'The Self and Its Sheaths'; 'Path of Discipleship'; 'Man and His Bodies'; 'Four Great Religions'; 'The Ancient Wisdom'; 'Three Paths to Union with God'; 'Evolution of Life and Form'; 'Dharma'; 'Avataras'; 'Ancient Ideals in Modern Life'; 'Esoteric Christianity'; 'Thought-Power'; 'The Religious Problem in India'; and in connection with G. R. S. Mead, translations of tracts and reviews.

Besant, bĕ-zănt', **Sir Walter,** English novelist: b. Portsmouth, England, 14 Aug. 1836; d. London, 9 June 1901. He was educated in London and at Christ's College, Cambridge, where he graduated with mathematical honors. He was for a time professor in the Royal College, Mauritius. His first work, 'Studies in Early French Poetry,' appeared in 1868, and to the field of French literature also belong his 'French Humorists' (1873), and his 'Rabelais' (1877 for the 'Foreign Classics' series). He was for years secretary to the Palestine Exploration Fund, and published a 'History of Jerusalem' (1871) in conjunction with Prof. Palmer, a life of whom he also wrote. The 'Survey of Western Palestine' was edited by him. He is best known by his novels, a number of which were written in partnership with the late James Rice, including 'Ready-Money Mortiboy' (1872); 'This Son of Vulcan'; 'The Case of Mr. Lucraft'; 'The Golden Butterfly' (1876); 'The Monks of Thelema'; etc. After Mr. Rice's death (1882) Sir Walter wrote: 'All Sorts and Conditions of Men' (1882), which led to the establishment of the People's Palace in London; 'All in a Garden Fair' (1883); 'Dorothy Foster' (1884); 'The World Went Very Well Then' (1887); 'The Ivory Gate' (1892); 'The Rebel Queen' (1893); 'Beyond the Dreams of Avarice' (1895); 'The Orange Girl' (1899); 'The Alabaster Box' (1900); 'The Story of King Alfred' (1901), etc. Among his other works are 'The Eulogy of Richard Jeffries' (1888). He labored for many years to promote the interests of all members of the literary profession, more especially in his capacity as editor of the monthly paper, 'The Author.' On 24 May 1895, he was knighted.

Be'show, the Alaskan pollack. See POLLACK.

Beside the Bonnie Brier Bush, a novel by Ian Maclaren (the Rev. Dr. John Watson), delineating Scottish character and life among the lowly. It consists of short sketches with no attempt at plot, but interest attaches to the well-drawn characters. It is one of the best examples of what has been styled the "kail-yard" school of fiction, whose principal exponents are Crockett, Barrie, and Watson.

Bes'ika Bay, an inlet of the Ægean Sea on the northwest coast of Asia Minor, opposite Tenedos, to the south of the entrance of the Dardanelles. The English fleet was stationed here during crises in the Eastern question in 1853–4 and 1877–8.

Beskow, bĕs'kŏv, **Bernhard,** Swedish dramatist: b. Stockholm, 19 April 1796; d. 17 Oct. 1868. He was ennobled in 1826 and appointed marshal of the royal household in 1833. He officiated for some time as director of the royal theatre, and is the author of several excellent tragedies, which were translated into Danish and German by Oehlenschläger, and of which 'Torkel Knutsson' is considered the best acting play on the Swedish stage. He wrote an opera, 'Trubaduren,' for which Oscar, the present king of Sweden, composed the music. His literary reputation was increased by his books of travel, by his poetical works, and by his contributions to the press. The great prize of the academy was awarded in 1824 to his poem 'Sveriges anor.'

Bessara'bia, a province in European Turkey since the Peace of Bucharest, in 1812, between Turkey and Russia. It extends in a northwesterly direction from the Black Sea, between the Pruth and the Dniester; area, 17,619 square miles. A portion of it at the southeast extremity was ceded to Turkey in 1856, but was restored in 1878. Agriculture is chiefly developed in the north, pasturage is most largely carried on the south, in the middle portion are extensive forests. It is watered by the Dniester, the Pruth, and the Danube. The inhabitants include Russians, Poles, Rumanians, Bulgarians, Germans, Armenians, Jews, etc. The capital is Kishenef. The products are salt, wool, tallow, leather, soap, etc. Pop. 1,782,900.

Bessa'rion, Johannes, or **Basilius,** Greek monk: b. Trebizond, 1389; d. Ravenna, 19 Nov. 1472. He was titular patriarch of Constantino-

ple, archbishop of Nicæa, afterward cardinal and legate to France, in the time of Louis XI. After having spent 21 years in a monastery of Greece, devoted to theology and literature, he left it to follow the Emperor John Palæologus to Italy, with the intention of being present at the Council of Ferrara, in the hope of uniting the Greek and Latin churches. They were accompanied by many Greeks, distinguished by their talents and dignity. Bessarion seconded with so much zeal the projects of Palæologus that he became odious to the Greek Church, while Pope Eugenius IV. rewarded him for his devotion to that of Rome, by the dignity of cardinal-priest. He was sent to France by Sixtus IV., to reconcile Louis XI. with the Duke of Burgundy, and obtain aid against the Turks. He did not succeed, and it is pretended that he received a personal insult from the king, which humiliation some suppose to have been the cause of his death.

Bes'sel, Friedrich Wilhelm, German astronomer: b. Minden, Prussia, 22 July 1784; d. 17 March 1846. An astronomical tract which he had drawn up brought him into communication with Olbers, who encouraged him in his labors, and procured for him the appointment of inspector of astronomical instruments to the University of Göttingen. In 1810 he removed to Königsberg, and in 1812–13 superintended the construction of the observatory of this town. From 1824 to 1833 he completed a series of 75,011 observations on the celestial zone contained between 15° N. and 15° S. declination. These observations included all the stars in the zone as far as the ninth magnitude. A dissertation which he published in 1844 contains important investigations on the variability of the movements of the fixed stars. An important share in the discovery of the new planet Neptune belongs to him, as in a paper read in 1840 he called attention to the existence of a planetary mass beyond Uranus, founding on considerations which were afterward happily proved to be correct. His principal works are an 'Essay on the Path Traversed by the Comet of 1807'; 'Astronomical Observations' during various years; 'Determination of the Length of the Pendulum Which Beats Seconds at Berlin'; 'Investigations and Measurements made with a View to Establish a Metrical Unit for Prussia'; 'Measure of the Distance of the Sixty-first Star of the Constellation of the Swan'; and 'Popular Lectures on Scientific Questions.' These last, consisting of papers which Bessel had read before the Physico-economical Society of Königsberg from 1832–44, were published in 1848.

Bes'sels, Emil, German naturalist: b. Heidelberg, 2 June 1847; d. Stuttgart, 30 March 1888. He was educated in the University of Heidelberg, and while an assistant at the Royal Museum in Stuttgart became interested in the subject of Arctic research. In 1869 he was a member of Petermann's expedition that sailed into the sea between Spitzbergen and Nova Zembla. In 1871 he came to the United States and was appointed both naturalist and surgeon to the expedition under Capt. Charles F. Hall, United States navy. Most of the scientific results of this expedition were gathered by his personal efforts, and published under the title of 'Report on the Scientific Results of the Polaris Expedition' (1876). In 1879 he published a German narrative of the expedition, illustrated with his own sketches. Later he returned to Germany, where he devoted himself to literary pursuits, art and geographical instruction.

Bes'semer, Sir Henry, English inventor of distinction: b. Charlton, Hertfordshire, 19 Jan. 1813; d. London, 15 March, 1898. He received mechanical training at an early age in the type-foundry of his father, a French artist, and going to London at 18 began his career as a modeler and designer. His earliest invention was an improved method of stamping deeds which the revenue office straightway adopted without giving him any compensation therefor. Late in life he brought the matter to the attention of the government and was then knighted (1879) in acknowledgment of his services in this particular. His inventive ability was next turned to the production of a new method of making bronze-powder or "gold" paint, as it was called, which proved a commercial success, and subsequent inventions of his were machines for making Utrecht velvet and improvements in type-casting machinery. At the time of the war in the Crimea he designed a projectile intended to revolve in its flight, but as the cannon of that day were not strong enough to permit of its use, he went on experimenting in Paris under the patronage of Louis Napoleon till he had secured a much improved kind of cast iron. This, however, did not fully satisfy him and he continued at work refining the iron until steel was produced. He took out patents for this invention in 1855, but persevered in experiments till at his London bronze factory steel ingots had been manufactured which could be rolled into rails without hammering. When this process had become fully developed the Bessemer Steel Works were built in Sheffield, where, besides employing a large number of workmen in steel manufacture, many others were trained for similar work in factories all over the world. On 13 Aug. 1856, he read before the British Association at Cheltenham a paper dealing with the invention which has made his name famous, "The Manufacture of Malleable Iron and Steel without Fuel." This was a new and cheap process of rapidly making steel from pig-iron by blowing a blast of air through it when in a state of fusion, so as to clear it of all carbon, and then adding just the requisite quantity of carbon to produce steel — a process which has introduced a revolution in the steel-making trade, cheap steel being now made in vast quantities and used for many purposes in which its price formerly prohibited its application. At the Birmingham meeting in 1865 he read a second paper "On the Manufacture of Cast Steel, Its Progress and Employment as a Substitute for Wrought Iron." The Bessemer process has not only stimulated the growth of the steel industry but greatly reduced the cost of manufacture and rendered steel available for rails and general engineering work. Since 1858, when the Sheffield works, the principal ones in England, produced less than 50,000 tons the amount manufactured has increased until in 1896 Great Britain produced 1,815,842 tons of Bessemer steel and the United States 3,019,906. In the past 50 years the Bessemer process has seen but few improvements of any importance.

SIR HENRY BESSEMER.

Beside his great invention, that of the Bessemer process, with others previously named, Bessemer was also the originator of a method still in use for compressing into a solid block the graphite employed in the manufacture of lead pencils; of a system of rollers for embossing and printing paper; of improvements in telephones; and of a ship with a stationary cabin, the latter the only failure of note in the long series of his inventions. In 1859 he received the Telford Medal of the Institute of Civil Engineers; and in 1872 the Albert Medal of the Society of Arts. He was president of the Iron and Steel Institute of Great Britain, 1871–3, and in 1879 became a Fellow of the Royal Society. Engineers have sometimes felt that Bessemer did not receive from his own government the honors that his distinguished services to British industrial development merited and that he was in effect more highly esteemed in the United States where eight localities and one railway bear his name. Bessemer was an honorary member of many foreign scientific and engineering societies, among which was the American Society of Mechanical Engineers. Before the latter, in December 1896, he presented a paper entitled "The Origin of the Bessemer Process," printed in its 'Transactions' (Vol. XVII. 1890). See STEEL MANUFACTURE.

Bessemer, Ala., a city in Jefferson County, on several trunk railroads; 12 miles southwest of Birmingham, the county-seat. It was founded in 1887 as a manufacturing place because of the valuable iron and coal mines in its immediate vicinity. It contains iron foundries, coke ovens, a number of blast furnaces, machine shops, planing mills, iron pipe works, fire brick works, and other works connected with the iron and steel industry. It has four banks, several weekly newspapers, electric lights, waterworks, and a property valuation of $3,000,000. It is governed by a mayor elected biennially and a city council. Pop. (1900) 6,358 within incorporated limits.

Bessemer, Mich., city and county-seat of Gogebic County, on the Chicago & N. W. and several other railroads; 40 miles east of Ashland, Wis. It is in an important iron mining and lumbering region; was founded in 1884, and has become important by reason of its mining and manufacturing and its trade relations with the surrounding territory. It has a good school system and a notably fine high school building, city-hall, stone court-house, a national bank, churches of all denominations, and weekly newspapers. Pop. (1904) 3,111.

Bessemer Steel Process. See BESSEMER, SIR HENRY; STEEL MANUFACTURER.

Bessey, Charles Edwin, American botanist; b. Wilton, Ohio, 21 May 1845. He was professor of botany in the Iowa Agricultural College in 1870–84; and has been professor of botany in the University of Nebraska since 1884. He was also president of the Society for the Promotion of Agricultural Science in 1883–5; president of the Nebraska Academy of Sciences in 1891; acting chancellor of University of Nebraska 1888–91 and 1899–1900; Fellow of the American Association for the Advancement of Science. His publications include: 'Reports on Insects' (1873–4); 'Geography of Iowa' (1876); 'The Erysiphei of North America' (1877); 'Botany for High Schools and Colleges' (1880); 'Essentials of Botany' (1884); 'Reports of the State Botanist of Nebraska' (1887 to 1892); 'Elementary Botany' (1904); 'Plant Migration Studies' (1905). He was editor of the department of botany of 'Johnson's Universal Cyclopædia,' in 1892–5; and is one of the editors of 'Science.'

Bessières, bĕs-yār, **Jean Baptiste** (DUKE OF ISTRIA), French marshal: b. Preissac, 6 Aug. 1768; d. Lutzen, 1 May 1813. Entering the army in 1792 as a private soldier, in less than two years he had attained the rank of captain. After making the Spanish campaign, he passed into the army of Italy, and soon attracted the notice of Napoleon, who took him to Egypt in 1798, where his conduct at St. Jean d'Acre and Aboukir covered him with glory. At the accession of Napoleon to the throne, he became marshal of France. He showed his usual conspicuous courage at Austerlitz, Jena, Eylau, and Friedland, and, raised to the rank of Duke of Istria, commanded in Spain in 1808–9. In the Russian campaign he led the cavalry of the Guard, and did much by his sleepless courage and presence of mind to save the wreck of the army in the disastrous retreat from Moscow. On the morning of the battle of Lützen he fell mortally wounded by a cannon ball.

Best, William Thomas, English musician: b. Carlisle, 13 Aug. 1826; d. Liverpool, 10 May 1897. In 1848 he was appointed organist of the Philharmonic Society in Liverpool; in 1852 he went to London and became organist of the Panopticon of Science and Art, and also of the Church of St. Martin-in-the-Fields; in 1854 was organist of Lincoln's Inn Chapel; in 1855 returned to Liverpool, and became organist of St. George's Hall; in 1868 was organist of the Liverpool Musical Society; and in 1872 was again engaged by the Philharmonic Society. He was the author of 'The Modern School for the Organ' (1853); 'The Art of Organ Playing' (1870); 'Arrangements from the Scores of the Great Masters' (1873); 'The Organ Student'; 'Organ Concertos'; 'Opera and Oratorio Songs,' etc.

Bes'tiaries, the name given to certain extremely popular books of the Middle Ages. In the written volumes, sometimes with copious illustrations, were given descriptions of animals, real and imaginary, which was which being left to the discretion or knowledge of the readers. They were composed in verse or prose or a mixture of both, and were designed not only as hand-books of zoology, but as teachers of morals as well. It was the fashion to attach spiritual meanings to the animals or their actions, until every quality of good or evil in the soul of man had its type in the beast world. It is to the bestiaries that we must look for explanation of the strange, grotesque creatures which are found sculptured on the churches and other buildings of the Middle Ages. The oldest Latin bestiaries had an early Greek original, the well-known 'Physiologus,' under which name about 50 such allegories were grouped. The Greek text of this famous work is found only in manuscript. There are old Syriac, Armenian, Ethiopic, Arabic, Icelandic, and numerous Latin versions. Editions of the Latin have been issued — Mai, Heider, and Cahier. An Old High German version was made earlier than the 11th century; in the 12th century, ver-

sions in French were made by Philippe de Thaun and Guillaume, a priest of Normandy. The 'Bestiary of Love' of Richard de Fournival was rather a parody upon the earlier form of such books. The following is a characteristic extract from the 'Divine Bestiary': "The unicorn has but one horn in the middle of its forehead. It is the only animal that ventures to attack the elephant; and so sharp is the nail of its foot, that with one blow it rips up the belly of that most terrible of all beasts. The hunters can catch the unicorn only by placing a young virgin in the forest which it haunts. No sooner does this marvelous animal descry the damsel than it runs toward her, lies down at her feet, and so suffers itself to be taken by the hunters. The unicorn represents our Lord Jesus Christ, who, taking our humanity upon him in the Virgin's womb, was betrayed by the wicked Jews, and delivered into the hands of Pilate. Its one horn signifies the Gospel truth, that Christ is one with the Father," etc.

Bestuzheff, bĕ-stoo'zhĕf, **Alexander Alexandrovitch,** Russian novelist and soldier: b. St. Petersburg, 3 Nov. 1797; d. 19 July 1837. Of his numerous novels, the most celebrated are 'Ammalat-Beg'; 'The Nadeshda Frigate'; 'The Terrible Prophecy.' His 'Private Correspondence' is highly prized. He was killed in battle in the Caucasus.

Bestuzheff-Ryumin, bĕ-stoo'zhef ryoo'men, **Count** (Michel Alexei Petrovitch), Russian statesman: b. Moscow, 1693, of a family of English origin, and of the second class of nobles in Russia; d. St. Petersburg, 24 April 1766. He entered the civil service under Peter the Great, and became a diplomatist. Under the Empress Anne he was made a member of the cabinet, and the Empress Elizabeth, whose fullest confidence he possessed, created him count, great chancellor of the empire, and his influence in the government was almost boundless. He was strongly opposed to the Prussian and French diplomatic influence, and was disliked on this account by Peter III., nephew and presumptive heir of Elizabeth. He concluded several treaties with England, Sweden, and Denmark, favorable to English policy. By a treaty concluded in 1747, he paved the way for the union of Schleswig and Holstein with the kingdom of Denmark. By his influence, the Russian troops supported Austria against Frederic the Great in the Seven Years' war. But their commander, Apraxin, retired to Russia, and this occasioned the fall of Bestuzheff. He was imprisoned and degraded, but Catharine II., in 1762, restored him to liberty and to his previous social position. He is regarded as the inventor of a chemical preparation known in medicine under the name of *tinctura tonica Bestucheffi.*

Be'tain, or **Be'taine,** an organic base, having the chemical composition $C_5H_{11}NO_2$, obtained from the juice of the common beet, or from beet-root molasses. It is not present in the beet-root in nature, but is obtained from it by the action of baryta or hydrochloric acid. The hydrochloride is one of its most important salts, and numerous others are also known.

Betanzos, bă-tän'thōs, **Juan Jose de,** Spanish adventurer of the 16th century. He settled at Cuzco, Peru, where he married a daughter of the inca and at the command of Mendoza, the viceroy, wrote an account of the conquest of Peru by Pizarro. It remained in manuscript till 1880, when it was published with the title, 'Suma y Narracion de los Incas.'

Be'tel, Betle, Pawn, or **Pinang,** popular Oriental names for various species of Piper, especially *P. betle,* and *P. siriboa,* climbing shrubs cultivated in the East for their leathery leaves which are used to a prodigious extent with bits of areca-nut and shell lime for chewing, particularly by the Malay races. The plants are trained upon trellises, poles, etc., in shady but hot and moist places, which in northern India are secured by means of sheds. Europeans do not take readily to the habit because the mixture is hot, acrid, astringent, abraids the mouth, temporarily destroys the sense of taste, reddens the lips as if they were covered with blood and blackens the teeth, which are sooner or later destroyed. At 25 years of age, habitués are often toothless. Among East Indian races the habit dates back more than 2,400 years and at the present time is as general as was the habit of using snuff among Europeans; the betel box is carried by old and young, men and women, and presented upon all occasions. Opinions differ as to the utility or perniciousness of this habit, some writers claiming advantages which in the face of the above-mentioned facts seem as far-fetched as like arguments in defense of the similar use of tobacco.

Betelgeuse, bĕt-ĕl-gẽrz', the star Alpha Orionis, the bright, reddish star in one of the shoulders of Orion. It varies somewhat in brightness, but in no regular period.

Beth Peor, bĕth pē'ôr (Hebrew, house of Peor), a city where the Israelites are said to have received the laws of Deuteronomy, and the supposed locality of Moses' burial. The precise locality of Beth Peor is undetermined, however, and various points have been suggested as probable sites, but the only theory which seems reasonably sure is that it stood somewhere among the Nebo-Visgah Mountains.

Beth'am-Edwards, Matilda, English author: b. Suffolk, 1836. She was privately educated, and has published numerous works in poetry, fiction, and on French rural life. She was made an officer of public instruction in France in 1891. Among her works are 'The White House by the Sea'; 'Kitty'; 'The Dream Charlotte'; 'France of To-day'; 'A Romance of Dijon'; 'The Lord of the Harvest,' a volume of poems, and an edition of Arthur Young's 'Travels in France.'

Beth'any, a village of Palestine, at the foot of Mount Olivet, on the eastern side, about two miles east of Jerusalem, where Lazarus dwelt and was raised from the dead, and where the ascension of Christ is related to have taken place. The house and grave of Lazarus, and the house of Mary Magdalene, are still shown to travelers.

Bethany College, a co-educational institution in Linsborg, Kan.; organized in 1881 under the auspices of the Lutheran Church; reported at the end of 1905: Professors and instructors, 60; students, 959; volumes in the library, 10,000; grounds and buildings valued at $120,000; income, $72,700; number of graduates, 809; president, Rev. E. F. Pihlblad, A.M.

Bethany College, a co-educational institution in Bethany, W. Va.; organized in 1841 under the auspices of the Church of the Disciples; reported at the end of 1905: Professors and instructors, 18; students, 265; volumes in the library, 67,000; grounds and buildings valued at $200,000; income, $9,000; president, T. E. Cramblet, A.M. LL.D.

Beth'el, a town of Palestine, about 10 miles from Jerusalem, now called Beitin, or Beiteen. The patriarch Jacob here had a vision of angels, in commemoration of which he built an altar. Interesting ruins abound in the vicinity.

Bethel College, an educational institution in Russellville, Ky.; organized in 1854 under the auspices of the Baptist Church; reported at the end of 1905: Professors and instructors, 8; students, 129; volumes in the library, 6,500; grounds and buildings valued at $62,500; productive funds, $125,000; income, $16,500; number of graduates, 275; president, Wm. H. Harrison, M.A.

Bethencourt, Jean de, bā-tŏn-koor, zhŏn dė, king of the Canary Islands: d. 1425. He was chamberlain to Charles VI. of France, but being ruined in the war with England, he sought to repair his fortunes in foreign countries, and made a descent from Spain on the Canary Islands in 1402. Not having sufficient force, however, he returned, and obtained reinforcements from Henry III. of Castile, with which he was successful, and was crowned king in 1404, under the title of Louis. He converted the greater portion of the Canaries to Christianity, and in 1405 received from the Pope the appointment of bishop to the islands. The following year he went to Normandy, where he passed the remainder of his days.

Bethesda, bė-thĕz'dą, a pool in Jerusalem, the name of which signifies "house of mercy." In the five halls or porticos near it many patients lay waiting, according to the account of John (ch.v.), for the moving of the waters, to bathe in. According to the belief of the Jews, an angel descended, at a certain time, into the pool and troubled the water, and whoever first entered the water after this agitation was cured. In 1888 a rock-hewn basin or reservoir was discovered, with five chambers adjoining, which is supposed to be identical with the pool of Bethesda.

Bethlehem, bĕth-lē-ĕm, or -hĕm, Palestine; a village five miles from Jerusalem, at the foot of a hill covered with vines and olive-trees; the birthplace of Jesus Christ. An aqueduct conveys water from the hill to the village. Its inhabitants are chiefly Christians, and make rosaries, crucifixes, etc., for pilgrims. There are three convents here, for Roman Catholics, Greeks, and Armenians, surrounding a stately church said to have been erected by the Empress Helena in 327, over the place where Christ was born. It is built in the form of a cross, and separate portions of it are allotted to the Latins, Greeks, and Armenians, respectively. On either side of the nave are two rows of beautiful columns, marking off two corresponding aisles. The top commands a fine view over the surrounding country. In a rich grotto, furnished with silver, and crystal lamps, under the choir of this church, a trough of marble is shown, and is said to be the manger in which Jesus was laid after his birth. Several other spots of interest are shown here. Bethlehem is also famous as the birthplace of King David. It was laid waste by Hadrian in 132 and since then has never been a place of great importance. Since the building of the church Bethlehem has been one of the great pilgrim shrines of Palestine. Pop. about 7,000, chiefly Christains, the Mussulman quarters having been destroyed in 1834.

Bethlehem, Pa., a borough in Northampton County; on the Lehigh River and canal, and the Lehigh V., the New Jersey C., and other R.R.'s; 57 miles north of Philadelphia. It was founded in 1741 by Moravians under Count Zinzendorf, and is the chief centre of that sect in the United States. It contains a Moravian theological seminary, a Moravian seminary for young ladies, more than a dozen churches, and two national banks. On the opposite side of the river, here spanned by two bridges, is South Bethlehem, the seat of Lehigh University (q.v.), the main offices of the Lehigh Valley Railroad Company, and a number of important manufacturing establishments, including silk mills, rolling mills, foundaries and machine shops, brass works, zinc oxid and spelter works, etc. Monocacy Creek separates Bethlehem from West Bethlehem, formerly a separate borough but now consolidated with Bethlehem borough. Bethlehem is attaining a conspicuous position in the musical world from the institution of an annual festival which has developed from the great love of the Moravians (q.v.) for music in their religious services, and especially for the compositions of John Sebastian Bach. The first organized festival was held in 1901. For musical and other ceremonies of the Moravian church see Moravian Church. Pop. (1907) Bethlehem, 17,000; South Bethlehem, 19,000.

Bethlehemites, an order of monks somewhat like the Dominicans, who settled in England in 1257. They were so named because they wore on the breast a five-pointed star in commemmoration of the star that appeared at the birth of Jesus. The order was comparatively insignificant and had only one convent in England (at Cambridge). An order of American Bethlehemites, sanctioned by Innocent XI. in 1687, was established in the city of Guatemala by a Franciscan monk named Bethencourt, a native of the island of Teneriffe, about 1655. A female order of Bethlehemites also was founded by Maria Anna del Galdo, who belonged to the Tertiaries of St. Francis. Twenty years later the privileges of the order were enlarged to an equality with those of the Augustinians, Dominicans, and Franciscans. The followers of Huss are sometimes called Bethlehemites, from the church in Prague in which Huss preached.

Bethlen-Gabor, bĕt-lĕm gä'bôr, or **Gabriel Bethlen,** Prince of Transylvania: b. 1580; d. 1629. He was of humble origin, but at the age of 17 he entered the service of Gabriel Bathori, prince of Transylvania, fought under his orders, and then repaired to Constantinople, where his courage gained him the esteem of the Turks. Prompted by ambition, he became ungrateful to his first benefactor; and after bringing Bathori into bad odor with both the Transylvanians and the Turks, managed to make the latter declare war, and actually headed a Turkish army against him. His treachery was suc-

cessful and in 1613 he was proclaimed prince of Transylvania. Shortly after, having succeeded in stirring up the Hungarians against the Emperor Frederick II., he took several towns, and in 1618 assumed the title of king of Hungary. Thereafter, supported by Turks and Tartars, he entered Austrian territory, laid waste Moravia, hemmed in the imperial army, and was on the eve of gaining a complete victory when the refusal of the Turks to undergo a winter campaign defeated all his hopes. The approach of Tilly compelled him to withdraw, and he was glad to conclude a peace which deprived him of his Hungarian title, but left him in possession of his conquests. While preparing for a new war against the imperialists he died of dropsy. He is said to have participated in 42 battles.

Beth'nal Green, England, an eastern suburban district and parish of London, in Middlesex County, now forming a parliamentary borough, having two divisions with two members. In 1872 a branch of the South Kensington Museum was opened in the district. Pop. (1891) 129,134.

Bethphage, bĕth'fāj (Hebrew, house of figs), a place of Scriptural interest, of which no trace is left. Its name was significant of its general location, but not of the particular site. "The place of figs," it must have been situated somewhere on the eastern slope of that range of hills extending north and south between Jerusalem and Bethany, at the foot of which in the western valley flowed the Kedron. The principal points of this range are the Mount of Offence and the Mount of Olives. The fig-tree still abounds both on the eastern and western slopes of the range, and even beyond Bethany toward Jericho. Some travelers have been disposed to place Bethphage on the site of the modern village of Abu Dis, lying south, and a little to the east of Bethany. Robinson thought this could not have been its position, and gave little credit to the tradition of the monks of the country, who place it between Bethany and the summit of the Mount of Olives, since there is no trace that a village of any description ever existed there. Lightfoot thought it was a district extending from the Mount of Olives to Jerusalem, and embracing a village of the same name.

Bethsaida, bĕth-sā'ĭ-da, a village on the west shore of the Lake of Galilee, the birthplace of Peter and Andrew and Philip. Its site has been identified with a heap of grass-grown ruins. At the northeast extremity of the lake was another Bethsaida, a village, near which the 5,000 were fed. Philip the Tetrarch raised it to the dignity of a town, and renamed it Julias, in honor of the Emperor Augustus' daughter.

Bethshemesh, bĕth-shē'mĕsh (Hebrew, house of the sun), a city of ancient Palestine, which probably occupied the site of the modern village, Ain Shems, about 15 miles west-southwest of Jerusalem, where extensive ruins are still remaining. The exploits of Samson were mainly in the neighborhood of Bethshemesh.

Bethune, bĕ-thoon', **Charles James Stewart,** Canadian educator: b. West Flamboro, Ont., 11 Aug. 1838. He was graduated at Trinity College, Toronto, in 1859; ordained deacon in the Church of England in 1861, and priest in 1862. He became incumbent of the Credit Mission in 1866, and in 1870 was appointed to the head mastership of Trinity College School, in Port Hope. He is well known as a writer on scientific subjects. He was the first editor of 'The Canadian Entomologist,' a monthly magazine. Resigning this place, he edited for a considerable time the entomological department of the *Canadian Farmer* and the *Weekly Globe.* In 1886 he again became editor of the 'Canadian Entomologist.' In 1892 he was elected a Fellow of the Royal Society of Canada.

Bethune, George Washington, American Dutch Reformed clergyman and poet: b. New York, 18 March 1805; d. Florence, Italy, 27 April 1862; was noted as an orator and a wit. He had charges at Rhinebeck, and Utica, N. Y., Philadelphia, Brooklyn, and New York city. Besides religious works, he wrote 'British Female Poets,' 'Lays of Love and Faith' (1847); several of the hymns in which are widely used. He also published an edition of Izaak Walton's 'Complete Angler' (1846); etc. See Life, by Van Nest (1867).

Bethune, bā-tün, France, a town in the department of Pas de Calais, 19 miles north-northwest of Arras. It stands on a rock washed by the Brette, and is a place of considerable strength. The appearance of the town is not prepossessing. There is, however, one fine square, the centre of which is occupied by an ancient belfry of remarkable construction, while the hotel-de-ville, among the best edifices in the town, forms one of its sides. The chief manufactures are oil, soap, and cloth. There are also distilleries, tanneries, and salt and sugar refineries. The trade is greatly favored by the canals of Lawe and Bassée, which meet here. The family of the lords of Bethune is very celebrated, and a branch of it was established in Scotland about the end of the 12th century. To this branch the celebrated Cardinal Beaton belonged. Pop. (1896) 11,627.

Betlis, or **Bitlis,** a town of Turkish Armenia, about 20 miles west from Lake Van. It is one of the most ancient cities of Kurdistan, situated in a wide ravine, traversed by a stream, on whose steep banks the town is built. The houses are of red stone, generally two stories in height, with grated windows to the streets. In the centre, on a high rock, is an ancient castle, formerly the residence of the khans of Betlis. The country around is fertile, well cultivated, and produces excellent crops of grain, cotton, hemp, rice, olives, tobacco of the best description, and excellent fruits and vegetables. The principal manufactures of the town are coarse cotton cloth and tobacco. Pop. about 30,000.

Betrothed, The. (1) A famous romance by Alessandro Manzoni — 'I Promessi Sposi.' It was its author's only romance, but it sufficed to place him at the head of the romantic school of literature in Europe. The scene of the story is laid within the country around Milan, and the plot concerns only the troubled and impeded but at last happily liberated course of true love between the humble peasant Renzo and his already betrothed Lucia. The religious motive of the book is sincere but not exaggerated, and never runs to fanaticism. Its original publication was in three volumes, and occupied two years, 1825–6, during which time it awakened a wide interest in European circles; and having been soon translated into all modern languages, it has become

probably the best known of all Italian romances to foreign readers. (2) A novel by Sir Walter Scott (1825), the scene of which is laid in the reign of Henry II. (3) An opera by **Pelrella,** first sung in 1869, at Lecco.

Betrothment, or **Betrothal,** a mutual promise or compact between two parties, by which they bind themselves to marry. The word imports giving one's troth, that is, true faith or promise. Formal ceremonies of betrothment are not the custom in the United States and Great Britain, as on the Continent, where the betrothment is either solemn (made in the face of the church), or private (made before witnesses out of the church). As betrothments are contracts, they are subject to the same rules as other contracts; for instance, that they are valid only between persons whose capacity is recognized by law; and the use of fraud, violence, or intimidation vitiates the contract. The consent of both parties, of course, is required. This may be expressed either verbally, or by writing, or by action. In Germany, the consent of the parents is always necessary, if the parties are under age, not yet *sui juris.* But if the parents withhold their consent unreasonably, the permission of the judge is allowed to sanction the contract. If the opinions of the parents are diverse, the law gives effect to that of the father. Betrothments contracted thus, according to law, are called *sponsalia publica;* others are called *sponsalia clandestina.* The latter are, in some places, utterly invalid; in others, only punishable. By the common German law, however, they are valid in every case in which consummation or consecration by the priest has taken place. The parents, in these cases, are not allowed to apply for a dissolution of the contract, nor can they refuse their consent, except for highly important reasons. Public betrothment induces the obligation to marry. In case of refusal to complete the contract by marriage, the injured party is allowed an action at law to compel its performance; but, since unhappy marriages are among the greatest misfortunes, the means of compulsion applied by the law are never great, amounting only to a small fine, or a short imprisonment. If circumstances take place which, if happening before the betrothment, would have necessarily prevented it, the party affected by them is allowed to recede from the engagement, and modern laws allow only an action for damages. In Germany, betrothment generally takes place in a small company of relations and friends. In Russia, it was once binding and indissoluble, like marriage, but is now a mere form accompanying the marriage ceremony. The contract is called by the Jews *thenaim rischonim.* In the laws of Moses there are certain provisions respecting the state of the virgin who is betrothed. Selden's 'Uxor Hebraica' gives the schedule of Hebrew contracts of betrothment. With the Jews, a young woman is rarely allowed to enter into an engagement without the cognizance of her relatives, who, in fact, in most cases, arrange matters for her, and generally avail themselves of the services of marriage brokers, who receive a percentage upon the amount of the dowry, beside a gratuity. In the continental cities these Jew marriage brokers have matches always on hand, with dowries varying from $5,000 to $200,000, and as soon as the betrothment has taken place they look upon the bargain as concluded; but cases frequently occur, in which on the day of the wedding the bridegroom breaks the match because the Austrian metalliques or Spanish Ardoins, tendered in payment for the dowry, have fallen in value, and reduced the dowry perhaps to the extent of 20 or 25 per cent. Among the ancient Greeks, the father made a selection for his daughter. The young couple kissed each other for the first time in the presence of their friends, and it was customary for the bridegroom to bring flowers daily, until the wedding day, to the house of his bride. The Arab sends a relative to negotiate about his intended bride, and the price at which she is to be had. The bridegroom of Kamchatka has to serve in the house of his prospective father-in-law before an engagement is allowed to take place. With the Letts and Esthonians no engagement is considered valid until the parent and relatives of the bride have tasted of the brandy which the bridegroom presents. Among the Hottentots, the would-be bridegroom is not allowed to propose without being accompanied by his father. Father and son walk arm in arm, with pipes in their mouths, to the house of the bride, where the engagement takes place. Among some of the indigenous tribes of America it was customary to keep the betrothed lady in durance for 40 days, as the superstition prevailed that she would exert an occult influence upon any thing she touched or anybody with whom she came into contact. During these 40 days the lady was kept on starvation fare, so that when the day of the wedding came she looked more like a skeleton than like a bride. See Pollock and Maitland, 'History of English Law' (2d ed. 1899).

Betsy and I Are Out, the title of a popular American poem by Will Carleton (q.v.), first printed in the Toledo *Blade* in 1872.

Betteloni, bĕt-tę-lō'nę, **Vittorio,** Italian poet: b. Verona, 1840. He was educated in Pisa, and became professor of Italian literature and history in the Female College in Verona. His verse proves him an adherent of that Italian classical school which dates from 1869, and includes 'In the Springtime' (1869); 'New Stanzas' (1880); and a translation of Goethe's 'Herman and Dorothea.'

Betterton, Thomas, English actor: b. August 1635; d. London, 28 April 1710. He was the son of an under-cook in the service of Charles I., and was apprenticed to a bookseller in London. His master, Mr. Rhodes, obtained a license for a company of players in 1659, and with him Betterton commenced his career. He was engaged by Davenant in 1662. His position was soon pre-eminent, and he became an established favorite. He seems to have had no personal graces from nature to second his rare talents, if the following account be true: "Mr. Betterton, though a superlatively good actor, labored under an ill figure, being clumsily made, having a great head, a short, thick neck, stooped in the shoulders, and had fat, short arms, which he rarely lifted higher than his stomach. His left hand frequently lodged in his breast between his coat and waistcoat; while with his right he prepared his speech; his actions were few but just; he had little eyes and a broad face, a little pockfretten; a corpulent body, and thick legs, with large feet; he was better to meet than to follow, for his aspect was serious, venerable, and majestic. In his latter time, a little para-

lytic; his voice was low and grumbling, yet he could tune it by an artful climax which enforced universal attention even from the fops and orange girls. He was incapable of dancing even in a country dance, as was Mr. Barry, but their good qualities were more than equal to their deficiencies.» Betterton had the rare faculty of identifying himself with his part. He married Mrs. Sanderson, an actress of almost equal merit with himself, whose Lady Macbeth was reckoned a perfect piece of acting. He was prudent and saving, but he lost his small means in a commercial speculation, and a theatre which he afterward opened was not successful. After his retirement from the stage, he reappeared in his old age a few times to take a benefit, his last appearance being 13 April 1710. He was buried in Westminster Abbey. See Howe, 'Thomas Betterton' (1891).

Bettinelli, bĕt-tē-nĕl'lē, **Saverio,** Italian author: b. Mantua, 1718; d. 1808. He studied under the Jesuits; entered, in 1736, the novitiate of this order, and taught from 1739 to 1744, belles-lettres at Brescia, where he made himself known by some poems composed for the use of schools. In Bologna, where he studied theology, he continued to cultivate his poetical talents, and wrote for the theatre of the college his tragedy of Jonathan. In 1751 he was intrusted with the direction of the college of nobles at Parma. After the suppression of the Jesuits in 1773 he returned to his native city, where he resumed his literary labors. His chief work is his 'Risorgimento negli Studj, nelle Arti e ne' Costumi dopo il Mille' (1775). The 'Lettere dieci di Virgilio agli Arcadi' attracted great attention, and its criticism of the older poets, particularly Dante, involved him in many contests. The best of his poems are his 'Versi Sciolti,' which though they do not show any great poetical power, are always elegant and ingenious.

Betting, the staking or pledging of money or property upon a contingency or issue. The processes of betting may be best illustrated in connection with horse-racing, which furnishes the members of the betting fraternity with their best markets. Bettors are divided into two classes — the backers of horses, and the book-makers, or professional bettors, who form the betting ring, and make a living by betting against horses according to a methodical plan. By the method adopted by the professional bettor the element of chance is as far as possible removed from his transactions, so that he can calculate, with a reasonable prospect of having his calculations verified, on making more or less profit as the result of a season's engagements. Instead of backing any particular horse, the professional bettor lays the same sum against every horse that takes the field, or a certain number of them, and in doing so has usually to give odds, which are greater or less according to the estimate formed of the chance of success which each of the horses has on which the odds are given. In this way, while in the event of the race being won (as is usually the case) by any of the horses entered in the betting-book of a professional bettor, the latter has always a certain fixed sum (say $1,000) to pay, he receives from the backers of the losers sums which vary in proportion to the odds given. Thus, if a book-maker is making a $1,000 book, and the odds against some horse is four to one, he will, if that horse wins, have to pay $1,000, while, if it loses, he will receive $250. It usually depends upon which horse it is that wins a race whether the book-maker gains or loses. If the first favorite wins it is evidently the worst thing that could happen for the book-maker, for as he is bound to receive the sum of the amounts to which all the horses except one have been backed, the largest deduction must be made from his total receipts on account of the first favorite. Very frequently the receipts of the book-maker are augmented by sums paid on account of horses which have been backed and never run at all. Sometimes, although not often, the odds are given upon and not against a particular horse. Books may also be made up on the principle of betting against any particular horse getting a place among the first three. The odds in this case are usually one fourth of the odds given against the same horse winning. Another mode of betting is that called a sweepstake, in which a number of persons join in contributing a certain stake, after which each of those taking part in the sweepstake has a horse assigned to him (usually by lot), which he backs, and the backer of the winning horse gains the whole stakes. If there are more persons taking part in the sweepstake than there are horses running some of them must draw blanks, in which case of course their stakes are at once lost.

At common law, wagers are not *per se,* void, but statutes prohibiting betting have been passed by many of the States. When one who loses a wager gets another to pay the money for him, an action lies for the recovery of the money. Wagers on the event of an election laid before the poll is open, or after it is closed, are illegal. In horse-racing, simple bets upon a race are unlawful both in England and the United States. In the case even of a legal wager, the authority of a stakeholder, like that of an arbitrator, may be rescinded by either party before the event happens. See Wager.

Betts, Craven Langstroth, American poet and story writer: b. New Brunswick, 23 April 1853. Besides translating 'Songs from Béranger' in the original metres, he has written 'The Perfume Holder, a Persian Love Poem'; with A. W. H. Eaton, 'Tales of a Garrison Town'; and 'A Garland of Sonnets.'

Betts, Samuel Rossiter, American jurist: b. Richmond, Mass., 8 June 1787; d. New Haven, Conn., 2 Nov. 1868. He practised law in Sullivan County, N. Y.; served in the War of 1812 and first became prominent when appointed judge advocate. He was a member of Congress 1815–17; circuit court judge, 1823–6; and United States district judge, 1827–67. As codifier of the maritime laws of the United States he exercised a clarifying influence upon such questions as salvage, wages, charters, insurance, seamen's wages, etc., and the formulation of the neutrality and patent laws. He published 'Admiralty Practice' (1838).

Betty, William Henry West, English actor, better known as the Young Roscius: b. Shrewsbury, 1791; d. London, 24 Aug. 1874. His first appearance was in Belfast, at the age of 11, when he assumed the role of Osman in 'Zara,' and achieved an immediate success. For almost five years after this he played the most

important parts before crowded and enthusiastic audiences, Pitt adjourning the House of Commons in 1805 on one occasion in order to permit members to witness the boy's Hamlet. He quitted the stage in 1808, but after studying for a while at Cambridge, returned to it in 1812, but failed to repeat his early triumphs. He retired finally in 1824, and lived for 50 years in the enjoyment of the fortune he had so early amassed.

Bet'ula, the generic name of birch (q.v.).

Bet'wa, a river in Hindustan, which takes its rise in the Vindhyan Mountains, near Bhopal, and flowing nearly 340 miles in a northeasterly direction through the provinces of Malwa and Allahabad, finally joins the Jumna below Kalpee. Near Erech a slight fall occurs. The country through which it flows is highly cultivated. The river at times is said to rise to a great height and in a portion of its course flows through beds of iron ore.

Beulah, bū'la, a region described in Bunyan's 'Pilgrim's Progress,' where there is nothing to annoy and all sounds are agreeable.

Beurnonville, bėr-nŏn-vēl, **Marquis de** (Pierre de Ruel, pē-ār de rü-ĕl), marshal of France: b. Champignolle, Burgundy, 10 May 1752; d. 23 April 1821. Originally intended for the Church, he chose the profession of arms and served in the East until 1789, when he was sent home by the governor of the Isle of Bourbon, his temper being quarrelsome. Arriving in Paris at the commencement of the Revolution, he identified himself at once with it, and in 1792 was appointed aide-de-camp to Marshal Luckner, and was soon after named general-in-chief of the army of the Moselle; in 1793 he became minister of war. Sent in 1793 to arrest Dumouriez, he was himself arrested by Dumouriez, and confined at Ehrenbreitstein, Eger, and Olmütz, until 1795, when he was exchanged, and became successively general-in-chief of the army of the north, inspector-general of infantry, ambassador to Berlin in 1800, to Madrid in 1802, and count of the empire. In 1814 he was commissioned by Napoleon to organize means of defense upon the frontier, and on the emperor's abdication was named minister of state and peer of France by Louis XVIII. On the return of Napoleon to Elba, he was proscribed by a special decree, and retired again, but was reinstated in all his dignities by Louis XVIII. after the battle of Waterloo. He became marshal of France in 1816, and marquis in 1817.

Beust, Friedrich Ferdinand, boist, frē-drih fêr'dē-nänd (Count von), Saxon and Austrian statesman: b. Dresden, 1809; d. 1886. He adopted the career of diplomacy, and as member of embassies or ambassador for Saxony resided at Berlin, Paris, Munich, and London. He was successively minister of foreign affairs and of the interior for Saxony. At the London conference regarding the Schleswig-Holstein difficulty he represented the German Bund. He lent his influence on the side of Austria against Prussia before the war of 1866, after which, finding his position in Saxony difficult, he entered the service of Austria as minister of foreign affairs, became president of the ministry, imperial chancellor, and in 1868 was created count. In 1871–8 he was ambassador in London, in 1878–82 in Paris.

Beutenmüller, boi'tĕn-mül-lėr, **William,** American entomologist: b. Hoboken, N. J., 31 March 1864. Educated in the public schools, he became in 1889 curator of the department of entomology in the American Museum of Natural History. He has written a useful work on butterflies and moths, and contributed to scientific and popular magazines over 100 articles on entomology. He has been president of the New York Entomological Society, and is editor of its 'Journal.'

Beuthen, boi'tĕn, Prussia, a town, province of Silesia, government of Oppeln, about two and a half miles from the Polish frontier. It has steam and electric tramways, and among buildings of note are the Roman Catholic Church of St. Mary (13th century), Protestant parish church (15th century), synagogue, royal Catholic gymnasium, higher girls' school, etc. It is an important centre of mining and metallurgy, having iron-works, zinc-works, lead-works, coal-mines, and various industrial establishments. Pop. (1895) 42,343.

Bevedero, bā-vā-dā'rō, Argentina, a lake in the province of Mendoza, consisting of two distinct bodies of water, called the Greater and Lesser Bevedero, connected by a river about eight miles long. Greater Bevedero is 40 miles in length from north to south, and from 3 to 25 miles in width. Lesser Bevedero measures about 22 miles by 15. The lake lies between 32° 45′ and 34° 17′ S. lat. and 66° and 66° 32′ W. lon.

Beveland, bā've-lănt, **North** and **South,** Netherlands, two islands in the province of Zealand, and formed by the mouths of the Scheldt. North Beveland lies east of the island of Walcheren, and is separated from South Beveland by the island of Wolfersdyke. South Beveland, the larger and more fertile, contains Goes, the capital, and several forts and villages. The united area of the islands is 120 square miles.

Beverages. Beverages are those drinks to which mankind resorts in order that he may relieve the pangs of thirst or supply some other demand of the system. In the beginning man's life was marked by its simplicity. Our first parents were content to eat the fruits that they found so convenient for their needs and it is doubtful if they knew any other beverage than the pure water coursing through the streams that irrigated the ground. It was not until they began to eat the flesh of beasts and searched the soil for delicacies to gratify their newly awakened appetite for a variety in foods that they felt the craving of unnatural thirst. But the eating of strong meats required the drinking of stronger drinks than water and in this fact we find the origin of the history of beverages.

It would be intensely interesting if we could know in just what way prehistoric man first satisfied his unnatural thirst for drink. It is, of course, more than probable that the second beverage discovered by man was the milk of the animals he slaughtered to gratify his taste for meat. From a temperate and hygienic point of view it was not a long stride from the waters of the brooks to the milk of cows and asses and yet it stands out as a landmark in the development of the demand for variety, the demand which may be regarded as the first tendency toward civilization. It is also quite probable that,

in the beginning, man drank his milk soon after it was drawn or while it was still fresh, but finally there came a day when some prehistoric investigator was bold enough to take a drink of the milk of mares that had been set aside, and from this fermented liquid learned the sensations of intoxication, for kumyss, still the favorite tipple of the Tartar, is unquestionably the most ancient of all intoxicating beverages.

To mankind, next to water, milk is still a favorite beverage, for it possesses the double advantage of being both food and drink. To the civilized taste the milk of cows is the most desirable but more barbaric taste calls for a stronger beverage and is best gratified by the milk of mares, asses, camels, or even reindeers.

It is undoubtedly true that if we ate only wholesome foods in such quantities only as our system requires; performed our work with regularity; enjoyed, at proper intervals, requisite rest and recreation, and avoided all such deleterious distractions as excitement and worry, water would be the only beverage that nature would demand. Of course, it is unnecessary to state that such an ideal condition could scarcely obtain in these days of modern civilization, and, as the result, it is just as impossible to deny the fact that man sometimes demands a drink that will have a tendency to stimulate or refresh the jaded system.

While it is the primary object of all beverages to relieve thirst nearly all of them also possess other properties that exercise more or less effect upon the body. For example, those drinks which contain the largest quantities of water pass most rapidly into the circulation, increasing the volume of blood. Diluting the food, they not only assist digestion but also aid in eliminating waste matter from the body through the ordinary channels. There are beverages that soothe and beverages that irritate, but all have their purpose. The former find their scope of usefulness in times of fever and cold, while the latter are stimulating irritants of great medicinal value.

Among the most useful beverages are those that best relieve the cravings of thirst, the sour liquids prepared from the lemon, or other fruit juices, which, while perhaps not acid in themselves, have been rendered acidulous by charges of carbon dioxide. While the carbonated and mineral waters have the greatest effect in eliminating waste matter from the system they are not so useful in this regard as the hot drinks, like tea, coffee, or even hot water, for they not only play their part in the elimination of waste but also cool the body by increasing the perspiration.

Particularly soothing are such mucilaginous or gelatinous liquids as barley water, flaxseed tea, and Irish moss. The mineral waters, malt liquors and light wines act with a tonic effect; the more common beverages, like tea and coffee and the milder alcoholic liquors are stimulating to the nerves, while tea and coffee, if milk and sugar are added, as well as chocolate, cocoa and the malt liquors may be classified as the nutritious drinks.

Next in popularity to milk are those unfermented beverages which are made from products of the vegetable world such as tea, coffee, cocoa, and chocolate. Although cocoa is by far the most ancient of these drinks, having been in use long before the stimulating qualities of either tea or coffee were discovered, coffee has long been in greatest demand. In fact, it has been estimated that about 500,000,000 people drink coffee daily, as against the 100,000,000 who drink tea, and the 60,000,000 who partake of chocolate and cocoa. In the United States alone some 500,000,000 pounds of coffee are consumed annually, as against 90,000,000 pounds of tea, and some 20,000,000 pounds of the various preparations of cocoa and chocolate.

There are several points of resemblance between all these table drinks, dissimilar as they are in appearance and flavor. In each case they exercise a stimulating effect, the caffeine of coffee and theine of tea being almost identical, while the theolronsine of chocolate and cocoa is but a slightly different principle. Each also contains the same bitter principle, tannin, and each owes its characteristic odor and flavor to an essential oil.

Coffee, which must be considered first, because of its great popularity, is the berry from the several species of the genus *Coffea*, of which *C. arabica* is the most important. First used in Abyssinia during the 9th century, it was later introduced into Arabia, and from there to Constantinople, where it had become popularized by the middle of the 16th century. It is supposed that it was Leonhard Rauwolf, a German physician, who introduced coffee into Europe in 1573. A few years later Prosper Alpinus brought some of the beans to Venice to use them as a drug, but it was many years before it was drank to any extent outside of Constantinople. In 1652, however, a coffee house was opened in London by the Greek servant of a merchant named Edwards, whose ships sailed to the Levant, and since that time the popularity of the beverage has never waned.

In its preparation as a drink coffee should not be boiled in water, but, instead, should be covered with water that has previously been boiled. Here it should be allowed to infuse for fully ten minutes, at a temperature little below the boiling point. As coffee does not contain as great a quantity of tannin as tea and does not yield it so readily, it may infuse longer without becoming bitter and indigestible, the effect which tannin exerts if it is boiled or left for too long a time over the fire.

Like many other beverages coffee exercises both good and evil effects upon the system. Stimulating the muscles, heart and nerves, its tendency is to overcome the ills of fatigue, while its strengthening effect upon the heart's action makes it a most valuable stimulant. At the same time its action upon the nervous system is so marked that over-indulgence in the drink is certain to be attended by such ill effects as insomnia, and nervous headaches, if not palpitation and general nervous disability.

Tea, which stands next to coffee as a table beverage, is a native of China where these shrubs of the *Camellia* family have been cultivated for more than a thousand years. It was once a general belief that there were many kinds of tea plants, but Robert Fortune, the botanist, exposed the myth by his thorough investigation of the various methods of cultivation and manufacture in use in the tea districts of China and India. It is now known, therefore, that while there are many variations in the tea plant, the varieties are all the same plant cultivated under

different conditions, while the two distinctive varieties, the green and the black tea, are the results of different methods of manufacture. Green tea, for example, is prepared by steaming the leaves before they have been rolled and dried, a method of procedure which produces a greater quantity of tannin.

As the flavor of tea as a beverage depends as much upon the quality of the water in which it is infused as upon the method of infusion, care should be taken to see that the water is neither too soft nor too hard, and that it has been well boiled before it is poured over the tea. The period of infusion, which is then continued at a lower temperature, should not last more than a few minutes, for the longer the infusion the greater the quantity of tannin that will be extracted.

Like coffee, tea has its good and evil effects. If infused too long it becomes bitter, unwholesome and indigestible. If drank too freely it not only induces insomnia and kindred nervous disorders but irritates the stomach, producing a serious kind of catarrh. At the same time it is a mild stimulant which refreshes the body and prepares the brain for intellectual energy. It is also beneficial in aiding one to withstand the ill effects of cold, fatigue and hunger. By producing perspiration it cools the body when heated, and, by means of its action upon the heart, it warms the body when cold.

While tea has been consumed in China and other parts of Asia since the latter part of the 6th century it was not introduced in European countries for more than one thousand years. Pepys mentions having tasted it for the first time in 1660, but the novel beverage must have met with almost instant recognition for, less than 18 years later, it was in general use in every part of England.

As both cocoa and chocolate contain starch and fat in considerable quantities they are among the most nutritious of the stimulating table beverages. Both are obtained from a small evergreen tree, native to tropical countries, for while the cocoa of commerce is prepared by grinding the seeds themselves, the commercial chocolate cakes contain the better parts of the berry, usually mixed with sugar and some distinctive flavoring. The preparation of the drink is a simple process, the cocoa or chocolate merely being dissolved in milk and boiling water.

Although by no means so popular as tea or coffee the drinking of mineral waters has become so general during the past century that they must now be regarded as among the most important temperance beverages. Early in the 16th century an attempt was made to produce artificial mineral waters, but it was not until the 18th century that chemistry had made sufficient progress to enable the experimenters to prove the elementary compounds of the waters both as to quality and quantity. In fact, the first unqualified success in this line of investigation was made by Dr. Frederick Adolphus Augustus Struve, a Dresden druggist, who celebrated his achievement by opening an artificial mineral water pavilion in that city, in 1820.

The alkaline and mineral waters which are so much in use to-day owe their distinctive characteristics to the preponderance of carbonate and bicarbonate of sodium as well as to the carbonate of potassium, lithium, calecum and magnesium which they contain, all of which tend to make them useful aids to the physician in the treatment of disease. The Vichy of France, for example, or the Ems of Germany, are extensively used in the dietetic treatments, correcting disorders of the stomach and acting as alkalinizers of the blood, bile and urine. In cases of gout, gall stones, rheumatism, dyspepsia, constipation, etc., they have proved of invaluable service and have also been used successfully in the treatment of obesity. In many instances their value as medicinal agents is enhanced by the addition of carbon dioxide, while, in other cases, they are made more palatable and easy of digestion by being served with milk. Among the natural mineral waters produced in this country are those of Saratoga, N. Y., Saint Louis, Mich., and Waukesha, Wis., all of which are well and favorably known to those who make use of such beverages.

Another class of drinks, the popularity of which is beyond question, are those beverages which contain alcohol as an active principle: beer, ale, wine, cider, and the many kinds of spirituous liquors that are now manufactured in almost every part of the world. In addition to the alcohol these beverages also contain such properties as tannin, sugar, carbon dioxide, or various acidulous substances, any or all of which exert an influence over the flavor of the liquid. As to alcohol itself it has so long been a bone of contention that it would be folly to attempt to review a century-long contest in a single article. Originally used exclusively as a medicine, and admittedly a valuable agent in the treatment of certain diseases it is to be doubted if even the moderate use of such liquors as beverages is not productive of far more evil than good, while the effect of immoderate indulgence in such liquid stimulants is too well known to require further discussion. In spite of all the warnings of science, however, man continues to gratify his craving for alcoholic preparations. Even in countries where the ordinary beverages of commerce are unknown, savage taste has learned to delight in the flavor of fermented liquors, and this desire even the most barbaric people have had ingenuity enough to gratify.

Beer, or lager, as it is more generally known in this country, is by no means a modern invention and no drink has continued to maintain a more steadfast hold upon the taste of man since the earliest days of civilization. The Egyptians manufactured beer from barley many hundred years before the Christian Era. Archilochus, 700 B.C., shows that the Greeks had learned the art of brewing, while we have such eminent authorities as Sophocles and Æschylus, Diodorus and Pliny to prove that the Greeks and Romans both made beer and loved it. Like the Gauls, the Romans called it Cerevisia, from Ceres, the goddess of field fruits, and there is ample history to prove that the art of making this beverage was known to man fully as early as the art of making wine from the grape. Prior to the invasion by the Romans the Britons were drinkers of milk and water although they occasionally drank mead, an intoxicating beverage made from honey. As Tacitus tells us that beer was the ordinary drink of the Romans, and beer and vinegar the favorite beverage of the soldiers of Julius Cæsar, it is not difficult to imagine why, so soon after his invasion, the Britons became a nation of beer-drinkers. Unlike the Romans,

however, they employed wheat instead of barley in their malting. In Germany, too, beer was introduced at a very early date. Charlemagne loved it dearly and not only compelled the best brewers in the land to become attachés of his court, but gave his personal attention to the subject so conscientiously that he was able to tell them how to improve their brew. As early as 1482 the monasteries of that country began to make beer and, by the 16th century, that beverage had become one of the chief exports of the country. In fact, the German brewer has always been recognized as one of the best beer makers of the world and it has only been within the past century that the success of their Austrian rivals has had a tendency to somewhat eclipse their glory. Centuries ago beverages known as beer were made in England by tapping such trees as the birch, maple, spruce, and ash for their juices, or by resorting to the properties contained in ginger and other roots, a practice which not only still prevails in that country, but that was brought to America by the first colonists, who loved these humble, harmless drinks too well to leave their recipes in the motherland.

Ale and porter, the heavier malted liquors which are so much used in England and the United States, cannot boast such ancient lineage as beer, but still there is reason to believe that it was a beverage like ale on which the Anglo-Saxons and the Danes loved to become drunken, and, fully as early as the reign of Henry II., the monks of England had become famous for their wondrous brews. In fact, it was due to the investigations of some of these fathers of the monasteries that the superior quality of the waters of Burton-on-Trent for brewing purposes was discovered, a discovery that has made the ales and porters of England world celebrated.

Wine, whose history is as old as that of civilization, is the most aristocratic of drinks. Ascribed to the gods by the ancients — to Dionysus by the Greeks, Bacchus by the Romans and Osiris by the Egyptians — there can be no question but that the use of the juice of the grape as a beverage was one of the first discoveries of civilized man. It is true that the very ancient Romans did not know it at the time when even the Israelites had learned the secret of its production, but, later, wine-making in Rome became such a general enterprise that Emperor Domitian ordered half of the vineyards destroyed that the more necessary wheat might be raised in the place of the grape.

According to the best authorities Asia was the country in which the vine first grew without the aid of man, while Armenia and Eastern Pontus were the lands in which the cultivation of the grape was first undertaken. From there the love of wine spread rapidly through all the lands of ancient civilization. Among the best known Asiatic wines was that of Chalybon, near Damascus, the beverages with which the tables of the Persian kings were constantly supplied, while the most famous Greek wines came from such places as Chios and Lesbos.

In ancient India and in Egypt priests were forbidden to drink, while the Jewish priests were only forbidden on days of religious services. In fact, the Hebrews were by no means as strict about the use of the wine cup as were some other nations and the fact that vine-culture was one of their favorite occupations is proved by history, both biblical and profane. Traditions state that it was the Phœnicians, the earliest of vine-growers, who carried the secret of wine making to Spain, Italy and France. They also established large vineyards on the islands of Chios, Mitylene and Tenedor.

As early as 550 B.C. the process of blending selected wines was known to the Carthaginians, while the ancient practice of adding turpentine to the wine for the purpose of preserving it was probably an invention of Italy. France, Spain, and Portugal are now the chief centres of vine-culture although the grape-growers in many parts of the United States, and particularly in the far Western States, have recently raised the making of wine to the dignity of a great American industry. Champagne, however, one of the most popular of wines, is a beverage of extremely modern invention when compared to other makes. Invented by Dom Perignon of Hautvillers about the beginning of the 18th century its use has become more and more general until it is now consumed by wine-lovers in all parts of the world. If wine is the most aristocratic, whiskey may be designated as the most democratic of drinks. Thoroughly cosmopolitan in character, in various countries it is distilled from various substances, but always, whether it is made from barley, corn, wheat, rye, or even from potatoes, it bears the same name and usually enjoys the same proportion of popularity. The word «whiskey» is a name that was bestowed upon this beverage by the Celts of Ireland and Scotland who began to make it about the middle of the 17th century. The word itself is a corruption of the Gaelic «uisge» (water), and closely interpreted means «strong water.» In the beginning this drink was used almost exclusively as medicine but as soon as it had become introduced as a beverage it became a favorite drink throughout Great Britain, and while the word «whiskey» once referred only to the Scotch and Irish drinks of that name, the rye and Bourbon whiskies of American manufacture are now consumed almost as generally as those made from recipes that have been handed down from the days of the ancient Celts.

Almost as strong as whiskey, brandy, the «brande-vin» or burnt wine, is a drink which is often used, both for medicinal purposes and as a beverage. Its name, as is indicated, was derived from the method of its manufacture, a formula for liquor making that has been followed for many generations and in many parts of the world. In Morocco the Jews use the refuse of the grape as well as such fruits as raisins, figs, dates and pears in its distillation, and they have become strongly attached to their strange drink because they believe that their freedom from that terrible disease, elephantiasis, always so common among the Mohammedans in that country, is due to the fact that they partake so freely of this unique spirit. Molière, in his travels, discovered a tribe on the Barbary coast which made excellent brandy from honey; in Persia it is the lees of the weaker sorts of wines that are distilled, and almost every country has its particular method of making this beverage. None of them, however, can compare in quality to the cognac of France, that rich distillation from wines which alone properly bears the name of «brandy.»

Gin is another distilled liquor. It is made

from rye, grain and malted barley, flavored with juniper-berries and sometimes with turpentine. It is also known as Hollands, and as Holland gin, these names being a relic of the days when the beverage was called Holland-Geneva, the word "gin" being a corruption of the word "Geneva." Although originally made in Holland it was soon introduced into England where it immediately became one of the most popular of drinks. Easily manufactured and always strong it could be sold so cheaply that it was finally found necessary to adopt strict legislative measures restricting its sale and consumption. Hogarth's horrible picture, 'Gin Lane,' which was one of the influences in bringing about the much needed reform, is said to have been but slightly an exaggeration of the actual conditions which existed in all the large English cities during the reign of gin.

Rum, formerly spelled as the French still spell it, "rhum," is a spirit which is distilled from the sugarcane juice, from the skimmings of the juice from the boiling house, or from the molasses mixed with the lees of former distillations. Although not so commonly used as some of the other strong liquors rum has been known both for its medicinal value and as a beverage ever since its introduction from the West Indies, more than a century ago.

The following are among the drinks which are not so generally known but which are in common use among the people of other countries:

Arrack, a drink manufactured widely in the East and West Indies, is much used by the natives. In making it it is sometimes distilled from the fermented juice of the palm tree, and sometimes from a combination of rice and molasses used in connection with the palm-tree juices.

Vodka, which is the chief source of intoxication in Russia, is a liquor which may be distilled either from rye or from potatoes.

In several parts of the world the sap of trees is called into requisition to satisfy the thirst for intoxicants. Pulque, for example, the beverage most commonly used in all Spanish-American countries, is made from the fermented sap of the aloe, while a somewhat different drink, called Tepache, is made by mixing sugar and water with this sap of the aloe, which afterward is allowed to ferment for a few hours only. In Tasmania the so-called "cider-tree" furnishes the bushmen with a means of intoxication. In this case the sap is of such a character that it may be drank as soon as it is drawn from the tree, in which state it is both refreshing and harmless, but when it is allowed to stand for some time it becomes an intoxicant of great potency.

The Soma of the Hindus is supposed by some to have been the original intoxicant of the human race. The Persians, who accept this tradition, revere the beverage as Haoma, while in India it is looked upon as the beverage of the mighty god, ever-giving new strength and new vigor. It is a milky fluid which is found in the climbing bindweed, and, when properly fermented, is extremely "heady."

Sake, the commonly used distilled liquor of Japan, is made entirely from rice, as also is Samshee, a drink used by the lower classes in China.

Kvass is the name of a sour beer much favored by the Russian peasantry. It is made from barley and rye, by a similar malting process as that applied to the manufacture of beer.

The natives of South America have a drink which they call Guarapo, which is made from the fermented juice of the sugarcane.

Chi-chi is the name of a peculiar kind of cider which is made by the natives of Patagonia. In brewing it, in the autumn when the apples are ripe, they dig large pits which they line and interline most carefully with hides in order that none of the juice may soak into the earth. Into these hides they throw the ripe apples which are left to decay and ferment until they are ready for use. It is then extremely intoxicating.

A drink called Kephir is drunk by the natives of the Caucasus. It is an effervescing milk-like liquid, the effervescence being caused by the introduction of horny, yellowish-brown masses called "Kephir-grains." Kern, who made a scientific examination of these grains, discovered that they were made of a rod-like bacterium and a yeast-like substance that was entirely unknown to him. Not unlike Kumyss in appearance and in taste, Kephir is far more intoxicating.

Kava, or ava, is a Polynesian drink which is made by macerating in water a portion of the root and stem of one of the piperaceæ.

There are several substitutes for tea in use in various parts of the world. In some of the Pacific Islands there are "tea-trees," while the natives of Tibet are very fond of their "brick tea," which is made from the offscourings and dust of the leaves and stems of the tea plants. It derives its name from the fact that the dust is pressed into hard, solid brick-shaped lumps, from which pieces are chipped off as they are to be used.

MILES BRADFORD,
Author of 'Carlotta and I.'

Beveridge, Albert Jeremiah, American lawyer: b. Highland County, Ohio, 6 Oct. 1862. He was brought up on a farm; graduated at De Pauw University; and engaged in law practice in Indianapolis. He entered political life in 1883, and soon won a reputation as an effective orator. On 17 Jan. 1899, he was elected United States senator for Indiana, as a Republican. Soon after his election he went to the Philippine Islands; made a thorough study of political and material conditions there; and, on the assembly of Congress in December following, delivered a thrilling speech in the Senate in support of the administration's policy concerning the new possessions in the East.

Beveridge, Kühne (COGHLAN), American sculptor: b. Springfield, Ill., 31 Oct. 1877. She studied under Rodin in Paris and O'Donovan in New York, and in 1893 married Charles Coghlan. Her works have been exhibited in New York, London, and Paris. She obtained honorable mention at the Paris Exposition of 1900.

Beveridge, William, English divine: b. Barrow, Leicestershire, 1637; d. Westminster, 1708. He studied at St. John's College, Cambridge, devoting his attention particularly to Oriental literature. In 1658 he published a work on Eastern tongues, especially Hebrew, Chaldee, Syriac, Arabic, and Samaritan, accom-

panied with a Syriac grammar. In 1660 he took orders, and obtained the vicarage of Ealing in Middlesex, where he wrote a useful 'Introduction to Chronology.' In 1672 he was appointed to the rectory of St. Peter, Cornhill, London, and the same year published his 'Synodicon' in two folio volumes, containing the Apostolic canons, decrees of the councils received by the Greek Church, and the canonical epistles of the early Fathers. This work called forth an opponent, to whom Beveridge replied in a 'Vindication.' In 1674 he obtained a prebend in St. Paul's, and in 1681 was appointed archdeacon of Colchester. In 1684 he became prebendary of Canterbury, and in 1688 was appointed chaplain to William and Mary. Shortly after, the see of Bath and Wells was offered him; but as it had become vacant by the conscientious refusal of Bishop Ken to take the new oaths, Beveridge, to his honor, declined to accept it. The episcopal dignity, however, was only delayed; in 1704 he became bishop of St. Asaph. Among his best-known works are 'The Church Catechism Explained'; 'Private Thoughts upon a Christian Life'; and 'The Great Necessity and Advantage of Public Prayer and Frequent Communion.' Collective editions of his works were published in 1824 and in 1842–6.

Beverley, Saint John of, English divine: b. about the middle of the 7th century at Harpham, Yorkshire; d. Beverley, 721. He was educated at Canterbury under Archbishop Theodore, and became a monk under Hilda in the monastery founded by her at Whitby. In 687 he was appointed to the see of Hexham, and in 705 was transferred to York. He founded a convent of nuns at Beverley, and built the choir of the church there. He resigned his bishopric and retired to Beverley in 718. Bede, who is said to have been his pupil, speaks of him with great veneration. He was canonized in 1037, and his remains were placed in a costly shrine, in Beverley minster. His fame was so widespread that when William the Conqueror led his army to the north and ravaged the country he saved the town of Beverley out of respect to the memory of the bishop. In 1416 Archbishop Chicheley ordered the anniversary of his death to be celebrated as one of the festivals of the Church, and special privileges were conferred on his church at Beverley by several English sovereigns. He is said to have written an 'Exposition of Luke' and 'Homilies on the Gospels.'

Beverley, Constance de, in Scott's poem 'Marmion,' a nun who for love of Marmion follows him in the disguise of a groom, and on being thrown over by Marmion is immured at Holy Isle for breach of her vow of chastity.

Beverley, Robert, American historian: b. Virginia, 1675; d. 1716. He was educated in England and about 1697 became clerk of the Council of Virginia and had charge of the records of the colony. He was the author of a 'History of the Present State of Virginia,' published in 1705, a most interesting account of the details of the daily life in colonial Virginia. A reprint was published in Richmond in 1855.

Beverley, England, a municipal borough and capital of the East Riding of Yorkshire, 29 miles east-southeast from York and a mile from the river Hull. It stands on the eastern edge of the Wolds, and on a branch of the Northeastern Railway, and consists of a principal street above a mile in length, and several minor streets, all spacious and tolerably well built. Its most remarkable edifice is the minster of St. John, in the Decorated and Perpendicular English styles, and one of the finest specimens of ecclesiastical architecture in the kingdom, its west front in the opinion of excellent authorities surpassing in magnificence that of York minster. Other churches are St. Mary's and St. Nicholas'. Among the other chief buildings are the guildhall and corn exchange. The chief manufactures are leather, iron castings, agricultural implements, whiting, linseed oil and cake, manures, wagons, cement, and ale. Its environs abound with beautiful walks. It sent two members to Parliament till disfranchised in 1870. Pop. (1901) 13,185. See Hiatt, 'Beverley Minster' (1900).

Beverly, Mass., a city in Essex County, on the Boston & M. R.R.; two miles north of Salem. It was founded 14 Oct. 1668; was incorporated as a city 23 March 1894; contains several villages; and is connected by trolley lines with Salem, Peabody, Gloucester, and Wenham. It is the seat of the New England Institute for the Deaf and Dumb; is principally engaged in the manufacture of women's boots and shoes, and leather; has considerable shipping and fishery interests; contains high and graded schools, a public library, a national bank, a number of handsome residences belonging to Boston business men; and has a property valuation exceeding $16,000,000. Pop. (1900) 13,884.

Beverly Farms, a name given to the eastern portion of the town of Beverly, Mass. It is a favorite summer residence for wealthy Bostonians and contains many beautiful mansions and park-like estates. In recent years it has endeavored to secure incorporation as a separate town.

Beverly's Ford, Va., scene of a sharp cavalry fight during the Civil War, between Buford, Pleasanton, and Gregg, commanding 9,000 Federals, and Stuart leading 12,000 Confederates. Hooker had sent Pleasanton to find Stuart, who was said to be near Beverly's Ford. Pleasanton planned to surprise the Confederates, but his plan miscarried. Stuart was fully prepared for him. Pleasanton was badly beaten. This action is also known as the battle of Brandy Station.

Be'vis of Hampton, Sir, a legendary English knight who has been made the hero of mediæval romances by both English and Continental writers. He was the son of Sir Guy, Earl of Hamtoun, who was treacherously murdered by Divoun, emperor of Almayne, he was given by his false mother to some heathen merchants to be sold for a slave among the Paynim. By them he was carried to Ermony, where he soon became dear to King Ermyn, and dearer still to his only daughter, the lovely Josian. His chief exploits were the overthrow of Brademond of Damascus, of a monstrous boar, of the giant Ascapard, whom he spared to become his squire, and of a dreadful dragon near Cologne. His famous sword "Morglay" he won in battle; his horse "Arundel" was the gift of Josian. Still more romantic episodes in his story are his carrying his own death-warrant in a sealed letter to the vassal Brademond; his escape from his noisome dungeon after seven years' imprisonment; and recovery of his wife,

who had preserved his love, though nominally the wife of King Ynor of Mombraunt. He next returned to England to avenge his father's death, then sailed for Ermony and defeated Ynor in a desperate battle. His last great fight was in the streets of London, when he slaughtered 60,000 citizens and forced King Edgar to grant him terms. Thirty-three years he then spent in love and perfect happiness at Ermony, dying at the same moment as his wife, while his famous steed Arundel had died just before. The romance was edited by Dr. E. Kölbing for the Early English Text Society in 1885.

Bewick, bū'ĭk, **Thomas,** English wood-engraver: b. Cherryburn, Northumberland, 12 Aug. 1753; d. Gateshead, 8 Nov. 1828. He early showed a great talent for drawing, and was apprenticed to an engraver in Newcastle. The celebrated Dr. Hutton, of Woolwich, then a schoolmaster in Newcastle, was preparing his great work on mensuration, and having employed Bewick's master in getting up the woodcuts for illustrating it, the execution of these was entrusted to the young apprentice. Bewick performed the work so admirably that his master advised him to turn his attention to wood-engraving, and accordingly with this view he proceeded to London. He returned, however, to Newcastle after a short time, and established himself there in partnership with his former master. His turn of mind led him to the study of natural objects, more especially animals; and in 1790 appeared his 'History of Quadrupeds,' the beauty of the illustrations of which attracted universal attention, so superior were they to anything hitherto produced by the art of wood-engraving. In 1797 appeared the first, and in 1804 the second volume of his 'British Birds,' generally regarded as the finest of his works. Bewick has never been surpassed in his spirited delineations of animals, and the admirable naturalness with which the accessories and backgrounds of the drawings, such as foliage, grass, and other rural objects, are represented. The tail-pieces to chapters throughout his works are of the highest excellence, and often display a rich vein of humor. His illustrated edition of 'Æsop's Fables' appeared in 1818. See Clement, 'Painters, Sculptors, Architects, and Engravers' (Boston, 1899); Dobson, 'Thomas Bewick and His Pupils'; Tytler, 'Modern Painters.'

Bewley, Anthony, American abolitionist b. Tennessee, 22 May 1804; d. Fort Worth, Texas, 13 Sept. 1860. A Methodist clergyman opposed to slavery, in 1858 he was driven from Texas for preaching according to his convictions. Against the advice of friends he returned in 1860, but remained only a few weeks, being again obliged to flee for his life. A reward of $1,000 was offered for his apprehension; he was seized in Missouri, carried to Fort Worth, and there hung by the mob, the only reason for whose act was that he had maintained human slavery to be unjust.

Bey, bā, among the Turks, signifies a governor of a town, seaport, or small district. The Turks write the word beg (q.v.).

Beyer, bī-ẽr, **Samuel Walker,** American geologist: b. Clearfield, Pa., 15 May 1865. He graduated at Iowa State College, 1889, and at Johns Hopkins University 1895. He is professor of geology and mining engineering in Iowa State College. As special assistant on the Iowa Geological Survey he has prepared reports on the geology of Boone, Marshall, Story, and Hardin counties, and annual reports on the mineral productions of the State. In 1897 he was a delegate to the International Geologic Congress at St. Petersburg.

Beyle, Marie-Henri, bāl, mä-rē-ŏñ-re (pseudonym De Stendhal), French author: b. Grenoble, 23 Jan. 1783; d. 23 March 1842. He held civil and military appointments under the empire; took part in the Russian campaign of 1812; thence until 1821 lived at Milan, chiefly occupied with works on music and painting. After nine years' residence at Paris he became in 1830 consul at Trieste, and in 1833 at Civita Vecchia. In 1841 he returned to Paris, where he died. The distinguishing feature of his works was the application of acutely analytic faculties to sentiment in all its varieties, his best books being the treatise 'On Love' (1822); 'The Red and the Black' (1830); 'History of Painting in Italy' (1817); 'Racine and Shakespeare' (1827); and 'Life of Napoleon,' etc. A collective edition of his works appeared in 18 volumes in 1855–6, and his 'Correspondance Inédite' in two volumes in 1855.

Beyrout. See Beirut.

Beza, bē'zą, or **de Bèze,** dė bāz, **Theodore,** Calvinistic divine: b. of a noble family at Vezelay, in Burgundy, 24 June 1519; d. 13 Oct. 1605. He was educated in Orleans under Melchior Volmar, a German philologer devoted to the Reformation; and, early familiar with the ancient classical literature, he became known at the age of 20 years as a Latin poet, by his petulant and witty 'Juvenilia' (a collection of poems of which he was afterward ashamed). In 1539 he was made a licentiate of law, and went to Paris. He received from his uncle the reversion of his valuable abbey Froidmond, and lived on the income of two benefices and on property which he inherited from a brother. His habits were dissipated, but a clandestine marriage in 1543 recalled him from his excesses, and a dangerous illness confirming the intention which he had formed at Orléans of devoting himself to the service of the Reformed Church, he went to Geneva with his wife in 1547. Soon after he accepted a Greek professorship at Lausanne. During his 10 years in this office he wrote a tragi-comic drama in French,—'The Sacrifice of Abraham,'—which was received with much approbation; delivered lectures (which were numerously attended) on the Epistle to the Romans and the Epistles of Peter (which served as the basis of his Latin translation of the New Testament, of which he afterward published several editions); finished Marot's translation of the Psalms in French verse; and obtained to such a degree the confidence of the Swiss Calvinists that he was sent in 1558 on an embassy to the Protestant princes of Germany to obtain their intercession at the French court for the release of the Huguenots imprisoned in Paris. In the following year he went to Geneva as a preacher, and soon after became a professor of theology and the most active assistant of Calvin, to whom he had already recommended himself by several works, in which many of the views of that eminent theologian were advocated with great zeal and no small measure of ability, so that he was generally regarded as Calvin's ablest

coadjutor, and the person destined to be his successor. His talents for negotiation were now often put in requisition by the Calvinists. He was sent to the court of Anthony, king of Navarre, at Nerac, to obtain toleration for the French Huguenots; and at his desire he appeared, 1561, at the religious conference at Poissy, where he spoke in behalf of his party with a boldness, presence of mind, and energy which gained him the esteem of the French court. He often preached in Paris before the queen of Navarre and the Prince of Condé; also in the suburbs. At the conference of St. Germain, in 1562, he spoke strongly against the worship of images, and after the commencement of the civil war accompanied the Prince of Condé as chaplain, and on the capture of the prince joined Admiral Coligny. After the restoration of peace he returned to Geneva in 1563, where, besides discharging the duties of his offices, he continued to engage in theological controversies in support of the Calvinists; and after Calvin's death in 1564 became his successor, and was considered the first theologian of this Church. He presided in the synods of the French Calvinists at La Rochelle (1571) and at Nismes (1572), where he opposed Morel's proposal for the alteration of clerical discipline; was sent by Condé (1574) to the court of the Elector Palatine; and at the religious conference at Montpellier (1586) opposed the theologians at Würtemberg, particularly James Andreas. At the age of 69 years he married his second wife (1588), and still continued to repel, with the power of truth and wit, the attacks and calumnies which his enemies, apostatized Calvinists (such as Bolsec), Lutherans, and Jesuits, heaped upon him. They reported in 1597 that he had died, and returned before his death to the Roman Catholic faith. Beza, now 78 years old, met his assailants in a poem full of youthful enthusiasm, and resisted in the same year the attempts of St. Francis de Sales to convert him, and the alluring offers of the Pope. In 1600 he visited Henry IV. in the territory of Geneva, who presented him with 500 ducats. Among his many works, his exegetic writings, and the able and correct 'History of Calvinism in France from 1521 to 1563,' which is ascribed to him, are still much esteemed. Beza's name is associated with the Codex which he presented to the University of Cambridge, for an account of which see BIBLE.

Beza's Codex. See BIBLE.

Bez'ant, a round, flat piece of pure gold, without any impression, supposed to have been at one time the current coin of Byzantium. Bezants are frequently employed as one of the charges in heraldry, a custom supposed to have been introduced by the Crusaders. Its value was about $2.

Beziers, bā-zē-a, France, a town in the department of Hérault, 38 miles southwest of Montpellier; situated on a height above the Orb, and on the Canal du Midi, a few miles from the Mediterranean, to which there runs a tramway line. It is surrounded by old walls, and though its streets are narrow, it is tolerably well built. Its most conspicuous edifice is the cathedral, a Gothic structure, crowning the height on which the town stands, and possessing a fine semicircular choir surrounded by columns of red marble. The city has a communal college, a museum, a library, and a society of economics and archæology. Its manufactures consist chiefly of woolens, silks, hosiery, chemicals, spirits, etc. In 1209 it was the scene of a horrible massacre of the Albigenses by Simon de Montfort, in which 20,000 persons were killed. Pop. (1896) 48,012.

Bezique, a card game which crystallized into official form in 1887. Two packs of cards are used, two players participate and the cards rank, ace high, then ten, king, queen, knave, nine, eight, and seven. All cards below that are discarded from both packs. Eight cards are dealt to each player. Trumps may be determined either by turning up the first card of the stack or by the suit of the first marriage. The non-dealer leads for the first trick, and the winner of each trick has the succeeding lead. After each trick, each player draws one card from the top of the stack, the winner of the trick taking the top card. The playing is as in whist, the leader taking the trick unless his opponent plays a higher card of the same suit or a trump. It is not necesssary to follow suit until the stack is exhausted, when one must do so and take each trick, if possible. Counting is done by means of the values of the cards; each ace or ten-spot taken in a trick counts 10, the winner of the last trick of each hand scores 10, and if the trump is turned, both sevens count 10 for the turner, and if one exchanges from his hand a seven of trumps for another turned trump or if one declares the other seven of trumps 10 more is scored. The game is won by the player who first makes 1,000 points, and if his opponent has not made 500 the game counts double. There are certain combinations of cards other than the above, which, when declared, count as follows: Double bezique (both queens of spades and both knaves of diamonds) 500; sequence of five highest trumps, 250; and 4 aces, 100; any 4 kings, 80; any 4 queens, 60; any 4 knaves, 40; bezique (queen of spades and knave of diamonds), 40; royal marriage (king and queen of trumps), 40; marriage (king and queen of same suit), 20. A declaration is made by placing the declared cards face up on the table where they remain till played or the stack is exhausted, except in the case of the seven of trumps. To score, a declaration can only be made after winning a trick and before drawing, and but one declaration can be made at a time. After a card has been used in one combination it may be used to form another, excepting when used to form an equal or inferior combination in the same class as before. A player need not declare a combination which he holds and only before the stack has been exhausted can a declaration be made. Consult: A. Howard Cady's treatise, for details and rules.

Bezo'ar, concretions found in the fourth stomach of many of the *herbivora,* notably goats, at one time held in high repute because of fancied miraculous healing properties.

Bhadrinath, bhä-drī-näth', a town in northern Hindustan, on the Bishengunga, celebrated for its temple of Vishnu, with a hot mineral spring in whose waters both sexes bathe indiscriminately, to wash away their sins. Some 50,000 pilgrims visit the place annually. The temple has been frequently overthrown by earthquakes. The principal idol is a figure of black

marble, clothed in gold and silver brocade while the season of pilgrimage lasts, and then stripped and stowed away in a vault the rest of the year. The Hindus believe that in the neighboring mountains some holy anchorites have lived for several thousand years. Their place of habitation is a cavern perpetually choked with snow, which forbids the approach of the curious and the skeptical. The Bhadrinath peaks in the neighborhood are above 22,000 feet high.

Bhagalpur, b'hä-găl-poor', a city of Hindustan, in Bengal, capital of a district and division of the same name, situated on the Ganges, 113 miles northwest of Moorshedabad. In the town and neighborhood are some interesting Mohammedan shrines; and there are here also two monuments, one erected (in 1780) by natives, and the other erected by government in memory of Augustus Cleveland, the conciliator of the formerly turbulent and marauding hill tribes of Sonthals. There are several indigo works in the neighborhood. Pop. (1901) 75,275. The division of Bhagalpur lies between that of Rajshahi on the east and that of Patna on the west. It has an area of 20,511 square miles. Pop. (1901) 8,721,484. The district of Bhagalpur is fertile, well watered, and highly cultivated. It is divided into two unequal portions by the Ganges. Area, 4,226 square miles; pop. (1901) 2,088,560.

Bhagavadgita, bhä'gă-văd-gē'ta (Sanskrit, the Divine Song), the title of a religious-philosophical didactic poem interwoven as an episode in the great Indian epic of the Mahâbhârata (q.v.).

Bhamo, bha-mō', India, a town of Burma, on the Upper Irrawaddy, about 40 miles from the Chinese frontier, and 180 north-northwest of Mandalay, with which it has railway communication. About 20 miles above Bhamo the river suddenly narrows from 1,000 to 150 yards and flows through a rocky gorge subject to eddies and back-waters. Navigation is at that point very difficult, and at times impossible. Bhamo is the starting-point of caravans to Yunnan, and will become one of the great emporiums of the East in the event of a regular overland trade being established between India and Western China. Pop. (estimated) about 7,000.

Bhang, băng, an Eastern name for hemp (*Cannabis Indica*) (q.v.).

Bhartpur, bhĕrt-poor', or **Bhurtpore.** (1) A native state of India with an area of 1,961 square miles. The surface is generally low and the state is scantily supplied with water; soil generally light and sandy; chief productions, corn, cotton, sugar, and salt. It has been under British protection since 1826. Pop. (1901) 626,000. (2) A town, the capital of the above state, on an extensive and fertile plain, 110 miles south-southwest of Delhi. It covers an area about four miles in circuit, and was so strongly fortified that in 1805 it stood a siege by Lord Lake of 14 weeks, and cost the besiegers 3,100 men. In a second siege, in 1826, its resistance to Lord Combermere was less successful. The fortifications have been demolished, but the fort still exists, and is enclosed by a wet ditch and a wall of hewn stone, which taken together are 60 feet high. Within the fort is the rajah's palace, built of red and yellow freestone in the Mogul style, and picturesquely crowning an eminence surrounded by flower-gardens and fountains. Pop. (1901) 43,000.

Bhartrihari, bhär-trę-hä'rę, Indian poet, author of a book of apothegms. According to the legend he was the brother of King Vikramâditya, who lived in the 1st century B.C. The collection of 300 apothegms (short poems) bearing his name present us with graceful descriptions of nature, charming pictures of love, shrewd remarks on everyday life, and profound thoughts on the Deity and the immortality of the soul. Bhartrihari was the first Indian writer who became known in Europe, 200 of the apothegms having been translated by the missionary Abraham Roger and published at Leyden (1653). His actual personality has been much discussed without any very satisfactory conclusion having been reached. The weight of opinion inclines to belief in his existence, and that he was a poet of a philosophical cast, possibly a grammarian also, and very likely of royal descent. See Von Bohlen, 'Bhartrihari's Sententiæ' (1833); Tawney, 'Two Centuries of Bhartrihari' (1877); Wortham, 'Translation of the Satakas of Bhartrihari' (1886); More, 'A Century of Indian Epigrams, Chiefly from the Sanskrit of Bhartrihari' (1898); Kale and Gurjar, 'Nitisataka and Vairagysataka, with Notes and an English Translation' (1898).

Bhatti, bhät'tę, Indian epic poet of the 6th or the 7th century. His poem, named after him, 'Bhattikâvyam,' is in 22 cantos. Its theme is the deeds of Râma; but the author designed the work to be also an exemplification of the rules of grammatical and rhetorical composition. It was published with a two-fold commentary at Calcutta (1828).

Bhavabhuti, bhä-va-bhoo'tę, surnamed SRÎ-ḲANTHA, Indian dramatist, of the first half of the 8th century. He wrote at least three plays, the 'Mahâvîracharita' ("life of the great hero"), and the 'Uttararâmacharita' ("later life of Râma"), forming together, in seven acts each, a dramatized version of the story of the Ramayana; and the 'Mâlatî-mâdhava,' a domestic drama in ten acts, full of life and incident. Bhavabhûti is often compared with Kâlidâsa, whom he equaled in vigor and variety, but hardly in genius. All three plays have been translated into English. See Levi, 'Le théâtre indien' (1890).

Bhawalpur, bhä-wal-poor', or **Bahawalpur,** a state of the Punjab, British India, south of the Indus and Sutlej rivers. It is chiefly a desert of shifting sand. Only the river banks are cultivable. The inhabitants are Játs, Baluchis, and Afghans, the greater part Mohammedans. Area, 17,285 square miles. Pop. (1901) 720,000. Bhawalpur, the capital, is on a branch of the Sutlej. It is enclosed by gardens and mud walls, four miles in circumference; noted for the manufacture of a kind of turban and scarf very popular among the Hindus; also produces considerable woolen, silk, and cotton cloth, indigo, alum, and saltpetre. Pop. 14,000.

Bhils, bēls, or **Bheels,** a Dravidic race inhabiting the Vindhya, Satpura, and Satmala Hills, a relic of the Indian aborigines driven from the plains by the Aryan Rajputs. They appear to have been orderly and industrious under the Delhi emperors; but on the transfer

of the power in the 18th century from the Moguls to the Marathas they asserted their independence, and being treated as outlaws took to the hills. Various attempts to subdue them were made by the Gaekwar and by the British in 1818 without success. A body of them was, however, subsequently reclaimed, and a Bheel corps formed, which stormed the retreats of the rest of the race and reduced them to comparative order. The hill Bheels wear little clothing, and live precariously on grain, wild roots, and fruits, vermin, etc., but the lowland Bheels are in many respects Hinduized. Their total numbers are about 750,000. See Rowney, 'Wild Tribes of India' (1882); Reclus, 'Primitive Folk' (1891).

Bhilsa, bēl-sa, or **Bilsa,** a town of Hindustan, on the Betwa, 280 miles southwest of Allahabad. It has a fort enclosed by a ditch and a stone wall surmounted by square towers, and is a place of Hindu pilgrimage. One of the curiosities of the place is a brass gun measuring 19½ feet in length, with a bore of 10 inches; elegantly proportioned, highly ornamented, and said to have been made by order of the Mogul emperor, Jehangir. Fine tobacco is produced in the vicinity. In the neighborhood are some very large and remarkable ancient Buddhist monuments known as *topes,* one of the principal being a dome-shaped structure 70 or 80 feet in height. Pop. (1891) 9,700.

Bhima, bē'ma, **Beemah,** or **Bimah,** (1) a god in Hindu mythology, the son of Pritha (or Kunti) by Vayu, the god of the wind, remarkable for his great size and strength; (2) the name of a river of India rising in the Poona district of Bombay and flowing southeast to the Kistnah River, about 400 miles in length.

Bhiwana, bhe-wā'ne, a town of India in the Punjab, district of Hissar. It is the trading centre of its district, exporting metals, sugar, and spices. Pop. 35,000.

Bhopal, bhō-pal'. 1. A native State of central India, with an area of 6,874 square miles. The country is full of jungles, and is traversed by a hilly tract, forming part of the Vindhya Mountains. The soil is fertile, yielding wheat, maize, millet, pease, and other vegetable productions peculiar to central India. Sugar, tobacco, ginger, and cotton are the chief exports. The district is well watered by the Nerbudda, Betwa, and other minor streams. The state of Bhopal was founded by an Afghan adventurer, named Dost Mohammed Khan, who in 1723 succeeded in establishing himself here by the countenance of Aurungzebe, on whose death he assumed the title of nabob, which was retained by his successors. Bhopal has all along been friendly in its relations with the British. In 1818 the state was placed under British protection. Pop. (1901) 1,198,350; (2) a town, capital of the above state, on the boundary between Malwah and Gundwana, 108 miles east of Oojein. It was defended successfully in 1813 against the forces of Scindia and the rajah of Nagpore. It is surrounded by a wall two miles in circuit, and contains a fort. Outside is another fort on a large rock, the residence of the ruler of Bhopal. Among other buildings of note are two mosques, arsenal, mint, and the palace of the Begum. Large artificial lakes supply good water. Pop. (1891) 70,338.

Bhuj, or **Bhooj,** the chief town of Cutch in India, Bombay presidency, at the base of a fortified hill, with military cantonments, high school and school of art, mausoleums, of the Raos or chiefs of Cutch, pagodas, etc., including a temple dedicated to the cobra di capello. Bhuj is famous for its manufactures of gold and silver. Pop. (1891) 25,421.

Bhutan, bhoo-tän', an independent State in the eastern Himalayas, with an area of about 16,800 square miles, lying between Tibet on the north and Assam and the Jalpaiguri district on the south, and consisting of rugged and lofty mountains, abounding in sublime and picturesque scenery. Pop. (estimated) 200,000. The Bhutanese are a backward race, governed by a Dharm Rajah, regarded as an incarnation of Deity, and by a Deb Rajah, with a council of eight. They are nominally Buddhists. After various aggressive incursions and the capture and ill treatment of Ashley Eden, the British envoy, in 1863, they were compelled to cede to the British considerable portions of territory, in return for a yearly allowance of £2,500.

Bia'fra, Bight of, a large bay on the west coast of Africa, at the head of the Gulf of Guinea, between Capes Formosa and Lopez. The principal rivers flowing into it are the Niger, the New and Old Calabar rivers, the Rio del Rey, the Cameroon, and the Gaboon; its islands are Fernando Po (Spanish), and St. Thomas' and Prince's (Portuguese). Opposite Fernando Po are the Cameroons.

Bialystok, byäl-e-stōk', or **Bielostok,** a town of Russian Poland, province of Grodno, on the Bialy, 45 miles south-southwest of Grodno, with which and Warsaw it is connected by rail. It is a well-built, handsome town, with a spacious market, gymnasium, and several churches, and has among its edifices a palace which belonged to the counts of Braniski, and was once known as the Polish Versailles. Its manufactures are woolen goods, leather, hats, soap, etc. Pop. (1897) 63,927.

Biancavilla, byän-ka-vēl'la (Italian *bianca,* white, and *villa,* town), a city of Sicily situated on the slope of Mount Etna, 20 miles northeast of Catania, founded in 1480 as an Albanian colony. Lava is employed for paving its streets, and in its neighborhood are the noted grottoes of Scila and Archi, the former basaltic, the latter in the lava of 1607 with a tunnel half a mile in extent. Wine and grain are produced in the district and all the cotton in this portion of Sicily is called Biancavilla. Pop. (1901) 13,358.

Bianchi, byän'ke, **Francesco** (called Il Frari), Italian painter: b. Modena, 1447; d. 1510. He was the instructor of Correggio, according to Vidriani, and his works were esteemed for graceful design and agreeable coloring. Among his few works extant are a 'Madonna with Saints,' now in the Louvre. He must not be confounded with Federigo Bianchi, a Milanese artist, born about the end of the 16th century. The paintings of the latter are numerous in northern Italy, and are held in high esteem. He wrote a volume of biographies of painters.

Bianchini, be-an-kē'ne, **Francesco,** Italian astronomer: b. Verona, 13 Dec. 1662; d. Rome, 2 March 1729. He was intended for the clerical

profession, but repaired to Rome, and applied himself to jurisprudence, and continued the study of experimental physics, astronomy, etc., as well as of Greek, Hebrew, and other languages. Pope Alexander VIII. bestowed on Bianchini a rich benefice, with the appointment of tutor and librarian to his nephew, the Cardinal Pietro Ottoboni. Pope Clement XI. also patronized him, and appointed him secretary to the commission employed in the correction of the calendar. Being on a tour through France, Holland, and England, he formed the idea of drawing a meridian in Italy, from one sea to the other, in imitation of that which Cassini had drawn through France. He was occupied eight years at his own expense in that work; but other employments withdrew his attention from it, and it remained unfinished. He concluded his career with two important works (1727) on the planet Venus, and on the sepulchre of Augustus.

Biard, Auguste François, byär, â-güst frŏñ-swä, French genre painter: b. Lyons, 27 June 1801; d. near Fontainebleau, 8 July 1882. He traveled extensively, visiting Spain, Greece, Syria, Egypt, Mexico, Brazil, etc. Among his best known pictures are the 'Babes in the Wood' (1828); the 'Beggar's Family' (1836); the 'Combat with Polar Bears' (1839); and 'The Strolling Players,' now in the Luxembourg. A strong element of caricature runs through most of his works.

Biard, Peter, French missionary in America: b. Grenoble, 1565; d. 1622. He was one of the first two missionary priests sent to New France, and with his companion, Masse, on 10 June 1611, he wrote the earliest letters sent by the Jesuit order from Canada. He at once began a study of Indian languages, established friendly relations with the Indians on the Kennebec in 1612, and in 1613 founded a colony on the island of Mount Desert. The colony was soon destroyed by the forces of Argall, deputy governor of Virginia, and Biard, being captured, was sent to England. This enterprise of Argall's marks the actual beginning of hostilities between the French and English in North America. Biard was liberated after a short time, and returning to Lyons, published in 1616, 'Relation de la Nouvelle France, et du Voyage des peres Jésuites dans cette Countrée.' This is the earliest of the 40 volumes of 'Jesuit Relations' (1632–72), which are such valuable storehouses of material for early American history.

Biarritz, bya-rĕts, a fashionable watering place of France, department of Basses-Pyrénées, five miles south of Bayonne. It is a favorite of bathers and other persons who come from all parts of Europe, and especially of the Basque mountaineers, who deem it an obligation to drink of the mineral waters once a year, as well as to bathe in the sea of Biarritz. In 1856, the place acquired additional importance from being made the summer residence of Napoleon III. and his court. Since then its popularity both in winter and summer, has steadily increased. It has no industries and is composed almost entirely of hotels and lodging houses. Pop. 12,000.

Biart, byär, **Lucien,** French novelist, poet and writer of travels: b. Versailles, 21 June 1829. He published a number of novels, containing masterly descriptions of Mexican and South American nature and customs. Among his works are 'The Mexican Women' (1853), poems; 'Adventures of a Young Naturalist' (1869); 'The Clients of Dr. Bernagius' (1873); 'Across America' (1876).

Bias, bē'as, one of the seven wise men of Greece: b. Priene, one of the principal cities of Ionia, about 570 B.C. He was a practical philosopher, studied the laws of his country, and employed his knowledge in the service of his friends, defending them in the courts of justice, or settling their disputes. He is said to have died at an advanced age immediately after successfully defending in court one of his friends. The inhabitants of Priene having resolved to abandon the city with their property, Bias replied to one of his fellow-citizens, who expressed his astonishment that he made no preparations for his departure — «I carry all that is mine with me.»

Bibb, George M., American jurist: b. Virginia, 1772; d. Georgetown, D. C., 19 April 1859. He graduated at Princeton in 1772, and took up the practice of law in Kentucky. He was twice chief justice of the State court of appeals, served two years in the State senate, and was chancellor of the court of chancery. He was a senator in Congress, 1814–19 and 1829–35, and secretary of the treasury under President Tyler. During later life he practised his profession in Washington, D. C. He compiled 'Reports of Cases at Common Law and in Chancery in the Kentucky Court of Appeals' (1808–11).

Bibbiena, be-byā'na, **Bernardo Dovizio** (styled BIBBIENA), Italian poet: b. Bibbiena, 4 Aug. 1470; d. 9 Nov. 1520. For many years secretary to Cardinal Giovanni de Medici, in whose election as Pope Leo X. he is said to have had a considerable share, he was appointed treasurer, and soon after raised to the dignity of cardinal (1513). In this dignity he became an ardent promoter of art and science. His comedy, 'Calandria,' is probably the earliest in Italian literature.

Bibbiena, Giuseppe, Italian painter: b. 1696; d. 1757. The most distinguished of the Bibbiena family, he was famed as architect, as well as an artist. Not only did he design gorgeous decorations for a court wedding at Munich in 1722 and a dazzling court festival in Prague in 1723, but he built the noted theatre at Bayreuth in 1757 and remodeled the opera house at Dresden. The 'Architettura e Prospettire' (1740) contains several illustrations of his works.

Biberach, bē'bĕ-räH, a town of Würtemberg, on the river Riss, 22 miles south-southwest from Ulm. It is irregularly built, and with its old walls, still in part remaining, and its old towers and gateways, has a mediæval aspect. Among its buildings is a fine church, dating from 1100, and recently restored. The town has important educational institutions, and a richly endowed hospital. The French, under Moreau, defeated the Austrians near Biberach in 1796. There is a monument to the poet Wieland, who was born in the vicinity, and another to the Emperor William I. The town it noted for its bell foundries and manufactures of artificial flowers, leather, toys, and machinery. Pop. (1900) 8,400.

Bibiru, be-bē'roo, a tropical tree of the laurel family.

Bible. I. The word Bible comes from a Greek word meaning book. It has come to us through the Latin *Biblia*. This is in the Greek a neuter plural. But it came to be used as a feminine singular, and so gives us our word Bible. Bibliotheca, also a Greek word, meaning library, was a designation during the Middle Ages. Earlier Latin writers used the word "testamentum" or "instrumentum," both designed to translate the Greek word for covenant. In the New Testament the usual word to designate the Old Testament is "Scripture" or "Scriptures."

II. *Languages.*—The Old Testament was written originally in Hebrew, with the exception of brief portions in Aramaic, a closely kindred dialect, namely, Jer. 10:11, Ezra 4:8–6:18, 7:12–26, Dan. 2:4–7:28. The New Testament was written wholly in Greek.

III. *Divisions.*—The most striking partition in the Bible is into two Testaments, the Old and the New. This is due to the broad difference between the era of Hebrew Messianic hope and the actual appearance and work of Christ. All preceding Christ belongs to the Old and unfulfilled. All following Christ belongs to the New and complete. Within the Old Testament there has been marked from the time of the prologue to Sirach, 132 B.C., a three-fold division. These are the Law, containing the five Mosaic books; the Prophets, including the so-called Former Prophets: Joshua, Judges, I and II Samuel, I and II Kings; and the Later Prophets: Isaiah, Jeremiah, Ezekiel, Hosea, Joel, Amos, Obadiah, Jonah, Micah, Nahum, Habakkuk, Zephaniah, Haggai, Zechariah, Malachi; and the Kethubim, a Hebrew word meaning "Writings" (called also Hagiographa, a Greek word meaning "Holy Writings"): Psalms, Proverbs, Job, Song of Songs, Ruth, Lamentations, Ecclesiastes, Esther, Daniel, Ezra, Nehemiah, I and II, Chronicles. There are also smaller divisions made by the Hebrew Scribes, 200–400 A.D. These were called Parashas. The longest of these number 54 in the Pentateuch, and are designed for Sabbath reading. Corresponding with these 54 Mosaic sections there were 54 lessons selected from the Prophets, also for Sabbath reading, called Haphtaroth. These divisions varied in number in different sections and times. The arrangement in books also shows variation. Some schemes give 24 books, so the Talmud; others give 22 books. The Septuagint and Vulgate versions reckon 39 books. This is now universal in Christian editions of the Bible, derived through the great edition of the Hebrew Bible by Jacob ben Hayim in 1525–6. The Talmud refers to still smaller divisions as Pesukim, nearly corresponding to our verses. In the manuscripts of the New Testament divisions appear very early. Such are traced to Tatian in the 2d century, to Ammonius in the 3d century, to Eusebius in the 4th century, to Euthalius in the 5th century. Our present chapter and verse divisions were completed by Robert Stephens in 1551, imitating Rabbi Nathan, c. 1437. Stephens' work was adopted by the Geneva Bible in 1560, and by the English version of 1611. The division into chapters originated with Stephen Langton, who died 1228.

IV. *Its Nature.*— The Bible, as it stands, is in the general judgment of Christendom a book altogether unique. Therein Christians look to find the very word of God. This divine message they deem pure and full, and they gladly adopt it as a binding rule of faith and life. A central feature of the volume is its claim to divine origin. Here God speaks to men. Here men learn of God. This is the direct assertion or the evident implication of its burden everywhere. The covenant with Abraham was made by God. God spoke to Moses. Hebrew history was dominated by God. The messages of all the prophets were obtained from God. The great poetical works carry continually the postulate and the evidence of open fellowship with God. If this note seems lacking, as in Esther and much of Ecclesiastes, this fact raises unfailingly a question as to their being in their proper place. In Christ, as portrayed in the Gospels, this note finds most perfect utterance. Jesus of Nazareth is the Incarnate Word. He hath seen and known the Father; and of all the Father's words he is true and faithful Witness. And the Apostles are Christ's specially prepared heralds of this same heavenly word. They speak for Christ and God. There is in all their ministry the living presence of the exalted Christ. This is "the thesis of the New Testament." Thus throughout, the Bible makes a claim to be the very word of the true and living God. This is its prime trait. This determines its nature.

Touching this quality a few things need to be said. Only so can the Bible be defined. First, as to the nature of the Deity thus made known. He is a Person. He has every personal trait. He is free and wise and kind. He is faithful and gracious and pure. He is full of goodness and truth. He is Spirit. He is of all being the only life and essence and strength. There is in him no transition or decay or change. He is pure and very life. He is transcendent. By him all things are made and ruled and judged. He is a friend. With him all persons may find fellowship. He is holy. His very being is the very energy of infinite and unfailing truth and love. Such is God. His person is the central glory of the Bible. Herein the Bible is unique. Its deity stands in simple, infinite, spiritual majesty unveiled in every part of the record. This truth finds culminating utterances in Christ's words to the woman in John 4:24: "God is a spirit, and they that worship him must worship him in spirit and truth." This fundamental verity stands clear amid all the obscurity of Gen. chapters i.–xi., and all the bewildering mysteries of the closing Apocalypse. This teaching concerning God, more than anything else, gives the Bible its peerless tone and worth. And this teaching is not abstract. It stands in life. Most powerfully is it proclaimed in the great Theophanies. These present at once the glory and the power of the Biblical claim. And these Theophanies are not incidents. They have commanding prominence and embody mighty meaning. They are in every case outstanding landmarks and points of departure. They are typical scenes. They figure in the Biblical landscapes like beacons whose rays fall everywhere.

But these disclosures are all gathered up in Christ. His figure stands in the very centre of this book. On him all symbols and expectations and prophecies converge. In him all excellencies and dignities and graces combine. From him all instructions and commissions, all judgments and mercies proceed. In him the old

and the new are made to agree. He is the very Lord of very life and truth and love. In his person and word and work all the energies and all the intimations of every Biblical scene find an equilibrium that is absolute. In him all Biblical life finds at once free play and full repose. In him the Bible lies concealed. In him the Bible stands revealed. He is the Son and Word of God.

It follows and stands evident that the Bible is a book of life. It is a record of the interplay of wills. It is always dealing with persons. Its central values are moral. Its revelations look toward reform. It is a searcher of hearts. Its appeals are to men; and they are potent. If repulsed, then its rebukes throb with resistless force. It is always scanning character, feeling after conscience, working toward the will. It has an unexampled amount of comment upon righteousness and sin, merit and blame, law and obligation, responsibility and reprisal in the moral field. It is from cover to cover a book of ethics, practical ethics, but an ethics that finds all its roots and regulations in its pure and lofty views of God. God, the pure, the holy, the supreme, is the ethical norm. With him man has vital fellowship — man the godlike and finite, the perishable and immortal, the lord and the slave, the individual and the brother. As is instantly apparent, such being God and such being man, their moral interrelations are bound to be most complex. But just here again, — and this is why these facts are named,— the Bible is in its nature unique. Its values are real, true to life. Its ethics are genuinely ethical, never formal, never partial. Its views of character are balanced and vital and full. It fully recognizes the moral value of humility and aspiration, of truth and love, of isolation and friendship, of physical and spiritual in man. Here again Christ alone is norm — norm of ethics, norm of the religious life, norm of the earthly experience, norm of the immortal life. This balanced completeness of life is a most manifest and distinguishing mark of the Biblical view. Its moral estimates are at once a full-voiced echo and a final interpretation of the life of the world.

These vital moral estimates, while fully unified, fall apart into two most striking subdivisions. This is due to human sin. Because of this undoing two widely different notes resound throughout the Sacred Word, namely, judgment and grace. In one or other of these two forms the Bible may be defined as the adjustment to sin. Universal man has gone morally astray. Upon this perversion moral judgment surely impends. This doom may be inflicted, or delayed, or reversed. This is the inner sum of Biblical truth. This is the Bible within the Bible. Here lies the inner secret of the Bible's matchless power. Under its high beliefs concerning God and its broad and searching thoughts on man, it fashions and proclaims, as no other volume ever did, its estimates of three stupendous themes: the deep and dark iniquity of sin; the awful inevitableness of its proper doom; and the divine provision and proffer of saving, sacrificial grace.

But once again, it needs to be said, the Bible is a book of life. Its messages are all set in the midst of events. It uncovers and traces the flow of a stream of history. This historical factor needs minute attention in defining the nature of the Bible. Here is a book always handling values of the highest, even absolute worth. But it is always setting them forth in simplest concrete forms. Its ideals, always phenomenally lofty and pure, are unfailingly in immediate touch with the real. Its events issue in the alternatives of eternity; but they always run along common historical paths. This striking feature, undeniably one secret of the Bible's strength, is as undeniably prolific of most vexing problems. As a storehouse of eternal principles for the moral and religious life, the Bible rises and stands beyond the reach of criticism, denial, or assault. But as a series and collection of historical events, it lies open on every side to every sort of historical challenge and test. Hence the Bible presents abidingly two widely diverse aspects — the ethical or theological, the philosophical or metaphysical, in a word the abstract; and the historical or literary, the natural or phenomenal, in a word the concrete. The former always challenges character. Its vesture and voice are imperial. It demands acceptance. To renounce its claim is to sin wilfully. The latter is always suggesting inquiry. It invites scholarly scrutiny. Multitudes of its problems hang in continual uncertainty. Hence the various phases of modern Biblical criticism.

Such is the Bible in its nature. It voices God's message to men. It reveals God's true being. It concentrates in Christ. It is a book of life, vivid, complete. Its attention is incessantly fixed on sin. It is enshrined in history. Its central religious and ethical teachings are fundamental postulates. They lie beyond the reach of fair debate. It is so embedded in incomplete and changing scenes as to provoke and sustain age-long debates. Some of the chief of these debates will be traced in succeeding sections of this article.

V. *Genesis of the Old Testament.*— A few general statements may be profitably made first. These will clear the way for a sketch of more special matters. The present Old Testament canon is substantially that adopted by the Jews of Palestine, and in vogue among them at the time of Christ. It had practically held sway there for at least over a century and a half. Prophetical writings and teachings had been sacredly revered for over seven centuries before Christ. Anterior to this, Mosaic laws were recognized as a religious and ethical norm. These scriptures were held by Christ in supreme esteem. In this view and under his interpretation they held the sum and essence of his teaching. They had divine value for such as sought the way of eternal life. In them was the word of God. This high estimate was adopted by Apostles and Church fathers.

All these statements may confidently be made. But they leave unanswered two important questions, each calling for extended treatment: when did the various constituents of the Old Testament gain entrance there? And what problems encumbered this process? These questions are exceedingly broad. They open up the whole debate of modern Bible study. In handling these matters the methods are mainly those of historical and literary criticism. In the historical study factors and arguments shift and change with the years. The method is mainly by comparative study of archæology, chronology, history, and literature. Illustrations are the tablets of Tel-el-Amarna, the Moabite

stone, the creation tablets, the lists of Babylonian and Assyrian kings, and the records of their various campaigns. But these studies deal mostly with the contents of the Old Testament books, and not with the books themselves and the main divisions of the Old Testament viewed as literature and growing into a canonical unity.

Of the literary arguments bearing upon this question the most telling is that of parallel accounts or doublets. These repetitions show variations. These variations suggest different points of view, different authors, and a combining editor. A careful study of these literary phenomena leads into a broad field of Biblical literary criticism. The aim of this study is to trace out the various authors and times and histories of these different documents. At present the tendency in this study is strongly analytic. The accent in the investigations is laid upon the differences. These differences once well defined and fixed, the effort is to trace the origin and date of each distinct document and to explain when, and how, and why they were combined into the present form. The keynote of all this process is differences. Upon this, main arguments rest. These arguments stand strongest, when the differences amount to discords or contradictions. Many of these variations are openly apparent. Many others, so it is claimed, are glossed over by ancient editorial efforts after harmony. These modulations should be removed, and the original contrast stand clear. Hence much textual emendation. It tends to sharpen contrasts. By this process each separate document is brought to a strict unison with itself, and a sharp dissonance with its companion in the doublet. Each fragment has a marked individuality, stripped as much as possible of inner manifoldness. One document, one idea; or if several ideas, then as few and similar as may be. These separate and diverse documents thus reduced and defined are then arranged, as to origin and editorship, in an evolutionary scheme of history. The simple and crude are dated early. The complex and refined are dated late. Thus the origin and evolution of the Old Testament is explained by the method of literary criticism at present characteristically in vogue. Elements aiding this process are direct historical testimony to a document's existence, the argument from silence, literary style, fixed literary forms, ethical, and religious views. A fundamental postulate is an evolutionary view of history. A dominant impulse is to trace phenomena to a natural source.

The outcome of this method is to affirm late origins for most Hebrew literature. A sample arrangement may be found in Driver, 'Introduction to Literature of Old Testament.' In general, the existence of any volume of recognized sacred Mosaic law prior to 622 B.C. is denied; or of anything but Deuteronomy prior to 444 B.C.; or of any recognized prophetical canon prior to 444 B.C.; or of any canonical volume including the books usually clustered with Psalms and Proverbs, prior to 165 B.C. In particular, the Psalms are largely denied to David, and dated instead after the exile. Daniel is dated at 164 B.C. Still it is largely concluded that teachings of Moses and of Prophets, as also certain Psalms, were held in honor earlier.

To this method and its conclusions are opposed considerations like the following: Its scheme of doublets is overworked; its conjectures are too numerous; its textual emendations too frequent and ungrounded; its standards are too uncertain; its documents are so stripped and reduced as to become void of life. By no such rigid rules does man express himself. Silence is no proof. The ancient editors are too mythical and their backs too heavily loaded, and that with most unlikely wares. Too much is made of documents. Not enough is made of men. History is fuller and more manifold everywhere than this method allows. Divine interventions, incitements, instructions, overrulings, and Theophanies are treated with too scanty respect. Evolutionary views do away too easily with the manhood of early men. Biblical history and conditions are not so primitive by long millenniums as this method seems to presume. In particular the lofty value of the Psalms demands more attention. By the negative critical method they stand unexplained. Vastly more lay back of the 8th century than this method presents. Too much is loaded upon Ezra and in the period of the Maccabees. Far too many direct Biblical affirmations have to be reversed.

Thus scholars conflict touching the genesis of the Old Testament. In this far-reaching debate the following evidence and events are of most importance to hold in view. The allusions within the Old Testament to the existence of sacred books, such as Ex. 24:4, 7; 34:27; 40:20; Deut. 31:26; Josh. 24:26; I Sam. 10:25; Isa. 8:16; Jer. 30:1; 36:1, 28; II Kings 22:8; Dan. 9:2; Neh. 8–9; the Praise of the Famous Men in Sirach (chapters 44–50); the prologue to Sirach; the opinions of Philo; the estimate and usage of the New Testament; Josephus, *contra Apion* 1, 8; II Esdras 14:44–46; the work of the Council of Jamnia; and the evidence of the Mishna; also all light obtainable in the great field of comparative studies, specially from Babylonian archæology. In broad outline, the main problems are to find out what sacred literature existed prior to 165 B.C.; then prior to 444 B.C.; then prior to 623 B.C.; then prior to 750 B.C., the period of the great written prophecies; then in the Davidic era; then at the time of Moses; then to find the origin of the various fragments in the unique section Gen. 1–11. Touching most of these problems, definite information is at present nowhere in reach. The precise connection of the Biblical creation and flood accounts with Babylonian material, the contents of the sacred books in the Mosaic era, the range of sacred literature in Isaiah's time, the list of Davidic Psalms, the literature held sacred in the exile, the scope of the books handled by Ezra, the outside outline of Sirach's sources, or of his grandson's allusions, a sharp definition of the rise and influence of apocryphal writings, a satisfying explanation of the varying or the final order of Old Testament books, the meaning of the Septuagint divergences, and the actual evaluation of apocryphal literature by our New Testament writers — these all are questions fairly open to debate. Knowledge is incomplete.

VI. *Canon of Old Testament.*— Study of the genesis of the Old Testament leads naturally into an examination of its development into a fixed and closed canon. While it seems proper and safe to say that our present Protestant Old Testament canon is identical with that accepted

by the Jews of Palestine in and before the time of Christ, there are numerous evidences that even among Palestinian Jews several canonical questions were under debate for a century or two after Christ.

To begin with the latest Jewish testimony and work backward toward origins, first mention has to be made of a full statement from the Babylonian Talmud. This passage is traced to Rabbi Judah the Holy, head of the school of Tiberias in the 2d century. He is said to have collected the Mishna. In this statement all the parts of the Old Testament, as we have it, are named with a definite statement as to authors. "Moses wrote his book and the section concerning Balaam and Job. Joshua wrote his book and those eight verses in the Law. Samuel wrote his book and the book of Judges and Ruth. David wrote the book of Psalms 'at the hand of' 10 old men, to-wit: Melchizedek, Abraham, Moses, Heman, Jeduthun, Asaph, and the three sons of Korah. Jeremiah wrote his book and the book of Kings and Lamentations. Hezekiah and his friends wrote Isaiah, Proverbs, Song of Songs, Ecclesiastes. The men of the great synagogue wrote Ezekiel, the Twelve, Daniel, and the little book of Esther. Ezra wrote his book and the genealogies which we read in the book of Chronicles." This statement seems, considering its probable source, to indicate a fixed canon. But discussions of certain Old Testament books occurred considerably later. These concerned Proverbs, Song of Songs, Ecclesiastes. Proverbs was charged with internal contradictions. All three were deemed uncanonical by some, because they contained parables. Repeatedly, debates rose as to whether Ecclesiastes and Esther were fully canonical, that is, whether they "defiled the hands." The regulations about the feast of Purim in Esther seemed to contradict the Pentateuch. While for Ezekiel, its strange legislation in the closing section made real trouble. At a much later time Jonah made occasion for special remark, because of its neglect of Israel and attention to Gentiles. For full information upon this stage of Jewish thought, see Wildeboer, 'The Origin of the Canon of the Old Testament,' pp. 56–75. As to the meaning of these facts men judge differently. Some say these books were all held canonical; it was simply a discussion of vexing problems which they contained. Others say these debates imply that these books were not as yet within the canon.

Another date and event to be marked is a council at Jamnia, in western Palestine, about 90 A.D. Then problems were raised about certain books, in general the Kethubim, but in particular, Ecclesiastes and Song of Songs. They were all declared holy, that is, canonical.

About this time is to be dated II Esdras 14:44–46. Here is an apocalyptic story of Ezra's miraculous dictation of 94 sacred books, 24 of which were to be promulgated as the public Jewish canon. This story must have found its motive partly in the fact that at about 90 A.D. the Jewish canon held 24 books.

Josephus also belongs to about this date. He has left in *contra Apionem*, 1:8, a painstaking list and estimate of the Jewish canon of his time. He makes the number of the books 22. He reckons five to Moses, 13 to the prophets, and four containing hymns to God and maxims for human life. He does not name the several books. It is therefore uncertain whether his list agrees with ours. Some think he left out Ecclesiastes and Song of Songs. Some think he joined Lamentations to Jeremiah, and Ruth to Judges. In any case his statement is most notable. He boasts of their limited number, of their antiquity and their cordial acceptance. He closes the canon with the period of Artaxerxes. Later books are not deemed worthy of like faith. No one has dared to increase or diminish their volume. They are cordially deemed God's oracle, and held as rules for life and death. All these arguments are made with deliberation for purposes of defense. They form a weighty evidence.

Philo, who lived somewhat earlier, an Alexandrian Jew, seems to have held just the list accepted by us as strictly canonical and of authority. His reverence for the Mosaic writings is most evident. He quotes nothing from the Apocrypha. This is noteworthy. He also leaves wholly unmentioned 17 of our canonical books.

In the prologue to Sirach is a reference three times over to "the Law," "the Prophets" (Prophecies), and the "Others" (other books, remaining writings) with suggestions, also repeated, of their unique value for culture and wisdom, and of their fulness and significance. This was written about 130 B.C. It seems to betoken a complete threefold canonical collection. It occurs in a brief statement explaining the work of his grandfather which he is about to publish and commend to the men of his time.

This work of Sirach, the grandfather of the foregoing, was written about 180 B.C. It is permeated with the very substance of our Old Testament. Its clearest light on the problem of the Old Testament canon is in chapters 44–50. Here he sings the praise of famous men. He selects 24 names, besides the Judges and the 12 Minor Prophets, from Enoch to Nehemiah, and sings their praise. To this he appends a song to Simon of his own time. And at the end he names himself. In these eulogies Sirach holds scripture in high esteem. He seems to especially honor the Law. But it becomes specially difficult to say anything about his views of Old Testament canon. He seems to attribute to Simon and even to himself a respect all but equal to that accorded to the prophets. Plainly all the law and all the prophets and all the historical books were before him. Some of the Hagiographa fail of mention. There was manifestly, at 180 B.C., an Old Testament canon of recognized sacred standing, all but commensurate with ours of to-day.

The situation in the time of Ezra is far from clear. The passages to examine are Nehemiah 8–9; Ezra 7:6, 10, 12, 25, 9:10. From these passages it stands apparent that Ezra was a ready scholar in the law of God; that he had prosecuted his study during the exile; that some literature held sacred by him had been long in hand; that much of our Mosaic law was recognized as Mosaic by him and by the assembly described in Nehemiah 8–9; that religion, morals and life were constructed upon this Mosaic foundation. But just the extent of the Mosiac writings, just their antiquity, and just what other literature may have supplemented them is far from explicitly said.

Daniel 9:2 alludes to books that must have been prophecies, alluding in particular to Jeremiah. In his prayer he alludes to laws, ordinances, a covenant, the deliverance from Egypt, the warnings of the prophets, mentioning Moses. But no canonical list can be constructed here.

To this may be added citations from earlier portions of Scripture, indicating the existence of sacred records. None of these citations are certainly definitive of canonical limits at any period. But it may not improperly be said that the multitudinous allusions throughout Old Testament scripture to early divine revelations and leadership all, if only taken at their face value, go to show that records of these early events were always at hand and held validly sacred depositories of the Word of God. But historically, the inner content and the outside outline of this Old Testament canon comes into sight and shape for the first time in the words of Sirach about 180 B.C. Then it stood practically as it stands with us to-day. Later queryings were limited and substantially insignificant. And such debates as did arise were due to the extreme reverence of the Jews for the Mosaic Law, to their peculiar interpretation of that law, and to their jealousy to have all their sacred writings stand in fullest harmony therewith. For statements of their extravagant respect for the law see Weber, 'Die Lehren des Talmuds,' pp. 1–60, and Wildeboer, pp. 94 —.

From among Church fathers three witnesses call for special mention here. Melito, Bishop of Sardis, about 170, went into Palestine expressly to get the Jewish view of the number and order of the books of the Old Testament. His finding is given in Eus. Hist. Eccl. iv. 26. His order is peculiar. He omits Esther entirely. Nehemiah and Lamentations are not named, but probably they are included, the one with Ezra, the other with Jeremiah. Origen's canon is also found in Eus. Hist. Eccl. vi. 26. This list omits the Twelve Prophets, probably some mistake. It includes Esther. It adds the letter of Baruch. Origen died 254 A.D. Jerome died 420 A.D. In his preface to his translation to Kings he gives the Hebrew canonical list, 22 books. This is a very precise and carefully detailed statement. It is found in full in Wildeboer, pp. 80–84. He gives Jewish views, names the Apocrypha separately, and lists the canon as we have it to-day. He speaks elsewhere of Jewish queryings about Ecclesiastes. The Nestorian Christians reject Esther, Chronicles, Ezra, and Nehemiah, but accept Sirach. But in the main always, and from Jerome onward the Christian Church accepted the Jewish canon as finally fixed by them 200 A.D., and as we have it to-day. Still, through the influence of the Septuagint, the Vulgate, and Augustine, the Roman Catholic Church has retained also the Apocrypha.

VII. *Text of Old Testament.*— Our earliest information names tables of stone. Upon these were written the commandments. Deuteronomy was a roll, when found in the temple. Jeremiah's writings were a roll. The script was originally the old square characters seen on the Moabite stone, and in the Samaritan copy of the law. Later, no one knows when, the Aramaic characters were used. This is the script used to-day in all Hebrew Bibles. In the Maccabean period, the Syrian oppressors destroyed most of the Jewish sacred literature. Judas Maccabeus collected them all again. Possibly it was he who introduced the new writing. See II Maccabees 2:14. When the Jews fixed and adopted an official Old Testament text is unknown. Most date the act at the beginning of our 2d century, at the councils of Jamnia, 90 and 118 A.D. Tradition says they used three manuscripts found at Jerusalem. These early texts were wanting in vowels and separation of words. The scribes, 200–500 B.C., made numerous changes in the way of corrections, definition, pronunciation, and other improvements, including divisions and arrangements for liturgical use. These scribes were followed by students who were called Massoretes who simply guarded and perpetuated the work of the scribes. From this has come our present, so-called Massoretic text. These Massoretes added vowel points, completing their work in the 7th century in Babylon, and in the 8th century in Palestine. This work is perpetuated in the text of Ben Asher of the 10th century. Upon this all later western manuscripts have been based. In these latest years some efforts have been made to reconstruct the ancient texts, notably by Baer and Delitzsch. For samples of just what may be done, consult Kautzsch, 'Die Heilige Schrift des Alten Testaments,' in the textual emendations collected in the appendix.

VIII. *Manuscripts of the Old Testament.*— Jews have been extremely jealous of the purity of their manuscripts. Rules calling for minutest accuracy are laid down in the Talmud. See Kenyon, 'Our Bible and the Ancient Manuscripts,' p. 34. This carefulness secures truthful copies. Hence recent manuscripts are prized quite as highly as those most ancient. Indeed the old manuscripts are religiously destroyed, so that they may escape desecration. Hence we have no Hebrew manuscripts earlier than about the 10th century, and even these are few and incomplete.

IX. *Versions of the Old Testament.*— The Samaritan Pentateuch, though not a version, should be mentioned. If its original form could be produced, it would give us a Hebrew text, perhaps dating from the days of Neh. 13:23–30. But we have no manuscripts older than the 10th century.

The Septuagint version was made from Hebrew into Greek, somewhere between 300 and 130 B.C. This version was extended to embrace the Apocrypha. Other Greek translations were made: one by Aquila about 150 A.D.; one by Theodotian a little later; and one by Symmachus about 200 A.D. Origen tried to restore the Hebrew text about 240 A.D. Only fragments of this work survive. The same effort is made about 300 A.D. by three other men, Eusebius, Lucian, and Hesychius. The best evidence for restoring to us the original Septuagint is contained in the three famous manuscripts: the Sinaitic, the Alexandrian, and the Vatican, dating from the 4th and 5th centuries A.D. The best printed edition of the Septuagint now extant is that by Swete. A much larger edition is now in progress at Cambridge.

Other versions of the Old Testament dating from the early centuries are the Syriac, 2d or 3d century A.D.; the Coptic, 3d century A.D.; and the Latin, chief being Jerome's Vulgate, about 400 A.D.

X. *Genesis of the New Testament.*—In the earliest days of the New Testament Church their sacred book of authority was the Old Testament. The apostles of Christ were continually referring to these Hebrew writings and expounding them. But in this process they were also always preaching that Jesus was the Christ. The Old Testament Messiah and the Nazarene were one. This was their dominant theme. As an outcome their message was full of statements about Jesus. Indeed, this was the centre and the sum of their preaching. Thus their proclamation put into being a body of teaching about the person and words and deeds of Jesus Christ. In this Christic life the Old Testament found its fulfillment. Hence there came to stand alongside the Old Testament material another body of truth, having equal sacred value, namely, the report and record of the life of Jesus Christ. Moreover, at the same time, and in the same process there came into form and shape the substance and sacred authority of an Apostolic message. And so, gradually, and in a vital way, as an outcome of the growing life of the New Church, a set of writings called Apostolic came to be acknowledged as a New Testament Canon and to be set alongside the Old Testament as having equal authority and worth. This process took time, and had its stages. Its separate steps we are not able to trace. It stood complete in the canons of the 3d Council of Carthage 379 A.D. From that date onward the New Testament stands in its full integrity as a canonical body of sacred literature. So all Christendom has agreed.

To trace this historical uprising of our New Testament is well nigh the most urgent task of modern Christian scholarship. Something needs to be said about this. Christ left no writings. This seems undoubtedly sure. It seems almost equally sure that the first New Testament writings were the natural outgrowth of the Apostolic work. In this process Paul holds the preeminent place. His writings, while mostly born of special needs, held an enduring value. They engrossed his authoritative message. As such they were cherished, and formed a nucleus of sacred New Testament literature. In some vital connection with this growing life and work under Apostolic lead, there grew up our gospels. Just how, and just when this most important work was done no one surely knows. Efforts at the reconstruction of this process are making everywhere and all the time. But the procedure is almost entirely theoretic.

Certain facts stand clear. The gospel of John stands in a place by itself. Its outline of Christ's life, its choice and treatment of material, and its central themes are all widely and strangely unlike the main features of the other gospels. Luke also has a striking individuality, containing a surprising quantity of material found nowhere else, though for all that agreeing strikingly and in essential respects with Matthew and Mark. Matthew and Mark are plainly very closely akin. They are commonly felt to have arisen in some way expressive of close felowship of aim, form, sources, and time. Touching the origin of all four explicit inner witness is lacking. The simple fact of their actual rise into a position of supreme authority and respect, whatever may have been the method or means, gives every presupposition in favor of the genuineness of all four as authorized reports of Jesus' life. Thus much needs saying by itself.

Certain traditions about their origin have figured very influentially. Eusebius, about 300, reports from Papias, about 140, that a "presbyter" used to say that "Peter used to give his instructions acording to what was required, but not as giving an orderly exposition of the Lord's words." These "Mark, having become an interpreter of Peter, wrote down accurately, etc." Immediately in the same context Eusebius quotes Papias as saying of Matthew that "he wrote the oracles in the Hebrew dialect, and each one interpreted them as he was able." Of Luke we can gather no helpful traditions; we have to gather all we know from references in his gospel, in Acts and in Paul's writings. While the mention of the gospel of John opens a world of sharpest scholarly divergence and debate.

Now to outline briefly leading theories: The gospels are conjectured to have originated something thus: First, in the first three gospels there are striking signs of broad similarity; their general synopsis of the main outline of Christ's public life is the same; they use many phrases in common; they expand and condense at the same points; such facts intimate that very definite and potent influences operated in common upon all three. This solicits explanation. But they also strikingly differ; these differences are commanding and broad. Luke has much unique material; Matthew distributes his material into coherent masses; Mark seems simpler, truer, strikingly independent. These variations also call for explanation. These resemblances and divergences are being traced with minutest carefulness. The aim is to find the facts as to their origin. Which gospel was first; which was next; what were their sources respectively and in common; how are Matthew and Mark, Matthew and Luke, Mark and Luke, related; did any one depend on any other, or upon the other two; did some fourth account, now lost, lie back of these; what was the Hebrew gospel, etc.? These are the leading questions which students are trying to answer. A view widely held at present supposes that Mark preserves to us a document which came to his hand from some source unknown to us; that Matthew preserves to us another document called the Logia; that these two were combined by Matthew in forming his gospel; that Luke also used the Logia, combining it with his own new material. This is the now widely known "two-document" theory. The main efforts here are to define the original full pure form of each of these two documents. Here positions vary manifoldly. Another view urges vigorously that no written documents lay behind any of our gospels. What preceded our written gospels was an era of very careful catechetical instruction. Out of this memorized and crystallized material grew our gospels. This method seems to find a measure of illustration in the oral discourses of the book of Acts. For a historical review of this study see Sanday, 'Expositor' 1891, 'A Survey of the Synoptic Question.'

The study of the origin of the gospel of John is getting to be a science by itself. It has hardly a single thing in common with the debate over the first three gospels. Look at

the fourth gospel carefully. Its progress of events, its relation to Judæa and Jerusalem, its report of the great debates, its miracles, its discourses, its style, its ideas, its very words are all peculiarly its own. Two questions have come to the front. Are its narratives authentic history? Was it written by the son of Zebedee? But other problems are also urgent: When and where and how was it written? What is the sum and drift of its internal evidence? What has been its external history? Has its order of chapters or paragraphs been disturbed? How is it related to the epistles of John, and to the Apocalypse? To list and classify the views that have been held, saying nothing of the literature, would be impossible here. See special article on Gospel of John. Suffice it to say that among scholars, as they strive to give some rational account of these matters, there has been a strong tendency to discount the historical value of this gospel, and to deny its full authorship to the apostle John. But the great heart of Christendom has always felt that it found and felt in the Gospel of John the very presence of its very Lord, as discerned and described by his most profound and intimate disciple. The prime question has always been in plain view. Did the only begotten Son of God become incarnate for our salvation? This is *the* Johannine question. Upon this prime problem hangs every other. Once state in full and in brief the entire sum and nature, the whole scope and purport of its words, as they stand; note its unity, its homogeneity and its profundity; survey the sweep of its thought; look into its religious purity, its ethical absoluteness, its transparent clarity; sense its overwhelming momentum; observe its entire fluidity, the energy of the whole pouring full from every part; being watchful all the while to see that these impressive qualities, all and single, lie throbbing and shining in this gospel wholly and only because of the clear and full presence of the Christ, whom some author, with an all-absorbing devotion, has endeavored to unveil — and one must conclude and exclaim that here is no human invention, no poetic embodiment of any earth-born type of thought; but rather the declaration and disclosure, by an anointed and enraptured eyewitness, of his own full and immediate vision of the heavenly glory of Jesus Christ, the only begotten and incarnate Son of God. At any rate it can be boldly said that a discussion of the origin of the Gospel of John, to say nothing of the other three gospels, deals with the inmost essence of the subject of this essay.

Some special mention of the book of Acts is also needful in any statement of the genesis of New Testament writings. Here is an authority of the first rank and importance. It is our sole reliable record of the earlier days of the Christian Church. It defines and presents the actual process of the transition from the life and time of Christ to the Apostolic Age. Its references to geography, and archæology and politics and civil administration and customs, all presented with singular minuteness, at the same time expose it to the sharpest tests of historical criticism and establish its singularly full trustworthiness. Written without much doubt by Luke, a personal friend and companion of Paul, and a man of painstaking accuracy, it offers from chapter 20:5 on, and also in chapter 16, the testimony of an eyewitness; from chapter 12 on, a record of first-hand knowledge; and in its first 12 chapters a compilation from sources which he was in a peculiarly good position to obtain and inspect with the aid of first rate authorities. But problems beset the book. The leading of these concern the day of Pentecost; the relation of the speaking with tongues in Acts 2 to that in I Corinthians 14: the relation of chapter 15 to Galatians 1 and 2; the sources of the book; the authorship; the text; and the speeches. In particular, certain scholars impugn chapters 1–7, and all records of miraculous events. But in the main these are matters that lie beyond the range of precise historical outside proof. Hence theories may continue to abound. But sober views must contend that here is a faithful reflection of the primitive Christian days, from the hand of an alert and competent historian who wrought under the immediate influence and presence of apostolic men, in the very midst and upon the very ground of the scenes which he reports.

One other section demands mention in this study of the genesis of the New Testament — the Apocalypse. The surface aspect of this book is bewildering. Its historical allusions are the puzzle of the ages. Interpretations are a crazy medley. But statements of another nature may also be made. This book belongs to a class. It is one of many. In fact it marks a world current. Taken altogether, the outpour of Apocalyptic literature is a phenomenon of noteworthy persistence. It springs up repeatedly in Old Testament life. A striking instance is Daniel. It wells up frequently in the speech of Christ. Many would deny all such ideas to him. But this is rash and violent in the extreme. His conscious connection with Daniel cannot be impugned. His own apocalyptical utterances must be allowed. Then the teachings and experiences of Paul cannot be erased. Thus much touching form. But once one penetrates beneath the form, and confronts the inner message of every Biblical apocalypse, — he is a rash assailant who would assume to undo its word. This is pre-eminently true of the Apocalypse of John. It is a book of impregnable strength. Its central theme is the world struggle between the true God and his blasphemous counterfeit for the worshipping allegiance of mankind. This is the one inmost and uppermost errand and office of the book. Specially in chapters 12–22 the evolution and description of this conflict stand forth in stupendous strength. The true God, the living God, the creator God, the spirit God, sole Lawgiver, Judge and Saviour of angels and men, holy, infinite and pure; the suffering and glorified Christ, mighty, gracious, and true; with their innumerable, worshipping, devoted human and angelic hosts, on the one side — the Dragon and Beast and pampered Queen, full of blasphemy, treachery, cruelty, and lust; with their hosts of devotees to every sordid lust, on the other side, representing all the personnel, good and bad of a teeming universe, surge and strive unto issues of eternal life and eternal death amid the scenes of this mysterious book. It is a volume of life in which the awful struggles within the realms of religion and ethics attain their ultimate culmination. It fixes for-

ever the issue toward which all the teachings of the Bible tend. Here, as nowhere else, the solemn undertone of the entire volume sounds forth in full expression. Here the full majesty of God, the full enormity of sin, the full anguish of guilt, the full felicity of grace stand clear. Here the inner structure and substance of true morals and religion are shown and seen to be imperishable. However mysterious and confusing the outer guise of this incomparable book, whatever historical allusions its various enigmas may really intend, whoever its author, whencesoever its sources, and whatever the motive stirring its writer's mind, its inner teaching, simple and sublime, concordant, inclusive, and pure, forms the crown and marks the consummation of all for which the Bible most distinctly stands. Its nature befits its place. It well corresponds to the mysteries and enduring strength that mark the opening chapters of the book standing at the beginning of the Biblical list. It is a book of issues. A study of its genesis leads back into a deep and far-seeing study of the real inner meaning of all the volume which it concludes. Thus much needs saying about its inner value.

Critical study of the origin of this book has in recent years taken a new turn. This study deals distinctly with its apocalyptical features, and its historical intimations. It has pursued two marked courses, one that of literary, the other that of historical criticism. The latter is at present paramount, and bids fair to hold the first place. It consists in an effort to trace, through a study of the world's apocalyptical literature, the actual historical genius of the forms found in this work ascribed to John. This work is as yet but fairly begun. Till it is done efforts at final estimates are vain. The nature and field and status of this study may be seen in Bousset, 'The Antichrist Legend.'

XI. *Canon of the New Testament.*— This study seeks to trace the actual historical acceptance of the New Testament writings by the Church as a recognized body of sacred literature, worthy to stand alongside the Old Testament. One has to begin with 140 A.D. Witness as to this date is very meagre and indefinite. The data are from the epistle of Clement to the Corinthians, the II Epistle of Ignatius the Epistle of Polycarp, the Didache, the Epistle of Barnabas, the Shepherd of Hermas, the writings of Justin Martyr. Some of these testimonies date later than 140 A.D. by a few years. But they stand so near that date as to form fair testimony as to that era. The evidence is mostly by way of allusions to sayings found in our New Testament writings; and not in the form of direct citation or mention. But these allusions and references are sufficiently numerous and suggestive to support quite firmly the supposition, which otherwise seems most natural, that our New Testament writings were at that date widely known and honored. In a few cases the exact words of our gospels were used by these early writers, as a quotation from the Lord's Prayer, and from his words in Gethsemane. In some cases New Testament writings are mentioned, as Paul's epistles, I Corinthians and Philippians. One writer refers to the words of Christ in Matthew 22:14 as Scripture. In particular the work of Papias is important. His words shed light on the period prior to 140 A.D. He explicitly attests "writings" as of Apostolic value, one from Peter through Mark, and one from Matthew. He also seems to have known of other writings from the hands of Peter and John. See Eus. 'Hist. Eccl.' iii. 39. The words of Justin are of the greatest value, though still indeterminate. He alludes repeatedly to 'Memoirs of the Apostles.' He uses the word "Gospels." He traces these writings to the "Apostles and those who followed them." He seems certainly to have had in hand our first three gospels. Some important elements of his work seem almost as surely traceable to the Gospel of John. He alludes to Paul's epistles as standard. He also names John's Apocalypse. Marcion also apparently knew and used Luke, and accepted 10 epistles of Paul, namely, Galatians, I and II Corinthians, Romans, I and II Thessalonians, Colossians, Philemon, Philippians, Laodiceans. Statements like the above are as definite as can be made about our New Testament prior to 150 A.D. The fullest testimony within the Church is from Justin Martyr. He bears witness that a New Testament canon was in vogue in his day, having fully equal validity with the Old Testament. How far back can this condition be supposed to date; and how many books were included. Zahn says that our four gospels and the 13 Pauline epistles were widely circulated as collections at the latest about 125 A.D. Harnack declares this unsupported by historical evidence.

200 A.D. In stating in general the situation of the New Testament canon at this date the chief witnesses are Tatian, Irenæus, Clement of Alexandria, Tertullian, Hippolytus, the Muratori canon. These sources make many features stand clear. Tatian prepared from our four gospels his Diatessaron. Irenæus attests all our New Testament books except Philemon, II Peter, Jude, specially emphasizing the value of the four gospels. He calls these New Testament writings the "pillar and ground of the faith." He combines them with the Old Testament as upborne by the same spirit. Clement of Alexandria distinctly attests the same writings as sacred writings, including II Peter, Jude, and Hebrews. Tertullian made abundant use of our New Testament writings as holy writings, excepting that he is silent about II Peter and II and III John, and sets Hebrews, I Peter, and Jude into a second rank. The Muratori Fragment makes a sharp definition of canonical books. It includes the four Gospels, Acts, 13 epistles of Paul, I and II John, Jude; and omits Hebrews, I and II Peter, III John. At this period, as in the earlier era, certain writings, not now held canonical, notably Barnabas, Shepherd of Hermas, and Apocalypse of Peter, seem to have stood near to sacred Scripture in Christian respect. For this era the Syriac version yields peculiar material. It accepts Hebrews, but omits II Peter, II and III John, Jude, and Revelation. In brief, at 200 A.D. our four Gospels, Acts, 13 epistles of Paul were established universally in supreme respect as sacred Scripture with the old Testament.

200 to 323 A.D. In this era two names call for mention. Origen, who died 254 A.D., has left quite outspoken statements. The most valuable are in Eus. H. E. VI. 25. He gives the four gospels sharp definition as unique and canonical. He exalts the works of Paul without numbering his books. He declares I Peter

«acknowledged,» and II Peter as in circulation. He includes Revelation and I John, mentioning II and III John as not held «genuine by all.» He discusses at length on Hebrews, honoring its contents, but wondering about its authorship. In other passages he includes Acts as by Luke, and credits 13 epistles to Paul, and uses James and Jude. One striking feature is Origen's distinctions. He speaks of some books as «not spoken against,» of others as not held «genuine» by all, of another as «acknowledged,» a term which he also applies to all the «Apostolic writings.»

Eusebius in H. E. III. 25 gives a classified list, aiming to summarize the views of the whole Christian period to his day. He gives the four gospels, Acts, 14 epistles of Paul, I John, I Peter, and Revelation. These he called «acknowledged.» He then names James, Jude, II Peter, II and III John as «disputed.» He names next «Acts of Paul,» Shepherd, Revelation of Peter, Barnabas, Teachings of the Apostles as «spurious.» Here is notable testimony. It is representative. It is discriminating. It contributes toward conclusions. It shows a universal, undoubted canonical standard. It shows cautious study and practice. It shows that precisely our present canon was held at that time, and we cannot be sure how early or how far his testimony reaches. And it shows that writings now finally rejected were then rejected. This is one of the chief landmarks in the history of the New Testament canon.

323 to 397 A.D. Constantine gave standing to the Christian Church. He revered and disseminated sacred Scripture. Conflicts with heretics made outlines precise. The canon, accordingly, became clear and took final form. Doubts vanish. The word «canon» comes into vogue. The Synod of Laodicea, about 360 A.D., has been said to have left a list, in its 60th canon. At any rate it belongs in this period. It gives the present Protestant canon for Old Testament and New Testament, only omitting Revelation. This omission was characteristic of the Eastern Church at this time. In the West, Hilary and Rufinus held to this canon. Augustine and Jerome also fixed upon our present list, though recognizing that some books were challenged. The formal concluding steps were taken authoritatively for the Western Church at the third Council of Carthage, 379 A.D. In 495 A.D. Bishop Gelasius I. of Rome put forth a synodical verdict as a decree adopting the list and fixing the order of the New Testament canon as we have it to-day. In 691 A.D. this was adopted for East and West by a universal council.

XII. *Text of the New Testament.*— Up to the time of Constantine the fortune of New Testament Scriptures was precarious. We know too little about it all. But Christians were largely poor, often persecuted, sadly scattered and altogether unable to solidify and maintain in permanent form all the elements and instruments of their life. We have no original New Testament manuscripts. We have no copies from the first three centuries. When Constantine accepted Christianity, among other things, he ordered Eusebius to prepare 50 copies of the Scriptures for the churches of Constantinople alone. From that century manuscripts begin to appear, two being preserved to our day. Two more date from the 5th century. From the 6th century 27 documents have come to our time. From the 7th century 8 small fragments. These authorities and many more of later days restore to us our New Testament text. Aid is also rendered by versions. Chief of these are the Syriac and the Latin. Further aid comes from the Church fathers. The text which lay underneath our authorized English version was based on very inadequate knowledge and study of textual authorities. In later years this study has become a noble science. In most recent years its prosecution has taken a turn of phenomenal meaning. Scholars are trying to group textual authorities. In this impressive undertaking Westcott and Hort are leaders. They seek to classify sources into families, and so to be able to estimate manuscript values. In this process one group is called «Syrian,» including a great number of authorities, but all alike being of low value. Another group is the «Western.» Of this the leading manuscript is D, Codex Bezæ, so-called. This group is remarkable for freedom, specially for adding otherwise unknown material. Another group is the «Alexandrian.» This group is of minor weight. The fourth group is called «Neutral.» This is believed to represent most nearly the original New Testament. Its leading authority is B, the Codex Vaticanus, so-called. This is the oldest and weightiest manuscript we have.

This raises the whole question of the relative worth of manuscripts. It may be surely expected that this problem is by no means solved. It is little more than opened.

Independent workers are challenging the positions of Westcott and Hort. But after all is said and done, our New Testament text is mainly assured. «The great bulk of the words of the New Testament stand out above all discriminative processes of criticism, because they are free from variation, and need only to be transcribed. . . . The words in our opinion still subject to doubt can hardly amount to more than a thousandth part of the whole New Testament. See Westcott and Hort, 'Principles of Textual Criticism.'

Manuscripts of the New Testament.— Four manuscripts deserve emphatic mention, as they are prime sources for both Old Testament and New Testament. Codex Alexandrinus, named A, dates probably from the 5th century. It contained originally the whole Bible in Greek, also the two epistles of Clement. At present it is mutilated. Parts of Genesis, I Kings, and Psalms, most of Matthew, parts of John and II Corinthians are lost. It is now in the British Museum. It came from Constantinople to England in 1627. As an authority it rates lower than the two next named.

Codex Vaticanus. B.— This dates from the 4th century and contained originally the whole Greek Bible. This is deemed by many the oldest and most precious manuscript known. It is in the Vatican library at Rome, since 1450 A.D. In its present state it lacks portions of Genesis, II Kings, Psalms, Hebrews, the Catholic epistles, and all of Revelation. Its text had predominant influence with Westcott and Hort and with the revisers of our English Bible.

Codex Ephræmi. C.— This dates from the 5th century. Originally it contained the whole Greek Bible. It is now in the National Library

in Paris. Early in the 16th century it was brought to Italy from the East. It was taken to Paris by Catherine de Medici. At present it is a palimpsest and only a fragment, having only a small part of the Old Testament and barely more than half of the New Testament. It is of great value.

Codex Sinaiticus. Aleph.— This dates from the 4th century. It now exists in two parts: one, of 43 leaves, in the Court Library in Leipsic; the rest in the Imperial Library in St. Petersburg. It originally contained the whole Greek Bible. But now the Old Testament is in fragments. The New Testament is complete. This is the manuscript that was found by Tischendorf under such thrilling experiences in the monastery of St. Catherine at Mount Sinai. It is of priceless value as a witness to the New Testament text.

Codex Bezæ. D.— This manuscript orginated perhaps in the south of France in the 6th century. It is now in the University Library at Cambridge, being the direct gift of Beza in 1581. It contains the Bible in two languages, Greek and Latin. The relation of these two texts to each other is a very curious and unsolved problem. As a witness it has to be used with great caution. Its New Testament text contains only the Gospels and Acts and a few verses from the Catholic epistles. Its most striking and puzzling feature is its strange omissions, and still stranger quite extensive additions.

The above named are the leading manuscripts. These are all written in large letters called uncials. Of these there are over 100. Many more, considerably over 2,000, are written in smaller letters and in a more running style, and so are called cursives. For further statements consult the Variorum Bible.

XIII. *Versions of the New Testament.*— Of these the Syriac would naturally date early. Until toward the middle of the last century all supposed the so-called Peshitto, or common version, to be the one and only Syriac translation of Scripture. In 1842 manuscripts came to view suggesting another and perhaps earlier version. Since that time there has been much debate over the problem of two versions in Syriac. Of late new light has come, and again from Mount Sinai. Here in 1892 two ladies found a palimpsest of a Syriac version which may possibly be older than either. This debate is destined to continue for some time. Of these versions the Peshitto is the great standard version of the Syriac Church. It has been current and in general use from the 4th century. We know of 177 manuscripts, gathered from the Nitrian Desert in Egypt, and now in the British Museum. This version does not include II Peter, II and III John, Jude, and Revelation. Other Syriac versions have been made.

Egyptian Versions.— These must have begun to originate by 300 A.D. At present five are known. The Memphitic represents lower Egypt, where the dominant dialect was at home. Here alone are complete copies of the New Testament found. Over a hundred manuscripts have been examined, all of late date, the oldest from 1173. Its text is surprisingly good. The Thebaic version was current in upper Egypt. It probably originated somewhat later than the Memphitic. It exists only in fragments, though many of them are very old manuscripts, some dating possibly into the 4th century.

Armenian Version.— This originated in the 5th century. It was made from mixed texts, Greek and Syriac. Its earliest manuscript dates from the 8th century.

Gothic Version.— This was made by Ulfilas in the 4th century directly from the Greek. Now it is in fragments.

Old Latin Version.— This was made, perhaps, in Africa about 150 A.D. Scholars trace rival translations and classify them as African, European, and Italian. These were supplanted by the Vulgate. Textual study of this early version is of peculiar interest, disclosing, as it does, a very free treatment as characteristic of that time, and containing what is called the «Western» text.

Vulgate.— This is a work undertaken by Jerome at the order of Pope Damasus in 382. At first he merely revised the Old Latin, working on the Gospels. Then he developed the rest of the New Testament. His Old Testament work was much later and more thorough-going. Manuscripts of the Vulgate exist everywhere in Europe. The best is the Codex Amiatinus. The text of this version has been in very bad condition, and it is very difficult to restore. The work is in progress. This is the standard Bible of Latin and Roman Catholic Christendom everywhere.

XIV. *History of the Bible as a Whole.*— Jerome's influence through his Vulgate version and through separation of the Apocrypha from the canon was far-reaching. In the 16th century the Roman Catholic and Protestant Churches took different courses. The Roman Catholic Church in its Council of Trent in 1545, adopted the Old Testament Apocrypha as an integral part of the Old Testament canon. The Lutheran party, after some indecision, settled down by usage upon the pure and full Biblical canon as held by us to-day, though during the process there was free discussion of the value of the parts that we have found under dispute. The same holds true of the Swiss or Reformed party. Through them, and by way of the Westminster Confession of Faith, we have received our present body of sacred Scripture.

Previous to this the Bible had made its way to England. About 670 A.D. Cædmon made a paraphrase in verse of the Bible narrative in Anglo-Saxon. Before 800 Aldhelm had translated the Psalms into English. In 735 Bede finished, with his life, a version of John. King Alfred also did some work of this kind. But of these nothing surely remains. Numerous other translations of parts of the Bible were made later. Of some of them manuscripts remain.

Wycliffe's first translation dates from 1380–2. This was a composite work. Soon after his death this was revised; and this revised Wycliffite Bible became the current version. About 170 copies are known. This is the first known complete English Bible. Though of untold value, it was not a scholarly work, being based upon a poor Latin translation.

In the 15th century printing appeared, November 1454. In the same century, and at about the same time the Turks took Constantinople and scattered scholars out of the East, with their learning and treasures, over Europe. Out of this revival of learning and printing came mighty sequels for the Bible. Translations and

copies now could multiply. In England several versions need mention.

In 1525 Tyndale completed in Hamburg his translation of the New Testament. Despite strenuous efforts to destroy it, copies multiplied. But most of them have perished. This version, variously revised, is the influence lying most potently underneath the present King James Bible, and through it our English tongue has gained and retained not a little of its peculiar charm.

Other translations are Coverdale's, undertaken at the request of Cromwell, dedicated to Henry VIII., covering the whole Bible, and published in 1536; Matthew's, really a completion of Tyndale's, made under favor of the king, finished in 1537; the Great Bible, a grand, authorized edition of Matthew's, under Cromwell's patronage, by the hand of Coverdale, published in 1539 and set up in every church; the Genevan Bible, prepared in Geneva by English refugees under the influence of Calvin and Beza and published in 1560; the Bishop's Bible, prepared under the patronage of Elizabeth and the editorship of the Archbishop of Canterbury for the English Church, and printed in 1568; and the Roman Catholic or Douay Bible made from the Latin Vulgate for the Roman Catholic Church, and published 1582 and 1609. Of these the Genevan Bible had the widest influences; it was the first entire English Bible to adopt the division of chapters into verses.

Authorized Version.— This work was produced under the patronage of King James I. at the suggestion of the Church leaders. About 50 scholars were engaged in the work, arranged in six groups. They used Beza's Greek Testament of 1589 for the New Testament. The Bishop's Bible formed the English basis, though the Genevan and Douay versions had much influence. Through the Bishop's Bible Tyndale still made his power felt. This version was published in 1611 to become the standard form of sacred Scripture for over 200 years for the entire English race. Its influence upon literature and life can never be told.

Revised Version.— Increase of knowledge of Biblical lore since 1611 made a revision imperative. This work was proposed officially by the Established Church of England in its Convocation of 1870. Rules were laid down governing the translation, enjoining use of best text, faithfulness to the original meaning, and as few alterations as possible. Two companies were formed, of 27 members each, selected from various denominations. These were supplemented by a body of American scholars, whose results, when not adopted by the English body, were incorporated in an appendix. The work began in 1870. The New Testament appeared in 1881, the Old Testament in 1884. The changes from the version of 1611, while very numerous (Dr. Kenyon records that the Greek New Testament of 1881 differs from that of 1611 in 5,788 readings, of which about one quarter are a notable change) are prevailingly in matters of minor moment.

American Version.— In 1901 the surviving members of the American committee, appointed by the English committee in 1870, published an edition of the English Bible in which the opinions of the American members of the revision hold first place. In this edition there are several notable improvements in the way of faithfulness and modernness and facility in use. Chief among these is the new list of marginal readings.

German Versions.— Luther's is the standard, though many translations appeared before his. He translated directly from the Greek and Hebrew, putting out 10 editions during his life. In 1863 the Evangelical Church Diet set afoot a revision of Luther's Bible. Specially to be mentioned for scholarly value are Weizsäcker's German translation of the New Testament; and the translation of the Old Testament conducted by Kautzsch and completed in 1894.

French Versions.— The chief early version is that by Olivetan in 1535. In 1588 a revision was made at the suggestion of Calvin and under the lead of Beza. This has been the standard French Bible. A new translation by Segond 1874–9 is now most widely used.

The standard Dutch Bible, called the States Bible, is a translation authorized in 1624 by the States-General of Holland, and completed in 1637.

To-day there exist at least 108 translations of the entire Scriptures. If partial translations are added, the total will nearly reach 500. In this work the past century has been a phenomenal era. It has seen the Bible put into the possession of 1,200,000,000 of people. This is pre-eminently the work of Protestant Christianity. During this past century 80 Bible Societies have come into being, with a multitude of auxiliaries. Of these the leading one, the British and Foreign Bible Society, issues annually nearly 4,000,000 copies.

XV. *Influence of the Bible.*— The persistence of the Bible and its unexampled dissemination command some remark. Its age-long and world-wide promulgation must contribute to extend and fortify its power. But its own original, creative force alone can explain its amazing diffusion and vitality. It proves itself pre-eminently the Book of Life. The sacred Scriptures of no other religion or faith can ever begin to parallel it for the number and value of its manuscripts, the number of its versions, the number of its publishing houses, and the number of its copies actually sold. As literature it is wholly unique. The stamp of its style has fixed the taste of the leading nations of our time. And its manifoldness is quite as wonderful as its excellence. It embodies history and oratory, dialogue and drama, philosophy and poetry, giving every essential form of human literary utterance. It has laws, tragedies, annals, parables, prayers, satires. It contains the epic, the lyric, the ode, the chorus, the oracle, the riddle, the chant, the liturgy, the refrain, the acrostic, the apostrophe, the proverb, the epistle, the philippic.

But it is not the form, pleasing and refining as it is, that holds the secret of the Bible's power. It is always the message that transmits force. The Bible figures always as the Word of God. It engrosses and addresses character. Its moral energies are the sources of its strength. It reveals and declares God. It announces law. It portrays the judge. It stirs up conscience to a final verdict upon human life. It summons the human will. Its heroes are prophets. Its great victors are princes in the moral realm. Its central figure is Jesus Christ. Its typical explorers are apostles. Its closing book is an apocalypse. Its outlook is eternity. These things create and sustain its matchless

style; and these explain and feed its undying life. It has to do with the being and majesty of a holy God, and with the inmost character and uttermost destiny of immortal man. Hence all its excellence and strength.

C. S. BEARDSLEE,
Professor Hartford Theological Seminary.

Bible, Harmony of the, with Science. The history of science in its connections with the Bible is full of these conflicts between the scientific and theological classes. Both parties have participated in them, as assailants and defenders. Sometimes scientists, after misleading the divine into some supposed scientific interpretation of Scripture, have charged back upon him their own exploded errors, and sometimes divines, after attacking some true theory of the scientists as hostile to Scripture, have gladly accepted it as among their best defenses of the faith.

Astronomy and the Bible.— The first of the seeming conflicts was between astronomy and the Bible. The Psalmist David, who was not a scientist, had poetically depicted the starry heavens as a spangled canopy wondrously wrought by the divine hand. But the astronomers in later times devised what is known as the theory of Ptolemy, according to which the heavens were composed of vast crystal spheres, one within another, having the sun, moon, and stars attached to them as they revolved around the earth, which was conceived of as a flat, circular plane, immovably fixed at the centre of the system. The divines of the day, docilely accepting this crude mechanism of the scientists, proceeded to celebrate the divine power, wisdom, and goodness which it displayed in producing the wonderful vicissitudes of day and night and summer and winter. Their logic was correct enough in form, but needed to be reinforced with better science. The better science at length came, not indeed from a professed scientist, but from a faithful priest of the Church, Nicholas Copernicus, who modestly broached as a working hypothesis, what is now known as the Copernican theory of the solar system. Galileo, however, who could equal Huxley in sarcasm and invective, published in his scientific journal called 'The Siderial Messenger,' such proofs of the Copernican theory as provoked a bitter controversy with the Church authorities and led to his pretended recantation. It is difficult for us now, with our advanced knowledge, to understand what a radical change was coming into men's opinions. Not only was the solid earth sent spinning through space like a cannon ball, but the entire orthodox conception of heaven and hell was literally revolutionized. The Inferno of Dante, with its descending ranks of lost spirits and demons, could not be contained within such a revolving globe, and his Paradiso, with the saints and angels worshipping the Blessed Virgin and Holy Trinity, vanished from such a receding firmament like sunset clouds. And when Bruno came with his daring speculations concerning other inhabited worlds our little planet seemed too utterly insignificant to be made the scene of a divine incarnation, redemption, and judgment. Every essential article of the faith appeared to be imperiled. It is no wonder that free thinking men of science fared badly in such a conflict with the Roman Inquisition. Galileo was imprisoned as a heretic, and Bruno was burned at the stake as an atheist and blasphemer. But what has been the issue of the conflict? Scarcely a trace of it remains. Gradually the new astronomy has been accepted, not only as true in itself, but as far more accordant with Scripture than the old astronomy of the Hebrew or Greek. Instead of a star spangled tent or an illuminated dome of glass, it has opened an unbounded universe for the illustration of the divine perfections and revealed doctrines. Does astronomy tell us of an immensity of space, with regions beyond regions which we cannot even conceive? The Bible also teaches us that Jehovah inhabiteth eternity, and the heaven of heavens cannot contain Him. Does astronomy tell us of countless orbs, moving with tremendous forces, in fixed orbits, under immutable laws? The Bible also teaches us that He hath ordained the heavens and established in them His power and faithfulness. Does astronomy tell us of wonderful adaptations of planet to sun, with changing zones, and climates, and

seasons? The Bible also teaches us that wisdom was with Him when he prepared the heavens, the sun and moon and stars for signs and for seasons, and that He hath garnished them by His spirit. Does astronomy hint to us of a variety of habitable worlds, with a corresponding variety of intelligent races? The Bible also teaches us of the heavens as the abode of angels and archangels and of a heavenly Father and His house of many mansions. Does astronomy tell us that our earth is akin to other orbs in mechanical and chemical constitution, and suggest that we may be some day knit together with them by ethereal vibrations in psychical sympathy? The Bible also teaches us that the angels desire to look into the mysteries of human redemption, that its manifold wisdom is now made known to principalities and powers in all heavenly places, and that there is rejoicing among them when one sinner on earth repenteth. Let it be observed, I am not now saying that the Bible teaches astronomy, but simply that its teaching is in harmony with astronomy.

Geology and the Bible.—The next seeming conflict was between geology and the Bible. It is certain that Moses did not speak as a man of science in his dramatic vision of the creation, when he described the heavens and the earth, land, sea and sky, plants, animals and man, as produced by divine commands in six working days, ending in a seventh day of rest. The early geologists, however, accepted this sublime vision as a scientific cosmogony, and like-minded divines followed them, magnifying such creative miracles as the formation of the terraqueous globe in 24 hours, the arrangement of its seasons and climates between a single sunrise and sunset, and the marshaling of its vegetable and animal kingdoms by divine fiats from Monday morning until Saturday night in the autumn of the year 4004 B.C. Here again the argument, absurd as it now seems, lacked scientific content rather than logical form. It is within living memory what a shock ensued when that scientific content was furnished, and it was discovered that the earth is of indefinite antiquity, that its continents have emerged from its oceans through long ages of subsidence, and that successive dynasties of plants and animals have flourished and decayed, leaving only a few fossil remains in its crust. The very doctrines of the creation and the Sabbath itself seemed directly assailed, and the defense of them was fierce and desperate. The geologists were not persecuted like Galileo and Bruno; but the most extraordinary makeshifts were devised to evade their conclusions. It was intrepidly declared that the Almighty created the earth in a stratified form with all its fossils, to serve as a trial of our faith. It was ingeniously surmised that the whole prehistoric geology was a chapter omitted in Genesis as not relevant to the purpose of the narrative. It was even fancied that the six days' works were a special miraculous creation in Eastern Asia to fit up a Paradise for the temptation and fall of man. When at length the vast geological periods could no longer be denied, they were forced into correspondence with the Mosaic days, conceived as days of Jehovah, with whom a thousand years are as one day; and elaborate schemes of reconciliation were proposed by such distinguished geologists as Hugh Miller, Dawson, Dana, and Guyot, with which some less distinguished geologists have since made themselves merry. Nevertheless, we are already emerging from these heated discussions with reassured faith. As astronomy has opened unbounded regions of space for the illustration of the divine immensity, omnipotence, immutability and omniscience, so geology has recalled unlimited periods of time for unfolding the divine power, wisdom, and goodness with cumulative richness and fulness. And as astronomy has shed new light upon the revealed doctrine of the heavens and the angels, so geology is confirming the revealed doctrine of an orderly creation and a sabbatical calendar. Though the dramatic days of Genesis be measured in hours or in ages, though the time element be excluded from them altogether, though they be treated as ideal rather than actual, they will still appear as coincident acts of creation and phases of evolution, founded perhaps in the periodicities of nature and expressed in the Fourth Commandment. On comparing them we have, first, a formless waste or the nebulous chaos; second, the earth as divided from the firmament or the planet as parted from the solar nebula; third, the seas and the dry land bringing forth grass and herb, or the terraqueous globe with its photosphere and commencing verdure; fourth, the appearing sun, moon, and stars for signs and seasons, or the mature planet, in the solar system, with its zones and climates; fifth, the swarming of the great fishes and winged fowl, or the production of sea monsters and mammoth reptiles; sixth, the earth bringing forth beasts each after its kind, and the making of man in the image of God, or the evolution of the higher animal and human species; seventh, the divine day of rest, or the tranquil historic period. The correspondence, it will be seen, is at least logical, even if not chronological. On the one hand, geology clearly indicates that there have been successive periods of energetic evolution ending in a period of repose and order; and on the other hand, the Bible declares that in six days God created the heavens and the earth, and rested from his works on the seventh day. Geology also tells us of a primitive watery globe, whose glaciers and inundations have ceased since the appearance of man; and the Bible also, after the deluge, speaks of a covenant between Jehovah and the earth for man's sake, that summer and winter, and seedtime and harvest shall not cease. Geology still hints of interior fires which might at any time burst forth in general conflagration; and the Bible still warns latter day scoffers of a day when the earth and all the works that are therein shall be burned up. You may say that this teaching of the Bible is religious rather than scientific; that is not the point — whatever it be, it is in harmony with geology.

Anthropology and the Bible.— We are still in the midst of a seeming conflict between anthropology and the Bible. In the vision of creation man appears as made in the

image of God, with dominion over all inferior nature. Then follows an allegorical picture of the first man, Adam, as formed out of the ground, inspired with a living soul, and placed among the beasts of the field, and the fowls of the air, which had also been formed out of the ground and brought to him to receive their names. The first woman, Eve, his wife, is depicted as fashioned out of one of his ribs while he was in a trance, and the pair were placed in a garden to till it, with liberty to eat of every tree but the tree of knowledge of good and evil. They were tempted to disobedience by the subtlety of Satan in the form of a serpent, and so fell from their state of innocence, entailing the curse of labor, sorrow, and death upon the whole of mankind. It would seem impossible to find any strict anthropological science in this instructive parable; and yet until recently it has been so treated by both scientists and divines, who have held that man was molded by the divine hand as a lifeless clay image among living plants and animals; that he was endowed with psychical faculties and God-like qualities in a few minutes or hours, and that the man Adam was the sole progenitor of all the savage and civilized races of Asia, Europe, Africa, and America. But scientists are now urging some very different theories of human origin and development. We are told by palæontologists and ethnologists that man was but the product of the whole evolution of organic nature; that his remote ancestor was a man-like animal or anthropoid ape; that next came a succession of pre-Adamite races, of which the Hottentot, the Patagonian, and the Esquimau may be the survivors; that there have also been co-Adamite races as indigenous in other continents than Asia as the plants and animals with which they are there found associated; that all civilized races, including the Adamite, or Caucasion, have risen from savagery, with improving implements and arts, through long epochs of stone, of bronze, and of iron, and have a prospect of indefinite improvement in the future. In spite of theological prejudice and some instinctive repugnance, we have begun to entertain these theories, and may already provide, if need be, for their acceptance. As astronomy and geology have afforded new illustration of the physical attributes of Jehovah, so anthropology is unfolding His intellectual and moral attributes, in the structure of both body and soul, and may in like manner be adjusted to the revealed doctrines of human depravity and the divine image. The essential truths in the allegorical story of Eden will stand unimpaired, whether we view man's sinfulness as a primitive lapse or as a present condition; whether we regard his ideal Godlikeness as impressed upon him thousands of years ago or as still in process of development. If anthropologists shall prove that primeval man, physically considered, was evolved from pre-Adamite and anthropoid races as a half-animal savage in a state of nature; that he slowly developed psychical powers and religious beliefs; that while many breeds of men remain debased and deteriorated the Caucasian breed, both Hebrew and Christian, has been steadily advancing in knowledge, virtue, and religion, and that the perfected man of the future, with growing arts and sciences, may yet transform the globe and even bring it into connection with other worlds and races. If the anthropologists, I say, shall prove all these things, the Bible will teach, in correlation with them, that the first man Adam was of the earth, earthy, placed in a fruitful garden, associated with the animals, but with dominion over them; that God breathed into him a living soul and made him after His own image; that as in Adam all die, so in Christ shall all be made alive, and as we have borne the image of the earthly, so also shall we bear the image of the heavenly, and that the man of prophecy, as renewed after the image of Christ, the Lord from heaven, shall yet inhabit the new heaven and the new earth, wherein dwelleth righteousness. And still, too, will such teaching of the Bible, though unscientific, be found to be in harmony with such facts of anthropology.

Archæology and the Bible.— And now we are entering a seeming conflict between archæology and the Bible. The historical books, with no show of historiographic art, record the fortunes of the peculiar people of Israel as descended from the patriarchs, Abraham, Isaac, and Jacob, as worshipping Jehovah in distinction from the false gods of the heathen around them, as returning even from their captivities in Egypt and Babylon with a fresh reassertion of their own creed and ritual, and as ever looking forward to the Messiah, Christ, in whom their whole religion was at length absorbed and fulfilled. Philosophical historians, as well as learned commentators, have hitherto accepted these simple annals as accurate and trustworthy. Of late, however, some discredit has been cast upon them by certain archæologists, who claim that the inscriptions on the tablets unearthed at Babylon bear suspicious resemblances and affinities with Biblical stories of creation and paradise. The American Professor Hilprecht, with the true scientific spirit, declines to make such invidious comparisons, and declares that the Babylonian polytheism stands in contrast with the Hebrew monotheism. But the German Professor Delitsch hastily infers from them that the Hebrew monotheism was no better than Babylonian polytheism, and jumps across the following centuries to the conclusion that our Saviour himself thus depreciated the Jewish religion. Meanwhile, the German Emperor William, after admonishing the learned antiquarian professor to stick to the Babylonian tablets, without drawing theological inferences, proceeds to give his own somewhat conservative views of the theology of the Old and the New Testaments. It is a very interesting controversy. But suppose we should concede, for the sake of argument, all that the theolgical archæologists are trying to prove,—grant that the inspired vision of creation and the divine allegory of Eden may have some crude counterparts in the corresponding myths and legends of Babel—is it quite inconceivable that both have descended, the one in a pure and the other in a corrupted form, from the same primeval revelation in the dim period before the flood? Are not the Hebrew Scriptures one continual

protest against the religious errors of surrounding nations, and have they not at the same time infinitely surpassed them in the religious truths which they have unfolded? Is it any more incredible that Judaism should have been developed out of, or in spite of, preceding religions than that Christianity should have been developed out of or in spite of Judaism, both of them under that wonderful Providence which has educated the chosen races of mankind? Moreover, it has distinctly taught that both Judaism and Christianity, after their isolation and pupilage, were destined to universal prevalence; that in Abraham all the families of the earth would be blessed, and Christ himself be revealed as the desire of the nations. And the Gospel, therefore, was proclaimed among the Gentiles as well as among the Jews. St. Paul, too, the Apostle to the Gentiles, when preaching to the Athenians, insisted upon the consensus of Christianity with their religion in those great theistic beliefs which were taught by their own poets and philosophers, and which are common to all mankind. And, as Christianity, clad in civilization, is now going forth among the religions of the world reclaiming their truths and rejecting their errors, she is simply fulfilling her mission as the one absolute and universal religion—the faithful saying, and worthy of all acceptation, that Christ came into the world to save sinners.

I do not forget how much the question is complicated by the views of a radical school of the higher critics who maintain, on literary grounds, that the Old Testament Scriptures themselves betray that mythical and legendary origin which some archæologists would ascribe to them. Many of the conclusions of this school are based upon unverified conjecture and continual asseveration. But it may be well to accept them hypothetically, in order to state the whole problem of opinion. Assume then, if you like, that the books of the Pentateuch or Hexateuch were not written by Moses, but were a sort of mosaic of pre-existing documents written by unknown scribes and collected by unknown redactors or editors, as we now possess them. Assume also that the Biblical stories of creation and paradise in their literary form are anthropomorphic, dramatic, allegorical, and unhistorical. Assume still further that in these respects they bear some external resemblance to the creation-myths and paradise-legends of other Eastern peoples. Prove all this, if possible; and yet you will not have destroyed the incontestable fact that these ancient writings contain an objective revelation from God to man which is infinitely superior in kind and degree to any supposed revelations in the religions of Babylon, Nineveh, Assyria, Egypt, Greece, and Rome; and which even as to literary form surpasses any other sacred books, ancient or modern. Nor will you have lessened the evidence which the Bible thus affords of growing harmony with the very sciences of archæology and philology which are now arrayed against it.

In this article I have sketched in a popular manner those physical sciences which have seemed to be in conflict with revealed religion, because such sciences just now are most popular in their impression and most likely to disturb existing faith in the inspiration and authority of the Holy Scriptures, and because they are the most advanced sciences. The argument might be carried up into the higher sciences of psychology, sociology, and the science of comparative religion, but such sciences, as yet, are not so mature nor in so apparent conflict with the Scriptures. It will be seen that the argument is strongest where science is most clear and full. It is also cumulative, and already, I trust, warrants the belief that when science shall have reached the utmost goal of its development it will still be, as it always has been, in harmony with the Bible.

Charles Woodruff Shields,
Professor Princeton University.

Bible, The Polychrome. A new translation of the Scriptures from a revised text, by eminent biblical scholars of Europe and America; Professor Paul Haupt of Johns Hopkins University, editor, with the assistance in America of Dr. Horace Howard Furness. The special scheme of this great work is its use of color backgrounds upon which to print the various passages by different writers which have been made up into one work, as Isaiah or the Psalms. It is not based on any doubt of inspiration, but on the general conviction of biblical scholars that only good can come from making perfectly clear to the public the full results of modern critical research.

Bible Statistics, an interesting compilation, said to be the fruits of three years' labor by the indefatigable Dr. Horne, and given by him in his introduction to the study of the Scriptures. The basis is an old English Bible of the King James version.

Old Testament.— Number of books, 39; chapters, 929; verses, 23,214; words, 593,493; letters, 2,728,100.

New Testament.— Number of books, 27; chapters, 260; verses, 7,959; words, 181,253; letters, 838,380.

The Bible.— Total number of books, 66; chapters, 1,189; verses, 31,173; words, 773,746; letters, 3,566,480.

Apocrypha.— Number of books, 14; chapters, 184; verses, 6,031; words, 125,185.

Old Testament.— The middle book of the Old Testament is Proverbs. The middle chapter is Job xxix. The middle verse is 2 Chronicles xx., between verses 17 and 18 The shortest book is Obadiah. The shortest verse is 1 Chron. i. 25. The word "and" occurs 35,543 times. Ezra vii. 21 contains all the letters of our alphabet. The word "Selah" occurs 73 times and only in the poetical books. 2 Kings xix. and Isaiah xxxvii. are alike. The Book of Esther does not contain the words God or Lord. The last two verses of 2 Chronicles and the opening verses of the Book of Ezra are alike. Ezra ii. and Nehemiah vii. are alike. There are nearly 30 books mentioned, but not found in the Bible, consisting of civil records and other ancient writings now nearly all lost. About 26 of these are alluded to in the Old Testament.

New Testament.— The middle book is 2 Thessalonians. The middle chapter is between Romans xiii. and xiv. The middle verse is Acts xvii. 17. The smallest book

is 2 John. The smallest verse is John xi. 35. The word «and» occurs 10,684 times. The name Jesus occurs nearly 700 times in the Gospels and Acts, and in the Epistles less than 70 times. The name Christ alone occurs about 60 times in the Gospels and Acts, and about 240 times in the Epistles and Revelation. The term Jesus Christ occurs 5 times in the Gospels.

The Bible.— The middle book is Micah. The middle (and smallest) chapter is Psalm cxvii. The middle verse is Psalm cxviii: 8. The middle line is 2 Chronicles iv. 16; the largest book is that of the Psalms; the largest chapter is Psalm cxix. The word Jehovah (or Lord) occurs 6,855 times. The word «and» occurs 46,227 times. The number of authors of the Bible is 50. The Bible was not until modern times divided into chapters and verses. The division of chapters has been attributed to Lanfranc, Archbishop of Canterbury, in the reign of William I.; but the real author of this division was Cardinal Hugo de Sancto-Caro, about 1236. The number of languages on earth is estimated at 3,000; the Bible or parts of it have been rendered into only about 180, or, languages and dialects together, 345. The first English translation complete of the Bible was by Wyclif in 1380. The first American edition was printed in Boston in 1752.

Bibles, The Seven, the seven principal Bibles of the world are the Koran of the Mohammedans, the Eddas of the Scandinavians, the Tripitikes of the Buddhists, the Five Kings of the Chinese, the three Vedas of the Hindus, the Zend Avesta, and the Scriptures of the Christians. The Koran is, except the Eddas, the most recent of these seven bibles and not older than the 7th century of our era. It is a compound of quotations from the Old and New Testaments, the Talmud and the Gospel of St. Barnabas. The Eddas of the Scandinavians was first published in the 14th century. The Tripitikes of the Buddhists contain sublime morals and pure aspirations, but their author lived and died in the 6th century before Christ.

The sacred writings of the Chinese are called the Five Kings, the term king meaning web of cloth or the warp that keeps the threads in their place. They contain the best sayings of the best sages on the ethico-political duties of life. These sayings cannot be traced to a period higher than the 11th century before Christ. The three Vedas are the most ancient books of the Hindus, and it is the opinion of Max Müller, Wilson, Johnson, and Whitney that they are not older than 11 centuries before Christ. The Zend Avesta of the Persians is the grandest of all these sacred books next to our Bible. Zoroaster, whose sayings it contains, was born in the 12th century before Christ.

Biblia Pauperum (Bible of the poor), the name for block books common in the Middle Ages, and consisting of a number of rude pictures of Biblical subjects with short explanatory Latin text accompanying each picture. A similar work, but more extended and with rhymed text, was the 'Speculum Humanæ Salvationis' or 'Mirror of Human Salvation'. Prior to the Reformation these two books were much used by the preaching monks, and as such orders as the Franciscans, Carthusians, etc., were styled 'Pauperes Christi,' the first named book, so popular with them, came to be known, therefore, as the 'Biblia Pauperum'.

Biblical Criticism, the science which has for its objects (1) to decide which books are entitled to a place in the Scripture canon, and (2) to bring the text of these canonical books to the utmost possible degree of purity. In prosecuting the first of these aims, the Biblical critic must not be confounded with the Christian apologist; the function of the former is a strictly judicial one, while the office of the latter is that of an advocate. One important subject of investigation is as to what Old Testament books were recognized as divine by the ancient Jewish Church or Synagogue; as also what New Testament books were at once and universally welcomed by the early Christian Church, and what others were for a time partially rejected, though they ultimately found acceptance everywhere. In seeking to purify the text, the Biblical critic must do much toilsome work in the collation of codices or manuscripts. He does not put the whole of these on one level and admit whatever reading has a majority of manuscripts in its favor; but attempts to test the value of each one apart, forming an hypothesis if he can as to when, where, and from whom it emanated, and from what other manuscripts it was copied at first, or in technical language, to what recension it belonged. See Bible.

Bibliog'raphy, a term signifying the knowledge of books, in reference to the subjects discussed in them, their different degrees of rarity, curiosity, reputed and real value, the materials of which they are composed, and the rank they ought to hold in the classification of a library. It is therefore divided into two branches, the first of which has reference to the contents of books, and may be called, for want of a better phrase, *intellectual* bibliography; the second treating of their external character, the history of particular copies, etc., may be termed *material* bibliography. The object of the first branch is to give information regarding the most valuable books in every department of study by means of catalogues.

Bibliography has been, and still is, cultivated most successfully in France. This is owing partly to the riches of the great and daily increasing public libraries, liberally thrown open to the use of the public, partly to the large number of fine private collections. Brunet's well-known 'Manuel du Libraire' was the first important work which contained, in an alphabetical form, a list of the most valuable and costly books of all literatures; Barbier's 'Dictionnaire des Ouvrages Anonymes,' the first systematic and satisfactory treatise on this subject; Renouard's 'Catalogue d'un Amateur,' the first, and for a long time the best guide of the French collectors; the 'Bibliographie de la France,' the first work which showed how the yearly accumulation of literary works can be recorded in the most authentic manner. No less valuable are the works of Peginot, Petit Radel, Renouard on the Aldines, and various others. Among more recent French works may

be cited 'Bibliographie de la France,' a periodical publication commenced in Paris in 1810. H. Bossange, 'Ma Bibliothèque Française' (1855), gives a list of standard editions of the best French authors. I. M. Quérard, 'La France Littéraire ou Dictionnaire Bibliographique,' an account of the literature of the 18th and 19th centuries (10 vols. 1827–39); Quérard, 'La Littérature Française Contemporaine' (1827–49); Brunet's 'Manuel du Libraire' (new edition, 6 vols. 1860–5); E. Hatin, 'Bibliographie de la Presse Périodique Française' (1 vol. 1866); Lorenz, 'Catalogue Général de la Librairie Française depuis 1840,' giving French publications from 1840 to 1899.

In England, although it contains many rich public and private collections, bibliography has not been so successfully cultivated as in France. The most extensive catalogues of books of which it can boast are those of the Bodleian Library, the British Museum, the Advocates' Library, Edinburgh, the Harleian Library (compiled partly by Dr. Johnson), etc. Catalogues compiled on a scientific system, by which the reader is assisted in his researches after books on a particular subject, are not numerous in English, but we may mention Sonnenschein's 'The Best Books' (1891), and 'Guide to Contemporary Literature' (1895), presenting classified lists of about 100,000 works. The most splendid catalogue perhaps ever published is that of the Earl of Spencer's Library, compiled by Dibdin, in four large volumes, with numerous engravings. Among English bibliographical works are the 'Typographical Antiquities' of Ames, Herbert, and Dibdin; Adam Clarke's 'Bibliographical Dictionary and Miscellany' (1803–6); Dibdin's 'Introduction to the Knowledge of Rare and Valuable Editions of the Classics' (1827, 2 vols.); Brydges' 'Censura Literaria' (1805), and 'British Bibliographer (1818); Beloe's 'Anecdotes of Literature' (1807); Savage's 'Librarian' (1808); Dibdin's 'Bibliographical Decameron' (1817); and 'Tour in France and Germany' (1821); Horne's 'Introduction to the Study of Bibliography' (1814); Robert Watt's 'Bibliotheca Britannica' (1824, 4 vols. 4to), a work of stupendous labor and great utility; Joseph W. Moss' 'Manual of Classical Bibliography' (1825); Darling's 'Cyclopædia Bibliographica' (chiefly theological literature, 1854); 'A Bibliographical and Critical Account of the Rarest Books in the English Language,' by J. Payne Collier (1865); Lowndes' 'Bibliographer's Manual,' edited by H. G. Bohn (1869, 6 vols.); S. A. Allibone's 'Critical Dictionary of English Literature and British and American Authors' (Philadelphia 1859–71, 3 vols., and 2 of Supplement 1891); Halkett and Laing's 'Dictionary of the Anonymous and Pseudonymous Literature of Great Britain' (1882–8, 4 vols.); Sampson Low's 'English Catalogue of Books,' which in a series of successive volumes catalogues the British books published from 1835 onward to the present time.

American literature has already given rise to quite an extensive series of bibliographical works on both sides of the Atlantic. Among these are: 'Bibliographical Catalogue of Books, etc., in the Indian Tongues of the United States' (1849); Duyckinck, 'Cyclopedia of American Literature' (1856); Ternaux-Compans, 'Bibliothèque Américaine' (Paris 1837); Trübner, 'Bibliographical Guide to American Literature' (London 1856); and 'General American Catalogue' of Leypoldt and Jones (1880, with continuations); 'The Publisher's Trade List Annual'; 'Monthly Cumulative Index'; 'American Book Prices Current.'

The learned Germans, little assisted by public and almost entirely destitute of private collections, consulting only the real wants of the science, have actively endeavored to promote it. Ersch is the founder of German bibliography. He gave it a truly scientific character by his extensive work, 'Allgemeines Repertorium der Literatur' ('Universal Repertory of Literature' 1793–1807), and by his 'Handbuch der Deutschen Literatur' ('Manual of German Literature'). German bibliography is particularly rich in the literature of separate sciences; and the bibliography of the Greek and Latin literature, as well as the branch which treats of ancient editions, was founded by the Germans. The first attempt, in Germany, to prepare a universal bibliographical work was made by Ebert. The following are valuable German bibliographical works in particular departments of science and literature: T. A. Nosselt, 'Anweisung zur Kenntniss der Besten Allgemeinen Bücher in der Theologie' (4th ed. 1800), and the continuation of it by Simon (1813); C. F. Burdach, 'Literatur der Heilwissenschaft' (1810); W. Gf. Ploucquet, 'Literatura Medica' (1808, 4 vols.); T. G. Meusel, 'Bibliotheca Historica' (1782–1802); his 'Literatur der Statistik' (1816); G. R. Böhmer, 'Bibliotheca Scriptorum Historiæ Naturalis' (1785–99, 7 vols.); Alb. Haller, 'Bibliotheca Botanica' (Zurich 1771, 2 vols.); 'Anatomica' (Zurich 1774, 2 vols.); 'Chirurgica' (Bern 1774, 2 vols.); and 'Medicinæ Practicæ' (Bern, 1776, et seq., 4 vols.); R. Buckner, 'Bibliographisches Handbuch der Deutschen Dramatischen Literatur' (Berlin 1837); W. Engelmann, 'Bibliotheca Geographica' (2 vols. 1858), a classified catalogue of all works in geography and travels published in Germany from the middle of the 14th century down to 1856, with prices, index, etc.; W. Engelmann, 'Bibliotheca Philologica' (3d ed. 1853) contains a list of Greek and Latin grammars, from 1750 to 1852; the same writer has published bibliographical works on mechanical technology, medicine, economy, veterinary art, geography, zoology, palæontology, etc.; W. Heinsius, 'Allgemeines Bücherlexikon,' an extensive work forming (with its continuations) an alphabetical catalogue of all the books published in Germany from 1700 to 1888, with sizes, prices, and publishers' names; and Keyser's 'Vollständiges Bücherlexikon,' giving books published between 1750 and 1882.

Directions for the study of bibliography are contained in Achard's 'Cours Élémentaire de Bibliographie' (1807, 3 vols.); Th. Hartwell Horne's 'Introduction to the Study of Bibliography' (1814, 2 vols.); and Brunet's 'Connaissances Necessaires à un Bibliophile' (Paris 1878).

Material Bibliography, often called by way of eminence bibliography, considers books in regard to their exterior, their history, etc., and has been principally cultivated in France and England. The different branches of material bibliography may here be mentioned: the knowledge of the ancient editions (*incunabula,* or, if classical authors, *editiones principes*), some of the best works on which are G. Wfg. Panzer's 'Annales Typographici' (1793–1803, 11 vols.),

coming down to 1536; the 'Annales Typographici,' by Maittaire (Hague 1719, et seq., 11 vols. 4to), which not only contains the titles, but investigates the subjects of works. More exact descriptions of particular ancient editions are found in Serna Santander's 'Dictionn. Bibliogr. du 15ième Siècle (Brussels 1805, 3 vols.); Fossius' 'Catalogus Codicum,' sec. 15, 'Impressor. Bibliothecæ Magliabecchianæ (Florence 1793, 3 vols. fol.); and others. The study of rare books, on account of the vague principles on which it rests, is more difficult than is generally believed, and easily degenerates into superficial and capricious trifling. This has been more injured than promoted by I. Vogt's 'Catalogus Librorum Rariorum' (1793), and J. Jac. Bauer's 'Bibliotheca Libror. Rarior. Universalis' (1770–91, 12 vols.). We may also mention here the catalogues of the books prohibited by the Roman Catholic Church ('Indices Librorum Prohibitorum et Expurgatorum'). For the discovery of the authors of anonymous and pseudonymous works, we may use Barbier's 'Dictionnaire des Ouvrages Anonymes et Pseudonymes' (1806–9, 4 vols.), which is valuable for its accuracy (but contains only French and Latin works); Quérard's 'Dictionnaire des Ouvrages Polyonymes et Anonymes de la Littérature Française' (Paris 1854–6), and his 'Supercheries Littéraires Dévoilées (5 vols. Paris 1845–56). We need not observe what an important source of information in the department of bibliography are literary journals. Poole's 'Index to Periodical Literature' contains references to an immense number of articles that have never been republished in books. See BIBLIOMANIA.

Bib'liomancy, divination performed by means of the Bible, also called *sortes biblicæ,* or *sortes sanctorum.* It consisted in taking passages at hazard, and drawing indications thence concerning things future. It was much used at the consecration of bishops. It was a practice adopted from the heathens, who drew the same kind of prognostications from the works of Homer and Virgil. In 465 the Council of Vannes condemned all who practised this art to be cast out of the communion of the Church; as did the councils of Agde and Auxerre. But in the 12th century we find it employed as a mode of detecting heretics. In the Gallican Church it was long practised in the election of bishops; children being employed, on behalf of each candidate, to draw slips of paper with texts on them, and that which was thought most favorable decided the choice. A similar mode was pursued at the installation of abbots and the reception of canons; and this custom is said to have continued in the cathedrals of Ypres, St. Omer, and Boulogne, as late as the year 1744. In the Greek Church we read of the prevalence of this custom as early as the consecration of Athanasius, on whose behalf the presiding prelate, Caracalla, archbishop of Nicomedia, opened the Gospels at the words, "For the devil and his angels" (Matt. xxv. 41). The bishop of Nice first saw them, and adroitly turned over the leaf to another verse, which was instantly read aloud: "The birds of the air came and lodged in the branches thereof" (Matt. xiii. 32). But this passage appearing irrelevant to the ceremony, the first became gradually known, and the Church of Constantinople was violently agitated by the most fatal divisions during the patriarchate.

Biblioma'nia ("book-madness"), a word formed from the Greek, and signifying a passion for possessing rare or curious books. The true bibliomanist is determined in the purchase of books less by the value of their contents than by certain accidental circumstances attending them. To be valuable in his eyes they must belong to particular classes, be made of singular materials, or have something remarkable in their history. Some books acquire the character of belonging to particular classes from treating of a particular subject; others from something peculiar in their mechanical execution (as the omission of the word "not" in the seventh commandment, which gives the Wicked Bible its name), or from the circumstance of having issued from a press of uncommon eminence, or because they once belonged to the library of an eminent man. But there are certain fashions in bibliomania, and books much sought at one time may at another be comparatively neglected. Some collections of books may possess or have possessed much intrinsic value; such as collections of the various early editions of the Bible; collections of editions of single classics (for example, those of Horace and Cicero); the editions of the Greek and Latin classics *in usum Delphini* and *cum notis variorum;* the editions of the Italian classics printed by the Academy *dell a Crusca;* works printed by the Elzevirs and by Aldus; the classics published by Maittaire or Foulis; and the celebrated Bipont editions, with others. It perhaps was more customary in former times than at present to make collections of books which have something remarkable in their history (for example, books which have become very scarce, and such as have been prohibited), yet various scarce books are highly prized on account of nothing but their rarity, the original (1786) Kilmarnock edition of Burns' Poems, for instance. First editions may be ranked in the same class. Books distinguished for remarkable mutilations have also been eagerly sought for. Those which appeared in the infancy of typography called *incunabula,* from the Latin *cunæ,* a cradle, and among them the first editions (*editiones principes*) of the ancient classics, are still in general request. An enormous price is frequently given also for splendid proof impressions of copperplate engravings, and for colored impressions, for works adorned with miniatures and illuminated initial letters; likewise for such as are printed upon vellum. Works printed upon paper of uncommon materials, or various substitutes for paper (asbestos, for instance), have been much sought after; likewise those printed upon colored paper. Other books in high esteem among bibliomanists are those which are printed on large paper, with very wide margins. In English advertisements of rare books some one is often mentioned as particularly valuable on account of its being "a tall copy." If the leaves happen to be uncut the value of the copy is much enhanced. Other works highly valued by bibliomanists are those which are printed with letters of gold or silver, or ink of singular color; for example: (1) 'Fasti Napoleonei' (Paris 1804, 4to), a copy on blue vellum paper, with golden letters; (2) 'Magna Charta' (London 1816, fol.), three copies upon purple-colored vellum, with golden letters.

Bibliomania often extends to the binding. In France the bindings of Derome, Padeloup, and

Bozerian are highly valued; in England those of Charles Lewis and Roger Payne, among 18th century binders; while Hayday, Rivière, Bedford, and Zaehnsdorf may be mentioned as among the notable craftsmen of the 19th. Even the edges of books are often adorned with fine paintings. Many devices have been adopted to give a factitious value to bindings. Jeffery, a London bookseller, had Fox's 'History of King James II.' bound in fox-skin, in allusion to the name of the author; and the famous English bibliomanist, Askew, even had a book bound in human skin. In the library of the castle of Königsberg are 20 books bound in silver (commonly called the silver library). These are richly adorned with large and beautifully engraved gold plates in the middle and on the corners. To the exterior decoration of books belongs the bordering of the pages with single or double lines, drawn with the pen (*exemplaire réglé*), commonly of red color — a custom which we find adopted in the early age of printing in the works printed by Stephens. The custom of coloring engravings has generally been dropped, except in cases where the subject particularly requires it (for instance, in works on natural history, or the costumes of different nations), because the colors conceal the delicacy of the engraving.

Other means of idle competition being almost all exhausted, a new method of gratifying the bibliomanist taste was adopted, that of enriching works by the addition of engravings,—illustrative indeed of the text of the book, but not particularly called for,—and of preparing only single copies. Books are often mutilated in this way to enrich some other book. Such "grangerized" copies have long been well known.

Among recent books valued as specimens of typography are some of those that issued from the Kelmscott Press of the late William Morris. Bibliomania, which flourished first in Holland (the seat likewise of the tulipomania) toward the end of the 17th century, has prevailed in England to a much greater extent than in France, Italy, or Germany. The modern bibliomania is very different from the spirit which led to the purchase of books in the Middle Ages at prices which appear to us enormous. External decorations, it is true, were then held in high esteem; but the main reason of the great sums then paid for books was their scarcity, and the difficulty of procuring perfect copies before the invention of the art of printing. See Dibdin, 'Bibliomania' (1811); Fitzgerald, 'The Book Fancier' (1886); Lary, 'The Library' (1886); Burton, 'The Book Hunter' (1882); Field, 'The Love Affairs of a Bibliomaniac' (1896); Merryweather, 'Bibliomania of the Middle Ages' (1849, reprint, 1900).

Bibra, bē-bra, **Ernst von,** German scholar and writer: b. Schwebheim, Bavaria, 9 June 1806; d. Nüremberg, 5 June 1878. Being left an orphan with a large fortune at an early age, he devoted himself to physical science, and published various works that brought his name before the public. He traveled in South America, taking home with him important natural history and ethnological collections. Among his numerous works are: 'Travels in South America'; 'Memories of South America'; 'Sketches of Travel and Novels'; etc.

Bib'ulus, Lucius Calpur'nius, Roman politician; d. near Corcyra, Greece, 48 B.C. He was consul with Julius Cæsar in 59 B.C., which office he acquired through the influence of the aristocratic party. After his opposition to Cæsar's agrarian law had failed, he secluded himself in his house, whence he issued edicts against the measures of Cæsar. In 49 B.C. Pompey appointed him commander of the fleet in the Roman Sea. In the following year Cæsar eluded him and crossed over into Greece.

Bicanere, bīk-ā'nēr, India, a town, capital of a principality of the same name; 240 miles west by south from Delhi. With its battlemented walls and large citadel, both flanked with round towers, and its temples, one of which rises to a great height, it presents a magnificent appearance to the traveler approaching it through the desolate tract of country in which it stands; but a nearer inspection dispels the illusion, and the greater part of the houses are found to be hovels of mud, painted red. Water is obtained from wells. Pop. (1901) 53,071.

Bicar'bonate. See CARBON.

Bicci, Ersilio, bē'chē, ār-sēl'yō, Italian poet: b. 1845. He studied in Florence, and became professor of Italian literature in the Licei Dante and Toscanelli of that city. His best composition is in the collection styled 'New Verses.'

Bice, bīce, the name of two colors used in painting, one blue, the other green, and both native carbonates of copper, though inferior kinds are also prepared artificially.

Bi'ceps (*biceps flexor cubiti*), the principal flexor muscle of the arm, the muscle popularly shown as evidence of muscular development. At its upper end it consists of two parts, one being attached to the coracoid process of the scapula, and the other to the margin of the glenoid fossa, about the joint. This latter, the long head, passes over the head of the humerus as a tendon and unites with the short head to form the belly of the muscle. The lower end of the biceps is inserted for the greater part to the radius, and a smaller tendonous expansion is inserted in the fascia of the forearm. The action of the biceps is to bring the forearm to the arm and to turn the inturned hand outward.

Bicêtre, bē-sātr, France, a village a little to the southwest of Paris, with a famous hospital for old men in indigent circumstances, and an asylum for lunatics, together forming one vast establishment. This establishment was originally founded by Louis IX. as a Carthusian monastery, became later a castle, which was demolished in 1632, after being long in a ruinous state, and was restored by Louis XIII., and destined as a retreat for infirm officers and soldiers. When Louis XIV. afterward erected the great Hôtel Royal des Invalides, Bicêtre became a general hospital, and it continued as such down to the Revolution, while it contained also a house of correction for swindlers, thieves, etc. The establishment was then entirely altered and converted to its present use, the buildings being partly pulled down and replaced by new ones. The poor persons admitted must be at least 70 years of age, or incapacitated by some incurable disease from earning a livelihood. The lunatics are such as belong to the department of the Seine. They are attended to with the greatest

care, and fabricate neat little articles of wood and bone, known in France by the name of «Bicêtre work.» The number of beds in the institution is over 2,700.

Bichat, Marie François Xavier, bē-shär, mä-re' frän-swä ksäv-ē-ā, French physician: b. Thoirette, department of Jura, 14 Nov. 1771; d. 22 July 1802. His father, a physician, early initiated him into the study of medicine, which the young Bichat prosecuted at Lyons and Paris, where he studied under the direction of Desault (q.v.), who treated him as a son. On the latter's death, Bichat superintended the publication of his surgical works, and in 1791 began to lecture upon anatomy in connection with experimental physiology and surgery. From this period, amidst the pressing calls of an extensive practice, he employed himself in preparing those works which spread his reputation through Europe and America, and which had the most beneficial influence upon medical science generally. In 1800 appeared his 'Treatise on the Membranes,' which passed through numerous editions, and immediately after publication was translated into almost all European languages, and 'Researches Concerning Life and Death,' followed, the next year, by his 'General Anatomy' (4 vols. 8vo) — a complete code of anatomy, physiology, and medicine, which was translated into English by Dr. G. Hayward, and published in 3 vols. 8vo. In 1800 he was appointed physician of the Hôtel-Dieu, in Paris, and with the energy characteristic of true genius began his labors in pathological anatomy. In a single winter he opened no less than 600 bodies. He had likewise conceived the plan of a great work upon pathology and therapeutics; and immediately upon commencing his duties as physician to the Hôtel-Dieu he began his researches in therapeutics by experiments upon the effects of simple medicines. In the midst of his activity and usefulness he was cut off by a malignant fever, probably the consequence of his numerous dissections. His friend and physician, Corvisart, wrote to Napoleon in these words: «Bichat has just fallen upon a field of battle which counts more than one victim; no one has done so much, or done it so well, in so short a time.» He was the creator of general anatomy, or of the doctrine of the identity of the tissues of the different organs, which is the fundamental principle of modern medicine.

Bichir, bĕ-shēr', one of the African mud-fishes (*Polypterus bichir*), which inhabits the upper Nile and its tributaries, and is regarded as the best food-fish of those waters. It is only about a foot long, and is one of the few remaining species of the great extinct group *Ganoidea* (q.v.), and is related to the American gar-pike. See Mud-Fish; Reed-Fish.

Bichlo'ride (-klo'-) **of Gold,** a substance formed by the action of chlorine gas upon dry metallic gold that has been previously thrown down in the form of an impalpable powder, by chemical means. Some authorities assert that the substance so formed is a true chemical compound, having the formula $AuCl_2$; while others maintain that it is a mere mixture of metallic gold and the well-known trichloride, $AuCl_3$. The so-called «bichloride of gold» has risen into notoriety on account of the use made of it by the late Dr. Keeley of Dwight, Ill., in the cure of dipsomania and chronic alcoholism. Its general characteristics, chemically and physiologically, are to a great extent similar to those of mercury bichloride. Its employment by Dr. Keeley produced a profound impression on the medical world, and many partisans both for and against its virtues exist. The success, from a financial standpoint, of the Dwight sanitarium, brought forth many imitators, and much harm has been done by unskilful persons using this dangerous and powerful medicinal agent.

Bickerstaffe, Isaac, Irish dramatic writer: b. Ireland, about 1735; d. about 1812. He wrote many successful pieces for the stage, some of which such as the operas of 'Love in a Village' and 'The Padlock,' are still represented. His celebrated comedy of 'The Hypocrite,' adapted from Colley Cibber's 'Nonjuror,' which was again borrowed in its leading incidents from Molière, long retained its place on the stage, with its well-known characters of Mawworm and Dr. Cantwell. The music of many of Bickerstaffe's pieces was composed by Charles Dibdin. Latterly he retired to the Continent, and died there.

Bick'ersteth, Rev. Edward, English clergyman: b. Kirkby-Lonsdale, Westmoreland, 19 March 1786; d. 24 Feb. 1850. He was educated in the grammar school of his native town, and at the age of 14 found a place in the post-office, London, where he remained for six years, afterward spending five years as an articled clerk with a London attorney. He then commenced business as a solicitor in Norwich, in partnership with his brother-in-law, and soon was in receipt of a large and increasing income. A great change, however, came over his mind and he began to exert himself in promoting the diffusion of the truths of religion among his fellowmen. Among other works accomplished by him was the establishment of the Norwich Church Missionary Society. He also published in 1814 'A Help to the Study of the Scriptures,' which met with great success. He then resolved to abandon the legal profession for that of a minister of the Church of England. The Church Missionary Society wished to send him abroad on a special mission to Africa, and in this view the bishop of Norwich, dispensing with the usual course of a university education, admitted him to deacon's orders on 10 Dec. 1815, and a fortnight afterward he was admitted to full orders by the bishop of Gloucester. Mr. Bickersteth thereupon, with his wife, proceeded to Africa, from which, after accomplishing the objects of his mission, he returned in the following autumn. He now filled the office of secretary to the Church Missionary Society, and from this period to 1830, when he resigned it, was indefatigable in the performance of its multiform duties. In the year last mentioned he became rector of Watton, in Hertfordshire, and spent there the remainder of his life. He had now become widely known as one of the most influential and popular clergymen of the evangelical section. Besides taking an active share in furthering the cause of the various religious societies, including the Evangelical Alliance, of which he was one of the founders, he likewise issued a series of publications which had an immense circulation, among others: 'The Christian Student'; 'A Treatise on the Lord's Supper'; 'A Treatise on Prayer'; 'The Signs of the Times'; 'The Promised Glory of the

Church of Christ'; 'The Restoration of the Jews'; 'A Practical Guide to the Prophecies,' besides sermons and tracts without number.

Bick'more, Albert Smith, American naturalist: b. St. George, Me., 1 March 1839. He graduated at Dartmouth College in 1860, and studied under Agassiz at the Lawrence Scientific School of Harvard. In 1865–9 he traveled in the Malay Archipelago and in eastern Asia; in 1870 became professor of natural history in Madison (now Colgate) University; and in 1885 professor in charge of the department of public instruction at the American Museum of Natural History, New York. His publications include: 'Travels in the East Indian Archipelago' (1869); 'The Ainos or Hairy Men of Jesso'; 'Sketch of a Journey from Canton to Hankow.'

Bick'nell, Frank Martin, American author: b. Melrose, Mass., 24 Jan. 1854. He graduated at the English High School, Boston, in 1872; engaged in business till 1888; and afterward devoted himself to literature. He has contributed largely to 'St. Nicholas'; 'Harper's Young People'; 'Youth's Companion'; 'Outing'; New York *Evening Post;* etc. He wrote 'The City of Stories'; 'The Apprentice Boy'; etc.

Bicknell, Thomas William, American educator: b. Barrington, R. I., 6 Sept. 1834. He was graduated from Brown University in 1860. During his senior year in college he was elected to the Rhode Island legislature, and after graduation was principal of schools in Rehobart, Bristol, and Providence, R. I., and in Elgin, Ill. In 1869–75 he was commissioner of the public schools of Illinois, and during this incumbency he secured the establishment of the State Normal School. He founded, edited, and owned 'The Journal of Education'; 'The Primary Teacher'; 'The American Teacher'; 'Education'; and 'Good Times,' between 1874 and 1886. He has been president of a number of educational institutes and Sunday-school unions. He has written 'State Educational Reports'; 'John Myles and Religious Toleration'; 'Life of W. L. Noyes'; 'Brief History of Barrington'; 'Barrington in the Revolution'; and 'The Bicknells.'

Bicycle, a light steel vehicle consisting of two wheels arranged tandem, united by a frame with the **rider's** seat upon it; propelled by his feet acting on pedals connected with one of the axles, at present that of the rear wheel; and steered by a handle-bar guiding the direction of the front wheel. As at present constructed the wheels are of equal size; the driving mechanism is usually a chain with the links fitting over a sprocket-wheel, but about one in 25 are chainless, mainly with a shaft and bevel driver; the weight is 23 to 27½ pounds, complete; the frame is of hollow cold-drawn tubing, with brazed joints; the wheels are suspension, with crossed tangent spokes, wooden rims, pneumatic tires, and ball bearings. The name dates from about 1865, though first so spelled in a patent of 8 April 1869, and elsewhere called "bysicle," "bicircle," "bicycular velocipede," etc.; but prior to 1870 the form of the machine was usually called a velocipede, a French name dating from 1779.

The pedomotor itself goes back perhaps to Egyptian and probably at least to classic times, winged figures astride of a stick connecting two wheels being found in the frescoes at Pompeii. In the 17th century it suddenly appears with surprising frequency; there is a picture of a bicycle in a stained-glass window at Stoke Pogis, England; in August 1665, John Evelyn writes in his diary of "a wheele to run races in"; in 1690 a Frenchman named De Sivrac invented a two-wheeled *célérifère* having a horse-shaped wooden body with a saddle, and steered by the rider's feet; in 1693 Ozanam described before the Royal Society a vehicle pedaled by a foot traveler. In 1761 the 'Universal Magazine' describes a similar one invented by an Englishman named Ovenden; in August 1769 the 'London Magazine' describes "a chaise to go without horses." On 27 July 1779, *Le Journal de Paris* describes a *vélocipède* invented by MM. Blanchard and Magurier, which is merely the *célérifère* with an upright bar to support the hands; this gained considerable vogue. From France and England the idea spread to Germany, which added to it the one idea needed to vivify it. In March 1784 one Ignaz Trexler, of Gratz, Austria, invented a pedomotor credited with the speed of a galloping horse — unquestionably meaning down hill. But the direct progenitor of the modern bicycle was one built in 1816 by Baron Karl von Drais, Freiherr von Sauerbronn (1784–1851), chief forester to the Grand Duke of Baden (to whose memory in 1891 the bicyclers erected a monument at Carlsruhe), often called "the father of the bicycle." It was designed to aid him in his daily journeys. The whole was of wood; the wheels of equal size, connected by a perch, astride which the rider sat in a saddle, and to the fore end of which was swiveled a fork into which the front wheel was axled; the rider propelled it on level ground or up hill by striking the ground with his feet, and coasted down hill. But the significant feature, the germ of the bicycle, was the pivoting of the front wheel and its steering by a handle-bar; for which there was a stuffed arm-rest on an elevated cross-piece. Drais patented this in Paris, 1816, and claimed that it would go up hill as fast as a man could walk, on a level, after a rain, at six or seven miles an hour, or courier's pace, the same when dry at eight or nine, and down hill at a horse's gallop. It excited much attention and was called the "draisine"; and in 1818 one Dennis Johnson patented in England an improved form called the "pedestrian curricle," with adjustable saddle and elbow-rest. This started a fashionable furore, and those who could not afford it laughed at it as the "dandy-horse," and "hobby-horse," while the serious-minded invented a swarm of names for it, such as "patent accelerator," "swift-walker" (a literal translation of "velocipede"), "manivelociter," "bivector," etc., and finally, in 1819, "bicipede" and "tricipede"; but by this time the name "velocipede" had become the recognized current term. It had then become common enough to be prohibited in London, and to make dodging the machines a common exercise on the suburban roads; and bred complaints of leg disease, and a consequent invention by one Birch for using the arms instead. In 1821 Louis Gompertz patented an improvement in which the handle-bar was connected with a segment rack gearing into a pinion on the front wheel, so that either arms or feet could be used for propulsion; but the craze had worn itself out, and

it was nearly half a century before it revived with a better machine. Meantime, in June 1819, the curricle had been introduced into the United States, and became a craze in Boston, New York, Philadelphia, etc.; and many riding-schools were opened. On 26 June 1819 William K. Clarkson was granted a patent for an "improved velocipede"; but the excitement soon subsided here also. The grotesque appearance of a person leaning forward on his elbows and kicking away at the ground beneath his clumsy vehicle proved too much for the national sense of humor, and riders were the objects of ridicule. A typical "hobby-horse" in the early 'twenties had the following specifications: Wheels, wood, 32 inches; wheel base, 4 feet 7 inches; backbone, wood, 5 feet 9 inches long; saddle, hard wood, 1 foot 6 inches long; handle-bar, wood, 9 inches, elevated 48 inches above ground; finish, black paint; weight, 90 pounds. The arm-rest was of wood.

With the death of the draisine the idea was not altogether forgotten; both in England and on the Continent scattering pedomotors were built every few years, and the capital improvement of putting cranks on the front axle, creating the true modern bicycle, was at length devised. It is asserted, though not proved, that one Kirkpatrick McMillan of Courthill, Scotland, having tried in 1835 a system of cranks, side-levers, connecting-rods, and pedals, for propelling a tricycle, applied them successfully to a wooden bicycle in 1840; and it is certain that in 1846 Gavin Dalzell of Lesmahagow, Scotland, who had heard of McMillan's machine, invented and rode a rear-driving velocipede propelled by pedals on hanging levers, which, by means of connecting-rods instead of chains, rotated cranks on the rear axle. This machine, whose wheels were of wood shod with iron, and its frame somewhat dipped like the present ladies' wheel, made 10 or 12 miles an hour; it was a rather striking forecast of the modern "safety," though not in the least a germ of anything, as its existence was not known till 1892. It had also some important differences: the rear wheel was the larger, as in the "Humber" and "Star" machines, and the action was to-and-fro and not rotary. In 1855 a German instrument-maker named Philipp Maritz Fischer made and extensively rode a velocipede. But none of these were ever made for any persons but the owners, nor incited further invention.

The real ancestor of our bicycle, the crank-driven velocipede that led straight to better things, arose in France: the honor of the invention is hotly disputed. According to one account it belongs to Ernest Michaux, the son of a Parisian carriage repairer (to whom a monument was erected in 1894); but if so, he did not make it public and it led to nothing, and it is generally accredited as theory, where it belongs as practical result, to Pierre Lallement, a Parisian blacksmith, said to have been in Michaux's employ. It sprang, in fact, not from Michaux's, if that existed, but from a multicycle invented in 1865 by one Marechal; a five-wheeler, each wheel having an independent axle with cranks, loose pedals, and a separate seat; the front was the guide-wheel, but it could be ridden by one or many. In September MM. Woirin and Leconde patented a tricycle, with two smaller rear wheels on the same axle, and a large front one with cranks and loose pedals, the whole connected with a wooden horse-shaped body like De Sivrac's, on whose back the rider sat well over the front wheel; this was the progenitor of the modern tricycle. Lallement, against the judgment of his friends, who thought that keeping one's balance would be impracticable on two wheels tandem, applied the principle thus the same year, learned the art of balancing, and exhibited his machine and his skill at the Paris Exposition of that year; but thought too little of it to patent it. The next year (1866) he came to the United States to look for work, made a velocipede and rode it about New Haven, Conn., and was induced by one James Carroll to patent it with him, which was done 20 November. It had two wooden wheels, the front one slightly the larger, with iron tires; was a front-driver; and the saddle was on a steel spring midway between the wheels. But it was too crude and unpleasurable to attract much notice. In France, however, great improvements were shortly made on it, and in the winter of 1867 it became the sensation of Paris; riding schools sprang up all about, and straps to fasten the machines were part of the equipment of the great places of amusement. This continued till the Franco-German war temporarily destroyed the business, which had developed a large manufacturing interest. Meantime, in England, Edward Gilman in 1866 had patented a rear-driver with a single treadle, and the chain gear had been broached. In 1869 the improved velocipede and the reflex of the French enthusiasm brought it into sudden vogue in the United States, and American inventiveness was turned toward perfecting it: at the time the "boom" burst in 1870 the Patent Office was receiving half a dozen applications for new patents every week. Up to 1869 the two wheels were of about the same size, 30 to 40 inches; and the earlier machines had wooden hubs, spokes, and rims, with steel tires. But the wire-spoke suspension wheel, re-invented in France in 1864, soon came in, and by 1869 all-steel wheels with hollow tubing were built; the prices were from $75 to $300, and cycling was a mark of some social distinction. In the West it was the universal roading sport, the leading manufactories being located there; rinks were built everywhere, and the wonderful trick-riding possible with the heavy wheels then made,—on flights of stairs, by jumps, etc., which our modern light wheels would not endure,—drew large crowds. But this weight,—116 pounds was medium, and in 1871 a 75-pound racer was much borrowed from its lightness,—made the sport a heavy tax even on the athletic, and insupportable to any others; the rigid tire made the jolting on rough roads or paved streets a torture, so that a current nickname for the machine was "bone-shaker." The low build covered the rider with the dirt of roads and carriages, and to avoid this and gain speed the front wheel was gradually raised and the seat carried up with it, and in 1869–70 two western builders placed large numbers of high or "ordinary" wheels on the market. But the steel tire made the exertion still more severe; and hostile municipal legislation, controlled by the horse owners, drove the bicyclers off every desirable riding road. The sport (till the "safety" came in it was only such) collapsed, with the suddenness of a financial crash, within a single week; thousands of machines, worth $100 to $150 one day, could not be sold at any price the next, and were ultimately disposed of to boys or the poorest classes at

nominal prices, or allowed to become old iron; manufactories crowded with orders had them countermanded in a mass; rinks no longer drew; and what little was left of the sport, among those who owned fine machines and clung to them, was killed by the sale at nominal prices of a stock of cheap wheels made of gas-pipe, malleable fittings, and wooden wheels with steel tires, which soon fell to pieces, but destroyed all prestige in the sport. It was nearly a decade before America took it up again in any general way, and then with a different wheel, the bicycle proper.

Meantime a great development had gone on in England, where the hard, smooth macadam roads, and beautiful by-paths for cyclers without disturbing horses, made all conditions more favorable. The bicycle under that name was patented 8 April 1869; it had steel rims and solid rubber tires, round or half round. For speed the front wheel was gradually enlarged and the rear reduced to a mere steerer, till the Ordinary was attained in 1871, with a 40- to 48-inch front wheel and 16-inch rear; it was made feasible and popular by the rubber tires, which reduced the friction and jar, and consequently the needed propelling power. The front wheel was gradually raised in proportion to the rider's height and skill, and in the early eighties attained 60 and even 64 inches. It still remains the perfection of grace and simplicity in bicycle construction: the motive power being applied direct, and the wheel, with cranks and pedals, forming a solid body. It is also the most exhilarating to ride, given strength and skill. The greatest improvements were made by James K. Starley, of Coventry, England, the second "father of the bicycle"; his wheels in 1873 had become nearly all that made the best Ordinary, with steel frame, cross tension spokes, and solid rubber tires. In 1874 he patented the tangent wheel.

The Ordinary, however, could not be the bicycle of the future. It was hard to mount, except in favorable spots, and if the rider was dismounted had often to be walked long distances on streets or hillsides; both from this and the great air resistance due to the rider's elevation, it was merely the sport of a few athletic men, mostly young; headers were frequent from the rider's mass centre being directly over that of the large wheel, and liable to be serious from his high seat, though the danger was exaggerated. A safer build was therefore mooted. The first idea was to bring the rider's centre below that of the driving wheel; this could only be accomplished by operating the pedal with some kind of leverage, and a rear-driving safety with lowered front wheel was patented in 1879 by H. T. Lawson of England. A similar type, called the "Bicyclette," followed in 1880. In the same year the "Star," a reversed Ordinary with the small wheel in front, was introduced and had something of a run; the "Humber Safety" in 1885 copied the type with more extreme difference in wheels, and the current joke upon it was an imaginary Irish description that "the big wheel is the smallest and the hind wheel is in front." But with the high wheel there is always liability to a tumble, and a "backfall" is worse than a "header"; and the "Dwarf Bicycle," as the safeties were called, grew in favor. The "Xtraordinary" and the "Facile" about 1882 had some trial; but a more popular form, which had high racing speed and made new records, was Starley's "Kangaroo" (1883), with diamond frame, independent crank-shafts, and two chains gearing them to the front wheel. The gain of the geared wheel over the Ordinary is not only in lessened air resistance from the lower seat, but because length of crank and pedal speed can be gauged to the most favorable speed for the rider, while in the Ordinary the crank is too short and the pedal speed too rapid for the best results. But the alternate tightening and loosening of the chain twice in every revolution, and other defects, caused its early displacement by Starley's famous and still speedier "Rover" (1884), for a long time the popular term for "safeties" of any pattern. Here the cranks and pedals were on a separate axle, connected with the driving-wheel by a single chain which was therefore permanently tight; the seat was far back over the rear wheel, so that headers over the handle-bar were absolutely impossible. The front wheel was about one fourth larger than the rear; later they were made of practically the same size as now, completing the evolution back to the velocipede, and making its general utility possible. With the low seat any one can mount, and the exercise is not too severe; and it makes possible the drop-frame for ladies. The Ordinary, as its name implies, maintained the field for a while; the sporting idea was still in the ascendant, the "safety" was sneered at as the effeminate and rather cowardly refuge of weaklings and old men, and it was not believed that it could compete in racing speed. But about 1886 the public began to realize its immense business and social advantages, and with numbers the fear of ridicule vanished; by 1888 five sixths of the sales were of "safeties," and by 1890 the Ordinary had become a curio or the equipment of trick riders. For many years now both names have gone out of use, all being "safeties," and the compendious "bicycle" or simply "wheel" (a reminiscence of the Ordinary, where the driving-wheel was everything) covers all. This advent of the "safety" has carried the bicycle into every-day business and the life of every household; carriers, policemen, messengers, etc., find it of great service; competition has lowered prices to the level of the very servant-girls and street boys; and there is hardly a spot in the modern world into which it has not penetrated. There are great manufactories engaged in bicycle manufacture, and also in making the machines used in their construction. In the United States alone, in 1900, nearly 20,000 people were earning their living by their direct manufacture, besides more than 6,000 establishments and nearly 10,000 persons employed in repairing and many more in selling them. Even in war they have shown their utility. They have been adopted for military purposes by many of the nations of the world: by Austria-Hungary in 1884; by England and Switzerland in 1887; by Belgium in 1889. The French army is said to be equipped with several thousand bicycles, and a perfected system of drill and tactics for advance-

guard duty, skirmishing, and rapid movements has been introduced into the various armies. A detachment of bicycle-mounted soldiers has been found useful in accompanying the motor Maxim gun, first tried in 1899. The military bicycle is especially constructed for hard work and rough usage. Some of the French machines are made to fold, so that when the riders come to impassable ground they can double them up and carry them on their backs.

Partly effect but mainly cause of this general use has been the direction of inventive genius to the advancement of speed or comfort, often both at once. Every feature,—material, frame, spokes, gearing, tire, bearings, rim, handle-bar, brake, and others,—has been vigilantly and tirelessly studied to win public favor, and there is hardly a more wonderful machine existent. The enormous brain-power devoted to its perfection is shown by the fact that in the United States alone 7,573 patents had been granted up to 1900 for cycles and their parts, and probably double that in the world altogether. Of these, in our own country only 16 had been issued before 1865, and the great majority were granted after 1890. In 1892 the applications had grown so numerous that a special department of the Patent Office was created for them.

The greatest of all single ones, and the one which has revolutionized the business and made cycling a luxury rather than an exertion, is the pneumatic tire, which not only saves jolts by rolling into instead of on and off the minute obstructions of the roadway, but for the same reason increases speed, each rise of the wheel taking so much more muscular exertion. It must be confessed, however, that a heavy price is paid in the endless nuisance of punctures, ending many rides abruptly, and involving a walk for miles — something unknown with the solid tire. It was originally invented, not for bicycles, but road wagons, by an English civil engineer named R. W. Thompson, in 1843, and patented in the United States in 1847; but fell flat and was allowed to lapse. The first bicycle tires were iron or steel; then a strip of rubber was fastened over the tire; later, a round or half-round piece of solid rubber was cemented or fastened into the hollow of the rim. But in 1889 an Irish veterinary surgeon, Dr. John B. Dunlop, fitted a piece of rubber hose to his son's bicycle; it worked so well that he patented it, not broadly, but for specific details now disused. Shortly after, I. W. Boothroyd of London described, but did not patent, a tire of this sort; and about the same time P. W. Tillinghast, of Providence, R. I., patented one in this country. Received with utter incredulity at first, and a not unjustifiable dread of punctures, in two years 40 per cent of all bicycles were fitted with it, and in two more no other was on the market. (The cushion tire, a large tire, solid except for a small air space running through it, was tried for a time in 1891 and after but was not a success). But even this would have been ineffectual save for the enormous reduction in weight by the use of steel weldless tubing and wire, so that a machine of the incredibly small weight of nine pounds has been used for racing, with a wheel on whose spokes four men can stand without injuring them: these machines are too frail for road use, but even the average roadster does not reach 28 pounds, while in 1873 65 pounds, and even in 1885, 48 was thought fair, and 27 a racing wonder.

The ball-bearing, invented by an Englishman named Bonn, is another epoch-making invention, which revolutionized all previous theories. The earliest bicycle bearing was a plain one with a sleeve, known as the parallel bearing. The friction was so heavy that the roller bearing was substituted, but did not work well; the next was the adjustable cone, which for a time was the universal one. But in all solid-surface bearings the grinding of the sand which worked in made them irregular and rattling after a while, and the layers of gudgeon grease required a steady tax on time for cleaning. In the ball-bearing, the conical axle bears against a row of steel balls in a circle, tangent to the bearing surface and to two other surfaces at right angles, so that the friction is only against three points, and the bearing parts roll over instead of sliding upon each other. The wear of the balls is astonishingly slight, and from the constant change of surface there is little irregularity, and from the small contact points scarcely any making of axle grease.
